#### **Scholarships and Bursaries**

Memorial Funds  
CaRMS bursary

#### **Other Sponsorships**

Community of Support  
Indigenous Student Mentorship Fund  
Black Health Alliance  
Ontario Medical Student's Weekend  
Medical Student Research Day  
Class formals and graduations

#### **NOTE:**

Many of you have wondered about the *Toronto Notes* logo, which is based on the rod of Asclepius, the Greek god of medicine. The rod of Asclepius consists of a single serpent entwined around a staff. This icon symbolizes both rebirth, by way of a snake shedding its skin, and also authority, by way of the staff.

In ancient Greek mythology, Asclepius was the son of Apollo and a skilled practitioner of medicine who learned the medical arts from the centaur Chiron. Asclepius' healing abilities were so great that he was said to be able to bring back people from the dead. These powers displeased the gods, who punished Asclepius by placing him in the sky as the constellation Orphiuchus.

The rod of Asclepius is at times confused with the caduceus, or wand, of Hermes, a staff entwined with two serpents and often depicted with wings. The caduceus is often used as a symbol of medicine or medical professionals, but there is little historical basis for this symbolism.

As you may have guessed, our logo uses the rod of Asclepius that is modified to also resemble the CN Tower – our way of recognizing the university and community in which we have been privileged to learn the art and science of medicine.

Thomas O'Brien, MD  
Class of 2009, M.D. Program, University of Toronto

## Preface – From the Editors

Dear reader,

We are grateful to present Toronto Notes 2023 to you. This edition is the product of an exceptional effort from the hundreds of editors and contributors who worked tirelessly with us as we navigated through the year. Together, we have created the thirty-ninth edition of Toronto Notes, thus continuing our organization's rich tradition of providing an up-to-date, comprehensive, and concisely written medical resource to our readers.

Thirty-nine years ago, Toronto Notes began as a humble initiative, with medical students from the University of Toronto collecting and circulating their notes. Nearly four decades later – with annual editions and an ever-expanding vision – Toronto Notes has become one of the most trusted medical review texts; it is a resource that is cherished by trainees and physicians throughout Canada and around the world.

The Toronto Notes for Medical Students Inc. is a nonprofit corporation whose mission is to provide a trusted medical resource in order to give back to our community. Keeping in line with our values and community needs, all proceeds from Toronto Notes sales are directly donated to support both global and local initiatives. Among other initiatives, we have supported U of T Medicine class activities, student scholarships and bursaries (such as the Mohammad and Zeynab Asadi-Lari award), our Daffy annual musical fundraiser for the Canadian Cancer Society, and the entirety of our (over twenty-five) student-led outreach programs that seek to enrich lives in the community.

This is why we, and all the members of our U of T team, gladly dedicated so many hours toward this immensely involved project. As our valued reader, we thank you for your honest and vital financial contribution through your purchase of our textbook. Each book sold makes an important difference.

The 2023 edition features substantial content revisions to the text, figures, and graphics of all 32 chapters, following a comprehensive review by our student and faculty editorial team. Up-to-date, evidence-based medicine studies are also summarized in highlighted boxes throughout the text. In particular, the *Ethical, Legal, and Organizational Medicine* chapter has been thoroughly revised and expanded, and all chapters reflect the most-updated COVID-19 guidelines. The new MCCQE objectives on Clinical Informatics and Health

and the Climate Crisis are also fully addressed. In addition to content updates, the Toronto Notes 2023 Clinical Handbook has been restructured to prioritize high-yield content to guide your learning during clerkship rotations. Toronto Notes prioritizes cultural sensitivity, health equity, and strives for accurate representation of our vibrant and diverse communities. To enhance our team's editorial lens on these concepts while editing the chapters, training was provided by the Anti-Racism and Cultural Diversity Office and Office of Inclusion & Diversity at the University of Toronto.

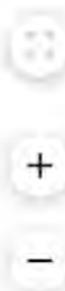

We sincerely thank each of our 170 student editors and 103 faculty editors, whose meticulous revisions and shared dedication to the bettering of this text has helped make Toronto Notes 2023 possible. We have learned so much from leading this team, and are especially grateful to everyone for contributions to Toronto Notes with challenging time commitments and demands. We thank our incredible Associate Editors – Ming Li, Dorrin Zarrin Khat, Christie Tan, Vrati Mehra, Alyssa Li, and Karolina Gaebe – for their tireless leadership, exceptional organization, and wonderful teamwork. We, and the success of this edition, lean on their shoulders. We also thank our Clinical Handbook Editors – Justin Lu, Janice Chan, and Rayoun Ramendra – for their exceptional editorial leadership and spearheading the work on this resource. We owe a great deal of gratitude to the Editors-in-Chief of the 2022 edition – Yuliya Lytvyn and Maleeha Qazi – for their continued guidance over the past two years. We would also like to thank the wonderful BMC illustration team for their work and especially the cover designs, with inspiration from the medical illustrations of Barry T. O'Neil. Lastly, we thank our longtime partners at Type & Graphics Inc – especially our backbone, Enrica Aguilera and Maria Garcia – for their years of support and excellent work producing Toronto Notes 2023. Finally, we thank you for supporting our initiative by purchasing and reading our product. We hope that you will find Toronto Notes 2023 to be a useful companion on your medical journey, both now and for years to come.

Sincerely,

**Anders W. Erickson**, MD/PhD student

**Jennifer Parker**, MD/PhD student

*Editors-in-Chief, Toronto Notes 2023*

## Acknowledgements

We would like to acknowledge the exceptional work of all previous Toronto Notes (formerly MCCQE Notes) Editors-in-Chief and their editorial teams. The 39th edition of this text was made possible with their contributions.

The Hospital for Sick Children

### RESPIROLOGY

**Samir Gupta, MD, FRCPC**  
Division of Respiriology, Department of Medicine  
Unity Health Toronto

**Ambrose Lau, MD, MEd, FRCPC**  
Division of Respiriology, Department of Medicine  
University Health Network and  
Unity Health Toronto  
Assistant Professor, University of Toronto

**Christopher Li, MD, FRCPC, DABSM**  
Division of Respiriology, Department of Medicine  
Unity Health Toronto - St. Michael's

### RHEUMATOLOGY

**Ahmed Omar, MBBCh, MRCP, MSc**  
Assistant Professor, University of Toronto  
Division of Rheumatology, Department of Medicine  
Mount Sinai Hospital, University Health Network

**Arthur Bookman, MD, FRCPC**  
Division of Rheumatology, Department of Medicine  
University Health Network

**Sahil Koppikar, MD, FRCPC**  
Assistant Professor, Division of Rheumatology  
Department of Medicine,  
Women's College Hospital

**Dharini Mahendira, MD, FRCPC, MScCH**  
Assistant Professor, Division of Rheumatology  
Department of Medicine, St. Michael's Hospital

**Medha L. Soowamber, MD, MSc, FRCPC**  
Division of Rheumatology, Department of Medicine  
Mount Sinai Hospital

# Faculty Contributors, University of Toronto

## SURGERY

### GENERAL AND THORACIC SURGERY

**Abdollah Behzadi, MD, MBA, FRCSC, FACS**  
Division of Thoracic Surgery, Department of Surgery  
Trillium Health Partners, University of Toronto

**Sayf Gazala, MD, MSc, FRCSC**  
Assistant Professor, Thoracic Surgery Department of  
Surgery, Michael Garron Hospital

**Jesse Pasternak, MD, MPH, FRCSC**  
Section of Endocrine Surgery  
Division of General Surgery, Department of Surgery  
University Health Network

**Fayez Qureshy, MD, MBA, FRCSC**  
Department of General Surgery  
University Health Network,  
Toronto Western  
Hospital

### GYNAECOLOGY

**Michael Chaikof, MD, FRCSC, MS-HPed**  
Division of Urogynecology  
Department of OB/GYN  
Sunnybrook Health Sciences Centre

**Sari Kives, MD, FRCSC**  
Associate Professor  
Division of Obstetrics and Gynecology  
Department of Obstetrics and Gynecology  
St Michael's hospital

### NEUROSURGERY

**Sunit Das, MD, PhD**  
Division of Neurosurgery  
St. Michael's Hospital

**Michael G. Fehlings, MD, PhD, FRCSC, FACS**  
Professor of Neurosurgery, Department of Surgery,  
University of Toronto  
Vice Chair Research, Department of Surgery,  
University of Toronto  
Senior Scientist, Krembil Brain Institute,  
University Health Network  
Staff Neurosurgeon, University Health Network  
Co-Director, University of Toronto Spine Program

**Eric M. Massicotte MD, MSc, MBA, FRCSC**  
Associate Professor University of Toronto  
Staff Neurosurgeon, University Health Network  
Medical Director, Back & Neck Program Altum  
Health

### OBSTETRICS

**Richard Pittini, MD, MEd, FRCSC, FACOG**  
Department of Obstetrics and Gynecology,  
University of Toronto  
Sunnybrook Health Sciences Centre

**Mara Sobel, MD, MSc, FRCSC**  
Department of Obstetrics and Gynecology,  
University of Toronto  
Mount Sinai Hospital, University Health Network,  
Toronto General Hospital, Women's College Hospital

**Melissa Walker, MD, MSc, FRCSC**  
Staff Obstetrician Gynecologist, Department of  
Obstetrics & Gynecology, Mount Sinai Hospital  
Assistant Professor, Department of Obstetrics &  
Gynecology, University of Toronto

### OPHTHALMOLOGY

**Asim Ali, MD, FRCSC**  
Professor of Ophthalmology, University of Toronto  
Ophthalmologist-in-Chief, The Hospital for Sick  
Children

**Wai-Ching Lam, MD, FRCSC**  
Department of Ophthalmology and Vision Science  
University Health Network,  
Toronto Western Hospital  
The Hospital for Sick Children

**Jonathan Micieli, MD, FRCSC**  
Department of Ophthalmology and Vision Sciences;  
Division of Neurology, Department of Medicine;  
Kensington Vision and Research Centre,  
St. Michael's Hospital, University of Toronto

### ORTHOPAEDIC SURGERY

**Jeremy Hall, MD, FRCSC**  
Division of Orthopaedic Surgery, Department of  
Surgery, St. Michael's Hospital

**Paul Kuzyk, MD, MSc, FRCSC**  
Assistant Professor  
Lower Extremity Reconstruction Surgery  
Division of Orthopaedic Surgery

**Jesse Wolfstadt, MD, MSc, FRCSC**  
Granovsky Gluskin Division of Orthopaedic Surgery,  
Department of Surgery, Sinai Health System

### OTOLARYNGOLOGY

**Yvonne Chan, MD, MSc, FRCSC**  
Otolaryngologist-in-chief,  
St. Michael's Hospital, Unity Health  
Associate Professor and Continuing Professional  
Development Director  
Department of Otolaryngology -  
Head & Neck Surgery

**Antoine Eskander, MD, ScM, FRCSC**  
Assistant Professor  
Department of Otolaryngology -  
Head & Neck Surgery  
Sunnybrook Health Sciences Centre,  
Odette Cancer Centre  
Michael Garron Hospital

**Jonathan Irish, MD, MSc, FRCSC**  
Department of Otolaryngology,  
Head and Neck Surgery,  
University Health Network

### PLASTIC SURGERY

**Joel Fish, MD, MSc, FRCSC**  
Professor, Plastic and Reconstructive Surgery  
Department of Surgery  
The Hospital for Sick Children

**Siba Haykal, MD, PhD, FRCSC, FACS**  
Division of Plastic and Reconstructive Surgery,  
Department of Surgery  
University Health Network

### UROLOGY

**Monica Farcas, BEng, MEng, MD, FRCSC**  
Assistant Professor, Division of Urology  
Department of Surgery, Unity Health Toronto

**Yonah Krakowsky, MD, FRCSC**  
Division of Urology  
Women's College & Mount Sinai Hospital

**Jason Lee, MD, MHPE, FRCSC**  
Division of Urology, Department of Surgery  
University Health Network, Toronto General  
Hospital

**Michael Ordon, MD, MSc, FRCSC**  
Division of Urology, Department of Surgery  
St. Michael's Hospital

### VASCULAR SURGERY

**Elisa Greco, BSc, MEd, MD, RPVI, FRCSC**  
Vascular Surgeon, St Michael's Hospital

**George Oreopoulos, MD, MSc, FRCSC**  
Division of Vascular Surgery,  
Department of Surgery  
University Health Network

# How To Use This Book

This book has been designed to remain as one book or to be taken apart into smaller booklets. Identify the beginning and end of a particular section, then carefully bend the pages along the perforated line next to the spine of the book. Then tear the pages out along the perforation.

The layout of *Toronto Notes* allows easy identification of important information. These items are indicated by icons interspersed throughout the text:

Icon	Icon Name	Significance
	Key Objectives	This icon is found next to headings in the text. It identifies key objectives and conditions as determined by the Medical Council of Canada or the National Board of Medical Examiners in the USA. If it appears beside a dark title bar, all subsequent subheadings should be considered key topics.
	Clinical Pearl	This icon is found in sidebars of the text. It identifies concise, important information which will aid in the diagnosis or management of conditions discussed in the accompanying text.
	Memory Aid	This icon is found in sidebars of the text. It identifies helpful mnemonic devices and other memory aids.
	Clinical Flag	This icon is found in sidebars of the text. It indicates information or findings that require urgent management or specialist referral.
	Evidence Based Medicine	This icon is found in sidebars of the text. It identifies key research studies for evidence-based clinical decision making related to topics discussed in the accompanying text.
	Colour Photo Atlas	This icon is found next to headings in the text. It indicates topics that correspond with images found in the Colour Photo Atlas available online ( <a href="http://www.torontonotes.ca">www.torontonotes.ca</a> ).
	Radiology Atlas	This icon is found next to headings in the text. It indicates topics that correspond to images found in the Radiology Atlas available online ( <a href="http://www.torontonotes.ca">www.torontonotes.ca</a> ).
	Online Resources	This icon is found next to headings in the text. It indicates topics that correspond with electronic resources such as Functional Neuroanatomy or ECGs Made Simple, available online ( <a href="http://www.torontonotes.ca">www.torontonotes.ca</a> ).

## Chapter Divisions

To aid in studying and finding relevant material quickly, many chapters incorporate the following general framework:

### Basic Anatomy/Physiology Review

- features the high-yield, salient background information students are often assumed to have remembered from their early medical school education

### Common Differential Diagnoses

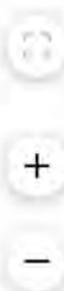

- aims to outline a clinically useful framework to tackle the common presentations and problems faced in the area of expertise

### Diagnoses

- the bulk of the book
- etiology, epidemiology, pathophysiology, clinical features, investigations, management, complications, and prognosis

### Common Medications

- a quick reference section for review of medications commonly prescribed

## Common Acronyms and Abbreviations Used in Medicine

The following are common medical acronyms/abbreviations that may be used without definition throughout the Toronto Notes text. These are typically not included in the acronym list at the beginning of each chapter. Please refer back to this list for definitions.

[ ]	concentration	ECG	electrocardiogram
β-hCG	beta human chorionic gonadotropin	ED	emergency department
ABx	antibiotics	EEG	electroencephalography
ACE	angiotensin-converting enzyme	EMG	electromyography
ACTH	Adrenocorticotrophic hormone	ENT	ears, nose, and throat
AIDS	acquired immune deficiency syndrome	ESR	erythrocyte sedimentation rate
ALP	alkaline phosphatase	EtOH	ethanol/alcohol
ALT	alanine aminotransferase	FMHx	family medical history
AR	absolute risk	FSH	follicle stimulating hormone
ASA	acetylsalicylic acid	G6PD	glucose-6-phosphate dehydrogenase
AST	aspartate transaminase	GGT	gamma-glutamyl transferase
aSx	asymptomatic	GH	growth hormone
AXR	abdominal x-ray	GHB	gamma hydroxybutyrate
BID	twice a day (bis in die)	GI	gastrointestinal
BMI	body mass index	GU	genitourinary
BP	blood pressure	Hb	hemoglobin
BPM/bpm	beats per minute	HIV	human immunodeficiency disease
C/I	contraindication	HR	heart rate
C&S	culture and sensitivity	HTN	hypertension
CAD	coronary artery disease	Hx	history
CBC	complete blood count	I&D	incision and drainage
CC	chief complaint	ICP	intracranial pressure
CHF	congestive heart failure	ICU	intensive care unit
COPD	chronic obstructive pulmonary disease	IM	intramuscular
CPR	cardiopulmonary resuscitation	IV	intravenous
Cr	creatinine	JVP	jugular venous pressure
CRH	corticotropin-releasing hormone	LDH	lactate dehydrogenase
CSF	cerebrospinal fluid	LFT	liver function test
CT	computed tomography	LH	luteinizing hormone
CXR	chest x-ray	LR	likelihood ratio
D&C	dilatation and curettage		
dBp	diastolic blood pressure		
DDx	differential diagnosis		
DM	diabetes mellitus		
DNR	do not resuscitate		
Dx	diagnosis		

## Common Acronyms and Abbreviations Used in Medicine

MAO	monoamine oxidase	sBP	systolic blood pressure
MAOI	monoamine oxidase inhibitor	SC	subcutaneous
MDI	metered-dose inhaler	SL	sublingual
MI	myocardial infarction	SLE	systemic lupus erythematosus
MRI	magnetic resonance imaging	SOB	shortness of breath
MSK	musculoskeletal	STAT	urgent or immediately (statum)
		STI	sexually transmitted infection
		Sx	symptom(s)
N/V	nausea/vomiting	T1DM	type 1 diabetes mellitus
NG	nasogastric	T2DM	type 2 diabetes mellitus
NMDA	N-Methyl-D-aspartate	TB	tuberculosis
NPO	nothing by mouth (nil per os)	TID	three times a day (ter in die)
NSAID	non-steroidal anti-inflammatory drug	TNM	tumour, nodes, and metastases
		TRH	thyroid releasing hormone
OR	operating room	TSH	thyroid stimulating hormone
OTC	over-the-counter	Tx	treatment
PCR	polymerase chain reaction	U/A	urinalysis
PE	pulmonary embolism	U/S	ultrasound
PMHx	past medical history	UTI	urinary tract infection
PO	oral administration (per os)	UTox	urine toxicology screen
POCUS	point-of-care ultrasound		
PPI	proton pump inhibitor	VDRL	Venereal Disease Research Laboratory test
PRN	as needed (pro re nata)		
		WBC	white blood cell
QID	four times a day (quater in die)	wt	weight
RBC	red blood cell		
RCT	randomized controlled trial		
ROS	review of symptoms		
Rx	medical prescription		

## Common Unit Conversions

To convert from the conventional unit to the SI unit, **multiply** by conversion factor

To convert from the SI unit to the conventional unit, **divide** by conversion factor

	<b>Conventional Unit</b>	<b>Conversion Factor</b>	<b>SI Unit</b>
ACTH	pg/mL	0.22	pmol/L
Albumin	g/dL	10	g/L
Bilirubin	mg/dL	17.1	μmol/L
Calcium	mg/dL	0.25	mmol/L
Cholesterol	mg/dL	0.0259	mmol/L
Cortisol	μg/dL	27.59	nmol/L
Creatinine	mg/dL	88.4	μmol/L
Creatinine clearance	mL/min	0.0167	mL/s
Ethanol	mg/dL	0.217	mmol/L
Ferritin	ng/mL	2.247	pmol/L
Glucose	mg/dL	0.0555	mmol/L
HbA1c	%	0.01	proportion of 1.0
Hemoglobin	g/dL	10	g/L
HDL cholesterol	mg/dL	0.0259	mmol/L
Iron, total	μg/dL	0.179	μmol/L
Lactate (lactic acid)	mg/dL	0.111	mmol/L
LDL cholesterol	mg/dL	0.0259	mmol/L
Leukocytes	$\times 10^3$ cells/mm <sup>3</sup>	1	$\times 10^9$ cells/L
Magnesium	mg/dL	0.411	mmol/L
MCV	μm <sup>3</sup>	1	fL
Platelets	$\times 10^3$ cells/mm <sup>3</sup>	1	$\times 10^9$ cells/L
Reticulocytes	% of RBCs	0.01	proportion of 1.0
Salicylate	mg/L	0.00724	mmol/L
Testosterone	ng/dL	0.0347	nmol/L
Thyroxine (T <sub>4</sub> )	ng/dL	12.87	pmol/L
Total Iron Binding Capacity	μg/dL	0.179	μmol/L
Triiodothyronine (T <sub>3</sub> )	pg/dL	0.0154	pmol/L
Triglycerides	mg/dL	0.0113	mmol/L
Urea nitrogen	mg/dL	0.357	mmol/L
Uric acid	mg/dL	59.48	μmol/L
Celsius → Fahrenheit	$F = (C \times 1.8) + 32$		
Fahrenheit → Celsius	$C = (F - 32) \times 0.5555$		
Kilograms → Pounds	1 kg = 2.2 lbs		
Pounds → Ounces	1 lb = 16 oz		
Ounces → Grams	1 oz = 28.3 g		
Inches → Centimetres	1 in = 2.54 cm		

# Commonly Measured Laboratory Values

Test	Conventional Units	SI Units
<b>Arterial Blood Gases</b>		
pH	7.35-7.45	7.35-7.45
PCO <sub>2</sub>	35-45 mmHg	4.7-6.0 kPa
PO <sub>2</sub>	80-105 mmHg	10.6-14 kPa
<b>Serum Electrolytes</b>		
Bicarbonate	22-28 mEq/L	22-28 mmol/L
Calcium	8.4-10.2 mg/dL	2.1-2.5 mmol/L
Chloride	95-106 mEq/L	95-106 mmol/L
Magnesium	1.3-2.1 mEq/L	0.65-1.05 mmol/L
Phosphate	2.7-4.5 mg/dL	0.87-1.45 mmol/L
Potassium	3.5-5.0 mEq/L	3.5-5.0 mmol/L
Sodium	136-145 mEq/L	136-145 mmol/L
<b>Serum Nonelectrolytes</b>		
Albumin	3.5-5.0 g/dL	35-50 g/L
ALP	35-100 U/L	35-100 U/L
ALT	8-20 U/L	8-20 U/L
Amylase	25-125 U/L	25-125 U/L
AST	8-20 U/L	8-20 U/L
Bilirubin (direct)	0-0.3 mg/dL	0-5 µmol/L
Bilirubin (total)	0.1-1.0 mg/dL	2-17 µmol/L
BUN	7-18 mg/dL	2.5-7.1 mmol/L
Cholesterol	<200 mg/dL	<5.2 mmol/L
Creatinine (female)	10-70 U/L	10-70 U/L
Creatinine (male)	25-90 U/L	25-90 U/L
Creatine Kinase – MB fraction	0-12 U/L	0-12 U/L
Ferritin (female)	12-150 ng/mL	12-150 µg/L
Ferritin (male)	15-200 ng/mL	15-200 µg/L
Glucose (fasting)	70-110 mg/dL	3.8-6.1 mmol/L
HbA1c	<6%	<0.06
LDH	100-250 U/L	100-250 U/L
Osmolality	275-300 mOsm/kg	275-300 mOsm/kg
<b>Serum Hormones</b>		
ACTH (0800h)	<60 pg/mL	<13.2 pmol/L
Cortisol (0800h)	5-23 µg/dL	138-635 nmol/L
Prolactin	<20 ng/mL	<20 ng/mL
Testosterone (male, free)	9-30 ng/dL	0.31-1 pmol/L
Thyroxine (T <sub>4</sub> )	5-12 ng/dL	64-155 nmol/L
Triiodothyronine (T <sub>3</sub> )	115-190 ng/dL	1.8-2.9 nmol/L
TSH	0.5-5 µU/mL	0.5-5 µU/mL
<b>Hematologic Values</b>		
ESR (female)	0-20 mm/h	0-20 mm/h
ESR (male)	0-15 mm/h	0-15 mm/h
Hemoglobin (female)	12.3-15.7 g/dL	123-157 g/L
Hemoglobin (male)	13.5-17.5 g/dL	140-174 g/L
Hematocrit (female)	36-46%	36-46%
Hematocrit (male)	41-53%	41-53%
INR	1.0-1.1	1.0-1.1
Leukocytes	4.5-11 x 10 <sup>3</sup> cells/mm <sup>3</sup>	4.5-11 x 10 <sup>9</sup> cells/L
MCV	88-100 µm <sup>3</sup>	88-100 fL
Platelets	150-400 x 10 <sup>3</sup> /mm <sup>3</sup>	150-400 x 10 <sup>9</sup> /L
PTT	25-35 s	25-35 s
Reticulocytes	0.5-1.5% of RBC	20-84 x 10 <sup>9</sup> /L

Kenya Costa-Dookhan and Zuhail Mohmand, chapter editors  
 Ming Li and Dorrin Zarrin Khat, associate editors

Further information on these topics can be found in the Objectives of the Considerations of the Legal, Ethical, and Organizational Aspects of the Practice of Medicine (CLEO) – which can be downloaded free of charge from the Medical Council of Canada website at <http://mcc.ca/wp-content/uploads/CLEO.pdf>.

There are three main types of law in Canada: criminal, civil, and administrative. The penalties for violating each are, in general, as follows: criminal – fine or incarceration; civil – monetary damages paid to the wronged party; and administrative – sanctions by the regulator (such as a suspension by the College of Physicians and Surgeons). All three types of law can be engaged by a single act. For example, a physician that inappropriately touches a patient can be liable for criminal (sexual assault), civil (monetary damages paid to the patient for the civil wrong of sexual assault), and administrative (fines and sanctions up to and including loss of ability to practice medicine for sexual abuse) penalties.

Canadian law applicable to medical practice varies between jurisdictions and changes over time.

Criminal law is nationwide, but civil and administrative law varies between provinces and territories. This section is meant to serve only as a guide. Students and physicians should ensure that their practices conform to local and current laws.

## Acronyms

AE	adverse event	CPSO	College of Physicians and Surgeons of Ontario	LMCC	Licentiate of the Medical Council of Canada	PTMA	Provincial/Territorial Medical Association
ART	assisted reproductive technologies	EMR	electronic medical record	MAID	Medical Assistance in Dying	RCPS	Royal College of Physicians and Surgeons of Canada
CFMS	Canadian Federation of Medical Students	FMEQ	Fédération médicale étudiante du Québec	MCC	Medical Council of Canada	RDoC	Resident Doctors of Canada
CFPC	College of Family Physicians of Canada	FRCPC	Fellow of the Royal College of Physicians of Canada	OECD	Organization for Economic Co-operation and Development	SDM	substitute decision-maker
CIHR	Canadian Institutes of Health Research	FRCSC	Fellow of the Royal College of Surgeons of Canada	OMA	Ontario Medical Association over the counter	TRC	Truth and Reconciliation Commission
CMA	Canadian Medical Association	GA	gestational age	OTC	Organization		
CME	continuing medical education	GDP	gross domestic product	PHO	Provincial House staff		
CMPA	Canadian Medical Protective Association	HCCA	Health Care Consent Act	PIPEDA	Personal Information Protection and Electronic Documents Act		
		IVF	in vitro fertilization	POA	Power of Attorney		

## The Canadian Healthcare System

### Overview of the Canadian Healthcare System

- one federal, three territorial, and ten provincial systems
- major complexities in establishment of Canadian health policy include geographical diversity, socioeconomic divisions, and international pressures
- financed by both the public (70%) and private (30%) sectors
- each provincial/territorial plan must cover all medically necessary health services and remain in compliance with the Canada Health Act in order to receive federal transfers
- provincial/territorial governments may choose to offer and fund supplementary services not covered under the Canada Health Act, such as prescription drugs and vision care
- non-insured health services and fees are either covered by private insurance or by the individual
- workers' compensation funds cover treatment for work-related injuries and diseases

**Table 1. Division of Government Responsibilities in Healthcare**

Federal Government	Provincial Government
Healthcare services for Indigenous peoples (Status First Nations peoples and Inuit only, Non-Insured Health Benefits (NIHB)), federal government employees (RCMP and armed forces), immigrants, and civil aviation personnel	Establishment, maintenance, and management of hospitals, asylums, charities, and charitable institutions ( <i>Constitution Act, 1867</i> )
Marine hospitals and quarantine ( <i>Constitution Act, 1867</i> )	Licensing of physicians, nurses, and other health professionals
Investigations into public health	Determining the standards for licensing all hospitals
Regulation of food and drugs	Administering provincial medical insurance plans
Inspection of medical devices	Financing healthcare facilities
Administration of healthcare insurance	Delivery of certain public health services
General information services related to health conditions and practices	
Role in health derives from constitutional responsibility over criminal law, spending powers, and legislation for 'peace, order, and good government.' Examples include <i>Canada Health Act, Food and Drugs Act, Controlled Substances Act, and Canada Health Transfer Act</i>	

### Legal Foundation

- the legal foundation of the Canadian health system is based on:
  - five constitutional documents:
    1. Royal Proclamation (1763): the foundation for the rights of Indigenous peoples in Canada; sets out the sovereignty of Indigenous peoples in Canada
    2. Constitution Act (1867): deals primarily with the jurisdictional power between federal and provincial governments
    3. Treaty 6 (1876): included the Medicine Chest Clause, which addresses Indigenous sovereignty in healthcare delivery and equitable access to all forms of medicine
    4. Dreaver vs. King court ruling (1935): provided the legal precedence for Non-Insured Health Benefits
    5. The Canadian Charter of Rights and Freedoms (1982): does not guarantee a right to healthcare; but, if the government decides to finance healthcare, they are constitutionally obliged to do so consistently with the rights and freedoms outlined in the Charter (including the right to equality, physicians' mobility rights, etc.)
  - two statutes:
    1. *Canada Health Act* (1984): outlines the national terms and conditions that provincial health systems must meet in order to receive federal transfer payments

#### Principles of the Canada Health Act

1. Public Administration: provincial/territorial health insurance programs must be administered on a not-for-profit basis by public authorities
2. Comprehensiveness: provincial/territorial health insurance programs must cover all medically necessary diagnostic, physician, and hospital services
3. Universality: all eligible residents must be entitled to healthcare services (including status First Nations peoples and Inuit; note that non-status First Nations and Métis are included under all eligible residents)
4. Portability: emergency health services must be available to Canadians who are outside their home province, paid for by the home province
5. Accessibility: provincial/territorial plans must ensure reasonable access to medically necessary hospital and physician services without financial or other barriers

The federal government can reduce its contributions to provinces that violate the key principles of the Canada Health Act

2. *Canada Health and Social Transfer Act (1996)*: federal government gives provinces a single grant for healthcare, social programs, and post-secondary education; division of resources at provinces' discretion

## History of the Canadian Healthcare System and Crown-Indigenous Relations Pursuant to Healthcare

- 1534 Europeans first arrive in Canada
- settlers find healthy inhabitants with complex societies, cultures, and belief systems
  - Indigenous peoples' have specific knowledge of local environment and medicines
    - early instance of medical practice occurs when local Indigenous nation (Haudenosaunee) used cedar as a source of vitamin C to treat scurvy experienced by European settlers
- 1763 *Royal Proclamation*
- identifies Indian Country that was under British sovereignty but Indigenous possession
  - sets out guidelines for European settlement of Indigenous territories in what is now North America; statements include: Aboriginal title (a legal term for ancestral land rights) has existed and continues to exist, and that all land would be considered Aboriginal land unless ceded by treaty
    - forbids settlers from claiming land from the Indigenous occupants, unless it was first bought by the Crown and then sold to the settlers
    - only the Crown can buy land from First Nations
- 1764 *Treaty of Niagara*
- the treaty is signed with 24 Indigenous Nations represented
  - Indigenous peoples and the Crown agree to co-exist and build their relationship on Turtle Island
- 1867 *British North America Act (now Constitution Act 1867)*
- establishes Canada as a confederacy
  - "establishment, maintenance, and management of hospitals" under provincial jurisdiction
  - gives the federal government control over lands reserved for "Indians"
- 1870 *Manitoba Act*
- Métis land is protected and they are given an additional 1.4 million acres for their descendants
  - this act was subsequently ignored and infringed upon as this land was given freely to incoming settlers
- 1871-1921 *Numbered Treaties*
- transfer large tracts of Indigenous land to the Crown with various promises made to Indigenous Peoples
    - Treaty 6 explicitly includes medicine, while others contain agreements related to social factors affecting health
- 1876 *Indian Act*
- reinforces the federal government's exclusive jurisdiction over Indians and lands reserved for Indians
  - gives complete control of "Indian bands," status, and reserves to the Canadian government
  - enfranchisement (the process of terminating one's legal Indian Status, identity, and ancestral rights in order to gain full Canadian citizenship) becomes legally compulsory in many situations (such as becoming a physician)
  - outlaws the practice of Indigenous culture and spirituality
  - imposes band councils and "Indian agents"
- 1884-1996 Residential Schools and Indian Hospitals
- legislated genocide (see [Public Health and Preventive Medicine, PH7](#))
- 1885 Execution of Métis leader Louis Riel
- leader of the North-West Rebellion against the Federal government due to infringement on Métis ancestral lands, rights, and way of life
- 1939 Court Decision *Reference Re Eskimo* rules that the federal government is has similar responsibility for Inuit people as Indigenous Peoples
- following this decision the government developed policies that enforced assimilation and benefited governmental goals, with disregard for Inuit wellbeing. This led to extensive harms, some of which are noted below:

- coercive relocation to isolated and sedentary communities away from ancestral lands, ending seasonally dynamic way of life
  - sled dogs were killed, which discontinued the Inuit traditional way of life and forced them to rely on government supplies
  - discs, to be worn around the neck, were issued with numbers in lieu of Inuit surnames and to ease bureaucratic workload
- 1965 *Royal Commission on Health Services* (Hall Commission) recommends federal leadership and financial support with provincial government operation
- 1966 *National Medical Care Insurance Act*
- federal government's first legislation with the goal of free access to healthcare
  - federal government to pay half of medicare costs in any province with insurance plans that meet criteria of being universal, publicly administered, portable, and comprehensive
  - Indian Health Services budget is reduced under the guise of equality and social and legal integration. Individuals can only receive support for healthcare services if they prove they are Indigenous, have been refused funds from their band, and can not obtain provincial health services. Financial limits are set to prevent "overuse" of services. This creates further barriers to accessing healthcare, while reducing barriers for non-Indigenous peoples
- 1984 *Canada Health Act* is passed by federal government
- replaces *Medical Care Act* (1966) and *Hospital Insurance and Diagnostic Services Act* (1957)
  - provides federal funds to provinces with universal hospital insurance
  - maintains federal government contribution at 50% on average, with poorer provinces receiving more funds
  - medical insurance must be "comprehensive, portable, universal, and publicly administered"
  - bans extra-billing by new fifth criterion: accessibility
- 1985 *Bill C-31*
- the *Indian Act* forced Indigenous women who married non-Indigenous men to lose their Indian status
  - *Bill C-31* attempted to stop the involuntary enfranchisement of Indigenous women (and their children) who married non-Indigenous men
  - *Bill C-3* in 2011 and later cases ensured that eligible grandchildren of women who lost status could regain it
- 1990 Oka Crisis
- land dispute over ancestral Kanienkehaka (Mohawk) territory
  - brought about the *Royal Commission on Aboriginal Peoples* (1996)
- 1996 *Canada Health and Social Transfer Act* passed by federal government
- federal government gives provinces a single grant for healthcare, social programs, and post-secondary education; division of resources at provinces' discretion
- 1996 *Royal Commission on Aboriginal Peoples*
- established in the wake of the Oka Crisis. The Commission's Report, the product of extensive research and community consultation, was a broad survey of historical and contemporary relations between Aboriginal and non-Aboriginal peoples in Canada
  - recommendations made on how to repair the relationship between Indigenous peoples and Canada
- 2001 *Kirby and Romanow Commissions* appointed
- *Kirby Commission* (final report, October 2002)
  - examines history of the healthcare system in Canada, pressures and constraints of current healthcare system, role of federal government, and healthcare systems in foreign jurisdictions
- Romanow Commission* (final report, November 2002)
- dialogue with Canadians on the future of Canada's public healthcare system
- 2004 *First Ministers' Meeting on the Future of Health Care* produces a 10 year plan
- priorities include reductions in waiting times, development of a national pharmacare plan, and primary care reform
- 2005 *Chaoulli v. Québec*, Supreme Court of Canada decision
- rules that Québec's banning of private insurance is unconstitutional under the Québec Charter of Rights since patients cannot access the relevant services under the public system in a timely manner

- 2007 Jordan's Principle
- Jordan Anderson was a First Nations child from Norway House Cree Nation born with complex medical needs
  - he spent two unnecessary years in hospital because provincial and federal governments could not decide who was responsible for paying for the home-based care that Jordan needed to be discharged. Consequently, he died in hospital at age 5 without ever going home
  - *Jordan's Principle* is a legal obligation that promises that First Nations children will get prompt and equitable access to healthcare and that payments (federal/provincial/local) will be determined later
  - in 2016, the Canadian Human Rights Tribunal found that the Canadian government was racially discriminating against First Nations children and their families for its failure to properly implement Jordan's Principle. The Tribunal issued legally binding orders that Canada has an obligation to fulfill
- 2011 First progress report by the Health Council reviews progress toward 2004 First Ministers' 10 year plan
- significant reductions in wait times for specific healthcare areas (such as cancer care, joint replacements, and sight restoration), but may have inadvertently caused increased wait times for other services
  - despite large investments into EMRs, Canada continues to have low uptake, ranking last in the Commonwealth Fund International Health Policy survey, with only 37% use among primary care physicians
  - minimal progress in creating a national strategy for equitable access to pharmaceuticals; however, there has been some success in increasing pharmacists' scope of practice, reducing generic drug costs, and implementing drug information systems
  - increase funding to provinces at 6% per annum until the 2016-2017 fiscal year; from then onwards, increases tied to nominal GDP at a minimum of 3% per annum
- 2012 Second progress report by the Health Council reviews progress towards 2004 First Ministers' 10 year plan
- funding is sufficient; however, more innovation is needed including incentivizing through models of remuneration
  - 46 recommendations are made to address the lack of progress
- 2014 Expiry of 10 Year Health Care Funding Agreement between federal and provincial governments
- *Canadian Doctors for Refugee Care v. Canada*, the Federal Court of Canada rules that the federal government could not significantly reduce/eliminate healthcare services for refugee claimants, as to do so would constitute "cruel and unusual treatment" contrary to the Charter of Rights and Freedoms
- 2015 Negotiations underway for a new Health Accord with a \$3 billion investment over four years to homecare and mental health services by the elected Liberal government
- 2015 The Truth and Reconciliation Commission releases 94 "calls to action" (or recommendations) to further reconciliation between Canada and Indigenous peoples
- the full list of calls to action can be found here: [http://trc.ca/assets/pdf/Calls\\_to\\_Action\\_English2.pdf](http://trc.ca/assets/pdf/Calls_to_Action_English2.pdf), while health-specific calls and subsequent government actions can be found here: <https://www.rcaanc-cirnac.gc.ca/eng/1524499024614/1557512659251>
  - the seven calls to action included under health are the following:
    18. we call upon the federal, provincial, territorial, and Aboriginal governments to acknowledge that the current state of Aboriginal health in Canada is a direct result of previous Canadian government policies, including residential schools, and to recognize and implement the health-care rights of Aboriginal people as identified in international law, constitutional law, and under the Treaties
    19. we call upon the federal government, in consultation with Aboriginal peoples, to establish measurable goals to identify and close the gaps in health outcomes between Aboriginal and non-Aboriginal communities, and to publish annual progress reports and assess longterm trends. Such efforts would focus on indicators such as: infant mortality, maternal health, suicide, mental health, addictions, life expectancy, birth rates, infant and child health issues, chronic diseases, illness and injury incidence, and the availability of appropriate health services
    20. in order to address the jurisdictional disputes concerning Aboriginal people who do not reside on reserves, we call upon the federal government to recognize, respect, and address the distinct health needs of the Métis, Inuit, and off-reserve Aboriginal peoples
    21. we call upon the federal government to provide sustainable funding for existing and new Aboriginal healing centres to address the physical, mental, emotional, and spiritual harms caused by residential schools, and to ensure that the funding of healing centres in Nunavut and the Northwest Territories is a priority

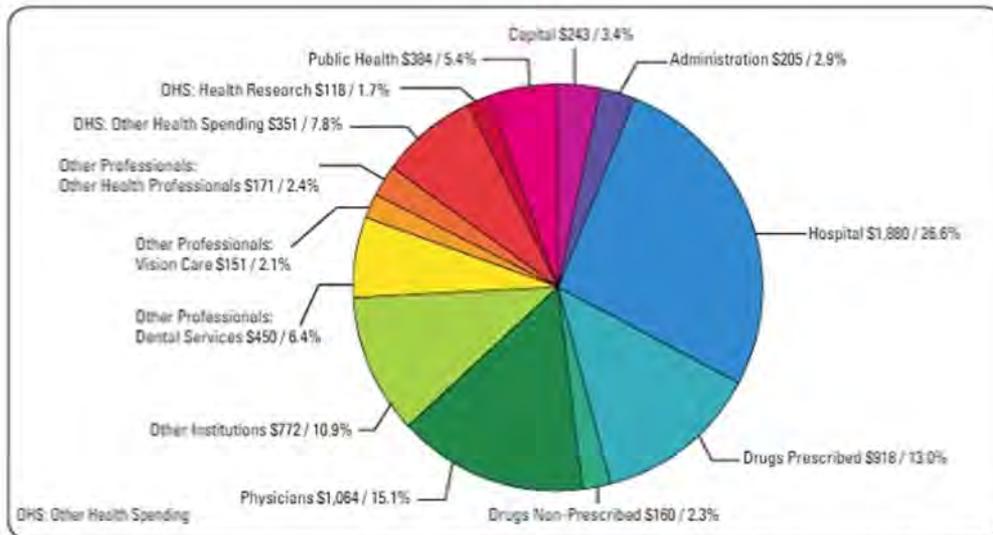

22. we call upon those who can effect change within the Canadian health-care system to recognize the value of Aboriginal healing practices and use them in the treatment of Aboriginal patients in collaboration with Aboriginal healers and Elders where requested by Aboriginal patients
  23. we call upon all levels of government to: i. Increase the number of Aboriginal professionals working in the health-care field. ii. Ensure the retention of Aboriginal health-care providers in Aboriginal communities. iii. Provide cultural competency training for all healthcare professionals
  24. we call upon medical and nursing schools in Canada to require all students to take a course dealing with Aboriginal health issues, including the history and legacy of residential schools, the United Nations Declaration on the Rights of Indigenous Peoples, Treaties and Aboriginal rights, and Indigenous teachings and practices. This will require skills-based training in intercultural competency, conflict resolution, human rights, and anti-racism
- 2016 Canada's Minister of Indigenous Affairs announces their full support for the *United Nations Declaration on the Rights of Indigenous Peoples*
- document describes individual and collective rights of Indigenous peoples and provides guidance about how to maintain a relationship with Indigenous peoples based on equality, partnership, good faith, and mutual respect
- 2017 New 10 year Canada Health Accord is reached with a \$11.5 billion federal investment over 10 years to homecare and mental health services and a 3% annual rise in the Canada Health Transfer (from 6% in the previous agreement)
- 2019 Missing and Murdered Indigenous Women and Girls Inquiry Final Report and Calls for Justice
- reveals that persistent and deliberate human and Indigenous rights violations and abuses amount to genocide and are the root cause behind Canada's staggering rates of violence against Indigenous women, girls, and 2SLGBTQIA people
  - the report calls for transformative legal and social changes to resolve the crisis that has devastated Indigenous communities across the country
- 2019 The federal government announces the creation of a national drug agency. It will negotiate prices on behalf of Canada's drug plans, assess the efficacy of prescription drugs, and develop a national formulary

## Healthcare Expenditure and Delivery in Canada

- the projected total healthcare expenditure in 2019 was expected to reach \$265.5 billion, or \$7064 per person. Health spending was expected to comprise 11.5% of Canada's GDP that year

### Sources of Healthcare Funding

- 69% of total health expenditure in 2018 came from public-sector funding with 65% coming from the provincial and territorial governments, and another 5% from other parts of the public sector: federal direct government, municipal, and social security funds. 31% is from private sources including out of pocket (16%), private insurance (12%), and other (3%)
- public sector covers services offered on either a fee for service, capitation, or alternate payment plan in physicians' offices and in hospitals
  - fee-for-service is a payment model where services are unbundled and paid for separately. This can serve as an incentive for physicians to provide more services because payment is dependent on the quantity of services provided
  - in Ontario, each service has a corresponding billing code defined by the Ministry of Health and Long-term Care in the Physician Services under the Health Insurance Act
  - capitation is a physician remuneration payment model determined by the number of patients rostered
  - APP is a mutual agreement between a physician (or group of physicians) and their provincial health authority. The agreement outlines the physician's salary, incentives, and various after-hour bonuses
- public sector does not cover services provided by privately practicing health professionals (e.g. dentists, chiropractors, optometrists, massage therapists, osteopaths, physiotherapists, podiatrists, psychologists, private duty nurses, and naturopaths), prescription drugs, OTC drugs, personal health supplies, and use of residential care facilities

**Figure 1. Total health expenditure per capita by use of funds, Canada 2019 (dollars and percentage share)**  
 Source: Canadian Institute for Health Information, National Health Expenditure Trends. Total health expenditure per capita by health spending category, Canada, 2019 (dollars and percentage share), 1975 to 2019. copyright © 2020. Reprinted by Permission of CIHI

**Delivery of Healthcare**

- hospital services in Canada are publicly funded but delivered through private, not-for-profit institutions owned and operated by communities, religious organizations, and regional health authorities
- other countries have different systems of healthcare delivery, such as the United States (mix of public and private funding, as well as private for-profit and private not-for-profit delivery), and the United Kingdom (primarily public funding and delivery)

**Physician Licensure and Certification**

**Table 2. Key Physician Certification and Licensing Bodies in Canada (and Ontario)**

Certifying Body	Description
<b>MCC</b>	Certifies physicians with the LMCC. LMCC acquired by passing the MCC Qualifying Examination Parts I and II
<b>RCPSC</b>	Certifies residents who complete an accredited residency program and pass the appropriate exam Voluntary membership of the RCPSC is designated FRCPC or FRCSC
<b>CFPC</b>	Certifies residents who complete an accredited family medicine residency program and pass the Certification Examination in Family Medicine
<b>Licensing Body</b>	13 provincial medical regulatory (licensing) authorities All postgraduate residents and all practicing physicians must hold an educational or practice license from the licensing body in the province in which they study or practice
<b>CPSO</b>	Membership to the provincial licensing authority is mandatory Licensing authority functions include: Provide non-transferable licensure to physicians Maintaining ethical, legal, and competency standards and developing policies to guide physicians Investigating complaints against physicians Disciplining physicians guilty of professional misconduct or incompetence At times of license investiture and renewal, physicians must disclose if they have a condition (such as HIV positivity, drug addiction, or other illnesses) that may impact their ability to practice safely

- physician certification is governed nationally, while the medical profession in Canada self-regulates under the authority of provincial legislation
- self-regulation is based on the premise that due to the advanced education and training involved in the practice of medicine, the lay person is not in a position to accurately judge the standards of the profession; the self-regulating colleges have a mandate to regulate the profession in the public interest
- the RCPSC and CFPC are responsible for monitoring ongoing CME and professional development
- certification by the LMCC plus either the RCPSC or CFPC is a minimum requirement for licensure by most provincial licensing authorities

## Role of Professional Associations

Table 3. Key Professional Associations

Association	Description
CMA	Provides leadership to physicians and advocates for access to high quality care in Canada Represents physician and population concerns at the national level Membership is voluntary
PTMAs (such as the OMA)	Negotiates fee and benefit schedules with provincial governments Represents the economic and professional interests of physicians Membership is voluntary Provide physician health support
CMPPA	Physician-run organization that protects the integrity of member physicians Provides legal defense against allegations of malpractice or negligence Provides risk management and educational programs Membership is voluntary but all physicians must have some form of liability insurance
RDoC and PHO	Upholds economic and professional interests of residents across Canada Facilitates discussion amongst PHOs regarding policy and advocacy items
CFMS and FMÉO	Medical students are represented at their universities by student bodies, which collectively form the CFMS or FMÉO FMÉO membership includes that of francophone medical schools

### Advocacy and Diversity

- Similar to how the FMÉO represents the interests of francophone medical schools and the CFMS represents those nation-wide, other professional associations serve and advocate on behalf of different communities
- These associations may serve traditionally underrepresented groups, underserved communities, communities facing structural barriers, and/or communities with unique health needs
- Some examples of professional associations that physicians or medical students may join are: Gay, Lesbian, Bisexual and Transgender (GLBT) Medical Students of Canada; the Black Medical Students Association of Canada; Black Physicians Association of Ontario (BPAO); Muslim Medical Association of Canada and the Indigenous Physicians Association of Canada (IPAC); Indigenous Medical/Dental Students Association (IMDSA, Alberta)

## Ethical and Legal Issues in Canadian Medicine

### Introduction to the Principles of Ethics

- ethics involves thinking about what the best course of action may be in a specific case, including:
  1. principles and values that help us consider what might be morally permissible and/or impermissible in specific circumstances
  2. rights, duties, and obligations of individuals and groups
- as a self-regulated profession, ethical and professional practice is guided by a shared code of conduct (the CMA code of ethics), and by our provincial licensing bodies (through policies)
- the physician-patient relationship significantly depends on trust, which is recognized in the concept of fiduciary duty/responsibility of physician towards patient
- a fiduciary duty is a legal duty to act in another party's interest. Profit from the fiduciary relationship must be strictly accounted for with any improper profit (monetary or otherwise) resulting in sanctions against the physician and potential compensation to the patient, even if no physical harm has befallen the patient

### Autonomy vs. Competence vs. Capacity

**Autonomy:** the right that patients have to make decisions according to their values, beliefs, and preferences  
**Competence:** the ability to make a specific decision for oneself as determined legally by the courts  
**Capacity:** the ability to make a specific decision for oneself as determined by the clinicians proposing the specific treatment

Table 4. The Four Principles Approach to Medical Ethics

Principle	Definition
<b>Autonomy</b>	Recognizes an individual's right to make their own decisions in their own way(s) based on their wishes, beliefs, values, and preferences  It may not be possible for a person to make a fully autonomous decision and/or to have an autonomous decision honoured in some circumstances. For instance, if an autonomous request for a medical intervention is deemed clinically inappropriate from the physician's perspective, then the physician need not offer it  Autonomy is not synonymous with capacity
<b>Beneficence</b>	Obligation to provide benefit to the patient, based on what is considered to be their best interests. Consideration of best interests should consider the patient's values, beliefs, and preferences, so far as these are known. Best interests extend beyond solely medical considerations  May be limited by the principle of Autonomy (such as when differences exist between patient and clinician's conception of best interests)  Paramount in situations where consent/choice is not possible
<b>Non-Maleficence</b>	Obligation to avoid causing harm; <i>primum non nocere</i> ("First, do no harm")  A limiting principle of the Beneficence principle
<b>Justice</b>	Fair distribution of benefits and harms within a community, regardless of geography, income, or other social factors  Concept of fairness: Is the patient receiving what they deserve – their fair share? Are they treated the same as equally situated patients? (equity) How does one set of treatment decisions impact others? (equality)  Equality and equity are different notions of justice. Equality involves providing the distribution of resources to all people irrespective of differing needs, and equity involves distributing resources in a way that considers differing needs (such as circumstance and social context). Both concepts raise different considerations  Basic human rights, such as freedom from persecution and the right to have one's interests considered and respected

Note: The four principles approach (i.e. principlism) is just one approach to medical ethics. There exist many other ethical principles that are also relevant to medicine (e.g. transparency, trust, etc.).

**CMA Code of Ethics and Professionalism**

- the CMA developed a Code of Ethics and Professionalism that provides standards of ethical practice to guide Canadian physicians, which covers virtues that should be exemplified by an ethical physician, fundamental commitments of the medical profession, professional responsibilities, and the relation of the physician to themselves, colleagues, and society
- the Code of Ethics and Professionalism is:
  - prepared by physicians for physicians and applies to physicians, residents, and medical students
  - informs ethical decision-making, especially where existing guidelines are insufficient or values and principles come into tension
  - not exhaustive; it is intended to provide standards of ethical practice that can be interpreted and applied in particular situations
  - founded on other principles including the Hippocratic Oath, developments in human rights, and recent bioethical discussions
- CMA policy statements address specific ethical issues/topics not mentioned by the code (e.g. abortion, transplantation, and medical assistance in dying)

The CMA Code of Ethics and Professionalism is a quasi-legal standard for physicians; if the law sets a minimal moral standard for physicians, the Code seeks to augment these standards

**Table 5. CMA Code of Ethics and Professionalism**

A. Virtues exemplified by the ethical physician	
Compassion	Integrity
Honesty	Prudence
Humility	
B. Fundamental commitments of the medical profession	
Commitment to the well-being of the patient	Commitment to professional excellence
Commitment to respect for persons	Commitment to self-care and peer support
Commitment to justice	Commitment to inquiry and reflection
Commitment to professional integrity and competence	
C. Professional responsibilities	
<b>Physicians and patients</b>	Patient-physician relationship Decision-making
<b>Physicians and the practice of medicine</b>	Patient privacy and the duty of confidentiality Managing and minimizing conflicts of interest
<b>Physicians and self</b>	Awareness of wellness services and promote health among self Seek support for professional and personal problems Cultivate safe training and working environments
<b>Physicians and colleagues</b>	Treating colleagues with respect and dignity Take responsibility for actions towards colleagues
<b>Physicians and society</b>	Commitment to high quality healthcare services Recognition of the social determinants of health Supporting equitable access to healthcare resources, and building collaborative relationships with marginalized groups

**Confidentiality**

**Overview of Confidentiality**

- when determining legal and ethical issues surrounding patient information, start from the foundational assumption point that all information given by the patient is both confidential (meaning it cannot be disclosed to others) and privileged (meaning it cannot be used in court), then determine whether exceptions to this exist
- the legal and ethical basis for maintaining confidentiality is that a full and open exchange of information between patient and physician is central to the development and maintenance of a therapeutic relationship
- privacy is a right of patients (which they may forgo), while confidentiality is a duty of physicians (which they must respect barring patient consent or requirements of the law)
- patients have the right to the expectation that their personal information will receive proper protection from unauthorized access (see *Privacy of Medical Records, ELOM10*)
- if confidentiality is inappropriately breached by a physician, that physician can be sanctioned by the hospital, court, or regulatory authority
- based on the ethical principle of autonomy, patients have the right to control their own health information
- confidentiality may be ethically and legally breached in certain circumstances (e.g. child abuse)
- while physician-patient privilege exists, it is limited in comparison to solicitor-client privilege. During conversations with patients about confidentiality, physicians should avoid promising absolute confidentiality or privilege, as it cannot be guaranteed by law
- physicians should seek advice from their local health authority or the CMPA before disclosing HIV status of a patient to someone else
- many jurisdictions make mandatory not only the reporting of serious communicable diseases (e.g. HIV), but also the reporting of those who harbour the agent of the communicable disease
- physicians failing to abide by such regulations could be subject to professional or civil actions
- legal duty to maintain patient confidentiality is imposed by provincial health information legislation and precedent-setting court cases in the common law

**Legal Aspects of Confidentiality**  
Advice should always be sought from provincial licensing authorities and/or legal counsel when in doubt

**CMA Code of Ethics and Professionalism**  
"Fulfill your duty of confidentiality to the patient by keeping identifiable patient information confidential; collecting, using, and disclosing only as much health information as necessary to benefit the patient; and sharing information only to benefit the patient and within the patient's circle of care. Exceptions include situations where the informed consent of the patient has been obtained for disclosure or as provided for by law"

### Statutory Reporting Obligations

- legislation has defined specific instances where public interest overrides the patient's right to confidentiality; varies by province, but may include:
  - suspected child abuse or neglect – report to local child welfare authorities (e.g. Children's Aid Society)
  - fitness to drive a vehicle or fly an airplane – report to provincial Ministry of Transportation (see [Geriatric Medicine, GM13](#))
  - communicable diseases – report to local public health authority (see [Public Health and Preventive Medicine, PH31](#))
  - improper conduct of other physicians or health professionals – report to College or regulatory body of the health professional (sexual impropriety by physicians is required reporting in some provinces)
  - vital statistics must be reported; reporting varies by province (e.g. in Ontario, births are required to be reported within 30 d to the Office of Registrar General or local municipality; death certificates must be completed by a physician then forwarded to municipal authorities)
  - reporting to coroners (see [Physician Responsibilities Regarding Death, ELOM20](#))
- physicians who fail to report in these situations are subject to prosecution and penalty, and may be liable if a third party has been harmed

### Duty to Protect/Warn

- the physician has a duty to protect the public from a known dangerous patient; this may involve taking appropriate clinical action (e.g. involuntary detainment of violent patients for clinical assessment), informing the police, and/or warning the potential victim(s) if a patient expresses an intent to harm
- Canadian courts have not expressly imposed a mandatory duty to report, however, the CMA Code of Ethics and some provincial/territorial regulatory authorities may oblige physicians to report (mandatory reporting rather than permissive)
- concerns of breaching confidentiality should not prevent the physician from exercising the duty to protect; however, the disclosed information should not exceed that required to protect others
- applies in a situation where:
  - there is an imminent risk
  - to an identifiable person or group
  - of serious bodily harm or death

### Disclosure for Legal Proceedings

- disclosure of health records can be compelled by a court order, warrant, or subpoena

### Privacy of Medical Records

- privacy of health information is protected by professional codes of ethics, provincial and federal legislation, the Canadian Charter of Rights and Freedoms, and the physician's fiduciary duty
- the federal government created the PIPEDA in 2000 which established principles for the collection, use, and disclosure of information that is part of commercial activity (e.g. physician practices, pharmacies, and private labs)
- PIPEDA has been superseded by provincial legislation in many provinces, such as the Ontario Personal Health Information Protection Act, which applies more specifically to health information

### Duties of Physicians with Regard to the Privacy of Health Information

- inform patients of information-handling practices through various means (e.g. posting notices, brochures and pamphlets, and/or through discussions with patients)
- obtain the patient's expressed consent to disclose information to third parties
  - under Ontario privacy legislation, the patient's expressed consent need not be obtained to share information between healthcare team members involved in the "circle of care." However, the patient may withdraw consent for this sharing of information and may put parts of the chart in a "lock box"
  - physicians have a professional obligation to facilitate timely transmission of the patient's medical record to third parties (with the patient's consent), such as for insurance claims. Failure to do so has resulted in sanctions by regulatory bodies
  - while patients have a right of access to their medical records, physicians can charge a "reasonable fee" commensurate with the time and material used in providing copies/access
- provide the patient with access to their entire medical record; exceptions include instances where there is potential for serious harm to the patient or a third party
- provide secure storage of information and implement measures to limit access to patient records
- ensure proper destruction of information that is no longer necessary
- regarding taking pictures or videos of patients, findings, or procedures, in addition to patient consent and privacy laws, trespassing laws apply in some provinces
- CPSO published policy is designed to help Ontario physicians understand legal and professional obligations set out under the *Regulated Health Professions Act, 1991*, the *Medicine Act, 1991*, and the *Personal Health Information Protection Act, 2004*. This includes regulations regarding express or implied consent, incapacity, lock boxes, disclosure under exceptional circumstances, mandatory reporting, ministry audits, subpoenas, court orders, and police, as well as electronic records and voice messaging communications: <https://www.cpso.on.ca/Physicians/Policies-Guidance/Policies/Protecting-Personal-Health-Information>

### Ontario's Medical Expert Panel on Duty to Warn

CMA J 1998;158(11):1473-1479

- There should be a duty to inform when a patient reveals that they intend to do serious harm to another person(s) and it is more likely than not that the threat will be carried out
- Where a threat is directed at a person or group and there is a specific plan that is concrete and capable of commission and the method for carrying it out is available to the threatener, the physician should immediately notify the police and, in appropriate circumstances, the potential victim. The report should include the threat, the situation, the physician's opinion, and the information upon which it is based
- While Canadian courts have not expressly imposed a mandatory "duty to warn" on physicians to alert third parties of a danger posed by a patient, Canadian supreme court decisions have held that a physician is permitted to warn (permissive vs. mandatory)

### CMA Code of Ethics and Professionalism

- Protect the health information of your patients
- Provide information reasonable in the circumstances to patients about the reasons for the collection, use, and disclosure of their health information
- Be aware of your patients' rights with respect to the collection, use, disclosure, and access to their health information; ensure that such information is recorded accurately

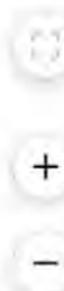

### Reasons to Breach Confidentiality

- Child abuse
- Fitness to drive
- Communicable disease
- Coroner report
- Duty to inform/warn

### Lock Boxes

The term "lock boxes" applies to situations where the patient has expressly restricted their physician from disclosing specific aspects of their health information to others, even those involved in the patient's circle of care. Note that the Personal Health Information Protection Act (PHIPA) provisions denote that patients may not prevent physicians from disclosing personal health information permitted/required by the law

- it is the physician's responsibility to ensure appropriate security provisions with respect to electronic records and communications
  - with the advent of digital records, there have been increasing issues with healthcare providers that are not part of a patient's circle of care accessing medical records inappropriately (e.g. out of curiosity or for profit). All staff should be aware that most EMRs log which healthcare providers view records and automatically flag files for further review in certain cases (e.g. same surname, VIP patients, or audit of access to records)

## Consent and Capacity

### Ethical Principles Underlying Consent and Capacity

- consent is the autonomous authorization of a medical intervention by a patient
- usually the principle of respect for patient autonomy must be balanced with the principle of beneficence, since a physician need not offer an intervention that does not serve some benefit based on their clinical judgment
- informed consent is a process, not a transaction or a signature on a page
- informed refusal is equivalent in principle and approach
- if a patient is deemed incapable of consenting to a proposed medical intervention, then it is the duty of the SDM (or the physician in an emergency) to act on the patient's known prior wishes or, failing that, to act in the patient's best interests
- there is a duty to discover, if possible, what the patient would have wanted when capable
- central to determining best interests is understanding and taking into account the patient's values, beliefs, and preferences, including any relevant cultural and/or religious considerations and the patient's interpretation of those considerations
- more recently expressed wishes take priority over remote ones
- patient wishes may be expressed verbally or in written form
- patients found incapable of making a specific decision should still be involved in the decision-making process as much as possible. If a patient found incapable expresses a willingness to pursue the proposed treatment/intervention, then this is known as assent (rather than 'consent,' which requires capacity)
- agreement or disagreement with medical advice does not determine findings of capacity/incapacity
- however, patients opting for care that puts them at risk of serious harm that most people would want to avoid should have their capacity carefully assessed. Steer clear from the tendency to define what reasonable person standards may be. If appropriate, look to discern patterns of justification offered by patients and their individual values and beliefs, which may be influenced by social context, such as culture and/or religion
- laws pertaining to consent and capacity may vary by province/territory and readers are encouraged to consult provincial/territorial guidelines

### Four Basic Requirements of Valid Consent

#### 1. Voluntary

- consent must be given free of coercion or pressure (e.g. from family members who might exert 'undue influence,' from members of the clinical team)
- the physician must not deliberately mislead the patient about the proposed treatment
- the physician must engage in self-reflection prior to entering the conversation regarding their position of power and privilege as well as take measures to mitigate the power differential within the relationship

#### 2. Capable

- the patient must be able to understand and appreciate the nature and effect of their condition as well as of the proposed treatment or decision

#### 3. Specific

- the consent provided is specific to the procedure being proposed and to the provider who will carry out the procedure (e.g. the patient must be informed if students will be involved in providing the treatment)

#### 4. Informed

- sufficient information and time must be provided to allow the patient to make choices in accordance with their wishes, including:
  - the nature of the treatment or investigation proposed and its expected effects
  - all significant risks and special or unusual risks
  - disclose common adverse events and all serious risks (e.g. death), even if remote
  - alternative treatments or investigations and their anticipated effects and significant risks
  - the consequences of declining treatment
  - answers to any questions the patient may have
- the reasonable person test – the physician must provide all information that would be needed "by a reasonable person in the patient's position" to be able to make a decision
- it is the physician's responsibility to make reasonable attempts to ensure that the patient understands the information, including overcoming language barriers, or communication challenges
- physicians have a duty to inform the patient of all legitimate therapeutic options and must not withhold information based on conscientious objections (e.g. not discussing the option of emergency contraception)

#### CPSO Policy Consent

Obtaining valid consent before carrying out medical, therapeutic, and diagnostic procedures has long been recognized as an elementary step in fulfilling the physician's obligations to the patient

#### PSO Policy on Capacity

Capacity is an essential component of valid consent, and obtaining valid consent is a policy of the CMA and other professional bodies

#### 4 Basic Elements of Consent

- Voluntary
- Capable
- Specific
- Informed

#### Professional Considerations

##### Geriatric Patient

- Identify their goals of care and resuscitation options (CPR or DNR) (Note: we should aim to have goals of care discussions with all patients, regardless of age)
- Check for documentation of advance care planning (commonly referred to as 'advance directives') and POA where applicable

##### Paediatric Patient

- Identify the primary decision-maker, if applicable (parents, guardian, wards-of-state, emancipated)
- Regarding capacity assessment (see *Paediatric Aspects of Capacity*, ELOM14)
- Be aware of custody issues, if applicable

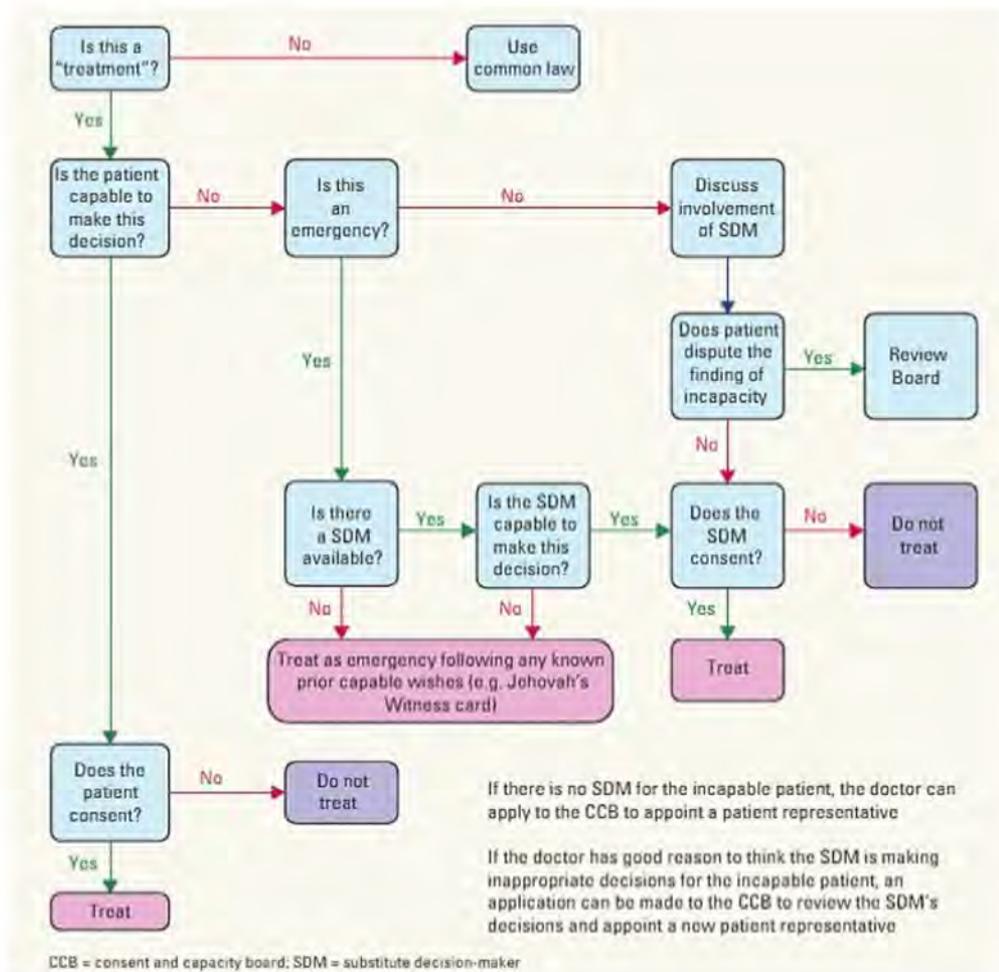

##### Terminally Ill or Palliative Patient

- Consider the SPIKES approach to breaking bad news (see ELOM15)
- Identify the patient's goals of care (i.e. disease vs. symptom management)?
- Identify whether an advance care plan exists (See *Palliative Medicine*, PMS)
- Determine the patient's SDM according to the SDM hierarchy. If the patient has a POA then obtain a copy of the document
- Check for documentation of resuscitation options (CPR or DNR)

##### Incapable Patient

- Note: Capacity is treatment-specific and time-specific. An incapable patient is only incapable for the specific treatment at the specific time
- If not already present, perform a formal capacity assessment and thoroughly document
- Identify if the patient has an SDM or who has their POA and locate it, if applicable
- Check the patient's chart for any Mental Health Forms (e.g. Form 1) or any forms they may have on their person (e.g. Form 42)

**Figure 2. Ontario consent flowchart**  
Adapted by Hébert P from Sunnybrook Health Sciences Centre Consent Guidelines

**Obtaining Legal Consent**

- consent of the patient must be obtained before any medical intervention is provided; consent can be:
  - verbal or written, although written is usually preferred
  - a signed consent form is only evidence of consent – it does not replace the process for obtaining valid consent
  - most important component is what the patient understands and appreciates, not what the signed consent form states
  - implied (e.g. a patient holding out their arm for an immunization) or expressed
  - consent is an ongoing process and can be withdrawn or changed after it is given, unless stopping a procedure would put the patient at risk of serious harm, and the patient is not informed of and/or capable of considering these harms
  - if consent has been withdrawn during a procedure, the physician must stop treatment unless stopping the procedure would threaten the patient's life
  - in obtaining consent to continue the procedure, the physician need only re-explain the procedure and risks if there has been a material change in circumstances since obtaining consent originally. If there has been no material change in circumstances, simple assent to continue is sufficient (*Ciarlariello v. Schachter*)
- HCCA of Ontario (1996) covers consent to treatment, admission to a facility, and personal assistance services (e.g. home care)

**Exceptions to Consent**

**1. Emergencies**

- treatment can be provided without consent where a patient is experiencing severe suffering, or where a delay in treatment would lead to serious harm or death and consent cannot be obtained from the patient or their SDM
- emergency treatment should not violate a prior expressed wish of the patient (e.g. a signed Jehovah's Witness card)
- if patient is incapable, the physician must document reasons for incapacity and why situation is emergent
- patients have a right to challenge a finding of incapacity as it removes their decision-making ability
- if a SDM is not available, the physician can treat without consent until the SDM is available or the situation is no longer emergent

## 2. Legislation

- mental health legislation allows for:
  - the detention of patients without their consent
  - psychiatric outpatients may be required to adhere to a care plan in accordance with community treatment orders
- Public Health legislation allows medical officers of health to detain, examine, and treat patients without their consent (e.g. a patient with TB refusing to take medication) to prevent transmission of communicable diseases

## 3. Special Situations

- public health emergencies (e.g. an epidemic or communicable disease treatment)
- warrant for information by police

### Consequences of Failure to Obtain Valid Consent

- treatment without consent is battery (a claim in tort, meaning a civil legal matter, as opposed to a criminal legal matter), even if the treatment is life-saving (excluding situations outlined in Exceptions to Consent)
- treatment of a patient on the basis of poorly informed consent may constitute negligence, also a claim in tort
- the onus of proof that valid consent was not obtained rests with the plaintiff (usually the patient)

### Overview of Capacity

- capacity is the ability to:
  - understand information relevant to a treatment decision
  - appreciate the reasonably foreseeable consequences of a decision or lack of a decision
- capacity is specific for each decision (e.g. a person may be capable to consent to having a CXR, but not for a bronchoscopy)
- capacity can change over time (e.g. temporary incapacity secondary to delirium)
- most Canadian jurisdictions distinguish capacity to make healthcare decisions from capacity to make financial decisions; a patient may be deemed capable of one, but not the other
- a person is presumed capable unless there is good evidence to the contrary
- capable patients are entitled to make their own decisions
- capable patients can refuse treatment even if it leads to serious harm or death; however, decisions that put patients at risk of serious harm or death require careful scrutiny

### Assessment of Capacity

- the person undergoing the assessment of capacity must be informed that they will be assessed
- capacity assessments must be conducted by the clinician providing treatment and, if appropriate, in consultation with other healthcare professionals (e.g. another physician or interprofessional healthcare provider)
- clinical capacity assessment may include specific capacity assessment (i.e. capacity specific to the decision at hand):
  - effective disclosure of information and evaluation of patient's reason for decision
  - understanding of:
    - the condition
    - the nature of the proposed treatment
    - alternatives to the treatment
    - the consequences of accepting and rejecting the treatment
    - the risks and benefits of the various options
  - for the appreciation needed for decision-making capacity, a person must:
    - acknowledge the symptoms that affect them
    - be able to assess how the various options would affect them
    - be able to reach a decision, and make a choice, not based primarily upon delusional belief
- general impressions
- input from psychiatrists, neurologists, etc. for any underlying mental health or neurological condition that may affect insight or decision-making
- employ "Aid to Capacity Evaluation" or any other capacity assessment tool/guideline
- a decision of incapacity may warrant further assessment by psychiatrist(s), legal review boards (e.g. in Ontario, the Consent and Capacity Review Board (CCRB)), or the courts; the patient has the right to a hearing before the CCRB
- if found incapable by the Consent and Capacity Review Board, patient must receive notice of their ability to pursue judicial review (and essentially appeal the determination)

### Treatment of the Incapable Patient in a Non-Emergent Situation

- obtain informed consent from SDM
- an incapable patient can only be detained against their will to receive treatment if they meet criteria for certification under the *Mental Health Act* (see [Psychiatry](#), PS62); in such a situation:
  - document assessment in chart
  - notify patient of assessment using appropriate Mental Health form(s) under the Mental Health Act (Form 42 or Form 30 in Ontario)
  - notify Rights Advisor

#### Capacity Assessment Criteria in Ontario

Test for understanding: can the patient recite what you have disclosed to them in their own words?

Test for appreciation: are their beliefs responsive to evidence?

Refer to: JAMA The Rational Clinical Examination "Does This Patient Have Medical Decision-Making Capacity?"

#### Aid to Capacity Evaluation

J Gen Intern Med 1999;14(1):27-34

- Ability to understand the medical problem
- Ability to understand the proposed treatment
- Ability to understand the alternatives (if any) to the proposed treatment
- Ability to understand the option of refusing treatment or of it being withheld or withdrawn
- Ability to appreciate the reasonably foreseeable consequences of accepting the proposed treatment
- Ability to appreciate the reasonably foreseeable consequences of refusing the proposed treatment
- Ability to make a decision that is not substantially based on delusions or depression

### Substitute Decision-Makers

- SDMs must adhere to the following principles when giving informed consent:
  - act in accordance with any wishes that were expressed when capable
  - if wishes unknown, act in the patient's best interest, taking the following into account:
    - values and beliefs held by the patient while capable
    - whether well-being is likely to improve with vs. without treatment
    - whether the expected benefit(s) outweighs the risk of harm
    - whether a less intrusive treatment would be as beneficial as the one proposed
- the final decision of the SDM may and should be challenged by the physician if the physician believes the SDM is not abiding by the above principles

### Instructional Advance Care Planning

- allow patients to exert control over their care once they are no longer capable
- the patient communicates their decisions about future healthcare, including who they would allow to make treatment decisions on their behalf and what types of interventions they would/would not want to be used once the patient is incapable with respect to treatment decisions
- in Ontario, a person can appoint a Power of Attorney for Personal Care to carry out their advance directives
  - the legal threshold to appoint a Power of Attorney for Personal Care is intentionally set lower than the legal threshold for capacity to consent to many complex medical treatments. This allows a patient that lacks treatment capacity to appoint a person of their choosing to make the decision for them
- patients should be encouraged to review these documents with their family and physicians and to reevaluate them often to ensure they reflect their current wishes

### POWERS OF ATTORNEY

- all Guardians and Attorneys have fiduciary duties for the dependent person

#### Definitions

- Power of Attorney for Personal Care**
  - a legal document in which one person gives another the authority to make personal care decisions (healthcare, nutrition, shelter, clothing, hygiene, and safety) on their behalf if they become mentally incapable
- Guardian of the Person**
  - someone who is appointed by the court to make decisions on behalf of an incapable person in some or all areas of personal care, in the absence of a POA for personal care
- Continuing Power of Attorney for Property**
  - legal document in which a person gives another the legal authority to make decisions about their finances if they become unable to make those decisions
- Guardian of Property**
  - someone who is appointed by the Public Guardian and Trustee or the courts to look after an incapable person's property or finances
- Public Guardian and Trustee**
  - acts as a SDM of last resort on behalf of mentally incapable people who do not have another individual to act on their behalf
- Paediatric Aspects of Capacity Covered**
  - no age of consent in all provinces and territories except Québec; consent depends on patient's decision-making capacity
  - Québec has a specific age of consent, but common law and case law deem underage legal minors capable, allowing these individuals to make their own choices
  - infants and children are assumed to lack mature decision-making capacity for consent but they should still be involved in decision-making processes when appropriate (i.e. be provided with information appropriate to their comprehension level)
  - adolescents are usually treated as adults
  - preferably, assent should still be obtained from patient, even if not capable of giving consent
  - in the event that the physician believes the SDM is not acting in the child's best interests, an appeal must be made to the local child welfare authorities
  - under normal circumstances, parents have right of access to the child's medical record

Most provinces have legislated hierarchies for SDMs; the hierarchy in Ontario is:

- Legally appointed guardian
- Appointed attorney for personal care, if a power of attorney confers authority for treatment consent (see Powers of Attorney)
- Representative appointed by the Consent and Capacity Board
- Spouse or common law partner
- Child (age 16 or older) or parent (unless the parent has only a right of access)
- Parent with only a right of access
- Sibling
- Other relative(s)
- Public guardian and trustee

Other Types of Capacity Not Covered by the HCCA

- Testamentary (ability to make a will)
- Fitness (ability to stand trial)
- Financial (ability to manage property – Form 21 of the Mental Health Act)
- Personal (ability to care for oneself on a daily basis)
- Substitute consent for a procedure whose primary purpose is research, sterilization for non-therapeutic purposes, or removal of organs or tissue for transplantation (does not apply to those already declared dead)

There is no age of consent in Ontario. Capacity is assessed on an individual basis.

## Negligence

### Ethical Basis

- the physician-patient relationship is primarily based on trust, which is recognized in the concept of fiduciary duty, the responsibility to act in the patient's best interest
- negligence or malpractice is a form of failure on the part of the physician in fulfilling their fiduciary duty in providing appropriate care and leading to harm of the patient (and/or abuse of patient's trust)

### Legal Basis

- physicians are legally liable to their patients for causing harm (tort) through a failure to meet the standard of care applicable under the circumstances

- standard/duty of care is defined as one that would reasonably be expected under similar circumstances of an ordinary, prudent physician of the same training, experience, specialization, and standing
- liability arises from physicians' common law duty of care to their patients in the physician/patient relationship (or in Québec, from the Civil Code provisions regarding general civil liability)
- action(s) in negligence (or civil liability) against a physician must be launched by a patient within a specific prescribed period required by the respective province in which the actions occurred

## Truth-Telling

### Ethical Basis

- helps to promote and maintain a trusting physician-patient relationship
- patients have a right to be told important information that physicians have regarding their care
- enables patients to make informed and autonomous decisions about healthcare and their lives

### Legal Basis

- required for valid patient consent (see *Consent and Capacity, ELOM11*)
- goal is to disclose information that a reasonable person in the patient's position would need in order to make an informed decision ("standard of disclosure")
- withholding information can be a breach of fiduciary duty and duty of care
- obtaining consent based on misleading information and/or insufficient information can be seen as negligent and/or coercive

### Evidence about Truth-Telling

- it is a patient's right to have the option of knowing about any clinical condition(s)/diagnoses that they may have
- most patients want to be provided with information regarding their health
- although some patients may want to protect family members from bad news, they themselves would want to be informed in the same situation
- truth-telling improves trust, adherence, and health outcomes
- informed patients are more satisfied with their care and most often receive news about their health better than expected
- negative consequences of truth-telling can include decreased emotional well-being, anxiety, worry, social stigmatization, and loss of insurability

### Medical Error

- medical error may be defined as 'preventable adverse events (AEs)' caused by the patient's medical care and not the patient's underlying illness; some errors may be identified before they harm the patient, so not all errors are truly 'adverse'
- many jurisdictions and professional associations expect and require physicians to disclose medical error; that is, any event that harms or threatens to harm patients must be disclosed to the patient or the patient's decision-maker(s) and reported to the appropriate health authorities
- physicians must disclose to patients the occurrence of AEs or errors caused by medical management, but should not suggest that they resulted from negligence because:
  - negligence is a legal determination
  - error is not equal to negligence
- disclosure allows the injured patient to seek appropriate corrective treatment promptly if possible
- physicians should avoid simple attributions as to the cause and sole responsibility of others or oneself
- physicians should offer apologies or empathic expressions of regret (e.g. "I wish things had turned out differently") as these may help to maintain and/or rebuild trust and are not admissions of guilt or liability
- *Apology Acts* across Canada protect apologies, both as expressions of regret and admissions of responsibility, from being used as evidence of liability and negligence

### Breaking Bad News

- 'bad news' may be any information that reveals conditions or illnesses threatening the patient's sense of well-being; different patients may classify 'bad news' in different ways
- disclosing medical information in a poor or insensitive manner may be as harmful as non-disclosure
  - caution patients in advance of serious tests and about the possibility of bad findings
  - give time for patient to reflect upon the situation prior to disclosing such news
  - give warnings of impending bad news by reviewing prior discussions
  - provide time for the patient to ask questions
  - adequate supports and strategies should always be provided following the disclosure of difficult news
- SPIKES protocol was developed to facilitate "breaking bad news" in a conscientious and effective manner
  - Setting, Perceptions, Invitation, Knowledge, Empathy, Strategy (see *Palliative Medicine, PM6*)
  - other tools such as the Serious Illness Conversation Guide or Vital Talk can also assist with conversations with patients with serious illness

#### CPSO Policy on Truth-Telling

Physicians should provide patients with whatever information that will, from the patient's perspective, have a bearing on medical decision-making and communicate that information in a way that is comprehensible to the patient

Errors of care are compatible with non-negligent care if they are ones that a reasonably cautious and skilled physician could make (i.e. mistakes can be made due to 'honest error')

#### Adverse Event

An unintended injury or complication from health care management resulting in disability, death, or prolonged hospital stay

#### Examples of Warning of Impending Bad News

Remember to clarify (invite) the level of knowledge desired by the patient  
 "I have something difficult to tell you..."  
 "Unfortunately, the results are not what we were hoping for..."  
 "This may come as a shock to you, but the tests indicate..."  
 "There is no easy way for me to tell you this, so I will tell you straight away that you have a serious problem..."

### Arguments Against Truth-Telling

- may go against certain cultural norms and expectations
- may lead to patient harm, but only in extreme, rare situations
- medical uncertainty may result in the disclosure of uncertain or inaccurate information

## Ethical Issues in Health Care

### Managing Controversial and Ethical Issues in Practice

- discuss the issue(s) in a manner that is as objective and non-judgmental as possible
- ensure patients have full access to relevant and necessary information to make informed decisions about their care
- identify if any options are outside of the physician's moral boundaries (e.g. something to which the physician has a conscientious objection) and refer to another physician if appropriate
- consult with a bioethicist and/or the appropriate ethics committees or boards
- protect freedom of moral choice for students or trainees

## Reproductive Technologies

- people of all gender identities may access reproductive technologies
- the words "maternal, mother, and woman" may refer to gender diverse individuals

### Overview of Maternal-Fetal Considerations

- medico-legally, maternal body and fetal body are considered one. In general, maternal and fetal interests align; however, in general/unless otherwise indicated via appropriate consent processes, maternal health takes precedence

### Ethical Issues and Arguments

- principle of reproductive autonomy: pregnant individuals have the right to reproductive choice (e.g. to make decisions that align with their personal values, interests, and beliefs)
- coercion of an individual to accept medical advice is an unacceptable infringement of their personal autonomy. It is important to empower individuals to make informed decisions about their medical care in relation to pregnancy. This involves providing the individual with information about any relevant benefits and risks in relation to recommendations, giving them time to ask questions and reflect upon the recommendation(s), etc. A fine, but important, line exists between making a strong recommendation and coercing an individual into consenting to a medical recommendation, the latter of which must be avoided. A recommendation is, precisely, a recommendation (not forced)
- Canada's colonial history includes a legacy of infringement of reproductive rights. It is important to be mindful of one's own inherent power and privilege when engaging in conversations
- biases: It is important to be cognizant of one's potential biases in relation to reproductive decision-making. Ensuring that one's personal values and preferences do not unduly influence a patient's decision-making process is of the utmost importance in order to enable autonomous decision-making

### Legal Issues and Arguments

- the law protects a gestating individual's right to life, liberty, and security of person. Key aspects of the gestating individual's rights include:
  - an individual with capacity (recognizing that capacity is decision- and time-specific) has the right to consent or refuse to consent to any medical recommendations irrespective of whether or not they are gestating. It is up to the treatment-proposing clinician to ensure that all relevant information related to a medical recommendation (e.g. risks, benefits) is provided to help ensure informed decision-making
  - the fetus does not have legal rights until it is born alive and with complete delivery
  - a pregnant person with comorbid substance use disorder cannot be detained and treated to protect the fetus (*Winnipeg Child and Family Services (Northwest Area) v. G. (D.F.)*, [1997] 3 S.C.R. 925)
  - a fetus is not a "human being" within the meaning of the Criminal Code of Canada, thus medical negligence during delivery resulting in the death of a fetus that has not been born alive does not constitute criminal negligence causing death (manslaughter) and cannot attract criminal penalties (*R v Sullivan*)

### Assisted Human Reproduction Act (2004) principles:

- The Parliament of Canada recognizes and declares that
  - (a) the health and well-being of children born through the application of assisted human reproductive technologies must be given priority in all decisions respecting their use;
  - (b) the benefits of assisted human reproductive technologies and related research for individuals, for families and for society in general can be most effectively secured by taking appropriate measures for the protection and promotion of human health, safety, dignity and rights in the use of these technologies and in related research;
  - (c) while all persons are affected by these technologies, women more than men are directly and significantly affected by their application and the health and well-being of women must be protected in the application of these technologies;

### The Tri-Council Policy Statement

1. Genetic treatment aimed at altering germ cells is prohibited in Canada and elsewhere
2. Embryo research is permitted up to 14 d post-fertilization
3. Embryos created for reproductive purposes that are no longer required may be used
4. Gamete providers must give free and informed consent for research use
5. No commercial transactions in the creation and use of the embryos are permitted
6. Creation of embryos solely for research purposes is prohibited
7. Human cloning is strictly prohibited
8. Risks of coercion must be minimized (i.e. the fertility treatment team may not be pressured to generate more embryos than necessary)
9. One may only discuss the option of using fetal tissue for research after the patient makes a free and informed choice to have a therapeutic abortion
10. Physicians responsible for fertility treatment may not be part of a stem cell research team

- (d) the principle of free and informed consent must be promoted and applied as a fundamental condition of the use of human reproductive technologies;
- (e) persons who seek to undergo assisted reproduction procedures must not be discriminated against, including on the basis of their sexual orientation or marital status;
- (f) trade in the reproductive capabilities of women and men and the exploitation of children, women and men for commercial ends raise health and ethical concerns that justify their prohibition; and
- (g) human individuality and diversity, and the integrity of the human genome, must be preserved and protected.

### Assisted Reproductive Therapies

- includes non-coital insemination, hormonal ovarian stimulation, and IVF
- some commonly referenced, ethically complex topics related to assisted reproductive therapies (ART) include, but are not limited to:
  - donor anonymity vs. child-centred reproduction (i.e. knowledge about genetic medical history)
  - preimplantation genetic testing for diagnosis before pregnancy
  - use of new techniques without patients appreciating their experimental nature
  - moral status of embryo
  - access to ART
  - private vs. public funding of ART
  - social justice factors influencing one's access to and/or experiences with ART (e.g. same-sex couples having an opportunity to access welcoming, morally safe 2SLGBTQIA+ spaces to receive care)
  - the 'commercialization' of reproduction (e.g. surrogates)

### Fetal Tissue

- pluripotent stem cells can currently be derived from human embryonic and fetal tissue
- use of stem cells in research is reviewed by the Stem Cell Oversight Committee as part of the CIHR
- potential uses of stem cells in research:
  - studying human development and factors that direct cell specialization
  - evaluating drugs for efficacy and safety in human models
  - cell therapy: using stem cells grown in vitro to repair or replace degenerated/destroyed/malignant tissues (e.g. Parkinson's disease)
  - genetic treatment aimed at altering somatic cells (e.g. myocardial or immunological cells) is acceptable and ongoing

### Induced Abortion

- CMA definition of induced abortion: the active termination of a pregnancy before fetal viability (fetus >500 g or >20 wk GA)
- full CMA policy on induced abortion can be accessed here: <https://www.cmaj.ca/content/139/12/1176a>
- after a CMAJ publication in 2006, several letters to the editor were published, questioning the CMA's position on induced abortion. In response, the CMA published clarification of their stance. This clarification can be accessed here: Clarification of the CMA's position concerning induced abortion | CMAJ (<https://www.cmaj.ca/content/176/9/1310.1#ref-2>)

### Ethical and Legal Concerns and Arguments

- in Canada, there is no criminal prohibition regarding abortion
- termination of pregnancy is a medical and personal decision to be made in consultation with a healthcare provider, alongside anyone else the patient wishes
- there exist various reasons as to why a person may inquire about and choose to pursue termination of pregnancy
- termination of pregnancy is a value-laden and moralized topic. Healthcare providers, even those who conscientiously object to termination of pregnancy, ought to treat all patients requesting such termination with dignity, respect, and in a person-centred manner. It is of particular importance to be cognizant of one's own biases when caring for patients who want to receive a medical treatment that does not accord with one's personal belief system and preferences
- if a medical practitioner does not provide termination of pregnancy, an effective referral to a willing and available provider must be made without delay. From an ethics perspective, it is important to demonstrate continued trustworthiness and support, recognizing that trusting one's providers can influence health outcomes
- 2nd and 3rd trimester abortions are legal in Canada, but are usually, though not exclusively, pursued when there are risks to the person's health, if the fetus died in utero, and/or if the fetus has a known major irreversible condition which may subject them to poor health outcomes upon birth (e.g. anencephaly). In any of these cases, however, it is the choice of the pregnant individual as to whether or not they will maintain or terminate pregnancy

### Prenatal/Antenatal Genetic Testing

- uses:
  1. to confirm a clinical diagnosis
  2. to detect genetic predisposition to a disease
  3. genetic testing/learning of predispositions may allow for preventative steps to be taken and help the person prepare for the future

4. gives parents the option to terminate a pregnancy or begin early treatment if/as applicable
- ethical dilemmas may arise because of the sensitive nature of genetic information; important ethical complexities and considerations related to genetic testing may include:
    - the individual and familial implications (e.g. how will learning about information confirmed via genetic testing influence one's family dynamic?)
    - its pertinence to future disease
    - its ability to identify disorders for which there are no effective treatments or preventive steps (e.g. should a person know if they/their fetus is genetically predisposed to an incurable disease? Would the potential harms of knowing this information potentially outweigh the benefits?)
    - its ability to identify the sex of the fetus, which may or may not be desired and/or relevant information to one's decision-making
    - obtaining truly informed consent is difficult due to the complexity of genetic information and the inability to know precisely what will/will not occur as a result of such testing (e.g. people may receive unexpected and unwanted genetic information after consenting to the testing)
    - related to the above, consent to genetic testing and consent to disclosure of all genetic information that results from the test may be distinct
    - some patients may want to be informed of genetic test results in particular ways (e.g. with a support person present). In the case of delivering complex information, genetic counselling may be recommended
    - duty to maintain confidentiality vs. duty to warn family members (e.g. if a patient's sister is likely predisposed to the same genetic condition as your patient, what are your responsibilities to the sister, if any?)
    - risk of psychological harm
    - risk of experiencing unjust social discrimination if such genetic information is disclosed to certain parties

### Legal Aspects

- as of 2017, the Genetic Non-Discrimination Act exists
- genetic testing requires informed consent
- physicians are obligated to inform patients that prenatal testing exists and is available
- in some specific circumstances, a physician may be able to breach confidentiality in order to warn family members about a condition if harm can possibly be prevented via treatment or prevention. In general, the patient's consent is required, unless the harm to be avoided is sufficiently serious to rise to the level of imminent risk of serious bodily harm or death (i.e. not a chronic condition, but an acute life-threatening condition). It is recommended to consult with legal counsel and bioethics if complexities arise in regard to breach of confidentiality/duty to warn

## End-of-Life Care

### Overview of Palliative and End-of-Life Care

- focus of care is comfort and respect for person nearing death and maximizing quality of life for patient, family, and loved ones
  - palliative care is an approach that improves the quality of life of patients facing life-threatening illness, through the prevention and relief of suffering, including treating pain, physical, psychosocial, and spiritual concerns
- appropriate for any patient at any stage of a serious or life-limiting illness
- may occur in a hospital, hospice, in the community, or at home
- often involves an interdisciplinary team of caregivers
- addresses the medical, psychosocial, and spiritual dimensions of care
- palliative sedation: the use of sedative medications for patients that are terminally ill to relieve suffering and manage symptoms
- withdrawing or withholding life sustaining interventions (e.g. artificial ventilation or nutrition) that are keeping the patient alive but no longer wanted or indicated

### Medical Assistance in Dying

- medical assistance in dying: the administering or prescribing for self-administration, by a medical practitioner or nurse practitioner, of a substance, at the request of a person, that causes their death

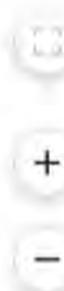

### Common Ethical Arguments/Opinions

- criminally prohibiting medical assistance in dying may influence some individuals to end their own lives and/or to endure intolerable suffering until their natural death occurs
- patient has the right to make autonomous choices about the time of their own death
- belief that there is no ethical difference between the acts of euthanasia/assisted suicide and forgoing life-sustaining treatments
- belief that these acts benefit terminally ill patients by relieving suffering
- belief that patient autonomy has limits and that one cannot and/or should not be allowed to make an autonomous request to end one's life
- death should be the consequence of the morally justified withdrawal of life-sustaining treatments only in cases where there is a fatal underlying condition, and it is the condition (not the withdrawal of treatment) that causes death

#### Palliative Care – Not the Same as Medical Assistance in Dying

Palliative care is an approach designed to improve symptoms and quality of life for the duration of a person's life, but unlike Medical Assistance in Dying, it does not aim directly at or intend to end the person's life. Many palliative care physicians are incorporating MAID into their practice, though some may conscientiously object

- an argument presented in the Carter case (see below) suggested permitting MAID will detract support for palliative care, since with proper palliative care, the number of requests for MAID would decrease. This argument was rejected in *Carter v. Canada*, as it was deemed unacceptable to make people suffer intolerably to potentially improve and/or increase support for palliative care

### Legal Aspect

- in the *Carter v. Canada* decision of February 2015, the criminal prohibition on assistance in suicide was ruled unconstitutional to the extent that they prohibit physician-assisted death for a competent adult person who (1) clearly consents to the termination of life and (2) has a grievous and irremediable medical condition that causes enduring suffering that is intolerable to the individual in the circumstances of his or her condition
- Bill C-14 (June 17, 2016) legalized MAID by amending the Criminal Code to create exemptions permitting medical practitioners to provide MAID, specified the eligibility criteria, safeguards, and required documentation and authorization from the Minister of Health, as well as new offences for failure to comply with the new regulations. As the Bill C-14 criteria are narrower than the Carter decision, there are ongoing constitutional challenges to the MAID framework as it currently stands

### Bill C-14 Criteria for MAID

- patient is eligible for publicly-funded health services in Canada
- at least 18 yr, and has capacity for clear and freely given consent
- grievous and irremediable medical condition: in an advanced state of irreversible decline in capability
- suffering intolerable to the patient, not relieved under conditions they consider acceptable
- recent update eliminated criteria of “reasonable foreseeability of natural death”
- MAID process
  1. eligibility criteria satisfied
  2. patient signs and dates a written request for MAID
  3. two independent witnesses sign the written request. Witnesses must be 18 y/o, understand the nature of MAID, and must not a) benefit (financially or otherwise) from the death, b) be an owner or operator of the healthcare facility where the patient is receiving care, c) be directly involved in the provision of health or personal care of the patient
  4. healthcare provider must inform the patient that they can withdraw their consent at any time
  5. two independent assessors (physician or nurse practitioner) must provide written confirmation that eligibility criteria are met
  6. 10 clear days must elapse between the request and the day on which MAID is provided, unless both healthcare providers agree that a shorter period is appropriate due to the patient's imminent death or loss of capacity
  7. as per the new MAID legislation (updated in 2021), a patient may request MAID even if death is not reasonably foreseeable. For a patient whose death is not reasonably foreseeable, their eligibility assessment must be a minimum of 90 days unless the assessments are completed sooner and the patient is at immediate risk of losing the capacity to consent.
  8. throughout the 10 or 90 day period and immediately before providing MAID, the healthcare provider must give the individual an opportunity to withdraw the request and ensure that the patient gives express consent to receive MAID
    - contravention of this process is an offence punishable by up to 5 yr in prison
  9. as of changes to the legislation in 2021, a patient may waive the requirement for giving final consent just before MAID is administered only if: (1) the patient's death is reasonably foreseeable and (2) while the patient has decision-making capacity the patient is:
    - (a) assessed and approved for MAID
    - (b) advised that they are at risk of losing capacity to provide final consent and
    - (c) the patient makes a written arrangement with their health care provider where they consent in advance to receive MAID on a chosen date if they (i.e. the patient) no longer has capacity to consent on that date

### Acceptable Use of Palliative and End-of-Life Care

- the use of palliative sedation with opioids in end-of-life care, knowing that death may occur as an unintended consequence (principle of double effect) is distinguished from euthanasia and assisted suicide where death is the primary intent
- the appropriate withdrawal of life-support is distinguished from MAID as it is seen as allowing the underlying disease to take its ‘natural course,’ but this distinction may be more theoretical than real
- consent for withdrawal of life-support must be sought from the capable patient, or in case of incapable patient the SDMs, as per the *Health Care Consent Act* and *Substitute Decisions Act*, and as re-affirmed by the ruling in *Cuthbertson v. Rasouli* in 2013, as palliative care would be instituted and consent for that would require SDM consent
- refusals of care by the patient that may lead to death as well as requests for a hastened death, ought to be carefully explored by the physician to rule out any ‘reversible factors’ (e.g. poor palliation, depression, poverty, ill-education, isolation) that may be hindering authentic choice
- Government of Canada – Services and Information for End-of-Life Care:
  - <https://www.canada.ca/en/health-canada/topics/end-life-care.html>
  - options and decision making at end of life: palliative care, Do Not Resuscitate orders, refusal or withdrawal of treatment, refusal of food and drink, palliative sedation, MAID
  - decisions at end of life: capacity for informed consent, SDM, advanced care planning (written plan, will, or medical directive) often established through a family meeting

### MAID: Ethically Appropriate Actions

- Respect capable decisions to forgo available treatment options and/or palliative care options
- Provide appropriate palliative measures with patient consent
- Try to assess reasons for MAID requests to see if there are ‘reversible factors’ that are directly and unduly influencing one's desire to receive MAID (e.g. depression, pain, loneliness, anxiety) that can be treated

### Exploring the Experience of Supporting a Loved One through a Medically Assisted Death in Canada

Can Fam Physician. 2018;64(9):e387-e393

**Purpose:** To explore the experience of family and close friends of patients seeking MAID in Canada.

**Methods:** Primary support givers of clinic patients seeking MAID were identified during consultations for an assisted death evaluation. The identified support givers were then invited to participate in the study, and those interested were asked to contact interviewers. Semi-structured interviews were conducted, transcribed, coded, and subjected to content analysis to elucidate common themes.

**Results:** 18 support people for patients seeking MAID were interviewed. All participants were supportive of their loved one's wishes for MAID and provided emotional and practical support in preparation for the procedure. Some participants reported feeling opposed, however, changed their minds after seeing the suffering their loved ones had to endure. The time before the procedure involved saying goodbye and ceremonial rituals. Those interviewed after the procedure found the death peaceful and reported that it offered advantages compared with natural death in their loved one's individual circumstances.

**Conclusion:** Participants were supportive of their loved one's wishes for assistance in death to end suffering and found the process to be peaceful overall.

### Physician Responsibilities Regarding Death

- physicians are required by law to complete a medical certificate of death unless the coroner needs notification; failure to report death is a criminal offence
  - Coroner's Act*, 1990 (specific to Ontario, similar in other provinces) requires physicians to notify a coroner or police officer if death occurs:
    - due to violence, negligence, misconduct, misadventure, or malpractice
    - during pregnancy or is attributable to pregnancy
    - suddenly and unexpectedly
    - from disease which was not treated by a legally qualified medical practitioner
    - from any cause other than disease
    - under suspicious circumstances
    - death from MAID
- coroner investigates these deaths, as well as deaths that occur in psychiatric institutions, jails, foster homes, nursing homes, hospitals to which a person was transferred from a facility, institution or home, etc.
- in consultation with forensic pathologists and other specialists, the coroner establishes:
  - the identity of the deceased
  - where and when the death occurred
  - the medical cause of death
  - the means of death (i.e. natural, accidental, suicide, homicide, or undetermined)
- coroners do not make decisions regarding criminality or legal responsibility
- while the Supreme Court of Canada noted that nothing in the *Carter v. Canada* decision compelled a physician to participate in MAID, the College of Physicians and Surgeons of Ontario mandatory referral policy, which has been upheld by the courts, requires physicians in Ontario to provide an effective referral if the physician conscientiously objects to MAID
  - the impact of MAID on religious institutions' obligation towards patients is not yet clear

#### Notify coroner if death occurs due to:

- Violence, negligence, misconduct
- Pregnancy
- Sudden or unexpected causes
- Disease not treated
- Cause other than disease
- Suspicious circumstances
- MAID

## Physician Competence and Professional Conduct

### CanMEDS Competencies (Ethical/Policy Statement)

- a framework of professional competencies established by the Medical Council of Canada (MCC) as objectives for the MCC Qualifying Exam
- further information on Medical Council of Canada objectives can be found at [www.mcc.ca](http://www.mcc.ca)

### Legal Considerations

- physicians' conduct and competence are legally regulated to protect patients and society via mandatory membership to provincial governing bodies (e.g. the CPSO)
- physicians are legally required to maintain a license with the appropriate authority, and are thus legally bound to outlined policies on matters of conduct within their medical practice
- the ultimate constraint on physician behaviour with regards to unprofessionalism is 'conduct unbecoming a physician,' such as inappropriate behaviour with colleagues, conflicts of interest, untruthfulness, unethical billing practices, and sexual impropriety with patients

### Common Policies on Physician Conduct

- physicians must ensure that patients have knowledge of/access to on-call coverage and are never abandoned
  - physicians are required to comply with the law, including human rights laws
- sexual conduct with patients, even when consented to by the patient can lead to accusations of battery and professional misconduct by the provincial governing body. Important notes on this topic include:
  - inappropriate sexual conduct includes intercourse, undue touching, inappropriate and unrelated references to sexual matters, sexual jokes, and physician presence when capable patients undress or dress
  - in specific situations, physicians may have a personal relationship with a patient provided a year has passed since the last therapeutic contact
  - physicians are permanently prohibited from personal relationships with patients whom they saw for psychotherapy
  - in Ontario, physicians must report any colleagues of whom they have information regarding sexual impropriety (as per CPSO Policy on Boundary Violations)
- physicians must maintain adequate records for each patient, which include:
  - demonstration that care has been continuous and comprehensive
  - minimal standards for record-keeping, including readability, diagnosis, differential diagnosis, appropriate tests and referrals, and a coherent patient record, including drugs, a cumulative patient profile, and all aspects of charting that are required for safe patient care (full standards available at [www.cpso.on.ca](http://www.cpso.on.ca)). Another physician should be able to take over the safe care of the patient based on the record
  - records stored for 10 yr in most jurisdictions, though this ought to be verified with one's provincial governing bodies
  - although the medical record is the property of the physician or an institution:
    - the patient or the patient's delegate must be allowed full access to information in the medical record

#### CPSO Policy: Treating Self and Family Members

Physicians will not diagnose or treat themselves or family members except for minor conditions or in emergencies, and only if no other physician is readily available

#### CPSO Policy: Ending the Physician-Patient Relationship

- Discontinuing services that are needed is an act of professional misconduct
- Exceptions include patient request, alternative services arranged, or adequate notice has been given

#### CMA Code of Ethics

Report any unprofessional conduct by colleagues to the appropriate authority

#### CanMEDS Competencies

- Communicator
- Collaborator
- Health Advocate
- Leader
- Professional
- Scholar
- Medical Expert

- the patient or delegate must obtain access within a reasonable period of time, usually upon a written request
- the physician can charge a reasonable fee for this service
- in the hospital, physicians must ensure their own competence, respect hospital by-laws and regulations, practice only within the limits of granted privileges, cooperate with other hospital personnel, and maintain hospital records

## Research Ethics

- involves the systematic analysis of ethical dilemmas arising during research involving human subjects to ensure that:
  - study participants are protected
  - study participants are treated in accordance with relevant research ethics norms, including but not limited to: respect for persons, concern for welfare, and justice
  - clinical research is conducted to serve the interests of the participants and/or society as a whole
- the protection of research participants is of the utmost importance when conducting clinical research
- a Research Ethics Board (REB) is responsible for reviewing and approving proposed human research. REB approval is required prior to commencing a research study involving humans
- an ethical dilemma arises for physician researchers when their obligation to patients as their physician comes into conflict with research obligations and/or incentives as a researcher. Physicians pursuing research should not be the primary point of contact responsible for recruiting and consenting their own patients due to the possibility of therapeutic misconception and/or feelings of undue influence/lack of voluntariness
- REB offices located within hospitals may have requirements about who can/cannot recruit and/or consent patients for their possible participation in research
- the Human Research Standards Organization (HRSO) develops and publishes national standards for those interested in overseeing, conducting, and/or participating in human research activities in Canada. All published national standards can be accessed here: <https://www.hrso-onrh.org>
- in order to become aware of all relevant research ethics principles and norms, of which there are many (the above-mentioned principles and norms are far from an exhaustive list), it is recommended that you read Declaration of Helsinki, the Belmont Report, and complete the Tri-Council Policy Statement: Ethical Conduct on Research Involving Human Subjects (TCPS2) online training. The TCPS 2 (2018) can be accessed here: Tri-Council Policy Statement: Ethical Conduct for Research Involving Humans – TCPS 2 (2018) ([ethics.gc.ca](https://www.ethics.gc.ca))

### Ethics on Research with Indigenous People

- the Ownership, Control, Access, and Possession (OCAP) principles are “a set of standards that establish important ground rules about how Indigenous peoples’ data should be collected, protected, used, or shared”
- OCAP principles are:
  - control: Indigenous peoples, their communities, and representatives have the right to control all aspects of “research and information management processes that impact them”
  - access: “Indigenous peoples must have access to information and data about themselves and their communities regardless of where it is held”
  - possession: Indigenous peoples are stewards of the data. As they possess the data, it is within their jurisdiction and control
- researchers working with Indigenous communities are expected to uphold OCAP principles in their research
- First Nations, Inuit, and Métis (FNIM) communities are self-determining, and as such, may have their own version of OCAP. Investigators should respect each community’s autonomy with respect to research, data collection, analysis, interpretation, and knowledge transfer
- Chapter 9 of the TCPS2 discusses and provides considerations regarding research involving FNIM Peoples of Canada. This chapter can be accessed here: Tri-Council Policy Statement: Ethical Conduct for Research Involving Humans – TCPS 2 (2018) – Chapter 9: Research Involving the First Nations, Inuit and Métis Peoples of Canada ([ethics.gc.ca](https://www.ethics.gc.ca))

The First Nations Principles of OCAP® [Internet]. Akwesasne (ON): First Nations Information Governance Centre (FNIGC); 2020 [cited 2020 Apr 12]. Available from: [www.FNIGC.ca/OCAP](http://www.FNIGC.ca/OCAP). OCAP® is a registered trademark of the First Nations Information Governance Centre (FNIGC)

## Physician-Industry Relations

- healthcare delivery in Canada involves collaboration between physicians and the pharmaceutical and healthcare supply industries in the areas of research, education, and clinical evaluation packages (e.g. product samples)
- however, unlike physicians, pharmaceutical and healthcare supply industries do not have a fiduciary duty to patients and are profit-driven. There exists a motive for pharmaceutical companies, which extends beyond your responsibility as a physician
  - literature is clear that our decision-making is influenced by items such as gifts provided by the pharmaceutical and healthcare supply industries (e.g. pens with brand names inscribed, free lunch and learn sessions)

**Guiding Principles for Research Ethics**  
There are a number of principles that are important to research ethics – the three listed are primary ones that are typically cited, but this list is non-exhaustive.

- Respect for persons: informed consent
- Beneficence: harm vs. benefit
- Justice: avoid exploitation/unjustified exclusion criteria

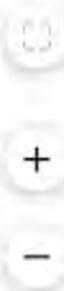

**Informed Consent for Research**

- Purpose of study
- Expectations of the research participant
- Name and probability of harm and benefits
- whether and/or how participants can withdraw their consent to participate
- confidentiality (e.g. how will it be maintained? Are participants going to be deidentified and anonymized?)
- privacy (e.g. for how long will participants’ data be stored?)
- Nature of physician’s participation including compensation
- Proposals for research must be submitted to a Research Ethics Board (REB)

**CMA and CPSO Guidelines for Ethically Appropriate Physician-Industry Relations**

- The primary goal should be the advancement of the health of Canadians
- Relationships should be guided by the CMA Code of Ethics
- The physician’s primary obligation is to the patient
- Physicians should avoid any self-interest in their prescribing and referral practices
- Physicians should always maintain professional autonomy, independence, and commitment to the scientific method

- accepting such offers (e.g. saying “yes” to a lunch and learn session being offered by a pharmaceutical company, personal injury law firm, etc.) can directly influence physician practices and beliefs in favour of such promoted products. This influence can result in, for instance, the prescription of medications for reasons other than their efficacy and safety profile, recommending particular law firms to patients (which is outside of one’s scope)
- ultimately, there is a reason as to why the pharmaceutical and healthcare supply industries spend money to build relationships (namely, to influence decision-making in favour of the company)
- the dissemination of free product samples by pharmaceutical companies is associated with increased patient preference for new drugs that are often more expensive, thus incurring a greater long-term cost for patients and the healthcare system
- new pharmaceutical products are not always more effective than previous standard of care and may have less robust safety evidence by virtue of being new
- physicians must ensure that their participation in any collaborative efforts with pharmaceutical and healthcare supply industries is in keeping with their duties to their patients and society; however, physicians often struggle to properly identify situations in which a conflict of interest is present. It is recommended that clinicians who want support in identifying and navigating potential conflicts of interest gain bioethics support
- gifts or free products from the pharmaceutical industry are usually inappropriate:
  - sponsorship for travel and fees for conference attendance may be accepted only where the physician is a conference presenter and not just in attendance
  - physicians receiving such sponsorship must disclose this at presentations and/or in written articles; it is important to note, however, that the disclosure of conflicts does not eliminate the potential influence that the conflict may have on physician behaviours

## Resource Allocation

- **definition:** the distribution of any resource to programs and people (e.g. goods and services)
- if healthcare resources are clinically indicated, physicians must make such resources available to patients in a manner that takes into consideration equity, potential biases, and possible discriminatory motivation of offering/not offering such resources
  - a person’s and/or society’s need for and benefit of certain resources are morally relevant criteria for determining allocation, particularly if resources are scarce
  - gender identity, sex, sexual orientation, religion, level of education, socioeconomic status, or age alone are morally irrelevant criteria in and of themselves (i.e. one must not prevent a patient from accessing a scarce resource exclusively on the basis of age)
  - factors determining whether and/or how resources ought to be allocated must be balanced against each other and weighed on a case-by-case, situation-by-situation basis. For instance, there may be some cases where one’s age is relevant to determining how much a patient is expected to/ not to benefit from a particular resource, but in other cases, age may be entirely irrelevant
- ethical dilemmas that may arise when deciding how best to allocate scarce resources:
  - favouring best outcome vs. giving all patients fair access to limited resources (e.g. transplant list prioritization)
  - aggregation problem: providing modest benefits to many individuals vs. significant benefits to few individuals
  - decision-making framework considerations: when to rely on a fair democratic process to arrive at a decision, what does a ‘fair’ process look like?

### Guidelines for Appropriately Allocating Resources

- protect and promote the welfare and best interests of patients
- enable informed, autonomous, and voluntary decision-making
- choose interventions known to be beneficial based on evidence of efficacy
- seek the test(s) or treatment(s) that will be most likely to accomplish the diagnostic or therapeutic goal with minimal expected harms
- advocate for one’s patients, but do not manipulate the system to gain unfair advantage
- resolve conflicting claims for scarce resources justly and equitably, on the basis of morally relevant criteria such as need and benefit, using fair and publicly defensible procedures. Consult with external resources (e.g. bioethics team) to help reduce potential biases in decision-making processes
- if appropriate, sensitively inform patients of the impact of cost constraints on care/the healthcare system
- seek resolution of unacceptable shortages at the level of hospital management or government

## Conscientious Objection

### Patients Refusing Treatment

- in accordance with the principle of autonomy, it is generally acceptable for capable patients to make an informed decision to refuse medical interventions, although exceptions may occur
- it is important to determine justification for refusal of recommended treatment, to ensure decision-making is informed, etc., particularly if the risks of such refusal are significant

Choosing Wisely Canada is the national voice for reducing unnecessary tests and treatments in healthcare. Refer to <https://choosingwiselycanada.org/recommendations/> for a comprehensive list of recommendations to assist in decision making as healthcare stewards

- if SDMs make decisions that are not in the best interests (or, if known, previously expressed wishes) of an incapable child, physicians may have grounds for administering treatment, depending on the acuity of the clinical situation. It is best to consult with Legal Counsel, Bioethics, and one's College if you are considering the administration of treatment without consent since applications to gain this permission (via the Consent and Capacity Board in Ontario, for instance) may be essential
  - in high-acuity scenarios (e.g. refusing blood transfusion based on religious grounds for a child in hemorrhagic shock), physicians have a stronger obligation to act in the child's best interests
  - in lower acuity scenarios (e.g. refusing childhood immunization in a developed nation), there is a stronger obligation to respect the autonomy of the decision-makers

### Physicians Refusing to Provide Treatment

- it is the case that with justification provided, physicians may refuse to provide a desired treatment (e.g. a treatment that is not clinically indicated and may cause harm) and/or discharge/discontinue relationships with patients (e.g. if there is no therapeutic relationship or trust due to a series of conflicts), but must ensure these patients can access services elsewhere by way of referring the patient to an available and willing practitioner

### Implicit Bias

- implicit bias involves: implicit attitudes, thoughts, and/or feelings that may exist outside of conscious awareness and are therefore difficult to acknowledge and control
  - there exist various types of (implicit) biases (e.g. related to age, race, sex, sexual orientation, gender identity, socioeconomic circumstances)
  - negative attitudes towards certain patients based on implicit biases may contribute to disparities in quality of healthcare received
  - these negative attitudes caused by implicit biases reflect constant pervasive exposure to stereotypical portrayals of members of different "social groups"
- bias and stereotypes can be lethal
  - on September 21, 2008, Brian Sinclair, an Indigenous man, presented to a Winnipeg emergency department with a blocked catheter. His presence was not recorded by triage
  - while he waited in the emergency department waiting room, he lost consciousness, but was not checked on by healthcare staff
  - after being in the waiting room for 34 h, he passed away without having received any medical attention
  - later, an inquest found that healthcare staff thought he was intoxicated or homeless
  - a Manitoba court stated that Brian Sinclair's race, and consequently the stereotypes staff held leading to the assumption that he was intoxicated, were relevant factors in his tragic and preventable death

### Suggestions for Noticing Implicit Bias

- before a clinical encounter, physicians are advised to check-in with themselves
- physicians may want to ask themselves:
  - how are they feeling?
  - what are they worried about?
  - what do they notice in their body?
  - what is their intention for the interaction?
  - what do they need to feel more grounded and supported before going into the clinical space?
  - how can they leave some of their assumptions and fears in the hall, instead of bringing them into the examination room?

### Working with Vaccine-Hesitant Parents: An Update

Canadian Paediatric Society 2018

1. Understanding the health provider's key role in parental decision-making and not dismissing vaccine refusers from practice
2. Using presumptive and motivational interviewing techniques to identify specific vaccine concerns
3. Using effective and clear language to present evidence for disease risks and vaccine benefits fairly and accurately
4. Managing pain during immunization
5. Reinforcing the importance of parental responsibility for community protection

## Clinical Informatics and Ethical Considerations

### Key Terms

#### Health Informatics

- is the study of information design and use in healthcare

#### Clinical Informatics

- is the application of health informatics knowledge in the clinical setting to promote quality care. It has three domains: collection of longitudinal personal health information for direct patient care, exchange of health information between services and locations, and aggregation of health data for analysis using analytics, artificial intelligence, and machine learning

#### Digital Health

- is the use of information technology and electronic communication tools, services, and processes to deliver healthcare services

## Overview of Digital Health Technologies

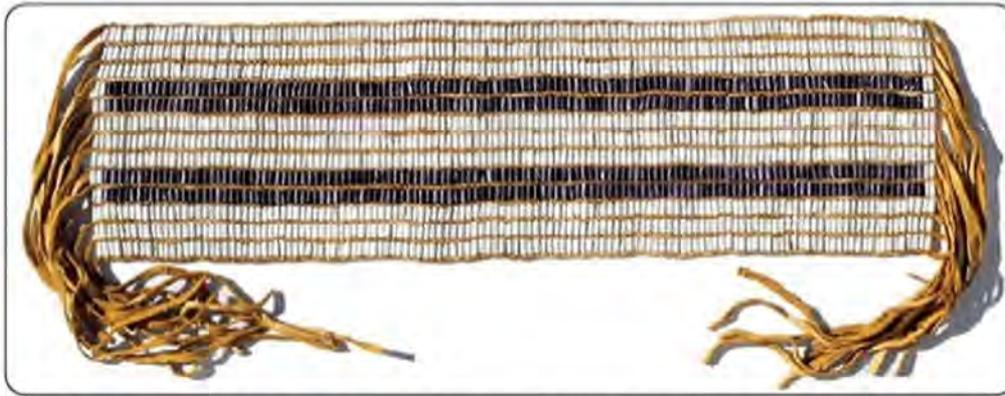

**Table 6. Overview of Digital Health Technologies and Relevant Ethical Considerations**

Digital Health Technologies	Definitions	Ethical Considerations
<b>EMR (Electronic Medical Record)</b>	System of electronically stored patient health information in a digital format	Impact of threats to healthcare information Privacy and confidentiality
<b>EHR (Electronic Health Record)</b>	Digital collection of medical information (e.g. patient's health history, allergies, immunizations, treatment plans)	Security breaches System implementation Data entry inaccuracies
<b>LIS (Laboratory Information System)</b>	Computer software that processes, stores, and manages data from all stages of medical processes and tests	
<b>PACS (Picture Archiving and Communication System)</b>	Computer software providing storage and access to images from multiple modalities	

## Indigenous Health

### Overview of the History and Impact of Colonialism

- the Indigenous health crisis that exists today is a result of many factors, including the impact of colonial laws, oppression, and genocide
- Indigenous health is deeply connected to the land and freedom that have been systematically stolen from its people
- physicians can consider how oppressive legislation plays a role in precluding many Indigenous patients from experiencing health
- you might find this timeline outlining "Key Moments in Indigenous History" helpful: [http://education.historicacanada.ca/files/426/Key\\_Moments\\_in\\_Indigenous\\_History\\_Timeline.pdf](http://education.historicacanada.ca/files/426/Key_Moments_in_Indigenous_History_Timeline.pdf)
- long before the arrival of European newcomers, Indigenous peoples lived on and cared for Turtle Island (now known as North America). This history is richly steeped in culture, relationship, and a holistic worldview. The Indigenous peoples had a flourishing trade, complex social and legal systems, and scientific knowledge about astronomy, ecology, agriculture, and medicine. Despite hundreds of years of adversity, Indigenous peoples and their rich cultures persist and thrive today – an indication of the resilience and tenacity of Indigenous peoples and communities
- upon European arrival, Indigenous and non-Indigenous people formed friendships based on mutual respect. These relationships were formalized through treaties. Treaties provided a framework for relationships and the sharing of Indigenous lands in a peaceful and respectful way
- one example of how treaties were documented and enacted was through wampum belts. Wampum belts are intricate visual displays made from clam shells. These belts serve as a living record of agreements. The two-row wampum belt is particularly important for understanding the relationship between Indigenous peoples and Europeans
- in 1613, Kanienkehaka (Mohawk) peoples noticed that settlers were using and living on their traditional lands. The Haudenosaunee Confederation met and discussed how they could live and work together peacefully on the land. Through these discussions, they learned much about one another and the two-row wampum was created: "In one row is a ship with our White Brothers' ways; in the other a canoe with our ways. Each will travel down the river of life side by side. Neither will attempt to steer the other's vessel." This wampum represented three principles: friendship, peace, and the concept of forever
- soon after these treaties were forged, greed and colonial policies began to erode these relationships.
- the treaties and the rights they established with Indigenous peoples became an inconvenience to the expanding European empire, and consequently, they began to be ignored, as they continue to be today
- the Doctrine of Discovery was the piece of colonial law that let European explorers 'discover' lands previously occupied for thousands of years. This doctrine arose from a series of statements from the Pope, which morally and legally justified the dispossession of lands from their Indigenous inhabitants (Terra Nullius)
- this justification is based erroneously on the supposed 'inferiority' of Indigenous peoples to their 'superior' European counterparts. This allowed monarchs to exploit North American land and resources regardless of its original caretakers and use the power of this doctrine to extinguish Indigenous rights. This doctrine continues to have devastating impacts on Indigenous peoples in Canada

**Figure 3. Image of a two row wampum belt. It represents friendship, peace, and the concept of forever**

Bonaparte D. The Two Row Wampum Belt: An Akwesasne Tradition of the Vessel and Canoe [Internet]. [place unknown]: The People's Voice; 2005 Aug 5 [cited 2020 Apr 16]. Available from: <http://www.wampumchronicles.com/tworowwampumbelt.html>

- in 1763, King George III issued the *Royal Proclamation* that delineated the process of British settlement of Indigenous lands. This proclamation gave ownership of North America to King George III; however, it stated that Indigenous title existed and would continue to exist. Therefore, any land would belong to the Indigenous people unless otherwise noted and agreed upon in a treaty. This prevented European settlers from taking possession of land that was occupied by Indigenous peoples, unless already purchased by the Crown
- this document unequivocally recognizes Indigenous rights, title, and self-determination. To this day, no law has overruled the *Royal Proclamation*; therefore, it is still valid according to Canadian law. Additionally, the notion of Indigenous rights is protected in *section 25* of the *Constitution Act*. Although Indigenous rights cannot be legally diminished or extinguished, the Canadian government frequently disregards this fact
- in 1764, the year following the *Royal Proclamation*, the *Treaty of Niagara* would lay the foundation for the relationship between the Crown and First Nations and their coexistence on Turtle Island. At this instance, the Silver Covenant Chain of Friendship was affirmed and both Indigenous and British sovereignty were recognized. The *Treaty of Niagara* established a multinational familial relationship between the Crown and the Indigenous nations
- over 2000 Indigenous dignitaries, representatives of 24 Indigenous nations across Turtle Island, were present, and the 24-nation wampum belt was created. This wampum represents the relationship between the Indigenous nations and the Crown
- the *British North America (BNA) Act* of 1867 (later renamed the *Constitution Act*, 1982) gave the Canadian government control over "Indians" (notably excluding Inuit and Métis peoples). This act included New Brunswick, Nova Scotia, Ontario, and Québec as a new self-governing federation. This laid the foundation for Canada's laws and governance and the rights of those living in the territory now defined as Canada. The BNA Act stated that the federal government had jurisdiction over "Indians and lands reserved for Indians." Indigenous peoples were not involved in conversations or proceedings associated with the passing of this act
- in 1857, *An Act for the Gradual Civilization of the Indian Tribes in Canada* passed and later absorbed under the larger umbrella of the *Indian Act*
- "it is desirable to encourage the progress of Civilization among the Indian Tribes in this Province, and the gradual removal of all legal distinctions between them and Her Majesty's other Canadian Subjects, and to facilitate the acquisition of property and of the rights accompanying it, by such Individual Members of the said Tribes as shall be found to desire such encouragement and to have deserved it"
- this act encouraged the voluntary enfranchisement of Indigenous people. Enfranchisement is the legal process of exterminating one's "Indian" status and ancestral rights in order to gain Canadian citizenship. Later, involuntary enfranchisement would be enforced. This would extinguish the status of any Indigenous person who served in the armed forces, received a university degree, or became a professional (e.g. lawyer, engineer, physician)
- this act depicts the deliberate intentions of Canadian parliament to erase Indigenous culture and diversity from Canada. Other assimilatory programs such as residential schools, the Sixties Scoop, and Indian hospitals have been implemented over various time periods since Confederation. These policies have created irreparable harm, and much of the poverty and current physical and mental health crises facing Indigenous communities today can be traced back to these colonial injustices, as well as ongoing colonialist policies
- a strong understanding of these historical factors can equip physicians to provide better care and cultivate a more empathetic physician-patient relationship
- the *Indian Act* (1876) allows the Canadian government to obtain complete control over First Nations, status, and reserves. It precluded equal political and economic participation and actually made cultural and spiritual practices illegal

- the *Indian Act* still exists today but has morphed significantly since its establishment. This act has taken total political control, imposed foreign governmental structures (band councils), and eliminated the rights of Indigenous peoples to practice their sacred cultural and spiritual beliefs. Indian agents were government workers who enforced these laws and were given the power to prevent Indigenous peoples from leaving their communities. In 1887, Sir John A. MacDonald stated, "The great aim of our legislation has been to do away with the tribal system and assimilate the Indian people in all respects with other inhabitants of the Dominion as speedily as they are fit to change"
- in terms of health, the *Indian Act* gives the Governor in Council control over the decisions made surrounding regulations of public health and treatment. However, this act does not present any obligation of the Canadian government to provide health services for Indigenous peoples
- Section 141 of the *Indian Act* prevented Indigenous peoples from gathering and discussing their rights or hiring legal representation to fight against this oppression
- Judge Alfred Scow describes the impact that this has had on his peoples: "This provision of the *Indian Act* was in place for close to 75 years and what that did was it prevented the passing down of our oral history. It prevented the passing down of our values. It meant an interruption of the respected forms of government that we used to have, and we did have forms of government be they oral and not in writing before any of the Europeans came to this country. We had a system that worked for us. We respected each other. We had ways of dealing with disputes"
- in 1951, some amendments were made to the *Indian Act*. The more oppressive sections were amended or erased, such as the outlawing of sacred practices, the inability to leave reserve without permission of an Indian agent, the inability to hire legal counsel, and the inability of Indigenous women to vote in Band Council elections
- the *Indian Act* continued to oppress Indigenous women uniquely by taking away their status if they married a non-Indigenous man. This means that a woman would have to leave her family and community, and consequently lose her treaty and health benefits, including her right to be buried on reserve with her ancestors. The opposite held true for Indigenous men, as it allowed for non-Indigenous women to gain Indian status through marriage
- in the 1970s-80s, Indigenous women began lobbying for equal rights and *Bill C-31* was passed that nullified this law, allowing many women to regain status. However, this law continues to pose significant controversy as this status is only allowed to be passed down to one generation
- Indian status is defined under section 6 of the *Indian Act* and denotes who qualifies and therefore becomes a ward of the government. This is a paternalistic legal relationship that creates two categories of First Nations status
  - 6(1): this person can pass on their status to their children regardless of their partner's heritage
  - 6(2): this person can only pass on their status if their partner is also Indigenous
- this idea of status complicates the identities of many Indigenous peoples (including non-status First Nations, Métis, and Inuit peoples who do not fall under the *Indian Act*) who are prevented from registering and therefore lose government support, their treaty, and health benefits. They also lose their ability to:
  - participate in community politics
  - partake in land claims
  - connect to their ancestral lands
- this displacement and the misconception that non-status peoples are "less Indian" is extremely harmful and often serves as a platform for lateral violence. In this context, lateral violence refers to when a member of an oppressed group behaves in a malicious or violent manner towards another member of that same oppressed group or in a lower position of power. Lateral violence can be traced back to the impact of colonialism
- Indigenous individuals are generally subject to full taxation, though individuals with status are eligible for select tax exemptions through section 87 of the *Indian Act*. It is a pervasive and harmful myth that Indigenous individuals do not pay taxes. For the most part, exemptions only apply to financial matters located on-reserve, with complex and specific criteria to be met. Matters located off-reserve are generally taxed in full. A summary of this is available in Bob Joseph's "Dispelling Common Myths about Indigenous Peoples" <https://www.ictinc.ca/hubfs/ebooks/ebooks%202019/Common%20Myths%20eBook%20July%202019.pdf>
- the *Indian Act* is a controversial piece of legislature because it undermines the nationhood and sovereignty of Indigenous peoples. However, it is important to understand the *Indian Act* because it also provides the basis for the historical and constitutional relationship between Indigenous peoples and the Canadian government. Therefore, it cannot be easily removed without having significant ramifications

## Movement Towards Reconciliation

- in 1991, the Royal Commission on Aboriginal Peoples (RCAP) was formed to address the inequities that exist, and to work to repair the relationship between Indigenous peoples and Canada. This commission was brought about after the Oka Crisis. The Oka crisis (The Mohawk Resistance) arose from a long-standing history of rejection and ignoring of Indigenous land rights by the Canadian government, and resulted in a 78-day protest of a proposed golf course expansion onto sacred Mohawk territory. The RCAP report (1996) detailed extensive research and recommendations needed to heal and restructure the relationship between Indigenous and non-Indigenous peoples. The majority of these recommendations have not been implemented and there continues to be little government interest in the constitutional issues that affect Indigenous peoples and communities
- in 2008, the Prime Minister of Canada apologized to all those who were affected by the residential school system, where Indigenous children were forced into abusive schools (see [Public Health and Preventive Medicine, Colonization and Healthcare, PH7](#)). The Truth and Reconciliation Commission was born out of a settlement agreement between the government and residential school survivors. The mission of this commission is to learn and tell the stories of those who attended these schools. This commission hopes to bring about renewed relationships and healing based on mutual understanding and respect. To achieve this goal, the commission put out 94 Calls to Action aiming to bring us closer to reconciliation. These calls urge all levels of the Government of Canada to work together to address systemic inequities by changing policies and programs that continue to oppress Indigenous peoples. Under the category of health, the following recommendations are quoted below:
  - we call upon the federal, provincial, territorial, and Aboriginal governments to acknowledge that the current state of Aboriginal health in Canada is a direct result of previous Canadian government policies, including residential schools, and to recognize and implement the healthcare rights of Aboriginal people as identified in international law, constitutional law, and under the Treaties
  - we call upon the federal government, in consultation with Aboriginal peoples, to establish measurable goals to identify and close the gaps in health outcomes between Aboriginal and non-Aboriginal communities, and to publish annual progress reports and assess long-term trends. Such efforts would focus on indicators such as: infant mortality, maternal health, suicide, mental health, addictions, life expectancy, birth rates, infant and child health issues, chronic diseases, illness and injury incidence, and the availability of appropriate health services
  - in order to address the jurisdictional disputes concerning Aboriginal people who do not reside on reserves, we call upon the federal government to recognize, respect, and address the distinct health needs of the Métis, Inuit, and off-reserve Aboriginal peoples
  - we call upon the federal government to provide sustainable funding for existing and new Aboriginal healing centres to address the physical, mental, emotional, and spiritual harms caused by residential schools, and to ensure that the funding of healing centres in Nunavut and the Northwest Territories is a priority
  - we call upon those who can effect change within the Canadian healthcare system to recognize the value of Aboriginal healing practices and use them in the treatment of Aboriginal patients in collaboration with Aboriginal healers and Elders requested by Aboriginal patients
  - we call upon all levels of government to:
    - increase the number of Aboriginal professionals working in the healthcare field
    - ensure the retention of Aboriginal healthcare providers in Aboriginal communities
    - provide cultural competency training for all healthcare professionals
  - we call upon medical and nursing schools in Canada to require all students to take a course dealing with Aboriginal health issues, including the history and legacy of residential schools, the United Nations Declaration on the Rights of Indigenous Peoples, Treaties and Aboriginal rights, and Indigenous teachings and practices. This will require skills-based training in intercultural competency, conflict resolution, human rights, and anti-racism
- going forward as healthcare professionals, we are uniquely responsible for knowing and understanding the impact these historical and legal truths have on our patients. When addressing health inequities that are disproportionately experienced by Indigenous peoples, we need to take into account the impact of 500 years of colonialism. We need to understand how our patients and their ancestors have experienced structural violence and trauma in order to address their physical, mental, emotional, and spiritual health needs. Physicians need to understand that we are all treaty people, and that the above legislation not only applies to Indigenous peoples, but to physicians as well, and all those who benefit from these laws

## Indigenous Disproportionate Over-Representation of Biological, Psychological, and Social Co-Morbidities

- physicians may work in various settings in which Indigenous peoples make up a large proportion of the population. Treatment approaches in these settings must consider issues unique to Indigenous peoples, particularly considering that past colonial practices and historical traumas have led to their over-representation in vulnerable groups. Indigenous peoples in Canada have shown great resilience against a long history of colonialism, structural oppression, dispossession, and harmful policies.

These historical realities perpetuate current structural barriers that impact the health of Indigenous peoples (see [Public Health and Preventive Medicine, Colonization and Healthcare, PH7](#))

- importantly, physicians will encounter Indigenous peoples from a wide variety of personal and historical experiences. Individuals should be invited to share their backgrounds and perspectives if they would like to do so, in an effort to understand the individual's unique context and to endeavour to provide culturally safe care (see [Resources in Indigenous Health, ELOM29](#))

### **Those Receiving Child Welfare Services (The Cycle of Apprehension and the Millennial Scoop)**

- similar continuation of the legacies of the residential school systems and the Sixties Scoop, Indigenous families face higher rates of child apprehension currently. In Canada, 52.2% of children (ages 0-14) in foster care are Indigenous, while Indigenous children account for only 7.7% of all Canadian children in this age range (2016)
- 38% of Indigenous children live in poverty compared to 13% of non-Indigenous non-racialized children in Canada (2011)
- in 2016, the Canadian Human Rights Tribunal ruled that the federal government discriminates against First Nations children on reserves by failing to provide the same level of funding for child welfare services that exists for non-Indigenous children, resulting in inequitable services. Despite the ruling recommending compensation, the Tribunal has issued 10 subsequent orders to ensure Canada's compliance. In 2019, the federal government argued the Tribunal was the wrong forum to discuss compensation and suggested there was no evidence of harm to individual children before the Tribunal. The Tribunal rejected both arguments. In September 2019, the Tribunal found that Canada's ongoing discrimination against First Nations children and families was "wilful and reckless" and that it had caused serious pain and suffering for victims of the discrimination. Canada was ordered to pay the maximum amount allowable under the Canadian Human Rights Act to compensate First Nations children, youth, and families who have been harmed by the child welfare system. In October 2019, the federal government launched a court challenge at the Federal Court in an attempt to quash the compensation order, which was subsequently denied
- only once the Tribunal reinforced the initial ruling in December 2019 did the federal government pass an Act respecting First Nations, Inuit, and Métis children, youth, and families, which came into effect in January 2020. This act allows Indigenous communities to exercise jurisdiction in the welfare of their own children over Indigenous Services Canada and provincial or territorial governments. However, the federal government continues to delay compensation and oppose the order for the maximum allowable amount of compensation, despite other federal parties calling on the government to pay

### **Those in State Custody and the Colonial Legacy Within the Canadian Judicial System**

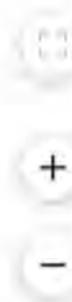

- there is a direct link between family breakdown due to the residential school system, intergenerational trauma and abuse from colonialism, and subsequent higher rates of child apprehension. Interacting with the foster care system and the instability of multiple (sometimes abusive) homes is a predictor of future interaction with the criminal justice system along with poverty and higher unemployment
- 27-30% of adults and 50% of youth taken into custody in 2016-17 were Indigenous, yet Indigenous peoples make up only 4.1% and 8% of Canada's adult and youth populations, respectively
- Indigenous youth are also overrepresented in community supervision
- from 2000 to 2010, the number of incarcerated Indigenous women increased by 86.4%, representing the fastest growing incarcerated population
- Indigenous-based restorative (rather than punitive) justice programs have been proposed to lower recidivism rates for Indigenous offenders

### **Those with no Fixed Address and the Colonial Legacy of Homelessness**

- Toronto's Indigenous population is approximately 2-4x larger than estimates reported by Statistics Canada, as the National Household Survey relies on mailing addresses, and some Indigenous People may be skeptical about providing information to the government given historical and ongoing breaches of trust
- as the statistics significantly underestimate the Indigenous population, resource allocation is severely compromised. More information is available here: <http://www.welllivinghouse.com/wp-content/uploads/2022/03/OHC-Toronto-2021-Population-Estimates.pdf>
- in Toronto, Indigenous peoples make up roughly 15% of the homeless population, yet only 0.5% of the total population (2010)
- enfranchisement (giving up Indigenous status in order to become a Canadian citizen), on-reserve housing limitations and shortages, dislocation from community and lands in concert with poor government funding and support are important links to Indigenous homelessness today
- attempts to serve the needs of Indigenous people in urban areas include the employment of traditional healers or cultural coordinators in urban health centres as well as the use of traditional medicines (e.g. sage, cedar, sweetgrass, tobacco)

### **Missing and Murdered Indigenous Women, Girls and Gender Diverse People**

- in Canada, Indigenous women and girls are significantly more likely to be murdered or go missing than any other demographic of women
- between 2001 and 2015, homicide rates for Indigenous women were nearly 6 times higher than for non-Indigenous women

- interpersonal violence within Indigenous communities is closely tied to the lasting trauma suffered in the residential school era and has far-reaching health impacts including acute injuries, chronic pain, sexually transmitted infections, unplanned pregnancies, addiction, self-harm, and suicide
- loss of a mother, sister, or daughter also incurs multi-generational trauma on family and family structure in Indigenous communities

## Indigenous Health Coverage and Jurisdictions

- policy pertaining to the health of Indigenous peoples is considered to be shared amongst various levels of government, the private sector, and First Nations communities themselves
- this current model relies heavily on state-imposed definitions of Indigenous identity and limits the right to self-determination and self-governance for Indigenous peoples in Canada
- significant historical legislative vagueness, in combination with the multiplicity of authorities involved, creates much variation across provinces and territories, contributing to inequitable distribution of care for Indigenous peoples
- bureaucratic delays in approving and providing care, and jurisdictional debates between authorities over the responsibilities of care, further contribute to a healthcare system which frequently fails to adequately respond to the needs of Indigenous peoples and communities
- the federal government is responsible for the Non-Insured Health Benefits (NIHB) program, which is managed by the First Nations and Inuit Health Branch of Indigenous Services Canada and is based on the Indian Health Policy (1979) and the Health Transfer Policy (1989)
  - the role of the NIHB is to provide eligible First Nations and Inuit individuals with coverage for specific health benefits and services (most predominantly: eye and dental care, pharmacare, transport to and from medical appointments, and mental health counselling). There are very strict criteria to have certain medications and procedures covered
  - the NIHB relies on state-imposed definitions of Indigenous identity; access to the NIHB extends only to individuals who are (1) registered under the Indian Act (and consequently referred to using the paternalistic term "Status Indian"); (2) Inuk, as recognized by the Inuit Land Claim Organization; or (3) a child under 18 months of age whose parent is registered First Nations or recognized Inuk
  - access to care for non-status First Nations and Métis patients is consequently denied under NIHB criteria, despite encountering similar social determinants of health and barriers to healthcare experienced by eligible individuals
  - clients deemed ineligible for NIHB must then rely on provincial or territorial health insurance, social programs, or private insurance plans for healthcare
  - note that NIHB eligibility does not guarantee access to care, as the criteria for approved services is subject to frequent changes and impacted by factors including whether the applicant lives on- or off-reserve
- the Canadian healthcare system must recognize that Indigenous communities are best positioned to identify their own unique health priorities and manage and deliver health care in their communities
  - although there is some development and implementation of Indigenous-led and Indigenous-directed healthcare services in Canada, the effects of colonialist policies and practices continue to perpetuate inequities among Indigenous peoples
  - healthcare providers can work towards dismantling the effects of colonialism in a number of manners, including allyship and advocacy, engaging in cultural safety training, and better educating oneself on Indigenous history, the impact of colonialism, and resources available to meet the unique needs of their patients (see *Resources in Indigenous Health*)
  - British Columbia (BC) has established a First Nations Health Authority as a step in addressing Indigenous self-determination in healthcare

## Resources in Indigenous Health

- please consider watching "The Unforgotten," a 36-minute film, which consists of five segments: <https://theunforgotten.cma.ca/full-film/>
- please consider reviewing this Indigenous Health Guide for Medical Students
  - <https://temertymedicine.utoronto.ca/sites/default/files/IndigenousHealthinOntario-compressed.pdf>
- the following is a list of fact sheets, reports, and toolkits as well as organizational websites providing resources relating to Indigenous health. All were created by or with Indigenous peoples and organizations unless otherwise stated. These resources share the aim of highlighting Indigenous resilience and promoting strength in Indigenous communities. Though not exhaustive, this list serves as a foundation for the kinds of resources that are available to healthcare providers and/or Indigenous Peoples seeking care. Of note, physicians have a responsibility to become familiar with local or regional services that may be able to provide culturally safe trauma-informed care for Indigenous People

Table 7. Resources in Indigenous Health

	Resource	Ref #
<b>Health Care</b>		
National Collaborating Centre for Indigenous Health (NCCIH)	Extensive database of Indigenous Health research and resources across Canada. Please note that some of these materials may have been collated without Indigenous consultation	1
Canadian Institutes for Health Research (CIHR)	Recommendations in culturally appropriate care for healthcare providers in Canada working with Indigenous peoples, reviewed by the Aboriginal Health Issues Committee	2
<b>Wellesley Institute</b>		
First Peoples, Second Class Treatment: The Role of Racism in the Health and Well-being of Indigenous Peoples in Canada	Report looking in-depth at the relationship between racism, health, and the well-being of Indigenous peoples in Canada	3
First Nations Health Authority (FNHA) (BC)	BC has its own health authority responsible for the planning, delivery, and funding of First Nations Health Programs across the province	4
Indigenous Health Primer produced by the Royal College of Physicians and Surgeons of Canada	An extensive document that discusses anti-racism interventions, trauma-informed care, Indigenous health principles, impact of policies on Indigenous peoples, and the diversity of present Indigenous communities	5
Thunderbird Partnership Foundation	Offers special skills, knowledge, and resources to healthcare workers providing care to First Nations communities. Has particular expertise in providing addiction care	6
<b>Child and Family</b>		
First Nations Child and Family Services (FNCFSS)	Interactive map of Canada with all FNCFSS service provider locations	7
National Aboriginal Council of Midwives (NACM)	Subset of the larger organization, Canadian Association of Midwives, that provides Indigenous midwives for natal care	8
Indigenous Services Canada	Social programs, such as women's shelters and income assistance in Indigenous communities, funded federally by Indigenous Services Canada	9
<b>Population-Specific</b>		
Inuit Tapiriit Kanatami (ITK)	The national representational body for Inuit people in Canada, with publications on TB elimination strategies and Inuit-specific health literacy resources	10
<b>Patients Facing Additional Layers of Systemic Barriers</b>		
People with no fixed address	Description of Indigenous homelessness from an Indigenous perspective, emphasizing criteria that are not captured in colonial definitions of "homelessness"	11
Indigenous women, girls, and gender diverse people	Multitude of fact sheets published by the Native Women's Association of Canada covering issues such as housing, violence, and health with an intersectional lens	12
	The Final Report of the National Inquiry into Missing and Murdered Indigenous Women and Girls containing testimonies from survivors and Knowledge Keepers, discussion of influencing factors such as intergenerational trauma and insecure housing, as well as 231 calls for justice directed at Canadians and institutions alike	13
Mental health and suicide	The Centre for Suicide Prevention (branch of the Canadian Mental Health Association) offers many Indigenous-specific resources on suicide prevention, life planning, trauma, and cultural sensitivity	14
	Online course called "River of Life," created for people working with Indigenous youth ages 15-24, discusses strategies to strengthen the protective factors of youth at risk of suicide	15
	Trauma-informed Indigenous programs, e.g. Bidaaban Healing Lodge in Ontario and Tsow-Tun Le Lum Society in BC	16, 17
<b>Building Cultural Competency</b>		
University of Alberta's Indigenous Canada online course	Indigenous Canada is a Massive Open Online Course (MOOC) from the Faculty of Native Studies that explores Indigenous histories and contemporary issues in Canada.	18
Cancer Care Ontario, Indigenous Relationship and Cultural Safety Courses	13 courses available to provide knowledge about the history and culture of First Nations, Inuit and Métis people and communities	19

## Acronyms

2,3-BPG	2,3-Bisphosphoglycerate	CV	cardiovascular	INR	international normalized ratio	PCA	patient-controlled analgesia
ABG	arterial blood gas	CVS	cardiovascular system	IOP	intraocular pressure	PCV	pressure-controlled ventilation
ACC	American College of Cardiology	CVP	central venous pressure	ITP	immune thrombocytopenic purpura	PEEP	positive end-expiratory pressure
ACH	acetylcholine	CVD	cardiovascular disease	IV	intravenous	PNS	parasympathetic nervous system
ACHE	acetylcholinesterase	CXR	chest X-ray	LA	local anesthetic	PACU	post-anesthetic care unit
ACV	assist-control ventilation	DIC	disseminated intravascular coagulation	LABA	long-acting $\beta$ -agonist	PONV	postoperative nausea and vomiting
AFib	atrial fibrillation	DKA	diabetic ketoacidosis	LES	lower esophageal sphincter	PPV	positive pressure ventilation
AHA	American Heart Association	DM	diabetes mellitus	LMA	laryngeal mask airway	PVD	peripheral vascular disease
ALS	amyotrophic lateral sclerosis	ETCO <sub>2</sub>	end-tidal CO <sub>2</sub>	LOC	level of consciousness	RA	regional anesthesia
aPTT	activated partial thromboplastin time	ETT	endotracheal tube	MAC	minimum alveolar concentration	RSI	rapid sequence induction
ARDS	acute respiratory distress syndrome	FiO <sub>2</sub>	fraction of oxygen in inspired air	MAP	mean arterial pressure	SABA	short-acting $\beta$ -agonist
ASA	American Society of Anesthesiologists	FFP	fresh frozen plasma	MH	malignant hyperthermia	SCh	succinylcholine
atm	atmosphere	FRC	functional residual capacity	MS	multiple sclerosis	SIADH	syndrome of inappropriate antidiuretic hormone
BBB	blood brain barrier	GA	general anesthesia	MSK	musculoskeletal	SNS	sympathetic nervous system
BMV	bag-mask ventilation	GE	gastroesophageal	NMJ	neuromuscular junction	SV	stroke volume
BP	blood pressure	GERD	gastroesophageal reflux disease	NPO	nil per os	SVR	systemic vascular resistance
CCS	Canadian Cardiovascular Society	GI	gastrointestinal	NYHA	New York Heart Association	TIA	transient ischemic attack
CHF	congestive heart failure	GU	genitourinary	OCS	oral corticosteroids	TBW	total body water
CK	creatinine kinase	Hb(i)	initial hemoglobin	OG	orogastric	TIVA	total intravenous anesthetic
CNS	central nervous system	Hb(f)	final hemoglobin	OR	operating room	TURP	transurethral resection of prostate
CO	cardiac output	Hct	hematocrit	OSA	obstructive sleep apnea	URTI	upper respiratory tract infection
CPAP	continuous positive airway pressure	HES	hydroxyethyl starch	PA	pulmonary artery	V/O	ventilation/perfusion
CSF	cerebrospinal fluid	HHS	hyperosmolar hyperglycemic state	PaCO <sub>2</sub>	arterial partial pressure of carbon dioxide	VT	ventricular tachycardia
		HR	heart rate	PaO <sub>2</sub>	arterial partial pressure of oxygen	VTE	venous thromboembolism
		ICP	intracranial pressure	PC	patient-controlled		
		ICS	inhaled corticosteroids				

## Overview of Anesthesia

- anesthesia: lack of sensation/perception

Preoperative	Preoperative/Intraoperative	Postoperative
1. Preoperative assessment	3. Plan anesthetic	11. Postoperative care
2. Patient optimization	4. Re-medication	
	5. Airway management	
	6. Monitors	
	7. Induction	
	8. Maintenance	
	9. Emergence	
	10. Tracheal extubation	

### Difficult Mask Ventilation

Anesth Analg 2009;109(5):1070-1080

**Purpose:** Define and predict difficult mask ventilation.

**Conclusions:** Age >55, obesity with BMI >26, history of snoring, beard, lack of teeth, Mallampati III/IV (see Figure 1, A2), abnormal mandibular protrusion test, and male gender are all independent risk factors that should be used as predictors for difficult mask ventilation.

## Preoperative Assessment

### Purpose

- identify concerns for medical and surgical management of patient
- allow for questions to help allay any fears or concerns patient and/or family may have
- arrange further investigations, consultations, and treatments for patients not yet optimized
- plan and consent for anesthetic techniques

## History and Physical

### History

- age and gender
- indication for surgery
- surgical/anesthetic Hx: previous anesthetics, any complications, previous intubations, and PONV
- FMHx: abnormal anesthetic reactions, MH, and pseudocholinesterase deficiency (see *Uncommon Complications, A29*)
- medications and allergies (see *Preoperative Optimization: Medications, A4*)
- PMHx
  - neuro: seizures, TIA/strokes, raised ICP, spinal disease, aneurysm, and conditions affecting NMJ (e.g. myasthenia gravis)
  - CVS: angina/CAD, MI, CHF, HTN, valvular disease, dysrhythmias, PVD, conditions requiring endocarditis prophylaxis, exercise tolerance, and CCS/NYHA class (see *Cardiology and Cardiac Surgery sidebar for CCS Classification, C31 and sidebar for New York Heart Association Classification, C41*)
  - respiratory: smoking, asthma, COPD, recent URTI, and sleep apnea
  - GI: GERD, liver disease, and NPO status
  - renal: acute vs. chronic renal insufficiency, dialysis, and chronic kidney disease
  - hematologic: anemia, coagulopathies, and blood dyscrasias

- MSK: arthritis (e.g. rheumatoid arthritis, scleroderma), cervical spine pathology (e.g. cervical tumours, cervical infections/abscesses, trauma to cervical spine, and previous cervical spine surgery), and cervical spine instability (e.g. trisomy 21)
- endocrine: DM, thyroid disorders, and adrenal disorders
- other: morbid obesity, pregnancy, and ethanol/recreational drug use

**Physical Exam**

- weight, height, BP, HR, respiratory rate, and O<sub>2</sub> saturation
- focused physical exam of the CNS, CVS, and respiratory systems
- general assessment of nutrition, hydration, and mental status
- airway assessment is done to determine intubation difficulty (no single test is specific or sensitive) and ventilation difficulty
  - cervical spine stability and neck movement – upper cervical spine extension, lower cervical spine flexion (“sniffing” position – see Figure 6C, A8)
  - Mallampati classification (see Figure 1)
  - “3-3-2 rule” (see Figure 2)
    - 3 of patient’s own fingers can be placed between the incisors (incisor distance)
    - 3 fingers along the floor of the mandible between the mentum and hyoid bone (hyoid-mental distance)
    - 2 fingers in the superior laryngeal notch (thyroid-hyoid distance)
  - thyromental distance (distance from the mentum to the thyroid notch in midline with neck extended); <3 finger breadths (<6 cm) is associated with difficult intubation
  - anterior jaw subluxation; <1 finger breadth is associated with difficult intubation
- tongue size
- dentition, dental appliances/prosthetic caps, existing chipped/loose teeth – pose aspiration risk if dislodged and patients should be informed of rare possibility of damage
- nasal passage patency (if planning nasotracheal intubation)
- assess potential for difficult ventilation
- examination of anatomical sites relevant to lines and blocks
  - bony landmarks and suitability of anatomy for regional anesthesia (if relevant)
  - sites for IV, CVP, and PA catheters

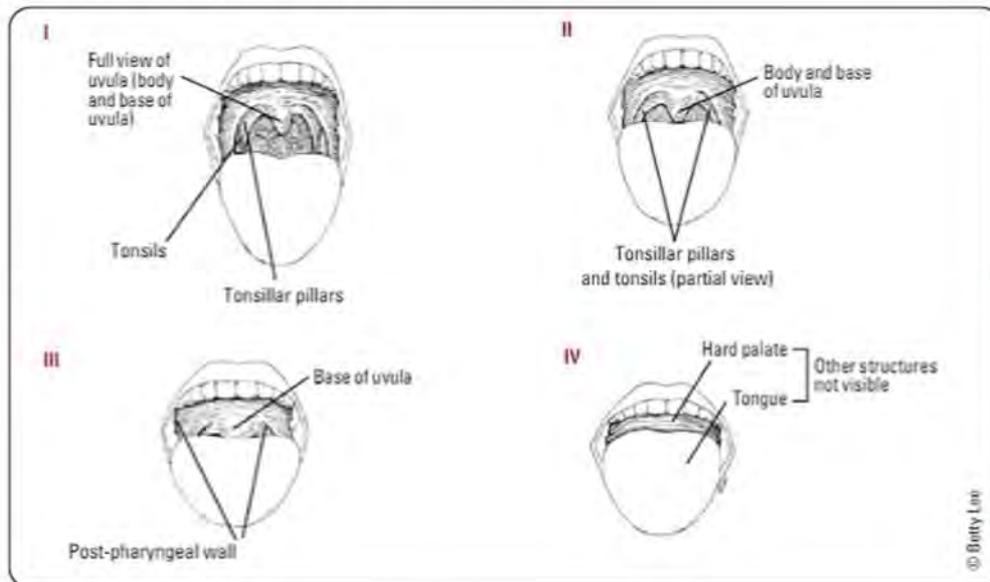

Figure 1. Mallampati classification of oral opening

**Evaluation of Difficult Airway**

**LEMON**

- Look – obesity, beard, dental/facial abnormalities, neck, facial/neck trauma
- Evaluate – 3-3-2 rule
- Mallampati score (≥3)
- Obstruction – stridor, foreign bodies, masses
- Neck mobility

**Assessment of Difficult Ventilation**  
Anesthesiology 2000;92:1229-1236

**BONES**

- Beard
- Obesity (BMI >26)
- No teeth
- Elderly (age >55)
- Snoring Hx (sleep apnea)

Figure 2. 3-3-2 Rule

**Cormack-Lehane Classification of Laryngeal View** (Figure 3, A4)

- **Grade 1:** all laryngeal structures revealed
- **Grade 2:** posterior laryngeal showing posterior vocal folds and arytenoids
- **Grade 3:** larynx concealed, only epiglottis
- **Grade 4:** neither glottis nor epiglottis

## Preoperative Investigations

- routine preoperative investigations are only necessary if there are comorbidities or certain indications

**Table 1. Suggested Indications for Specific Investigations in the Preoperative Period**

Test	Indications
<b>CBC</b>	Major surgery requiring group and screen or cross and match; chronic CV, pulmonary, renal, or hepatic disease; malignancy; known or suspected anemia; bleeding diathesis or myelosuppression; patient <1 y/o
<b>Sickle Cell Screen</b>	Genetically predisposed patient (hemoglobin electrophoresis if screen is positive)
<b>INR, aPTT</b>	Anticoagulant therapy, bleeding diathesis, liver disease
<b>Electrolytes and Creatinine</b>	HTN, renal disease, DM, pituitary or adrenal disease; vascular disease, digoxin, diuretic, or other drug therapies affecting electrolytes
<b>Fasting Glucose Level</b>	DM (repeat on day of surgery)
<b>Pregnancy (β-hCG)</b>	Women of reproductive age
<b>ECG</b>	Heart disease, DM, other risk factors for cardiac disease; subarachnoid or intracranial hemorrhage, cerebrovascular accident, head trauma
<b>CXR</b>	Patients with new or worsening respiratory symptoms/signs

Guidelines to the Practice of Anesthesia Revised Edition 2013. Supplement to the Canadian Journal of Anesthesia, Vol 60, Dec. 2013. Reproduced with permission © Canadian Anesthesiologists' Society

## American Society of Anesthesiology Classification

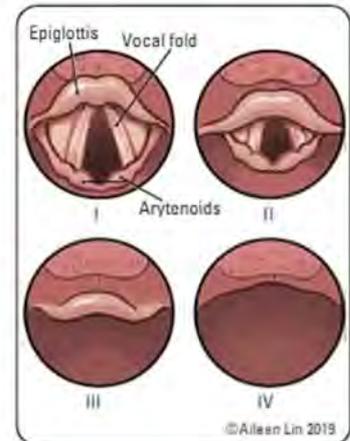

- common classification of physical status at the time of surgery
- a gross predictor of overall outcome, NOT used as stratification for anesthetic risk (mortality rates)
- **ASA 1:** a healthy, fit patient
- **ASA 2:** a patient with mild systemic disease
  - e.g. controlled T2DM, controlled essential HTN, obesity, smoker
- **ASA 3:** a patient with severe systemic disease that limits activity
  - e.g. stable CAD, COPD, DM, obesity
- **ASA 4:** a patient with incapacitating disease that is a constant threat to life
  - e.g. unstable CAD, renal failure, acute respiratory failure
- **ASA 5:** a moribund patient not expected to survive 24 h without surgery
  - e.g. ruptured abdominal aortic aneurysm (AAA), head trauma with increased ICP
- **ASA 6:** declared brain dead, a patient whose organs are being removed for donation purposes
- for emergency operations, add the letter E after classification (e.g. ASA 3E)

## Preoperative Optimization

- in general, prior to elective surgery:
  - any fluid and/or electrolyte imbalance should be corrected
  - extent of existing comorbidities should be understood and these conditions should be optimized prior to surgery
  - medications may need adjustment

## Medications

- pay particular attention to cardiac and respiratory medications, opioids, and drugs with many side effects and interactions
- **preoperative medications to consider as prophylaxis**
  - risk of GE reflux: antacids (e.g. sodium citrate), H<sub>2</sub> antagonists and/or prokinetic agents (e.g. metoclopramide) 0.5-1 h prior to surgery
  - risk of infective endocarditis, GI/GU interventions: antibiotics
  - risk of adrenal suppression: steroid coverage
  - anxiety: consider benzodiazepines
  - COPD, asthma: bronchodilators
  - CAD risk factors: nitroglycerin and β-blockers
- **preoperative medications to stop prior to surgery**
  - oral antihyperglycemics: do not take on the day of surgery
  - angiotensin-converting enzyme inhibitors (ACEI) and angiotensin receptor blockers (ARB): do not take on the day of surgery (controversial – they increase the risk of hypotension post-induction but have not been shown to increase mortality or adverse outcomes; therefore, some people hold and some do not)
  - warfarin (consider bridging with heparin), antiplatelet agents (e.g. clopidogrel), Xa inhibitor, direct thrombin inhibitors
    - discuss perioperative use of ASA and NSAIDs with surgeon (± patient's cardiologist/internist)

**Figure 3. Laryngeal views**

### Continuation vs. Discontinuation of Antiplatelet Therapy for Bleeding and Ischaemic Events in Adults Undergoing Non-Cardiac Surgery

Cochrane DB Syst Rev 2018; CD012584

**Purpose:** To compare the effect of continuation vs. discontinuation of antiplatelet therapy on the occurrence of bleeding and ischaemic events in adults undergoing non-cardiac surgery.

**Methods:** RCTs in Cochrane Central Register of Controlled Trials, MEDLINE, and Embase that compared adults taking single or dual antiplatelet therapy for at least two weeks, including patients with at least one cardiac risk factor. Included general, spinal, and regional anesthesia and excluded minor procedures involving only local anesthetic/ sedation.

**Results:** 5 trials, 666 adult patients. Continuation or discontinuation had no difference on mortality at 30 d postoperative (RR 1.21, 95% CI 0.34-4.27), blood loss (RR 1.37, 95% CI 0.83-2.26), or ischaemic events within 30 d of surgery (RR 0.67, 95% CI 0.25-1.77).

**Conclusions:** Moderate evidence supporting continuation or discontinuation of antiplatelet therapy makes no difference on bleeding requiring transfusion. Low evidence supporting no difference in mortality or ischaemic events.

### Integration of the Duke Activity Status Index into Preoperative Risk Evaluation

Br J Anaesth 2020;124(3):261-270

**Purpose:** Duke Activity Status Index (DASI) questionnaire could be integrated into preoperative risk assessment.

**Methods:** Nested cohort analysis of the Measurement of Exercise Tolerance (METS) study to characterize association of preoperative DASI scores with postoperative deaths and complications. Analysis included 1546 patients >40 y/o at elevated cardiac risk that had inpatient non-cardiac surgery.

**Results:** Results were non-linear but threshold was found. Self-reported functional capacity better than a DASI score of 34 was associated with reduced odds of 30 d death or MI (OR: 0.96 per 1 point increase above 34; 95% CI: 0.96-0.99) and 1 yr death or new disability (OR: 0.96 per 1 point increase above 34; 95% CI: 0.92-0.99).

**Conclusion:** A DASI score of 34 represents a threshold for identifying patients at risk for myocardial injury, MI, moderate-to-severe complications, and new disability.

- for patients undergoing non-cardiac surgery, starting or continuing low-dose ASA in the perioperative period does not appear to protect against postoperative MI or death, but increases the risk of major bleeding
  - **note:** this does not apply to patients with bare metal stents or drug-eluting coronary stents
- herbal supplements (e.g. ephedra, garlic, ginkgo, ginseng, kava, St. John's Wort, valerian, echinacea - stop one week prior to elective surgery)
- **preoperative medications to adjust**
  - insulin (consider insulin/dextrose infusion or holding dose), prednisone, bronchodilators

## Hypertension

- BP <180/110 is not an independent risk factor for perioperative cardiovascular complications
- target sBP <180 mmHg, dBP <110 mmHg
- assess for end-organ damage and treat accordingly

## Coronary Artery Disease

- ACC/AHA Guidelines (2014) recommend that at least 60 d should elapse after a MI before non-cardiac surgery in the absence of a coronary intervention
  - this period carries an increased risk of re-infarction/death
  - if operative procedure is essential and cannot be delayed, then invasive intra- and postoperative ICU monitoring is required to reduce the above risk
- mortality with perioperative MI is 20-50%
- perioperative  $\beta$ -blockers
  - may decrease cardiac events and mortality (but increases risk of perioperative strokes)
  - continue  $\beta$ -blocker if patient is routinely taking it prior to surgery
  - consider initiation of  $\beta$ -blocker in:
    - patients with CAD or indication for  $\beta$ -blocker
    - intermediate or high-risk surgery, especially vascular surgery

## Respiratory Diseases

- smoking
  - adverse effects: altered mucus secretion and clearance, decreased small airway calibre, altered O<sub>2</sub> carrying capacity, increased airway reactivity, and altered immune response
  - abstain at least 4-8 wk preoperatively if possible
  - if unable, abstaining even 24 h preoperatively has been shown to increase O<sub>2</sub> availability to tissues
- asthma
  - preoperative management depends on degree of baseline asthma control
  - increased risk of bronchospasm from intubation
  - administration of short course (up to 1 wk) preoperative corticosteroids and inhaled  $\beta_2$ -agonists decreases the risk of bronchospasm and does not increase the risk of infection or delay wound healing
  - avoid non-selective  $\beta$ -blockers due to risk of bronchospasm (cardioselective  $\beta$ -blockers (metoprolol, atenolol) do not increase risk in the short-term)
  - delay elective surgery for poorly controlled asthma (increased cough or sputum production, active wheezing)
  - ideally, delay elective surgery by a minimum of 6 wk if patient develops URTI
- COPD
  - anesthesia, surgery (especially abdominal surgery and upper abdominal surgery, in particular) and pain predispose the patient to atelectasis, bronchospasm, pneumonia, prolonged need for mechanical ventilation, and respiratory failure
  - preoperative ABG is needed for all COPD stage II and III patients to assess baseline respiratory acidosis and plan postoperative management of hypercapnia
  - cancel/delay elective surgery for acute exacerbation

## Aspiration

- increased risk of aspiration with:
  - decreased LOC (drugs/alcohol, head injury, CNS pathology, trauma/shock)
  - delayed gastric emptying (non-fasted within 8 h, diabetes, narcotics)
  - decreased sphincter competence (GERD, hiatus hernia, nasogastric tube, pregnancy, obesity)
  - increased intra-abdominal pressure (pregnancy, obesity, bowel obstruction, acute abdomen)
  - unprotected airway (LMA mask vs. ETT)
- management
  - manage risk factors if possible
  - utilize protected airway (i.e. ETT)
  - reduce gastric volume and acidity

### Perioperative $\beta$ -blockers for Preventing Surgery-Related Mortality and Morbidity in Adults undergoing Cardiac Surgery

Cochrane DB Syst Rev 2019;9:CD013435

**Purpose:** To assess the effectiveness of perioperatively administered  $\beta$ -blockers for the prevention of surgery-related mortality and morbidity in adults undergoing cardiac surgery.

**Conclusions:** No evidence of a difference in early all-cause mortality, MI, cerebrovascular events, hypotension, and bradycardia. However, there may be a reduction in AFib and ventricular arrhythmias when  $\beta$ -blockers are used. A larger sample size is likely to increase the certainty of this evidence.

### Perioperative $\beta$ -blockers for Preventing Surgery-Related Mortality and Morbidity in Adults undergoing Non-Cardiac Surgery

Cochrane DB Syst Rev 2019;9:CD013438

**Purpose:** Assess effectiveness of preoperatively administered  $\beta$ -blockers in prevention of surgery-related morbidity and mortality after non-cardiac surgery.

**Conclusions:** No difference in cerebrovascular events or ventricular arrhythmias.  $\beta$ -blockers may reduce AFib and MI. However,  $\beta$ -blockers may increase bradycardia and probably increase hypotension. Overall low quality and certainty evidence for these findings.

### $\beta$ -blockers

- $\beta_1$ -receptors are located primarily in the heart and kidneys
- $\beta_2$ -receptors are located in the smooth muscle (i.e. bronchi, uterus)
- Non-selective  $\beta$ -blockers block  $\beta_1$  and  $\beta_2$ -receptors (labetalol\*, carvedilol\*\*, nadolol). Caution is required with non-selective  $\beta$ -blockers, particularly in patients with respiratory conditions where  $\beta_2$  blockade can result in airway reactivity

\*labetalol is both an  $\alpha$ - and  $\beta$ -blocker

\*\*carvedilol is also both an  $\alpha$ - and  $\beta$ -blocker

- delay inhibiting airway reflexes with muscular relaxants
- employ RSI (see *Rapid Sequence Induction, A16*)

## Fasting Guidelines

### Fasting Guidelines Prior to Surgery (Canadian Anesthesiologists' Society)

- fasting guidelines should change depending on patients' pre-existing medical conditions. In the case of emergent procedures, consider the risk of delaying surgery against the risk of aspiration
- before elective procedures, the minimum duration of fasting should be:
  - 8 h after a large meal of solids particularly containing protein (e.g. meat) or fatty foods
  - 6 h after a light meal (e.g. non-fatty meal such as toast)
  - 6 h after ingestion of infant formula, non-human milk, or expressed breast milk fortified with additions
  - 4 h after ingestion of breast milk
  - 2 h after clear fluid intake (including water, pulp-free juice, complex carbohydrate beverages, and tea or coffee without milk) for adults
  - 1 h after clear fluid intake for infants and children

## Hematological Disorders

- history of congenital or acquired conditions (sickle cell anemia, factor VIII deficiency, ITP, liver disease)
- evaluate hemoglobin, hematocrit, and coagulation profiles when indicated (see *Table 1, A4*)
- anemia
  - preoperative treatments to increase hemoglobin (PO or IV iron supplementation, erythropoietin, or pre-admission blood collection in certain populations)
- coagulopathies
  - discontinue or modify anticoagulation therapies (warfarin, clopidogrel, ASA, apixaban, dabigatran) in advance of elective surgeries
  - administration of reversal agents if necessary: vitamin K, FFP, prothrombin complex concentrate, recombinant activated factor VII

## Endocrine Disorders

- DM
  - clarify type 1 vs. type 2
  - clarify treatment – oral anti-hyperglycemics and/or insulin
  - assess glucose control with history and HbA1c; patients with well-controlled diabetes have more stable glucose levels intraoperatively
  - end organ damage: be aware of damage to cardiovascular, renal, and central, peripheral, and autonomic nervous systems
  - preoperative guidelines for DM:
- verify target blood glucose concentration with frequent glucose monitoring: <10 mmol/L in critical patients, <7.8 mmol/L in stable patients
- use insulin therapy to maintain glycemic goals
- hold biguanides,  $\alpha$ -glucosidase inhibitors, thiazolidinediones, sulfonylureas and GLP-1 agonists on the morning of surgery
- consider cancelling non-emergency procedures if patient presents with metabolic abnormalities (e.g. DKA, HHS, etc.) or glucose reading above 22.2-27.7 mmol/L
  - formulate intraoperative glucose management plan based on type (1 vs. 2), glucose control, and extent of end organ damage
- hyperthyroidism
  - can experience sudden release of thyroid hormone (i.e. thyroid storm) if not treated or well-controlled preoperatively
  - treatment:  $\beta$ -blockers and preoperative prophylaxis
- adrenocortical insufficiency (e.g. Addison's, exogenous steroid use)
  - consider intraoperative steroid supplementation

## Obesity and Obstructive Sleep Apnea

- assess for co-morbid conditions in obese patient (independent risk factor for CVD, DM, OSA, cholelithiasis, HTN)
- previously undiagnosed conditions may require additional testing to characterize severity
- severity of OSA may be determined from sleep studies and prescribed pressure settings of home CPAP device

### Implementation of a Comprehensive Patient Blood Management Program for Hospitalized Patients at a Large United States Medical Center

Mayo Clin Proc. 2021;96(12):2900

**Purpose:** To assess changes to utilization of inpatient transfusion and the associated outcomes with implementation of a Patient Blood Management Program.

**Methods:** An observational study was conducted between 2010 and 2017 at a major US academic centre. Transfusion usage and clinical outcomes were assessed.

**Results:** 400998 admissions were assessed. Overall usage of inpatient transfusion decreased from 607 to 405 per 1000 admissions. Also, length of stay in hospital and in-hospital adverse events decreased.

**Conclusion:** This study exhibits that hospital-wide patient blood management protocols result in an overall decrease in transfusion usage and improved clinical outcomes.

### Interventions for Preoperative Smoking Cessation

Cochrane DB Syst Rev 2014;3:CD002294

**Purpose:** Assess the effect of preoperative smoking intervention on smoking cessation at the time of surgery and 12 mo postoperatively, and on the incidence of postoperative complications.

**Methods:** Systematic review including RCTs that recruited people who smoked prior to surgery, offered a smoking cessation intervention, and measured preoperative and long-term abstinence from smoking or the incidence of postoperative complications or both.

**Results:** Thirteen trials enrolling 2070 participants included. Overall quality of evidence was moderate. Compared studies involving intensive intervention, which included multi-session face to face counselling or computer-based scheduled interventions, vs. brief interventions. These were pooled separately.

An effect on cessation at the time of surgery was apparent in both subgroups, but the effect was larger for intensive intervention. For long-term cessation, only the intensive intervention showed effect. In those that had intensive intervention there was significant effect in preventing any postoperative complications.

**Conclusion:** There is evidence that preoperative smoking interventions providing behavioural support and offering NRT in create short-term smoking cessation and may reduce postoperative morbidity. Interventions that begin 4 to 8 wk before surgery, include weekly counselling, and use NRT are more likely to have an impact on complications and long-term smoking cessation.

### Preoperative Anemia and Postoperative Outcomes in Non-Cardiac Surgery: A Retrospective Cohort Study

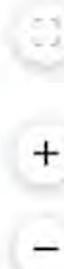

Lancet 2011;378:1396-1407

**Purpose:** Assess effect of preoperative anemia on 30 d postoperative morbidity and mortality in patients undergoing major non-cardiac surgery.

**Methods:** Patients undergoing major non-cardiac surgery in 2008 from the American College of Surgeons' National Surgical Quality Improvement Program database.

**Results:** 227425 adult patients. Postoperative mortality at 30 d was higher in patients with anemia than those without (OR 1.42, 95% CI 1.31-1.54).

**Conclusion:** Preoperative anemia, even to a mild degree, is independently associated with an increased risk of 30 d morbidity and mortality.

# Monitoring

## Canadian Guidelines to the Practice of Anesthesia and Patient Monitoring

- an anesthetist present: "the only indispensable monitor"
- a completed preanesthetic checklist: including ASA class, NPO policy, and Hx and investigations
- a perioperative anesthetic record: HR and BP every 5 min, O<sub>2</sub> saturation, ETCO<sub>2</sub>, dose and route of drugs and fluids
- continuous monitoring: see *Routine Monitors for All Cases*

## Routine Monitors for All Cases

- pulse oximeter, BP monitor, ECG, capnography (required for GA and deep procedural sedation, Ramsay Sedation Scale 4-6), and an agent-specific anesthetic gas monitor when inhalational anesthetic agents are used
- the following must also be available: temperature probe, peripheral nerve stimulator, stethoscope, appropriate lighting, spirometry, and manometer to measure ETT cuff pressure

## Elements to Monitor

- anesthetic depth
  - end-tidal inhaled anesthetic monitoring and EEG monitoring, such as a Bispectral Index monitor, can be used as assessments of anesthetic depth
  - inadequate: blink reflex present when eyelashes lightly touched, HTN, tachycardia, tearing, or sweating. However, these findings are non-specific
  - excessive: hypotension, bradycardia
- oxygenation: pulse oximetry, FiO<sub>2</sub>
- ventilation: verify correct position of ETT, chest excursions, breath sounds, ETCO<sub>2</sub> analysis, end-tidal inhaled anesthesia analysis
- circulation: HR, rhythm, BP, telemetry, oximetry, pulmonary capillary wedge pressure
- temperature
- hourly urine output

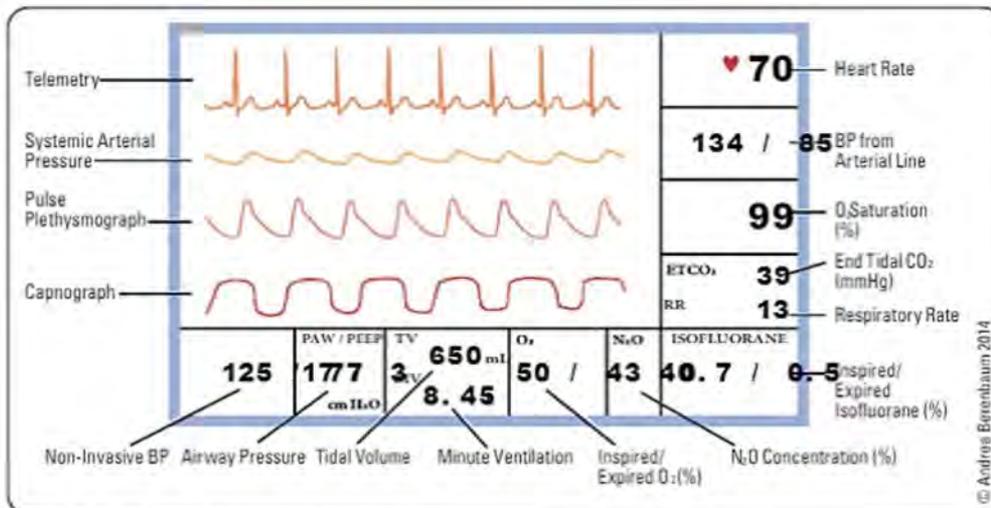

Figure 4. Typical anesthesia monitor

## Pre-Anesthetic Checklist

### MS MAIDS

- Machine:** connected, pressures okay, all metres functioning, vaporizers full
- Suction:** connected and working
- Monitor:** all monitors appropriate for the case
- Airway:** laryngoscope and blades, ETT, syringe, stylet, oral and nasal airways, tape, bag, and mask
- IV:** second IV set-up and ready if needed
- Drugs:** case-specific drugs ready and emergency medications in correct location and accessible
- Special equipment:** OG tube, CVP monitor, shoulder roll, etc.

## Screening for OSA

Br J Anaesth 2012;108:768-775

### STOP-BANG

- Snoring – loud
- Tiredness – day-time
- Observed apnea – during sleep
- Pressure – HTN
- Body mass index – >35
- Age – >50 y/o
- Neck – large neck circumference
- Gender – male

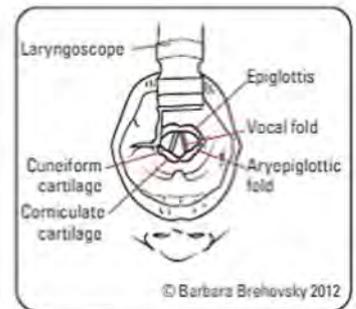

Figure 5. Landmarks for intubation

# Airway Management

## Airway Anatomy

- resistance to airflow through nasal passages accounts for approximately 2/3 of total airway resistance
- pharyngeal airway extends from posterior aspect of the nose to cricoid cartilage
- glottic opening: triangular space formed between the true vocal cords; narrowest segment of the laryngeal opening in adults
  - space through which one visualizes proper placement of the ETT
- trachea begins at the level of the thyroid cartilage, C6, and bifurcates into the right and left main bronchi at T4-T5 (approximately the sternal angle)

## Will This Patient Be Difficult to Intubate?

JAMA 2019;321:493-503

- Purpose:** To identify risk factors and physical findings that predict difficult intubation.
- Methods:** Systematic review of MEDLINE and EMBASE databases.
- Results:** 62 studies, 33559 patients. Physical examination findings that best predicted a difficult intubation included grade of class 3 on upper lip bite test (lower incisors cannot reach upper lip): LR 14, 95% CI 9.9-22), shorter hyomental distance (<3-5.5 cm; LR 9.4, 95% CI 4.1-10), retrognathia (mandible <9 cm from angle of jaw to tip of chin; LR 6.0, 95% CI 3.1-11), and a Mallampati score ≥3 (LR 4.1, 95% CI 3.0-5.6).

## Methods of Supporting Airways

1. non-definitive airway (patent airway)
  - jaw thrust/chin lift
  - oropharyngeal and nasopharyngeal airway
  - bag mask ventilation
  - LMA
2. definitive airway (patent and protected airway)
  - ETT (oral or nasal)
  - surgical airway (cricothyrotomy or tracheostomy)

Table 2. Methods of Supporting the Airway

	Bag and Mask	LMA	ETT
<b>Advantages/Indications</b>	Basic Non-invasive Readily available	Easy to insert Less airway trauma/irritation than ETT Frees up hands (vs. face mask) Primarily used in spontaneously ventilating patient	Indications for intubation (5 Ps) Patent airway Protects against aspiration Positive pressure ventilation Pulmonary toilet (suction) Pharmacologic administration during hemodynamic instability
<b>Disadvantages/Contraindications</b>	Risk of aspiration if decreased LOC Cannot ensure airway patency Inability to deliver precise tidal volume Operator fatigue	Risk of gastric aspiration PPV > 20 cm H <sub>2</sub> O needed Oropharyngeal/retropharyngeal pathology or foreign body Does not protect against laryngospasm or gastric aspiration	Insertion can be difficult Muscle relaxant usually needed Most invasive – see <i>Complications During Laryngoscopy and Intubation, A9</i> Supraglottic/glottic pathology that would preclude successful intubation
<b>Other</b>	Facilitate airway patency with jaw thrust and chin lift Can use oropharyngeal/nasopharyngeal airway	Sizing by body weight (approx.): 40-50 kg: 3 50-70 kg: 4 70-100 kg: 5	Auscultate to avoid endobronchial intubation Sizing (approx.): Male: 8.0-9.0 mm Female: 7.0-8.0 mm Paediatric Uncuffed (age > 2 yls): (age/4) + 4 mm

### Equipment for Intubation

- MDSOLES**  
**M**onitors  
**D**rugs  
**S**uction  
**O**xygen source and self-inflating bag with oropharyngeal and nasopharyngeal airways  
**L**aryngoscope  
**E**TT (appropriate size and one size smaller)  
**S**tylet, Syringe for tube cuff inflation

### Medications that can be given through the ETT

- NAVEL**  
**N**aloxone  
**A**trypine  
**V**entolin  
**E**pinephrine  
**L**idocaine

## Tracheal Intubation

### Preparing for Intubation

- failed attempts at intubation can make further attempts more difficult due to tissue trauma
- plan, prepare, and assess for potential difficulties (see *Preoperative Assessment, A2*)
- ensure equipment is available and working (test ETT cuff, check laryngoscope light and suction, machine check)
- pre-oxygenate/denitrogenate: patient breathes 100% O<sub>2</sub> for 3-5 min or for 4-8 vital capacity breaths
- may need to suction mouth and pharynx first

### Proper Positioning for Intubation

- align the three axes (mouth, pharynx, and larynx) to allow visualization from oral cavity to glottis
- “sniffing position”: flexion of lower C-spine (C5-C6), bow head forward, and extension of upper C-spine at atlanto-occipital joint (C1), nose in the air (see *Figure 6C*)
  - contraindicated in known/suspected C-spine fracture/instability
    - poor/no view of glottic opening can be remediated by anterior laryngeal pressure
- laryngoscope tip placed in the epiglottic vallecula in order to visualize cord

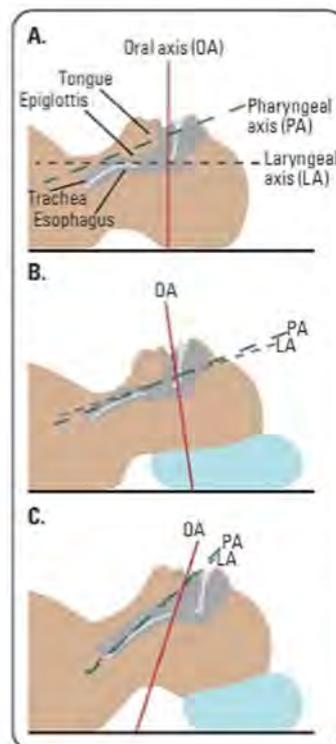

Figure 6. Anatomic considerations in laryngoscopy  
 A. Neutral position  
 B. C-spine flexion  
 C. C-spine flexion with atlanto-occipital extension

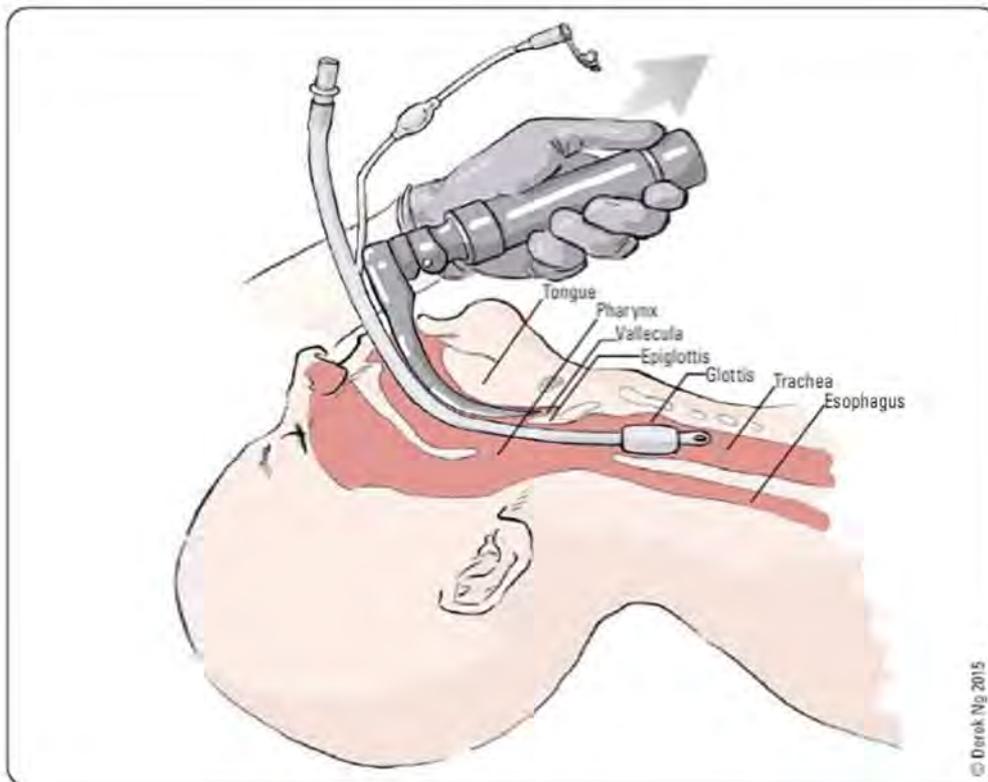

Figure 7. Sagittal view of airway with laryngoscope in vallecula

### Tube Insertion

- laryngoscopy and ETT insertion can incite a significant sympathetic response via stimulation of cranial nerves IX and X due to a “foreign body reflex” in the trachea, including tachycardia, dysrhythmias, myocardial ischemia, increased BP, and coughing
- a malpositioned ETT is a potential hazard for the intubated patient
  - if too deep, may result in right endobronchial intubation, which is associated with left-sided atelectasis and right-sided tension pneumothorax
  - if too shallow, may lead to accidental extubation, vocal cord trauma, or laryngeal paralysis as a result of pressure injury by the ETT cuff
- the tip of ETT should be located at the midpoint of the trachea at least 2 cm above the carina, and the proximal end of the cuff should be placed at least 2 cm below the vocal cords
- approximately 20–23 cm mark at the right corner of the mouth for men and 19–21 cm for women

### Confirmation of Tracheal Placement of Endotracheal Tube

- direct
  - visualization of ETT passing through cords
  - bronchoscopic visualization of ETT in trachea
- indirect
  - ETCO<sub>2</sub> in exhaled gas measured by capnography (gold standard for confirming the ETT is in the airway)
  - auscultate for equal breath sounds bilaterally and absent breath sounds over epigastrium
  - bilateral chest movement, condensation of water vapour in ETT visible during exhalation, and no abdominal distention
  - refilling of reservoir bag during exhalation
  - CXR (rarely done): only confirms the position of the tip of ETT, not its location in the trachea vs. esophagus, but can confirm endobronchial intubation
- esophageal intubation suspected when:
  - ETCO<sub>2</sub>: zero or near zero on capnograph
  - abnormal sounds during assisted ventilation
  - impairment of chest excursion
  - hypoxia/cyanosis
  - presence of gastric contents in ETT
  - breath sounds heard when auscultating over epigastrium/left upper quadrant
  - distention of stomach/epigastrium with ventilation

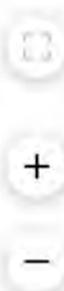

### Complications During Laryngoscopy and Intubation

- dental damage
- laceration (lips, gums, tongue, pharynx, vallecula, esophagus)
- laryngeal trauma
- esophageal or endobronchial intubation

### Differential Diagnosis of Poor Bilateral Breath Sounds after Intubation

**DOPE**  
 Displaced ETT  
 Obstruction  
 Pneumothorax  
 Esophageal intubation

- accidental extubation
- insufficient cuff inflation or cuff laceration: results in leaking and aspiration
- laryngospasm (see *Extubation, A20, for definition*)
- bronchospasm
- accidental extubation

## Difficult Airway

- difficulties with bag-mask ventilation, supraglottic airway, laryngoscopy, passage of ETT through the cords, infraglottic airway, or surgical airway
- algorithms exist for difficult airways (Can J Anesth 2013;60:1119-1138), see *Appendices, A30*
- preoperative assessment (history of previous difficult airway, airway examination) and pre-oxygenation are important preventative measures
- if difficult airway expected, consider:
  - awake intubation
  - intubating with bronchoscope, fiberoptic laryngoscope, video laryngoscope, etc.
- if intubation unsuccessful after induction:
  1. CALL FOR HELP
  2. ventilate with 100% O<sub>2</sub> via bag and mask
  3. consider returning to spontaneous ventilation and/or waking patient
- if bag and mask ventilation inadequate:
  1. CALL FOR HELP
  2. attempt ventilation with oral airway
  3. consider/attempt LMA
  4. emergency invasive airway access (e.g. surgical or percutaneous airway, jet ventilation, and retrograde intubation)

If you encounter difficulty with tracheal intubation, oxygenation is more important than intubation

## Oxygen Therapy

- in general, the goal of O<sub>2</sub> therapy is to maintain arterial O<sub>2</sub> saturation (SaO<sub>2</sub>) >90%
- small decrease in saturation below SaO<sub>2</sub> of 90% corresponds to a large drop in PaO<sub>2</sub>
- in intubated patients, O<sub>2</sub> is delivered via the ETT
- in patients not intubated, there are many O<sub>2</sub> delivery systems available; the choice depends on O<sub>2</sub> requirements (FiO<sub>2</sub>) and the degree to which precise control of delivery is needed
- cyanosis can be detected at SaO<sub>2</sub> <85%, frank cyanosis at SaO<sub>2</sub> = 67%

### Low Flow Systems

- provide O<sub>2</sub> at flows between 0-10 L/min
- acceptable if tidal volume 300-700 mL, respiratory rate (RR) <25 breaths/min, consistent ventilation pattern
- dilution of O<sub>2</sub> with room air results in a decrease in FiO<sub>2</sub>
- an increase in minute ventilation (tidal volume x RR) results in a decrease in FiO<sub>2</sub>
- e.g. nasal cannula (prongs)
  - well tolerated if flow rates <5-6 L/min; drying of nasal mucosa at higher flows
  - nasopharynx acts as an anatomic reservoir that collects O<sub>2</sub>
  - delivered O<sub>2</sub> concentration (FiO<sub>2</sub>) can be estimated by adding 4% for every additional litre of O<sub>2</sub> delivered
  - provides FiO<sub>2</sub> of 24-44% at O<sub>2</sub> flow rates of 1-6 L/min

### Reservoir Systems

- use a volume reservoir to accumulate O<sub>2</sub> during exhalation, thus increasing the amount of O<sub>2</sub> available for the next breath
- simple face mask
  - covers patient's nose and mouth and provides an additional reservoir beyond nasopharynx
  - fed by small bore O<sub>2</sub> tubing at a rate of at least 6 L/min to ensure that exhaled CO<sub>2</sub> is flushed through the exhalation ports and not rebreathed
  - provides FiO<sub>2</sub> of 55% at O<sub>2</sub> flow rates of 10 L/min
- non-rebreather mask
  - a reservoir bag and a series of one-way valves prevent expired gases from re-entering the bag
  - during the exhalation phase, the bag accumulates with O<sub>2</sub>
  - provides FiO<sub>2</sub> of 80% at O<sub>2</sub> flow rates of 10-15 L/min

### High Flow Systems

- generate flows of up to 50-60 L/min
- meet/exceed patient's inspiratory flow requirement
- deliver consistent and predictable concentration of O<sub>2</sub>
- Venturi mask
  - delivers specific FiO<sub>2</sub> by varying the size of air entrainment
  - O<sub>2</sub> concentration determined by mask's port and NOT the wall flow rate
  - enables control of gas humidity
  - FiO<sub>2</sub> ranges from 24-50%

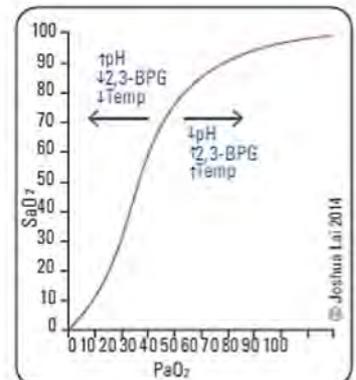

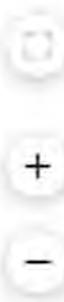

Figure 8. HbO<sub>2</sub> saturation curve

**Composition of Air**  
 78.1% nitrogen  
 20.9% oxygen  
 0.9% argon  
 0.04% carbon dioxide

## Ventilation

- ventilation is maintained with PPV in patients given muscle relaxants
- assisted or controlled ventilation can also be used to assist spontaneous respirations in patients not given muscle relaxants as an artificial means of supporting ventilation and oxygenation

### Mechanical Ventilation

- indications for mechanical ventilation
  - apnea
  - hypoventilation/acute respiratory acidosis
  - intraoperative positioning limiting respiratory excursion (e.g. prone, Trendelenburg)
  - required hyperventilation (to lower ICP)
  - deliver PEEP
  - increased intrathoracic pressure (e.g. laparoscopic procedure)
- complications of mechanical ventilation
  - airway complications
    - ♦ tracheal stenosis, laryngeal edema
  - alveolar complications
    - ♦ ventilator-induced lung injury (barotrauma, volutrauma, atelectrauma), ventilator-associated pneumonia (nosocomial pneumonia), inflammation, auto-PEEP, patient-ventilator asynchrony
  - cardiovascular complications
    - ♦ reduced venous return (secondary to increased intrathoracic pressure), reduced cardiac output, hypotension
  - neuromuscular complications
    - ♦ muscle atrophy
    - ♦ increased ICP
  - metabolic complications
    - ♦ decreased CO<sub>2</sub> due to hyperventilation
    - ♦ alkalemia with overcorrection of chronic hypercarbia

### Ventilator Strategies

- mode and settings are determined based on patient factors (e.g. ideal body weight, compliance, resistance) and underlying reason for mechanical ventilation
- hypoxemic respiratory failure: ventilator provides supplemental O<sub>2</sub>, recruits atelectatic lung segments, helps improve V/Q mismatch, and decreases intrapulmonary shunt
- hypercapnic respiratory failure: ventilator augments alveolar ventilation; may decrease the work of breathing, allowing respiratory muscles to rest

### Modes of Ventilation

- assist-control ventilation (ACV) or volume control (VC)
  - every breath is delivered with a pre-set tidal volume and rate or minute ventilation
  - extra controlled breaths may be triggered by patient effort; if no effort is detected within a specified amount of time the ventilator will initiate the breath
- pressure control ventilation (PCV)
  - a minimum frequency is set and patient may trigger additional breaths above the ventilator
  - all breaths delivered at a pre-set constant inspiratory pressure
  - in traditional PCV, tidal volume is not guaranteed, thus changes in compliance and resistance affect tidal volume
- synchronous intermittent mandatory ventilation (SIMV)
  - ventilator provides controlled breaths (either at a set volume or pressure depending on whether in VC or PCV, respectively)
  - patient can breathe spontaneously (these breaths may be pressure supported) between controlled breaths
- pressure support ventilation (PSV)
  - patient initiates all breaths and the ventilator supports each breath with a pre-set inspiratory pressure
  - useful for weaning off ventilator
- high-frequency oscillatory ventilation (HFOV)
  - high breathing rate (up to 900 breaths/min in an adult), very low tidal volumes
  - used commonly in neonatal and paediatric respiratory failure
  - occasionally used in adults when conventional mechanical ventilation is failing
- non-invasive positive pressure ventilation (NPPV)
  - achieved without intubation by using a nasal or face mask
  - Bi-level positive airway pressure (BiPAP): increased pressure (like PSV) on inspiration and lower constant pressure on expiration (i.e. PEEP)
  - CPAP: delivers constant pressure on both inspiration and expiration

#### Tracheostomy

Tracheostomy should be considered in patients who require ventilator support for extended periods of time. Shown to improve patient comfort and give patients a better ability to participate in rehabilitation activities

Changes in peak pressures in ACV and tidal volumes in PCV may reflect changes in lung compliance and/or airway resistance – patient may be getting better or worse

#### Positive End Expiratory Pressure (PEEP)

- Positive pressure applied at the end of ventilation that helps to keep alveoli open, decreasing V/Q mismatch
- Used with all invasive modes of ventilation

#### Monitoring Ventilatory Therapy

Pulse oximetry, ETCO<sub>2</sub> concentration  
Regular arterial blood gases  
Assess tolerance regularly

Patients who develop a pneumothorax while on mechanical ventilation require a chest tube

#### Causes of Intraoperative Hypoxemia

##### Inadequate Oxygen Supply

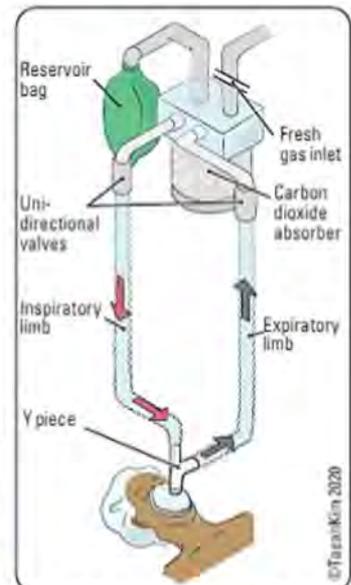

e.g. breathing system disconnection, obstructed or malpositioned ETT, leaks in the anesthetic machine, loss of oxygen supply

##### Hypoventilation

**Ventilation-Perfusion Inequalities**  
e.g. atelectasis, pneumonia, pulmonary edema, pneumothorax  
**Reduction in Oxygen Carrying Capacity**  
e.g. anemia, carbon monoxide poisoning, methemoglobinemia, hemoglobinopathy  
**Leftward Shift of the Hemoglobin-Oxygen Saturation Curve**  
e.g. hypothermia, decreased 2,3-BPG, alkalosis, hypocarbia, carbon monoxide poisoning  
**Right-to-Left Cardiac Shunt**

**Table 3. Causes of Abnormal End Tidal CO<sub>2</sub> Levels**

Hypocapnea (Decreased CO <sub>2</sub> )	Hypercapnea (Increased CO <sub>2</sub> )
Hyperventilation	Hypoventilation
Hypothermia (decreased metabolic rate)	Malignant hyperthermia, other hypermetabolic states
Decreased pulmonary blood flow (decreased cardiac output)	Improved pulmonary blood flow after resuscitation or hypotension
Technical issues	Technical issues
Incorrect placement of sampling catheter	Water in capnography device
Inadequate sampling volume	Anesthetic breathing circuit error
	Inadequate fresh gas flow
	Rebreathing
	Exhausted soda lime
	Faulty circuit absorber valves
V/Q mismatch	Low bicarbonate
Pulmonary thromboembolism	
Incipient pulmonary edema	
Air embolism	

**Figure 9. The anesthesia circuit****Impact of Hypothermia (<36°C)**

- Increased risk of wound infections due to impaired immune function
- Increases the period of hospitalization by delaying healing
- Reduces platelet function and impairs activation of coagulation cascade, increasing blood loss and transfusion requirements
- Triplies the incidence of VT and morbid cardiac events
- Decreases the metabolism of anesthetic agents, prolonging postoperative recovery

See Landmark Anesthesiology Trials table for more information on results from study of Wound Infection and Temperature, which details the impact of normothermia on wound healing and length of stay as seen in 200 patients aged 18-80 yr who underwent elective colorectal surgery.

## Intraoperative Management

### Temperature

**Causes of Hypothermia (<36.0°C)**

- intraoperative temperature losses are common (e.g. 90% of intraoperative heat loss is transcutaneous), due to:
  - OR environment (e.g. cold room, IV fluids, instruments)
  - open wound
- prevent with forced air warming blankets/warm-water blankets, heated humidification of inspired gases, warmed IV fluid, and increased OR temperature

**Causes of Hyperthermia (>37.5-38.3°C)**

- drugs (e.g. atropine)
- blood transfusion reaction
- infection/sepsis
- medical disorder (e.g. thyrotoxicosis)
- hypermetabolic states (e.g. malignant hyperthermia, neuroleptic malignant syndrome, pheochromocytoma)
- over-zealous warming efforts

### Heart Rate

**Cardiac Arrest**

- pulseless arrest occurs due to 4 cardiac rhythms divided into shockable and non-shockable rhythms
  - shockable: ventricular fibrillation (VF) and ventricular tachycardia (pVT)
  - non-shockable: asystole and pulseless electrical activity (PEA)
- for VF/pVT, key to survival is good early CPR and defibrillation
- for asystole/PEA, key to survival is good early CPR and exclusion of all reversible causes
- reversible causes of PEA arrest (5 Hs and 5 Ts)
  - 5 Hs: hypothermia, hypovolemia, hypoxia, hydrogen ions (acidosis), hypo/hyperkalemia
  - 5 Ts: tamponade (cardiac), thrombosis (pulmonary), thrombosis (coronary), tension pneumothorax, toxins (overdose/poisoning)
  - when a patient sustains a cardiac arrest during anesthesia, it is important to remember that there are other causes on top of the Hs and Ts to consider (e.g. local anesthetic systemic toxicity (LAST), excessive anesthetic dosing, etc.)
- for management of cardiac arrest, see *Appendices, A30*

**Intraoperative Tachycardia**

- tachycardia – HR >100 bpm; divided into sinus tachycardia (HR = 100-150 bpm) or supraventricular tachycardia (SVT)
- SVT: can be further divided into narrow complex or wide complex tachycardia
  - narrow complex: atrial fibrillation/flutter, accessory pathway mediated tachycardia, paroxysmal atrial tachycardia
  - wide complex: VT, SVT with aberrant conduction
- causes of sinus tachycardia
  - shock/hypovolemia/blood loss
  - anxiety/pain/light anesthesia
  - full bladder
  - anemia

- febrile illness/sepsis
- drugs (e.g. atropine, cocaine, dopamine, epinephrine, ephedrine, isoflurane, isoproterenol, pancuronium) and withdrawal
- hypermetabolic states: malignant hyperthermia, neuroleptic malignant syndrome, pheochromocytoma, thyrotoxicosis, serotonin syndrome
- for management of tachycardia, see *Appendices, A30*

### Intraoperative Bradycardia

- bradycardia – HR <50 bpm; most concerning are 2nd degree (Mobitz type II) and 3rd degree heart block, which can both degenerate into asystole
- causes of sinus bradycardia
  - increased parasympathetic tone vs. decreased sympathetic tone
  - must rule out hypoxemia
  - arrhythmias (see *Cardiology and Cardiac Surgery, C19*)
  - baroreceptor reflex due to increased ICP or increased BP
  - vagal reflex (oculocardiac reflex, carotid sinus reflex, airway manipulation)
  - drugs (e.g. opioids, edrophonium, neostigmine, halothane, digoxin,  $\beta$ -blockers)
  - high spinal/epidural anesthesia
  - hypothermia and hypothyroidism
- for management of bradycardia, see *Appendices, A30*

### Intraoperative Shock Box

#### SHOCKED

Sepsis or Spinal shock  
 Hypovolemic/Hemorrhagic  
 Obstructive  
 Cardiogenic  
 anaphylactic  
 Endocrine/other (e.g. Addison's disease, hyperthyroidism, transfusion reaction)  
 Drugs

$BP = CO \times SVR$ , where  $CO = SV \times HR$   
 SV is a function of preload, afterload, and contractility

## Blood Pressure

### Causes of Intraoperative Hypotension/Shock

- shock: inability of cardiovascular system to maintain adequate end-organ perfusion and delivery of  $O_2$  to tissues
  - a) septic shock
    - see *Infectious Diseases, ID20*
  - b) spinal/neurogenic shock
    - decreased sympathetic tone
    - hypotension without tachycardia or peripheral vasoconstriction (warm skin)
  - c) hypovolemic/hemorrhagic shock
    - most common form of shock, due to decrease in intravascular volume
  - d) obstructive shock
    - obstruction of blood into or out of the heart
    - increased JVP, distended neck veins, increased SVR, insufficient CO
    - e.g. tension pneumothorax, cardiac tamponade, pulmonary embolism (and other emboli – i.e. fat, air)
  - e) cardiogenic shock
    - inability of the heart to pump an adequate volume of blood
    - increased JVP, distended neck veins, increased SVR, decreased CO
    - e.g. myocardial dysfunction, dysrhythmias, ischemia/infarct, cardiomyopathy, acute valvular dysfunction
  - f) anaphylactic(K) shock
    - see *Emergency Medicine, ER29*
  - g) endocrine/other
    - transfusion reaction, Addisonian crisis, thyrotoxicosis, hypothyroid, aortocaval syndrome
    - see *Hematology and Endocrinology*
  - h) drugs
    - vasodilators, high spinal anesthetic interfering with sympathetic outflow

### Causes of Intraoperative Hypertension

- inadequate anesthesia causing pain and anxiety
- pre-existing HTN, coarctation, or preeclampsia
- hypoxemia/hypercarbia
- hypervolemia
- increased intracranial pressure
- full bladder
- drugs (e.g. ephedrine, epinephrine, cocaine, phenylephrine, ketamine) and withdrawal
- allergic/anaphylactic reaction
- hypermetabolic states: malignant hyperthermia, neuroleptic malignant syndrome, serotonin syndrome, thyroid storm, pheochromocytoma (see *Endocrinology, E29, E40*)

## Fluid Balance and Resuscitation

- total requirement = maintenance + deficit + ongoing loss
- in surgical settings, this formula must take into account multiple factors including preoperative fasting/decreased fluid intake, increased losses during or before surgery, and fluids given with blood products and medications
- increasingly, Enhanced Recovery After Surgery protocols recommend consumption of clear fluids up to 2 h prior to surgery

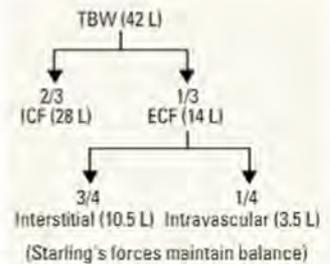

- both inadequate fluid resuscitation AND excessive fluid administration increase morbidity postoperatively

**Maintenance Fluid**

- average healthy adult requires approximately 2500 mL water/d
  - 200 mL/d GI losses
  - 800 mL/d insensible losses (respiration, perspiration)
  - 1500 mL/d urine (beware of renal failure)
- maintenance should not exceed 3 mL/kg/h
- increased requirements with fever, sweating, GI losses (vomiting, diarrhea, NG suction), adrenal insufficiency, hyperventilation, and polyuric renal disease
- decreased requirements with anuria/oliguria, SIADH, highly humidified atmospheres, and CHF
- maintenance electrolytes
  - Na<sup>+</sup>: 3 mEq/kg/d
  - K<sup>+</sup>: 1 mEq/kg/d
- 4-2-1 rule: 4 mL/h first 10 kg, 2 mL/h next 10 kg, 1 mL/h for every kg after to calculate maintenance fluid requirement
  - alternatively, may add 40 to adults who weigh ≥20kg to calculate maintenance fluid requirement in mL/h
- e.g. a 50 kg patient's maintenance requirements
  - fluid = (4 mL/h x 10 kg) + (2 mL/h x 10 kg) + (1 mL/h x 30 kg) = 40 mL/h + 20 mL/h + 30 mL/h = 90 mL/h = 2160 mL/d
  - Na<sup>+</sup> = 150 mEq/d (therefore 150 mEq/2.16 L/d ≈ 69 mEq/L)
  - K<sup>+</sup> = 50 mEq/d (therefore 50 mEq/2.16 L/d ≈ 23 mEq/L)
- above patient's requirements roughly met with 2/3 dextrose 5% in water (D5W), 1/3 normal saline (NS) 0.9%
  - 2/3 + 1/3 at 100 mL/h with 20 mEq KCl per litre

**Fluid Deficit**

- patients should be adequately hydrated prior to anesthesia
- total body water (TBW) = 60% or 50% of total body weight for an adult male or female, respectively (e.g. for a 70 kg adult male TBW = 70 x 0.6 = 42 L)
- total Na<sup>+</sup> content determines ECF volume; [Na<sup>+</sup>] determines ICF volume
- hypovolemia due to volume contraction
  - extra-renal Na<sup>+</sup> loss
    - GI: vomiting, NG suction, drainage, fistulae, diarrhea
    - skin/respiratory: insensible losses (fever), sweating, burns
    - vascular: hemorrhage
    - renal Na<sup>+</sup> and H<sub>2</sub>O loss
    - diuretics
    - osmotic diuresis
    - hypoaldosteronism
    - salt-wasting nephropathies
    - renal H<sub>2</sub>O loss
    - diabetes insipidus (central or nephrogenic)
    - hypovolemia with normal or expanded ECF volume
    - decreased CO
    - redistribution
- hypoalbuminemia: cirrhosis, nephrotic syndrome
- capillary leakage: acute pancreatitis, rhabdomyolysis, ischemic bowel, sepsis, anaphylaxis
- replace water and electrolytes as determined by patient's needs
- with chronic hyponatremia, correction must be done gradually over >48 h to avoid central pontine myelinolysis

**Figure 10. Total body water division in a 70 kg adult**

**Table 4. Signs and Symptoms of Dehydration**

Percentage of Body Water Loss	Severity	Signs and Symptoms
3%	Mild	Decreased skin turgor, sunken eyes, dry mucous membranes, dry tongue, reduced sweating
6%	Moderate	Oliguria, orthostatic hypotension, tachycardia, low volume pulse, cool extremities, reduced filling of peripheral veins and CVP, hemoconcentration, apathy
9%	Severe	Profound oliguria or anuria and compromised CNS function with or without altered sensorium

**What are the Ongoing Losses?**

- traditionally thought that fluid loss during surgery resulted from blood loss, losses from Foley catheter, NG, surgical drains, and minor losses due to sequestration of fluid into other body compartments
- fluid therapy accounting for these losses often resulted in excess crystalloid administration
- goal-directed fluid regimens associated with lower rate of postoperative complications compared to predetermined calculations. These can be done using point of care ultrasound (POCUS), esophageal doppler, or pulse or pressure variation available either using arterial line monitoring or certain pulse oximetry

## IV Fluids

- replacement fluids include crystalloid and colloid solutions
- IV fluids improve perfusion but NOT O<sub>2</sub> carrying capacity of blood

### Initial Distribution of IV Fluids

- H<sub>2</sub>O follows ions/molecules to their respective compartments

### Crystalloid Infusion

- salt-containing solutions that distribute only within ECF
- consensus guidelines recommend use of balanced crystalloid (i.e. Ringer's lactate) over NS for routine replacement and resuscitation
- maintain euolemia in patient with blood loss: 3 mL crystalloid infusion per 1 mL of blood loss for volume replacement (i.e. 3:1 replacement)
- best practice is to use goal-directed therapy
- if large volumes are to be given, use balanced fluids such as Ringer's lactate or Plasmalyte®, as too much NS may lead to hyperchloremic metabolic acidosis

### Colloid Infusion

- includes protein colloids (albumin and gelatin solutions) and non-protein colloids (dextrans and starches, (e.g. hydroxyethyl starch) (HES))
- distributes within intravascular volume
- 1:1 ratio (infusion: blood loss) only in terms of replacing intravascular volume
- the use of HES solutions is controversial because of recent RCTs and meta-analyses highlighting their renal (especially in septic patients) and coagulopathic side effects, as well as a lack of specific indications for their use
  - colloids are being used based on mechanistic and experimental evidence but there is a paucity of definitive studies investigating their safety and efficacy; routine use of colloids should be avoided

Table 5. IV Fluid Solutions

		ECF	Ringer's Lactate	0.9% NS	0.45% NS in D5W	D5W	2/3 D5W + 1/3 NS	Plasmalyte
mEq/L	Na <sup>+</sup>	142	130	154	77	-	51	140
	K <sup>+</sup>	4	4	-	-	-	-	5
	Ca <sup>2+</sup>	4	3	-	-	-	-	-
	Mg <sup>2+</sup>	3	-	-	-	-	-	3
	Cl <sup>-</sup>	103	109	154	77	-	51	98
	HCO <sub>3</sub> <sup>-</sup>	27	28*	-	-	-	-	27
mOsm/L		280-310	273	308	154	252	269	294
pH		7.4	6.5	5.0	4.5	4.0	4.3	7.4

\*Converted from lactate

Table 6. Colloid HES Solutions

	Concentration	Plasma Volume Expansion	Duration (h)	Maximum Daily Dose (mL/kg)
Voluven®	6%	1:1	4-6	33-50
Pentaspán®	10%	1:1.2-1.5	18-24	28

## Blood Products

- see Hematology, H54

### Colloids vs. Crystalloids for Fluid Resuscitation in Critically Ill People

Cochrane DB Syst Rev 2018; CD000057

**Purpose:** To assess effect of colloids vs. crystalloids in critically ill patients on mortality, need for transfusions or renal replacement therapy, and adverse events.

**Methods:** Systematic review of RCTs and quasi-RCTs involving trauma, burns, or medical conditions (i.e. sepsis). Searched CENTRAL, MEDLINE, and Embase.

**Outcomes:** 69 studies, 30020 participants. Starches, dextrans, albumin or FFP (moderate-certainty evidence), or gelatins (low-certainty evidence) vs. crystalloids has no difference on mortality. Starches slightly increase the need for blood transfusion (moderate-certainty evidence), and albumin or FFP may make little or no difference to the need for renal replacement therapy (low-certainty evidence). Evidence for blood transfusions for dextrans, and albumin or FFP, is uncertain.

### Calculating Acceptable Blood Losses (ABL)

- Blood volume
  - term infant 80 mL/kg
  - adult male 70 mL/kg
  - adult female 60 mL/kg
- Calculate estimated blood volume (EBV) (e.g. in a 70 kg male, approx. 70 mL/kg)
  - EBV = 70 kg x 70 mL/kg = 4900 mL
- Decide on a transfusion trigger, i.e. the Hb level at which you would begin transfusion (e.g. 70 g/L for a person with Hb(initial) = 150 g/L)
  - Hb(final) = 70 g/L
- Calculate
 
$$ABL = \frac{Hb(i) - Hb(f)}{Hb(i)} \times EBV$$

$$= \frac{150 - 70}{150} \times 4900$$

$$= 2613 \text{ mL}$$
- Therefore, in order to keep the Hb level above 70 g/L, RBCs would have to be given after approximately 2.6 L of blood has been lost

### Transfusion Infection Risks

Virus	Risk per 1 unit pRBCs
HIV	1 in 21 million
Hepatitis C virus	1 in 13 million
Hepatitis B virus	1 in 7.5 million
HTLV	1 in 1-1.3 million
Symptomatic Bacterial Sepsis	1 in 40,000 from platelets and 1 in 250,000 from RBC
West Nile virus	No cases since 2003

# Induction

## Routine Induction vs. Rapid Sequence Induction

- routine induction is the standard in general anesthesia; however, an RSI is indicated in patients at risk of regurgitation/aspiration (see *Aspiration, A5*)
- RSI uses
  1. pre-determined doses of induction drugs given in rapid succession to minimize the time patient is at risk for aspiration (e.g. from the time when they are unconscious without an ETT until the time when the ETT is inserted and the cuff inflated)
  2. no bag mask ventilation
  3. cricoid pressure may be applied (although there are some exceptions, e.g. trauma to upper airway)
  4. use of rapid onset muscle relaxant (i.e. SCh)

**Table 7. Comparison of Routine Induction vs. RSI**

Steps	Routine Induction	RSI
Equipment Preparation	Check equipment, drugs, suction, and monitors; prepare an alternative laryngoscope blade and a second ETT tube one size smaller, suction on	
Pre-Oxygenation/ Denitrogenation	100% O <sub>2</sub> for 3 min or 4-8 vital capacity breaths; reduce risk of hypoxemia during apneic period following induction	
Pre-Treatment Agents	Use agent of choice to blunt physiologic responses to airway manipulation 3 min prior to laryngoscopy	Use agent of choice to blunt physiologic responses to airway manipulation; if possible, give 3 min prior to laryngoscopy, but can skip this step in an emergent situation
Induction Agents	Use IV or inhalation induction agent of choice	Use pre-determined dose of fast acting induction agent of choice
Muscle Relaxants	Muscle relaxant of choice given after the onset of the induction agent	Pre-determined dose of fast acting muscle relaxant (SCh or high dose rocuronium) given IMMEDIATELY after induction agent
Ventilation	Bag-mask ventilation	DO NOT bag ventilate – can increase risk of aspiration
Additional Helpful Maneuvers	External Laryngeal Manipulation using Backwards, Upwards, Rightward Pressure (BURP)	Cricoid pressure (Sellick Maneuver) to prevent regurgitation
Intubation	Intubate, inflate cuff, confirm ETT position	Intubate once paralyzed (~45 s after SCh given), inflate cuff, confirm ETT position; cricoid pressure maintained until ETT cuff inflated and placement confirmed
Secure		Secure ETT, and begin manual/machine ventilation

## Induction Agents

- induction of general anesthesia may be achieved with intravenous agents and/or volatile inhalational agents

### Intravenous Agents

- IV induction agents are non-opioid drugs used to provide hypnosis, amnesia, and blunt reflexes to laryngoscopy
- these are initially used to establish the plane of anesthesia rapidly and smoothly
  - most commonly used is propofol or ketamine
  - a continuous propofol infusion may be used as an alternative to inhalational volatile agents during the maintenance phase of general anesthesia. An indication would be malignant hyperthermia

**Table 8. Intravenous Induction Agents**

	Propofol (Diprivan®)	Thiopental (sodium thiopental, sodium thiopentone)*	Ketamine (Ketalar®, Ketaject®)	Benzodiazepines (midazolam (Versed®), diazepam (Valium®), lorazepam (Ativan®))	Etomidate	Methohexital (Brevital®)
<b>Class</b>	Alkylphenol – hypnotic	Short acting thiobarbiturate – hypnotic	Phencyclidine (PCP) derivative – dissociative	Benzodiazepines – anxiolytic	Imidazole derivative - hypnotic	Ultra short-acting barbiturate
<b>Action</b>	Inhibitory at GABA synapse Decreased cerebral metabolic rate and blood flow, decreased ICP, decreased SVR, decreased BP, and decreased SV	Inhibitory at GABA synapse Decreased cerebral metabolic rate and blood flow, decreased CPP, decreased CO, decreased BP, decreased reflex tachycardia, decreased respiration	May act on NMDA (antagonistically), opiate, and other receptors Increased HR, increased BP, increased SVR, increased coronary flow, increased myocardial O <sub>2</sub> uptake CNS and respiratory depression, bronchial smooth muscle relaxation	Inhibitory at GABA synapse Produces anti-anxiety and skeletal muscle relaxant effects Minimal cardiac depression	Decreases concentration of GABA required to activate receptor CNS depression Minimal cardiac or respiratory depression	Binds to the chloride ionophore site of GABA-A receptor
<b>Indications</b>	Induction Maintenance Total intravenous anesthesia (TIVA)	Induction Control of convulsive states, obstetric patients	Induction when sympathetic stimulation required (e.g. major trauma, hypovolemia), IM induction in children/uncooperative adults (i.e. when there is lack of IV access), severe asthma because sympathomimetic	Used for sedation, amnesia, and anxiety	Induction Poor cardiac function, severe valve lesions, uncontrolled hypertension	Procedural induction Electroconvulsive therapy (ECT)

\*As of 2011, Thiopental has been discontinued from production for North America

### Rocuronium vs. Succinylcholine for Rapid Sequence Induction Intubation

Cochrane DB Syst Rev 2015; CD002788

**Purpose:** Whether rocuronium creates intubating conditions comparable to those of succinylcholine during RSI intubations.

**Methods:** Systematic review of RCTs or CCTs with a dose of at least 0.6 mg/kg for rocuronium and 1 mg/kg for succinylcholine.

**Results:** 50 trials, 4151 participants. Succinylcholine was superior to rocuronium for achieving excellent intubating conditions (RR 0.66, 95% CI 0.41-0.92) and clinically acceptable intubating conditions (RR 0.97, 95% CI 0.85-0.99).

**Conclusion:** Succinylcholine created superior intubation conditions to rocuronium in achieving excellent and clinically acceptable intubating conditions.

**Figure 11. Solubility of volatile anesthetics in blood**

### Effects of Cricoid Pressure Compared with a Sham Procedure in the Rapid Sequence Induction of Anesthesia: The Iris Randomized Clinical Trial

JAMA Surg 2019; 154(1):9-17

**Purpose:** To determine if cricoid pressure impacts pulmonary aspiration in people undergoing rapid sequence induction (RSI) of anesthesia.

**Methods:** Randomized and double-blind trial to assess 3472 patients undergoing rapid sequence induction of anesthesia at 10 academic centers.

**Results:** Results demonstrated that patients undergoing anesthesia using RSI experience increased prevention of pulmonary aspiration using cricoid pressure when compared to the sham condition.

**Conclusion:** This study provides evidence to show the benefit of cricoid pressure in RSI and found that it is superior to the sham procedure in preventing aspiration.

Table 8. Intravenous Induction Agents

	Propofol (Diprivan®)	Thiopental (sodium thiopental, sodium thiopentone)*	Ketamine (Ketalar®, Ketaject®)	Benzodiazepines (midazolam [Versed®], diazepam [Valium®], lorazepam [Ativan®])	Etomidate	Methohexital (Brevital®)
<b>Caution</b>	Patients who cannot tolerate sudden decreased BP (e.g. fixed cardiac output or shock)	Allergy to barbiturates Uncontrolled hypotension, shock, cardiac failure Porphyria, liver disease, status asthmaticus, myxedema	Ketamine allergy TCA medication (interaction causes HTN and dysrhythmias) History of psychosis Patients who cannot tolerate HTN (e.g. CHF, increased ICP, aneurysm)	Marked respiratory depression	Postoperative nausea and vomiting Venous irritation	Contraindicated in acute intermittent porphyria
<b>Dosing</b>	IV induction: 1.5-2.5 mg/kg (less with opioids) Unconscious <1 min Lasts 4-6 min t <sub>1/2</sub> = 55 min Decreased postoperative sedation, recovery time, NIV	IV induction: 3-5 mg/kg Unconscious about 30 s Lasts 5 min Accumulation with repeat dosing – not for maintenance t <sub>1/2</sub> = 5-10 h Postoperative sedation lasts hours	IV induction 1-2 mg/kg Dissociation in 15 s, analgesia, amnesia, and unconsciousness in 45-60 s Unconscious for 10-15 min, analgesia for 40 min, amnesia for 1-2 h t <sub>1/2</sub> = 3 h	Onset <5 min if given IV Duration of action long but variable/somewhat unpredictable	IV induction 0.3 mg/kg Onset 30-60 s Lasts 4-8 min	IV induction 1 to 1.5 mg/kg of a 1% solution; doses must be titrated to effect
<b>Special Considerations</b>	-30% decreased BP due to vasodilation Reduce burning at IV site by mixing with lidocaine	Combining with rocuronium causes precipitates to form	High incidence of emergence reactions (vivid dreaming, out-of-body sensation, illusions) Pretreat with glycopyrrolate to decrease salivation	Antagonist: flumazenil (Anexate®) competitive inhibitor, 0.2 mg IV over 15 s, repeat with 0.1 mg/min (max of 2 mg), t <sub>1/2</sub> of 60 min Midazolam also has amnestic (antegrade) effect and decreased risk of thrombophlebitis	Adrenal suppression after first dose, cannot repeat dose or use as infusion Myoclonic movements during induction	

\*As of 2011, Thiopental has been discontinued from production for North America

### Volatile Inhalational Agents

- e.g. sevoflurane, desflurane, isoflurane, enflurane, halothane, and nitrous oxide

Table 9. Volatile Inhalational Agents

	Sevoflurane	Desflurane*	Isoflurane**	Enflurane	Halothane	Nitrous oxide (N <sub>2</sub> O)***
<b>MAC</b> (% gas in O <sub>2</sub> )	2.0	6.0	1.2	1.7	0.8	104
<b>CNS</b>	Increased ICP	Increased ICP	Decreased cerebral metabolic rate Increased ICP	ECG seizure-like activity Increased ICP	Increased ICP and cerebral blood flow	—
<b>Resp</b>	Respiratory depression (severely decreased TV, increased RR), decreased response to respiratory CO <sub>2</sub> reflexes, bronchodilation					—
<b>CVS</b>	Less decrease of contractility, stable HR	Tachycardia with rapid increase in concentration	Decreased BP and CO, increased HR, theoretical chance of coronary steal**	Stable HR, decreased contractility	Decreased BP, CO, HR, and conduction Sensitizes myocardium to epinephrine-induced arrhythmias	Can cause decreased HR in paediatric patients with existing heart disease
<b>MSK</b>	Muscle relaxation, potentiation of other muscle relaxants, uterine relaxation					

\*Airway irritant; desflurane can provoke breath holding, laryngospasm, and salivation, so it is not used for inhalational induction

\*\*Coronary steal: Isoflurane causes small vessel dilation which may compromise blood flow to areas of the heart with fixed perfusion (e.g. stents, atherosclerosis)

\*\*\*Properties and Adverse Effects of N<sub>2</sub>O

Due to its high MAC, N<sub>2</sub>O is combined with other anesthetic gases to attain surgical anesthesia. A MAC of 104% is possible in a pressurized chamber only

Second Gas Effect

Expansion of closed spaces: closed spaces such as a pneumothorax, the middle ear, bowel lumen, and ETT cuff will markedly enlarge if N<sub>2</sub>O is administered

Diffusion hypoxia: during anesthesia, the washout of N<sub>2</sub>O from body stores into alveoli can dilute the alveolar O<sub>2</sub>, creating a hypoxic mixture if the original O<sub>2</sub> is low

### Minimum Alveolar Concentration

- minimum alveolar concentration (MAC) is the alveolar concentration of a volatile anesthetic at one atmosphere (atm) of pressure that will prevent movement in 50% of patients in response to a surgical stimulus (e.g. abdominal incision)
- potency of inhalational agents is compared using MAC
- MAC of halogenated volatile anesthetics decreases by approximately 6% per additional decade of age in adults
- 1.2-1.3 times MAC will often ablate response to stimuli in the general population
- MAC values are roughly additive when mixing N<sub>2</sub>O with another volatile agent; however, this only applies to movement, not other effects such as BP changes (e.g. 0.5 MAC of a potent agent + 0.5 MAC of N<sub>2</sub>O = 1 MAC of potent agent)
- MAC-intubation: the MAC of anesthetic that will inhibit movement and coughing during endotracheal intubation; generally 1.3 MAC
- MAC-block adrenergic response (MAC-BAR): the MAC necessary to blunt the sympathetic response to noxious stimuli; generally 1.5 MAC
- MAC-awake: the MAC of a given volatile anesthetic at which a patient will open their eyes to command; generally 0.3-0.4 of the usual MAC

See Landmark Anesthesiology Trials table for more information on MYRIAD trial, which details the impact of volatile anesthetics vs. total intravenous anesthesia in patients undergoing CABG.

**Factors increasing MAC:** chronic alcohol use, hyperthyroidism, hyperthermia, acute amphetamine use, cannabinoids, young age  
**Factors decreasing MAC:** acute alcohol intoxication, hypothermia, sedating drugs, advanced age, chronic amphetamine use, drugs (opioids, benzodiazepines), α<sub>2</sub> adrenergic agonists, nitrous oxide, IV anesthetics, shock

## Muscle Relaxants and Reversing Agents

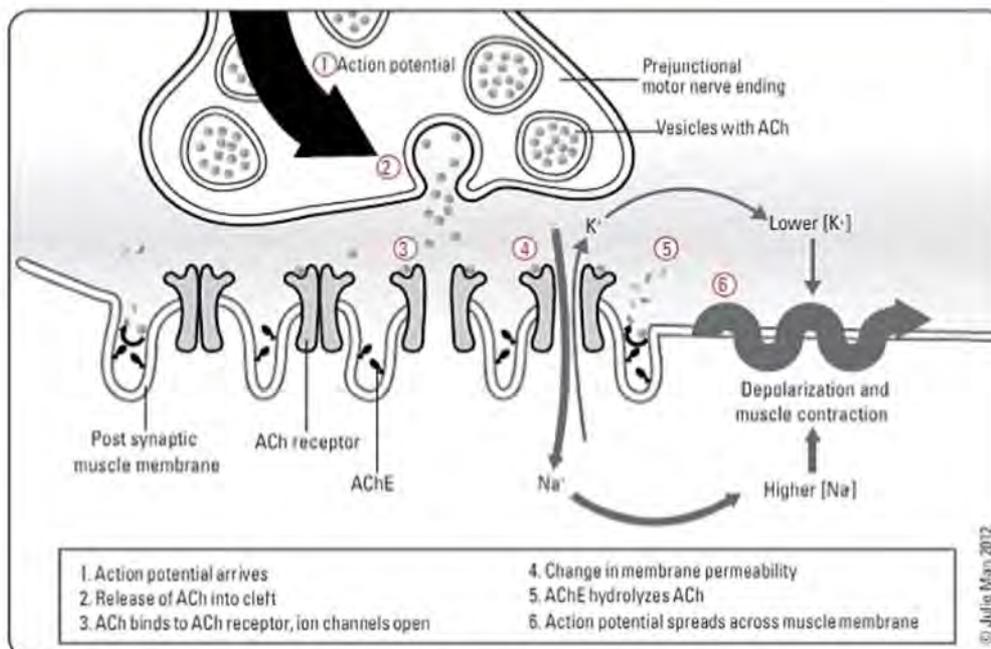

Figure 12. Review of anatomy and physiology of the neuromuscular junction (NMJ)

### Muscle Relaxants

- two types of muscle relaxants
  1. depolarizing muscle relaxants: SCh
  2. non-depolarizing muscle relaxants: rocuronium, mivacurium, vecuronium, cisatracurium, pancuronium
- block nicotinic cholinergic receptors in NMJ
- provides skeletal muscle paralysis, including the diaphragm, but spares involuntary muscles such as the heart and smooth muscle
- never use muscle relaxants without adequate preparation and equipment to maintain airway and ventilation
- muscle relaxation produces the following desired effects:
  1. facilitates intubation
  2. assists with mechanical ventilation
  3. prevents muscle stretch reflex and decreases muscle tone
  4. allows access to the surgical field (intracavity surgery)
- nerve stimulator (i.e. train of four) is used intraoperatively to assess the degree of nerve block; no twitch response seen with complete neuromuscular blockade

### Pseudocholinesterase

Pseudocholinesterase is produced by the liver and metabolizes SCh and mivacurium. A prolonged duration of block ade by SCh occurs with:

- (a) decreased quantity of plasma cholinesterase (e.g. congenital (hereditary), liver disease, pregnancy, malignancy, malnutrition, collagen vascular disease, hypothyroidism)
- (b) abnormal quality of plasma cholinesterase (e.g. normal levels but impaired activity of enzymes, genetically inherited)

**Table 10. Depolarizing Muscle Relaxants (Non-Competitive): Succinylcholine (SCh)**

<b>Mechanism of Action</b>	Mimics ACh and binds to ACh receptors causing prolonged depolarization; initial fasciculation may be seen, followed by temporary paralysis secondary to blocked ACh receptors by SCh
<b>Intubating Dose (mg/kg)</b>	1-1.5
<b>Onset</b>	30-60 s – rapid (fastest of all muscle relaxants)
<b>Duration</b>	3-5 min – short (no reversing agent for SCh)
<b>Metabolism</b>	SCh is hydrolyzed by plasma cholinesterase (i.e. pseudocholinesterase), found only in plasma and not at the NMJ
<b>Indications</b>	Assist intubation Increased risk of aspiration (e.g. full stomach, hiatus hernia, obesity, pregnancy, trauma); need rapid paralysis and airway control) Short procedures ECT Laryngospasm
<b>Side Effects</b>	1. SCh also stimulates muscarinic cholinergic autonomic receptors (in addition to nicotinic receptors; may cause bradycardia, dysrhythmias, sinus arrest, increased secretions of salivary glands (especially in children)) 2. Hyperkalemia Disruption of motor nerve activity causes proliferation of extrajunctional (outside NMJ) cholinergic receptors Depolarization of an increased number of receptors by SCh may lead to massive release of potassium out of muscle cells Patients at risk 3rd degree burns 24 h-6 mo after injury Traumatic paralysis or neuromuscular diseases (e.g. muscular dystrophy) Severe intra-abdominal infections Severe closed head injury Upper motor neuron lesions 3. Can trigger MH (see <i>Malignant Hyperthermia, A29</i> ) 4. Increased ICP/intraocular pressure/intra-gastric pressure (no increased risk of aspiration if competent LES) 5. Fasciculations, postoperative myalgia – may be minimized if small dose of non-depolarizing agent given before SCh administration
<b>Contraindications</b>	
<b>Absolute</b>	Known hypersensitivity or allergy, positive history of MH, myotonia (m. congenita, m. dystrophica, paramyotonia congenita), high-risk for hyperkalemic response
<b>Relative</b>	Known history of plasma cholinesterase deficiency, myasthenia gravis, myasthenic syndrome, familial periodic paralysis, open eye injury

**Table 11. Non-Depolarizing Muscle Relaxants (Competitive)**

<b>Mechanism of Action</b>	Competitive blockade of postsynaptic ACh receptors preventing depolarization				
<b>Classification</b>	<b>Short</b>		<b>Intermediate</b>		<b>Long</b>
	Mivacurium	Rocuronium	Vecuronium	Cisatracurium	Pancuronium
<b>Intubating Dose (mg/kg)</b>	0.2	0.6-1.0	0.1	0.2	0.1
<b>Onset (min)</b>	2-3	1.5	2-3	3	3-5
<b>Duration (min)</b>	15-25	30-45	45-60	40-60	90-120
<b>Metabolism</b>	Plasma cholinesterase	Liver (major) Renal (minor)	Liver	Hofmann Elimination	Renal (major) Liver (minor)
<b>Intubating Dose (mg/kg)</b>	0.2	0.6-1.0	0.1	0.2	0.1
<b>Indications</b>	Assist intubation, assist mechanical ventilation in some ICU patients, reduce fasciculations, and postoperative myalgias secondary to SCh				
<b>Side Effects</b>					
<b>Histamine Release</b>	Yes	No	No	No	No
<b>Other</b>	–	–	–	–	Tachycardia
<b>Considerations</b>	Increased duration of action in renal or liver failure	Quick onset of rocuronium allows its use in rapid sequence induction		Cisatracurium is good for patients with renal or hepatic insufficiency	Pancuronium if increased HR and BP desired

**Reversal Agents**

- sugammadex is a selective relaxant binding agent and can be administered immediately after dose of NMDR
- neostigmine, pyridostigmine, and edrophonium are acetylcholinesterase inhibitors - these are competitive inhibitors and therefore can only be administered when there has been some recovery of blockade (i.e. train of four muscle response to stimulation)
- can only reverse the effect of non-depolarizing muscle relaxants
- anticholinergic agents (e.g. atropine, glycopyrrolate) are simultaneously administered to minimize muscarinic effect of reversal agents (i.e. bradycardia, salivation, increased peristalsis, and bronchoconstriction)

**Table 12. Reversal Agents for Non-Depolarizing Relaxants**

Agent	Pyridostigmine	Neostigmine	Edrophonium	Sugammadex
Onset	Slow	Intermediate	Intermediate	Fast
Mechanism of Action	AChE; inhibit enzymatic degradation of ACh, increase ACh at nicotinic and muscarinic receptors, displace non-depolarizing muscle relaxants Muscarinic effects of reversing agents include unwanted bradycardia, salivation, and increased bowel peristalsis*			Encapsulates and inactivates rocuronium and vecuronium → • amount of agent available to bind to receptors in NMJ
Dose (mg/kg)	0.1-0.4	0.04-0.08	0.5-1	2-16
Recommended Anticholinergic	Glycopyrrolate	Glycopyrrolate	Atropine	N/A
Dose of Anticholinergic (per mg)	0.05 mg	0.2 mg	0.014 mg	N/A

\*Atropine and glycopyrrolate are anticholinergic agents administered to minimize muscarinic effects of reversal agents

### Analgesia

- options include opioids (e.g. morphine, fentanyl, hydromorphone), NSAIDs/COX-2- inhibitors, acetaminophen, ketamine, gabapentinoids, and local and regional anesthetics (see *Table 15, A25*)

## Maintenance

- general anesthesia is maintained using volatile inhalation agents and/or IV agents (i.e. propofol infusion)
- analgesia (usually IV opioids)
  - ± muscle relaxants given as needed

## Extubation

- criteria: patient must no longer have intubation requirements
  - patency: airway must be patent
  - protection: airway reflexes intact
  - patient must be oxygenating and ventilating spontaneously
- general guidelines
  - ensure patient has normal neuromuscular function (peripheral nerve stimulator monitoring) and hemodynamic status
  - ensure patient is breathing spontaneously with adequate rate and tidal volume
  - allow ventilation (spontaneous or controlled) with 100% O<sub>2</sub> for 3-5 min
  - suction secretions from pharynx, deflate cuff, remove ETT on inspiration (vocal cords abducted)
  - ensure patient is breathing adequately after extubation
  - ensure face mask for O<sub>2</sub> delivery available
  - proper positioning of patient during transfer to recovery room (supine, head elevated)

## Complications of Extubation

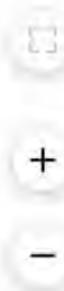

- early extubation: aspiration, laryngospasm
- late extubation: transient vocal cord incompetence, edema (glottic, subglottic), pharyngitis, tracheitis

### Laryngospasm

- defined as forceful involuntary spasm of laryngeal muscles caused by stimulation of superior laryngeal nerve (by oropharyngeal secretions, blood, early extubation)
- causes partial or total airway obstruction
- more likely to occur in semi-conscious patients
- prevention: extubate while patient is still deeply under anesthesia or fully awake
- treatment: suction, remove oral airway/LMA, apply sustained positive pressure (CPAP) with anesthetic reservoir bag and partial closure of APL valve BMV with 100% O<sub>2</sub>, low-dose propofol (0.5-1.0 mg/kg) optional, low-dose SCH (approximately 0.25 mg/kg), and re-intubate if hypoxia develops

See Landmark Anesthesiology Trials table for more information on results from the ENGAGES trial, which details the efficacy of using EEG guided anesthetic administration in patients with postoperative delirium.

## Regional Anesthesia

- local anesthetic applied around a peripheral nerve at any point along the length of the nerve (from spinal cord up to, but not including, the nerve endings) for the purpose of reducing or preventing impulse transmission
- no CNS depression (unless overdose of LA); patient remains conscious
- regional anesthetic techniques categorized as follows:
  - epidural and spinal anesthesia (neuraxial anesthesia)
  - peripheral nerve blocks
  - IV regional anesthesia (e.g. Bier block)

### Patient Preparation

- sedation and/or anxiolysis may be indicated before block
- monitoring should be as extensive as for GA

## Epidural and Spinal Anesthesia

- most common for surgeries performed below the level of umbilicus but can be extended to any level (useful in thoracic, abdominal, and lower extremity surgeries). Typically placed in thoracic or lumbar spine

### Anatomy of Spinal/Epidural Area

- spinal cord extends to L1; dural sac to S2 in adults
- nerve roots (cauda equina) from L2 to S2
- needle inserted below L2 should not encounter cord, thus L3-L4, L4-L5 interspace commonly used
- structures penetrated (outside to inside)
  - skin
  - subcutaneous fat
  - supraspinous ligament
  - interspinous ligament
  - ligamentum flavum (last layer before epidural space)
  - dura + arachnoid for spinal anesthesia

Table 13. Epidural vs. Spinal Anesthesia

	Epidural	Spinal
<b>Deposition Site</b>	LA injected in epidural space (space between ligamentum flavum and dura) Initial blockade is at the spinal roots followed by some degree of spinal cord anesthesia as LA diffuses into the subarachnoid space through the dura	LA injected into subarachnoid space in the dural sac surrounding the spinal cord and nerve roots
<b>Onset</b>	Significant blockade requires 10-15 min Slower onset of side effects	Rapid blockade (onset in 2-5 min)
<b>Effectiveness</b>	Effectiveness of blockade can be variable	Very effective blockade
<b>Difficulty</b>	Technically more difficult; greater failure rate	Easier to perform due to visual confirmation of CSF flow
<b>Patient Positioning Post-injection</b>	Position of patient not as important; specific gravity not an issue	Hyperbaric LA solution – position of patient important
<b>Specific Gravity/Spread</b>	Epidural injections spread throughout the potential space; specific gravity of solution does not affect spread	LA solution may be made hyperbaric (of greater specific gravity than the CSF by mixing with 10% dextrose, thus increasing spread of LA to the dependent (low) areas of the subarachnoid space)
<b>Dosage</b>	Larger volume/dose of LA (usually > toxic IV dose)	Smaller dose of LA required (usually < toxic IV dose)
<b>Continuous Infusion</b>	Use of catheter allows for continuous infusion or repeat injections	None
<b>Complications</b>	Failure of technique Hypotension Bradycardia if cardiac sympathetics blocked (only if ~T4 block), e.g. "high block" Epidural or subarachnoid hematoma Accidental subarachnoid injection can produce spinal anesthesia (and any of the above complications) Systemic toxicity of LA (accidental intravenous) Catheter complications (shearing, kinking, vascular, or subarachnoid placement) Infection Post-dural puncture	Failure of technique Hypotension Bradycardia if cardiac sympathetics blocked (only if ~T4 block), e.g. "high spinal" Epidural or subarachnoid hematoma Post-spinal headache (CSF leak) Transient paresthesias Spinal cord trauma Infection
<b>Combined Spinal-Epidural</b>	Combines the benefits of rapid, reliable, intense blockade of spinal anesthesia together with the flexibility of an epidural catheter	

### Benefits of Regional Anesthesia

- Reduced perioperative pulmonary complications
- Reduced perioperative analgesia requirements
- Decreased PONV
- Ability to monitor CNS status during procedure
- Improved perfusion
- Lower incidence of VTE
- Shorter recovery and improved rehabilitation
- Pain blockade with preserved motor function

### Landmarking Epidural/Spinal Anesthesia

- Spinous processes should be maximally flexed
- L4 spinous processes found between iliac crests
- T7 landmark at the tip of the scapula

### Classic Presentation of Dural Puncture Headache

- Onset 6 h-3 d after dural puncture
- Postural component (worse when sitting)
- Occipital or frontal localization
- ± tinnitus, diplopia

### Effect of Anaesthesia Type on Postoperative Mortality and Morbidities: A Matched Analysis of the NSQIP Database

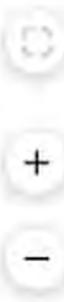

Br J Anaesth 2017;118:105-111

**Purpose:** Determine the effects of RA vs. GA on postoperative survival and morbidities.

**Methods:** Matched surgical procedures and type of anesthesia using the US National Surgical Quality Improvement database. Primary outcome was 30 d postoperative mortality and secondary outcomes were hospital length of stay and postoperative organ system dysfunction.

**Results:** There was no difference in 30 d mortality. RA was significantly associated with increased likelihood of early discharge (HR 1.09; P < 0.001). There were lower odds of intraoperative complications (4%), respiratory complications (24%), DVT (16%), and any one postoperative complication (15%) (OR 0.85; P < 0.001).

**Conclusion:** RA was associated with significantly lower odds of several postoperative complications, decreased hospital length of stay, but not mortality when compared with GA.

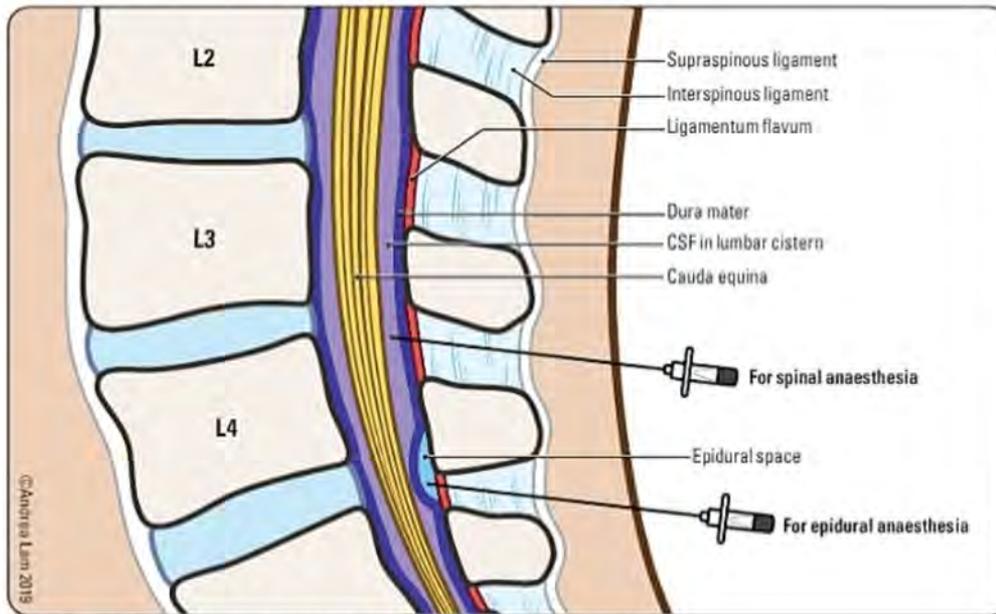

Figure 14. Sagittal cross-section of the anatomy of neuraxial anesthesia

#### Contraindications to Spinal/Epidural Anesthesia

- absolute contraindications
  - lack of resuscitative drugs/equipment
  - patient refusal
  - allergy to local anesthetic
  - infection at puncture site or underlying tissues
  - coagulopathies/bleeding diathesis
  - raised ICP
  - sepsis/bacteremia
  - severe hypovolemia
  - cardiac lesion with fixed output states (e.g. severe mitral/aortic stenosis)
  - lack of IV access
- relative contraindications
  - pre-existing neurological disease (e.g. demyelinating lesions)
  - previous spinal surgery; severe spinal deformity
  - prolonged surgery
  - major blood loss or maneuvers that can compromise reaction

### Peripheral Nerve Blocks

- deposition of LA around the target nerve or plexus
- ultrasound guidance and peripheral nerve stimulation (needle will stimulate target nerve/plexus) may be used to guide needle to target nerve while avoiding neural trauma or intraneural injection
- most major nerves or nerve plexuses can be targeted (e.g. brachial plexus block, femoral nerve block, sciatic nerve block)
- performed with standard monitors
- approximately 2-4 per 10000 risk of late neurologic injury
- resuscitation equipment must be available

#### Contraindications to Peripheral Nerve Blockade

- absolute contraindications
  - allergy to LA
  - patient refusal
- relative contraindications
  - certain types of pre-existing neurological dysfunction (e.g. ALS, MS, diabetic neuropathy)
  - local infection at block site
  - bleeding disorder

## Local Anesthesia

### Local Anesthetic Agents

- see Table 14, A23, for list of LA agents

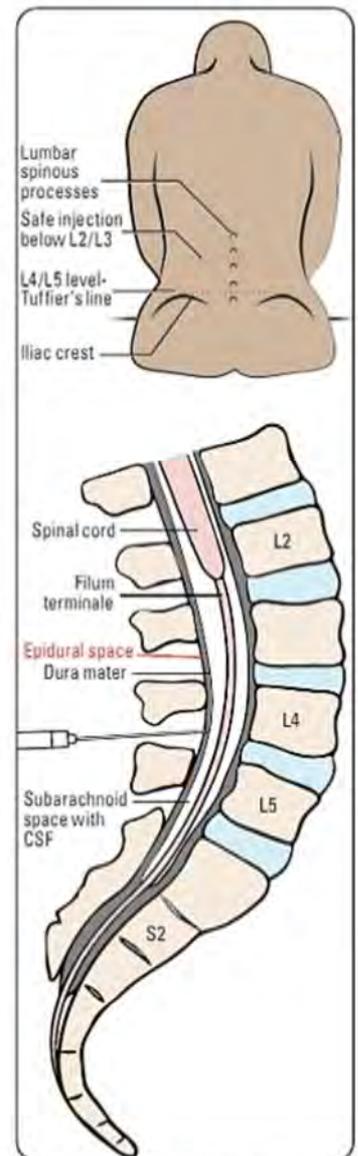

Figure 13. Landmarks for placement of epidural/spinal anesthesia

### Definition and Mode of Action

- LA are drugs that block the generation and propagation of impulses in excitable tissues: nerves, skeletal muscle, cardiac muscle, brain
- LA bind to receptors on the cytosolic side of the Na<sup>+</sup> channels, inhibiting Na<sup>+</sup> flux and thus blocking impulse conduction
- different types of nerve fibres undergo blockade at different rates

### Absorption, Distribution, and Metabolism

- LA readily crosses the BBB once absorbed into the bloodstream
- ester-type LA (e.g. procaine, tetracaine) are broken down by plasma and hepatic esterases; metabolites excreted via kidneys
- amide-type LA (e.g. lidocaine, bupivacaine) are broken down by hepatic mixed-function oxidases (P450 system); metabolites excreted via kidneys

### Selection of LA

- choice of LA depends on:
  - onset of action: influenced by pKa (the lower the pKa, the higher the concentration of the base form of the LA, and the faster the onset of action)
  - duration of desired effects: influenced by protein binding (longer duration of action when protein binding of LA is strong)
  - potency: influenced by lipid solubility (agents with high lipid solubility penetrate the nerve membrane more easily)
  - unique needs (e.g. sensory blockade with relative preservation of motor function by bupivacaine at low doses)
  - potential for toxicity

Table 14. Local Anesthetic Agents

	Maximum Dose (mg/kg)	Maximum Dose with Epinephrine (mg/kg)	Potency	Duration	Onset
chloroprocaine	11	14	Low	15-30 min	Fast
lidocaine	5	7	Medium	1-2 h	Fast
mepivacaine	5	7	Medium	3-6 h	Fast
bupivacaine	2.5	3	High	3-8 h	Slow
ropivacaine	2.5	3	High	2-8 h	Medium

## Systemic Toxicity

- see Table 14 for maximum doses, potency, and duration of action for common LA agents
- occurs by accidental intravascular injection, LA overdose, or unexpectedly rapid absorption

### CNS Effects

- CNS effects first appear to be excitatory due to initial block of inhibitory fibres, followed by subsequent blockade of excitatory fibres
- effects in order of appearance
  - numbness of tongue, perioral tingling, metallic taste
  - disorientation, drowsiness
  - tinnitus
  - visual disturbances
  - muscle twitching, tremors
  - unconsciousness
  - convulsions, seizures
  - generalized CNS depression, coma, respiratory arrest

### CVS Effects

- vasodilation, hypotension
- decreased myocardial contractility
- dose-dependent delay in cardiac impulse transmission
  - prolonged PR, QRS intervals
  - sinus bradycardia
- CVS collapse

### Treatment of Systemic Toxicity

- early recognition of signs; get help
- 100% O<sub>2</sub>, manage ABCs
- diazepam or other anticonvulsant to prevent potential onset of seizures
- manage arrhythmias
- Intralipid® 20% to bind local anesthetic in circulation

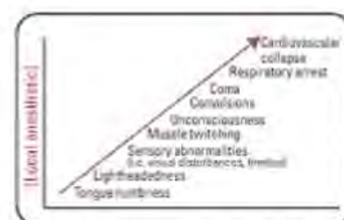

Figure 15. Local anesthetic systemic toxicity

## Local Infiltration and Hematoma Blocks

### Local Infiltration

- injection of tissue with LA, producing a lack of sensation in the infiltrated area due to LA acting on nerves
- suitable for small incisions, suturing, and excising small lesions
- can use fairly large volumes of dilute LA to infiltrate a large area
- low concentrations of epinephrine (1:100000-1:200000) cause vasoconstriction, thus reducing bleeding and prolonging the effects of LA by reducing systemic absorption

### Fracture Hematoma Block

- special type of local infiltration for pain control during manipulation of certain fractures
- hematoma created by fracture is infiltrated with LA to anesthetize surrounding tissues
- sensory blockade may only be partial
- no muscle relaxation

## Topical Anesthetics

- various preparations of LAs available for topical use, which may be a mixture of agents (e.g. EMLA cream is a combination of 2.5% lidocaine and prilocaine)
- must be able to penetrate the skin or mucous membrane

## Postoperative Care

- pain management should be continuous from OR to PACU to hospital ward and home

## Common Postoperative Anesthetic Complications

### Uncontrolled/Poorly Controlled Pain

- See below

### Nausea and Vomiting

- hypotension and bradycardia must be ruled out
- pain and surgical manipulation also cause nausea
- often treated with dimenhydrinate (Gravol<sup>®</sup>), ondansetron (Zofran<sup>®</sup>), granisetron (Kytril<sup>®</sup>), dexamethasone (Decadron<sup>®</sup>), metoclopramide (Maxeran<sup>®</sup>; not with bowel obstruction), prochlorperazine (Stemetil<sup>®</sup>)

### Confusion and Agitation

- ABCs first – confusion or agitation can be caused by airway obstruction, hypercapnia, hypoxemia
- neurologic status (Glasgow Coma Scale, pupils), residual paralysis from anesthetic
- pain, distended bowel/bladder
- fear/anxiety/separation from caregivers, language barriers
- metabolic disturbance (e.g. hypoglycemia, hypercalcemia, hyponatremia – especially post-TURP)
- intracranial cause (e.g. stroke, raised ICP)
- drug effect (e.g. ketamine, anticholinergics, serotonin, benzodiazepines, opioids)
- elderly patients are more susceptible to postoperative delirium

### Respiratory Complications

- susceptible to aspiration of gastric contents due to PONV and unreliable airway reflexes
- airway obstruction (secondary to reduced muscle tone from residual anesthetic, soft tissue trauma and edema, or pooled secretions) may lead to inadequate ventilation, hypoxemia, and hypercapnia
- airway obstruction can often be relieved with head tilt, jaw elevation, and anterior displacement of the mandible. If the obstruction is not reversible, a nasal or oral airway may be used

### Hypotension

- must be identified and treated quickly to prevent inadequate perfusion and ischemic damage
- reduced cardiac output (the most common cause is hypovolemia) and/or peripheral vasodilation (e.g. residual anesthetic agent)
- first step in treatment is usually the administration of fluids ± inotropic agents

### Hypertension

- pain, hypercapnia, hypoxemia, increased intravascular fluid volume, and sympathomimetic drugs can cause hypertension
- IV nitroglycerin, hydralazine, calcium channel blockers, or  $\beta$ -blocking drugs (e.g. esmolol and metoprolol) can be used to treat hypertension

### Local Anesthetics and Regional Anaesthesia vs. Conventional Analgesia for Preventing Persistent Postoperative Pain in Adults and Children

Cochrane DB Syst Rev 2018;6:CD007105

**Purpose:** Compare LA and RA vs. conventional anesthesia for the prevention of persistent postoperative pain (PPP) beyond 3 mo.

**Methods:** Searched CENTRAL, MEDLINE, and Embase to December 2016. RCTs comparing RA vs. conventional anesthesia were included.

**Results:** Total 63 RCTs included. Data on RA for the prevention of PPP beyond 3 mo after surgery from 39 studies, enrolling a total of 3027 participants in inclusive analysis. Moderate quality evidence favoring RA over conventional for thoracotomy, C-section (OR 0.52 and OR 0.46 respectively). Moderate quality evidence showing the infusion of IV LA for the prevention of PPP 3-6 mo after breast cancer surgery with an OR of 0.24. Low quality evidence in RA for the prevention of PPP 3-12 mo after breast cancer surgery with an OR of 0.43.

**Conclusions:** There is moderate-quality evidence that RA may reduce the risk of developing PPP after 3-18 mo after thoracotomy and 3-12 mo after caesarean section. Further studies including larger populations are needed.

### Risk Factors for PONV

- Young age\*
- Female\*
- History of PONV\*
- Non-smoker\*
- Type of surgery: ophtho, ENT, abdo/pelvic, plastics
- Type of anesthetic: N<sub>2</sub>O, opioids, volatile agents

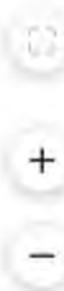

\*These factors refer to the Apfel tool for PONV risk stratification and management

See Landmark Anesthesiology Trials table for more information on results from the IMPACT trial which compares the efficacy of six well-established prophylactic antiemetic interventions in patients scheduled to undergo elective surgery during general anesthesia at high risk for postoperative nausea and vomiting.

See Landmark Anesthesiology Trials table for more information on results from the DREAMS trial, which details the effect of preoperative dexamethasone administration in patients with postoperative vomiting.

# Pain Management

## Definitions

- pain: an unpleasant sensory and emotional experience associated with, or resembling that associated with, actual or potential tissue damage (International Association for the Study of Pain (IASP); definition updated in 2020)
- nociception: detection, transduction, and transmission of noxious stimuli

## Pain Classifications

- temporal: acute vs. chronic
- mechanism: nociceptive vs. neuropathic

## Acute Pain

- pain of short duration (<6 wk) usually associated with surgery, trauma, or acute illness; often associated with inflammation
- usually limited to the area of damage/trauma and resolves with healing

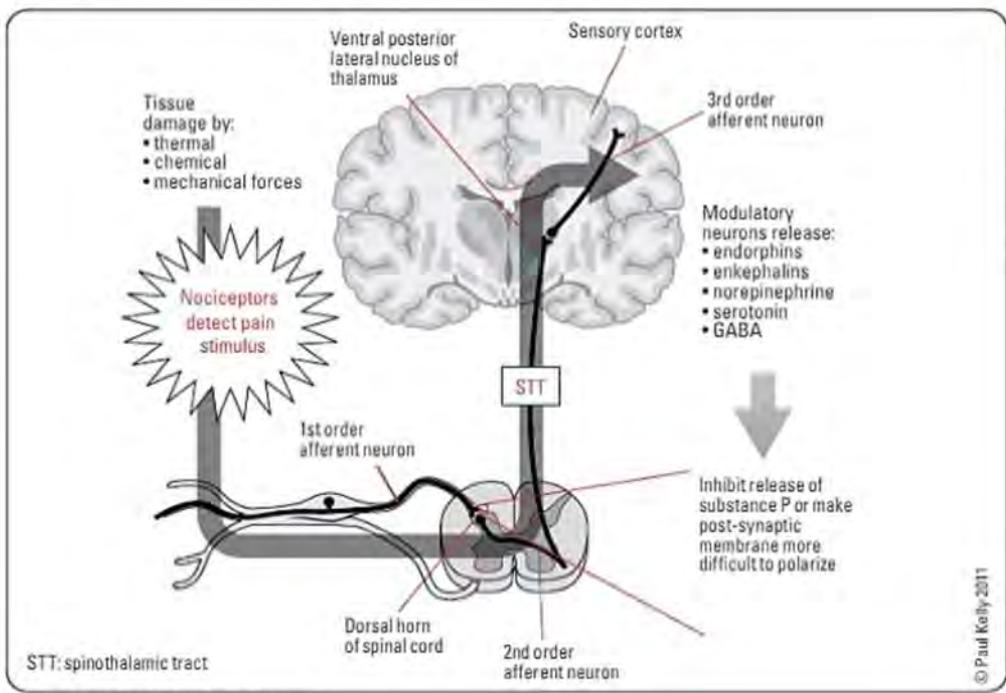

Figure 16. Acute pain mechanism

## Pharmacological Management of Acute Pain

- ask the patient to rate the pain out of 10 or use visual analog scale to determine severity
- pharmacological treatment guided by WHO analgesia ladder (Figure 17)

Table 15. Commonly Used Analgesics

	Acetaminophen	NSAIDs	Opioids
<b>Examples</b>	Tylenol®	Aspirin®, ibuprofen, naproxen, ketorolac (IV)	Oral: codeine, oxycodone, morphine, hydromorphone Parenteral: morphine, hydromorphone, fentanyl
<b>Indications</b>	First-line for mild acute pain	Mild-moderate pain	Oral: moderate acute pain Parenteral: moderate-severe acute pain
<b>Mechanism of Action</b>	Unclear, hypothesized cyclooxygenase-2 (COX-2) inhibition Unclear, hypothesized modulation of endogenous cannabinoid system	Non-selective COX-1 and -2 inhibition reducing proinflammatory prostaglandin synthesis	Dampens nociceptive transmission between 1st and 2nd order neurons in the dorsal horn Activates ascending modulatory pathways resulting in release of inhibitory neurotransmitters Inhibits peripheral inflammatory response and hyperalgesia Affects mood and anxiety – alleviates the affective component of perceived pain
<b>Dosing/ Administration</b>	Limited by analgesic ceiling beyond which there is no additional analgesia Opioid-sparing Max dose of 4 g/24 h	Limited by analgesic ceiling beyond which there is no additional analgesia Opioid-sparing Significant inter-individual variation in efficacy	No analgesic ceiling (except for codeine) Can be administered intrathecally (e.g. spinal block) or by continuous infusion Consider breakthrough dose and/or co-administration with anti-emetics, laxatives

See Landmark Anesthesiology Trials table for more information on study by HJ Shin et al. 2019, which highlights differences in postoperative analgesic effect of intraoperative sedation with dexmedetomidine (DEX) vs. propofol.

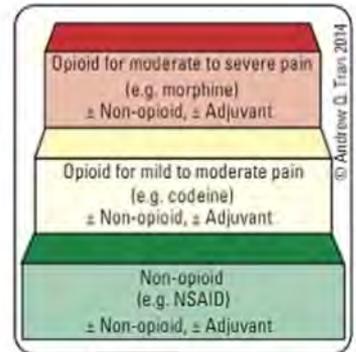

Figure 17. WHO analgesia ladder

### Cautionary Use of NSAIDs in Patients with:

- Asthma
- Coagulopathy
- GI ulcers
- Renal insufficiency
- Pregnancy, 3rd trimester

Table 15. Commonly Used Analgesics

	Acetaminophen	NSAIDs	Opioids
Side Effects/ Toxicity	Considered relatively safe Liver toxicity in elevated doses	Gastric ulceration/bleeding Decreased renal perfusion Photosensitivity Premature closure of the ductus arteriosus in pregnancy	Respiratory depression Constipation and abdominal pain Urinary retention Sedation N/V Pruritus Confusion (particularly in the elderly) Dependence

Table 16. Opioids

Agent	Relative Dose to 10 mg Morphine IV	Moderate Dose	Onset	Duration	Special Considerations
Codeine	100 mg IV 200 mg PO	15-30 mg PO	Late (30-60 min)	Moderate (4-6 h)	Primarily postoperative use, not for IV use Not ideal, as analgesic effect depends on highly variable CYP2D6 metabolism
Meperidine (Demerol®)	75 mg IV	2-3 mg/kg IV	Moderate (10 min)	Moderate (2-4 h)	Anticholinergic, hallucinations, less pupillary constriction than morphine, metabolite build up may cause seizures Decreased use for pain management due to potential toxicity compared to other opioids. Typically reserved to treat postoperative shivering. Absolute contraindication in patients taking MAO-inhibitors
Morphine	10 mg IV 30 mg PO	0.2-0.3 mg/kg IV 0.4-0.6 mg/kg PO	Moderate (5-10 min)	Moderate (4-5 h)	Histamine release leading to decrease in BP
Morphine Extended Release (e.g. M-Esion®, MS Contin®)	20 mg PO	5-20 mg PO	Late	Long	Do not split, crush, or chew tablet
Oxycodone Controlled Release (Oxyneo®)	20 mg PO	10-20 mg PO (no IV)	Late (30-45 min)	Long (8-12 h)	Do not split, crush, or chew tablet (but can be difficult to swallow)
Oxycodone Regular Tablet (Oxy IR®)	20 mg PO (no IV)	5-15 mg PO	Moderate (15 min)	Moderate (3-6 h)	Percocet® = oxycodone 5 mg + acetaminophen 325 mg
Hydromorphone (Dilaudid®)	1.5-2.0 mg IV 6-8 mg PO	40-60 µg/kg IV 2-4 mg PO	Moderate (15 min)	Moderate (4-5 h)	Less pruritus, N/V, and sedation compared to morphine
Hydromorphone Extended Release (e.g. Hydromorph Contin)	4.0-6.0 mg PO	3-12 mg PO	Late (30-45 min)	Long	Do not split, crush or chew tablet
Fentanyl	100 µg IV	2-3 µg/kg IV	Rapid (<5 min)	Short (0.5-1 h)	Transient muscle rigidity in very high doses
Remifentanyl	100 µg IV	0.5-1.5 µg/kg IV	Rapid (1-3 min)	Ultra short (<10 min)	Only use during induction and maintenance of anesthesia
Methadone (opioid agonist)	Morphine to methadone conversion is variable based on patient's morphine dose. Ranges from 1/4 to 1/20	15-40 mg/d in divided doses	Rapid (8 min)	15-90 h (24 h average)	Can only be prescribed by federally/provincially licensed physicians and nurse practitioners Acts through both NMDA and µ-opioid receptors Challenging due to variable equianalgesic dose and half-life After titration, accumulates in tissue for once/twice daily dosing Metabolized by CYP3A4 Caution with high doses, may cause QT prolongation, baseline ECG required
Buprenorphine (opioid agonist antagonist)	Varies depending on route of administration (pill/film, transdermal)	Film: 2 mg up to max of 24 mg	Moderate (30 min)	6-8 h	For moderate to severe chronic pain and opioid addiction Ceiling effect for respiratory depression but not analgesia High affinity to µ-opioid receptors, very resistant to reversal with opioid antagonists

In general, parenteral route is 2-3x more potent than oral

### Patient Controlled Analgesia

- patient controlled analgesia (PCA) involves the use of computerized pumps that can deliver a constant infusion and bolus breakthrough doses of parenterally-administered opioid analgesics
- limited by lockout intervals
- most commonly used agents: morphine and hydromorphone
- see Table 17 for suggested infusion rate, PCA dose, and lockout intervals

### Opioid Conversion

	Parenteral (IV)	Equivalent Oral Dose
Morphine	10 mg	30 mg
Hydromorphone	2 mg	4 mg
Codeine	120 mg	200 mg
Oxycodone	N/A	20 mg
Fentanyl	100 µg	N/A

### PCA Parameters

- Loading dose
- Bolus dose
- Lockout interval
- Continuous infusion (optional)
- Maximum 4h dose (limit)

### Advantages of PCA

- Improved patient satisfaction
- Fewer side effects
- Accommodates patient variability
- Accommodates changes in opioid requirements

Table 17. Opioid PCA Doses

Agent	PCA Dose	PCA Lockout Interval	PCA 4 h Maximum
Morphine	1-2 mg	5 min	30 mg
Hydromorphone	0.2-0.4 mg	5 min	10 mg
Fentanyl	25-50 µg	5 min	400 µg

### Opioid Antagonists (naloxone, naltrexone)

- indication: opioid overdose (manifests primarily at CNS, e.g. respiratory depression)
- mechanism of action: competitively inhibit opioid receptors, predominantly  $\mu$ -opioid receptors
  - naloxone is short-acting ( $t_{1/2} = 1$  h); effects of narcotic may return when naloxone wears off; therefore, the patient must be observed closely following its administration
  - naltrexone is longer acting ( $t_{1/2} = 10$  h); less likely to see return of opioid effects
- side effects: relative overdose of naloxone may cause nausea, agitation, sweating, tachycardia, HTN, re-emergence of pain, pulmonary edema, seizures (essentially opioid withdrawal)

## Neuropathic Pain

- see [Neurology, N43](#)

## Chronic Pain

- chronic pain: pain greater than 3 mo, or recurrent pain that occurs at least 3 times throughout 3 mo period
- pain of duration or intensity that persists beyond normal tissue healing and adversely affects functioning
- in the perioperative period, consider continuing regular long-acting analgesics and augmenting with regional techniques, adjuvants, additional opioid analgesia, and non-pharmacological techniques (e.g. mindfulness, physiotherapy, acupuncture)

### Central Sensitization

- central sensitization: hyperalgesia (i.e. increased sensitivity to pain) as a result of CNS mechanisms
- may have nociceptive and neuropathic components; dysregulation of analgesic pathways implicated
- plays a role in fibromyalgia

### Chronic Post-Surgical Pain

- chronic post-surgical pain (CPSP): pain that develops after surgery and persists for at least 2 mo
- primary predictor of CPSP is history of chronic pain; other risk factors include female gender, surgical procedure/approach, poor social supports, catastrophizing behaviour

## Obstetrical Anesthesia

### Anesthesia Considerations in Pregnancy

- **Airway**
  - possible difficult airway as tissues become edematous and friable, especially in labour
- **Respiratory System**
  - decreased FRC and increased O<sub>2</sub> consumption cause more rapid desaturation during apnea
- **Cardiovascular System**
  - increased blood volume > increased RBC mass results in mild anemia
  - decreased SVR proportionately greater than increased CO results in decreased BP
  - prone to decreased BP due to aortocaval compression (supine hypotensive syndrome) – a pregnant patient is positioned in left uterine displacement (approximately 15° angle) using a wedge under her right flank when supine
- **Central Nervous System**
  - decreased MAC due to hormonal effects
  - increased block height due to engorged epidural veins
- **Gastrointestinal System**
  - delayed gastric emptying
  - increased volume and acidity of gastric fluid
  - decreased LES tone
  - increased abdominal pressure
  - combined, these lead to an increased risk of aspiration; therefore, for surgery, a pregnant patient is given sodium citrate 30 cc PO immediately before surgery to neutralize gastric acidity

### Options for Analgesia during Labour

- psychoprophylaxis – Lamaze method
  - patterns of breathing and focused attention on fixed object

### Patient Controlled Opioid Analgesia vs. Non-Patient Controlled Opioid Analgesia for Postoperative Pain

Cochrane DB Syst Rev 2015:CD003348

**Purpose:** To evaluate the efficacy of patient controlled analgesia (PCA) vs. non-patient controlled opioid analgesia of as-needed opioid analgesia for postoperative pain relief.

**Methods:** Meta-analyses of RCTs comparing PCA vs. conventional administration of opioid analgesia. Assessment employed a visual analog scale (VAS) for pain intensity along with overall analgesic consumption, patient satisfaction, length of stay, and adverse side effects.

**Results:** 49 studies with a total of 1725 patients receiving PCA and 1687 patients assigned to a control group. PCA had a lower VAS pain intensity score vs. non-patient controlled analgesia over most time intervals in the first 48 h. PCA was associated with higher patient satisfaction and consumed higher amounts of opioids than controls. PCA was also associated with higher incidence of pruritus but not other adverse events.

**Conclusions:** Moderate to low quality evidence that PCA is an efficacious alternative to non-patient controlled systemic analgesia for postoperative pain control.

### Nociceptive Pathways in Labour and Delivery

- **Labour**
  - Cervical dilation and effacement stimulates visceral nerve fibres entering the spinal cord at T10-L1
- **Delivery**
  - Distention of lower vagina and perineum causes somatic nociceptive impulses via the pudendal nerve entering the spinal cord at S2-S4

### Epidural vs. Non-Epidural or No Analgesia for Pain Management in Labour

Cochrane DB Syst Rev 2018:CD000331

**Purpose:** To assess effectiveness and safety of all types of epidural analgesia when compared with non-epidural or no pain relief during labour.

**Methods:** Systematic review of RCTs comparing epidural with any form of pain relief not involving regional blockade, or no pain relief in labour.

**Results:** 52 studies involving over 11000 women were included; 34 studies compared epidural analgesia with opioids. Epidural analgesia was associated with lower pain intensity, higher satisfaction, and decreased need for additional pain relief vs. opioids. While it was also associated with increased risk of assisted vaginal birth (RR 1.44, 95% CI 1.29-1.60), post-hoc analysis of studies conducted after 2005 eliminates this risk (RR 1.19, 95% CI 0.97-1.46). Women with epidural analgesia experienced more hypotension, motor blockade, fever, and urinary retention with less risk of respiratory depression and nausea/vomiting. There was no difference in neonatal outcomes, admission to NICU, caesarean section rates, or maternal long-term backache.

**Conclusions:** Epidural analgesia may be more effective in reducing pain during labour and increasing maternal satisfaction than non-epidural methods and, when considering modern approaches, is not associated with increased instrumentation. Epidural analgesia had no impact on the risk of caesarean section or long-term backache, and did not appear to have an immediate effect on neonatal status as determined by Apgar scores or in admissions to NICU.

- systemic medication
  - easy to administer, but risk of maternal or neonatal respiratory depression
  - opioids most commonly used if delivery is not expected within 4 h; fentanyl can be considered
- inhalational analgesia
  - easy to administer, makes uterine contractions more tolerable, but does not relieve pain completely
  - 50% nitrous oxide is insufficient alone but good safety profile for mother and child
- neuraxial anesthesia
  - provides excellent analgesia with minimal depressant effects
  - hypotension is the most common complication
  - maternal BP monitored q2-5 min for 15-20 min after initiation and regularly thereafter
  - epidural usually given as it preferentially blocks sensation, leaving motor function intact

### Options for Caesarean Section

- neuraxial: spinal or epidural
- general: used if contraindications or time precludes regional blockade (see *Regional Anesthesia, Epidural and Spinal Anesthesia, A21*)

### Techniques for Preventing Hypotension During Spinal Anesthesia for Caesarean Section

Cochrane DB Syst Rev 2017;8:CD002251

**Purpose:** To assess the effects of prophylactic interventions for maternal hypotension following spinal anesthesia for caesarean section.

**Methods:** Searched Cochrane Pregnancy and Childbirth's Trials Register and reference lists. Included RCTs comparing interventions to prevent hypotension with placebo or alternative treatment.

**Results:** 126 studies were included involving 9565 participants. Identified 3 intervention groups which were IV fluids (colloid vs. crystalloid vs. no fluid), pharmacological interventions (ephedrine vs. phenylephrine, or ondansetron vs. control), and physical interventions (lower limb compression, or lying vs. walking). All groups showed better control of hypotension with no differences between colloid vs. crystalloid, ephedrine vs. phenylephrine, or lying vs. walking. All evidence was very-low quality to low-quality.

**Conclusions:** While interventions such as crystalloids, colloids, ephedrine, phenylephrine, ondansetron, or lower leg compression can reduce the incidence of hypotension, none have been shown to be superior to the other.

## Paediatric Anesthesia

### Respiratory System

- in comparison to adults, anatomical differences in infants include:
  - large head, short trachea/neck, large tongue, larynx positioned more superior and anterior, adenoids, and tonsils
  - narrow nasal passages (obligate nasal breathers until 5 mo)
  - narrowest part of airway at the level of the cricoid vs. glottis in adults
  - epiglottis is longer, U-shaped and angled at 45°; carina is wider and is at the level of T2 (T4 in adults)
- physiologic differences include:
  - faster respiratory rate, immature respiratory centres that are depressed by hypoxia/hypercapnia (airway closure occurs in the neonate at the end of expiration)
  - less O<sub>2</sub> reserve during apnea – decreased total lung volume, vital capacity, and FRC together with higher metabolic needs
  - to increase alveolar minute ventilation in neonates, increase respiratory rate, not tidal volume
  - neonate: 30-40 breaths/min
  - age 1-13: (24 - [age/2]) breaths/min
  - greater V/Q mismatch – lower lung compliance due to immature alveoli (mature at 8 yr)
  - greater work of breathing – greater chest wall compliance, weaker intercostals/diaphragm, and higher resistance to airflow

### Cardiovascular System

- blood volume at birth is approximately 80 mL/kg; transfusion should be started if >10% of blood volume is lost
- children have a high HR and low BP
- CO is dependent on HR, not SV because of low heart wall compliance; therefore, bradycardia severely compromises CO

### Temperature Regulation

- vulnerable to hypothermia
- minimize heat loss by use of warming blankets, covering the infant's head, humidification of inspired gases, and warming of infused solutions

### Central Nervous System

- MAC of halothane is increased compared to the adult (0.75% adult, 1.2% infant, 0.87% neonate)
- NMJ is immature for the first 4 wk of life, and thus, there is an increased sensitivity to non-depolarizing relaxants
- parasymphatics mature at birth, sympathetics mature at 4-6 mo; thus, there is an autonomic imbalance
- infant brain is 12% of body weight and receives 34% of CO (adult: 2% body weight and 14% CO)

### Glucose Maintenance

- infants <1 yr can become seriously hypoglycemic during preoperative fasting and postoperatively if feeding is not recommenced as soon as possible
- after 1 yr, children are able to maintain normal glucose homeostasis in excess of 8 h

### Pharmacology

- higher dose requirements because of higher TBW (75% vs. 60% in adults) and greater volume of distribution
- barbiturates/opioids more potent due to greater permeability of BBB

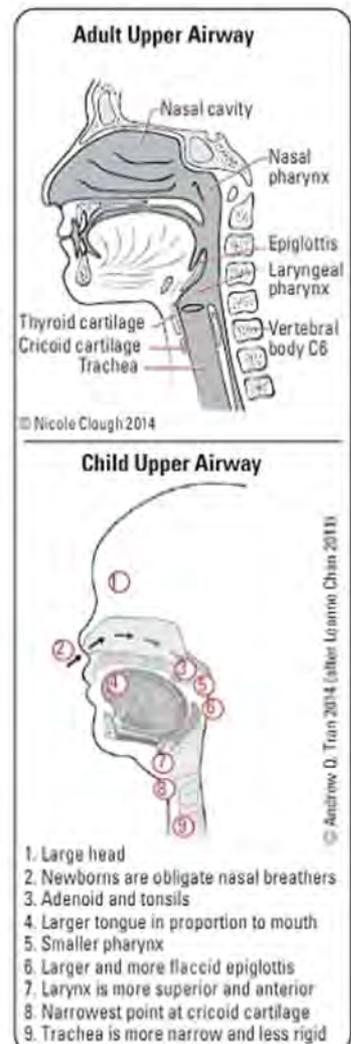

Figure 18. Comparison of paediatric vs. adult airway

- muscle relaxants
  - non-depolarizing
    - immature NMJ, variable response
  - depolarizing
    - must pre-treat with atropine or may experience profound bradycardia and/or sinus node arrest due to PNS > SNS (also dries oral secretions)
    - more susceptible to arrhythmias, hyperkalemia, rhabdomyolysis, myoglobinemia, masseter spasm, and malignant hyperthermia

## Uncommon Complications

### Malignant Hyperthermia

- hypermetabolic disorder of skeletal muscle
- due to an uncontrolled increase in intracellular  $\text{Ca}^{2+}$  (because of an anomaly of the ryanodine receptor that regulates  $\text{Ca}^{2+}$  channel in the sarcoplasmic reticulum of skeletal muscle)
- autosomal dominant inheritance
- incidence of 1-5 in 100000, may be associated with skeletal muscle abnormalities such as dystrophy or myopathy
- anesthetic drugs triggering MH include:
  - all inhalational agents except nitrous oxide
  - depolarizing muscle relaxants: SCh

#### Clinical Picture

- onset: immediate or hours after contact with trigger agent
  - increased  $\text{O}_2$  consumption
  - increased  $\text{ETCO}_2$  on capnograph
  - tachycardia/dysrhythmia
  - tachypnea/cyanosis
  - diaphoresis
  - HTN
  - hyperthermia (late sign)
- muscular symptoms
  - trismus (i.e. masseter spasm) common but not specific for MH (occurs in 1% of children given SCh with halothane anesthesia)
  - tender, swollen muscles due to rhabdomyolysis
  - trunk or total body rigidity

#### Complications

- coma
- DIC
- rhabdomyolysis
- myoglobinuric renal failure/hepatic dysfunction
- electrolyte abnormalities (e.g. hyperkalemia) and secondary arrhythmias
- ARDS
- pulmonary edema
- can be fatal if untreated

#### Prevention

- suspect MH in patients with a family history of problems/death with anesthetic
- avoid all trigger medications, use vapour-free equipment, use regional anesthesia if possible
- central body temp and  $\text{ETCO}_2$  monitoring

#### Malignant Hyperthermia Management

Based on Malignant Hyperthermia Association of the U.S. [MHAUS] Guidelines, 2008

1. notify surgeon, discontinue volatile agents and SCh, hyperventilate with 100%  $\text{O}_2$  at flows of 10 L/min or more, halt the procedure as soon as possible
2. dantrolene 2.5 mg/kg IV, through large-bore IV if possible
  - repeat until there is control of signs of MH; up to 30 mg/kg as necessary
3. bicarbonate 1-2 mEq/kg if blood gas values are not available for metabolic acidosis
4. cool patients with core temperature  $>39^\circ\text{C}$ 
  - lavage open body cavities, stomach, bladder, rectum; apply ice to surface; infuse cold saline IV
  - stop cooling if temperature is  $<38^\circ\text{C}$  to prevent drift to  $<36^\circ\text{C}$
5. dysrhythmias usually respond to treatment of acidosis and hyperkalemia
  - use standard drug therapy except  $\text{Ca}^{2+}$  channel blockers as they may cause hyperkalemia and cardiac arrest in presence of dantrolene

#### ETT Sizing in Paediatrics

Diameter (mm) of tracheal tube in children after 1 year =  $(\text{age}/4) + 4$   
 Length (cm) of tracheal tube =  $(\text{age}/2) + 12$

See Landmark Anesthesiology Trials table for more information on a study by Sun et al., 2016, which details the association between a single general anesthesia exposure prior age 36 months and neurocognitive outcomes in later childhood.

#### Signs of Malignant Hyperthermia

- unexplained rise in  $\text{ETCO}_2$
- increase in minute ventilation
- tachycardia
- rigidity
- hyperthermia (late sign)

#### Basic Principles of MH Management

##### "Some Hot Dude Better Get Iced Fluids Fast"

Stop all triggering agents, give 100%  $\text{O}_2$   
 Hyperventilate  
 Dantrolene 2.5 mg/kg every 5 min  
 Bicarbonate  
 Glucose and insulin  
 IV fluids; cool patient to  $38^\circ\text{C}$   
 Fluid output; consider furosemide  
 Fast Heart [tachycardia]; be prepared to treat VT

6. hyperkalemia
  - treat with hyperventilation, bicarbonate, glucose/insulin, calcium
  - bicarbonate 1-2 mEq/kg IV, calcium chloride 10 mg/kg, or calcium gluconate 10-50 mg/kg for life-threatening hyperkalemia and check glucose levels hourly
7. follow ET/CO<sub>2</sub>, electrolytes, blood gases, creatine kinase (CK), core temperature, urine output/colour with Foley catheter, coagulation studies
  - if CK and/or potassium rises persistently or urine output falls to <0.5 mL/kg/h, induce diuresis to >1 mL/kg/h urine to avoid myoglobinuric renal failure
8. maintain anesthesia with benzodiazepines, opioids, and propofol
9. transfer to ICU bed

### Abnormal Pseudocholinesterase

- pseudocholinesterase hydrolyzes SCh and mivacurium
- individuals with abnormal pseudocholinesterase will have prolonged muscular blockade
- SCh and mivacurium are contraindicated in those with abnormal pseudocholinesterase
- if SCh or mivacurium are given accidentally, treat with mechanical ventilation until function returns to normal (do not use cholinesterase inhibitors as it will cause rebound neuromuscular blockade once cholinesterase inhibitor effect is terminated)

## Appendices

### Difficult Tracheal Intubation in Unconscious Patient

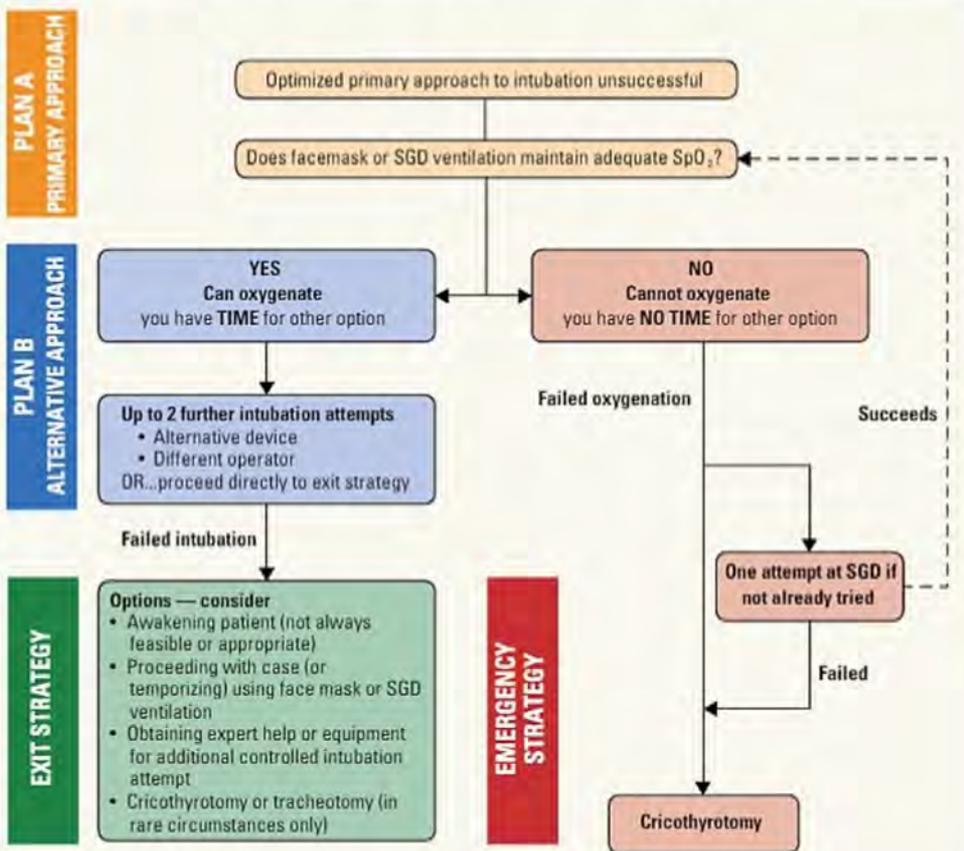

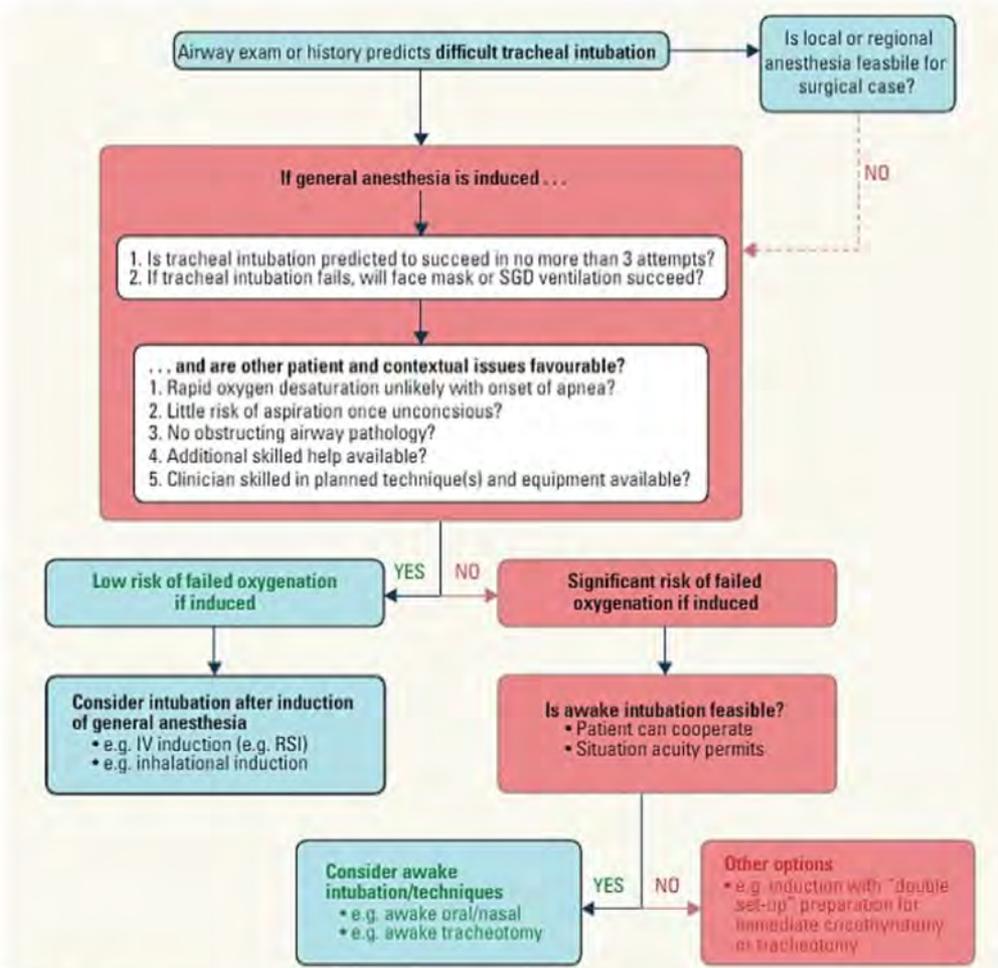

Figure 19. Difficult tracheal intubation encountered in the unconscious patient

SGD = supraglottic device

Reprinted with permission. Law JA, Broemling N, Copper RM, et al. The difficult airway with recommendations for management – Part 1 – Difficult tracheal intubation encountered in an unconscious/induced patient. Can J Anesth 2013;60:1089–1118.

## Difficult Tracheal Intubation

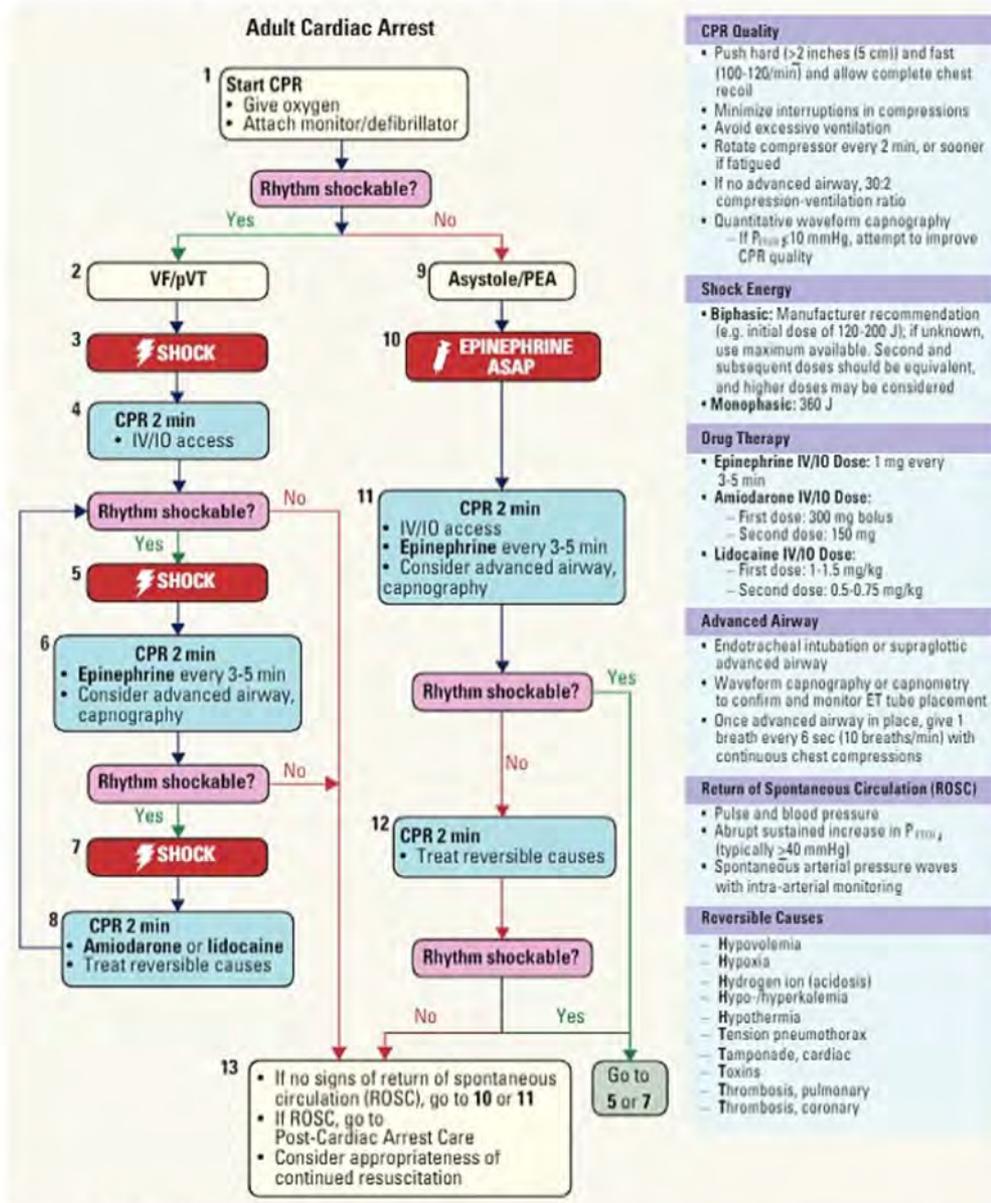

**Figure 20. Anticipated difficult tracheal intubation**

SGD = supraglottic device

Reprinted with permission: Law JA, Broemling N, Copper RM, et al. The difficult airway with recommendations for management – Part 2 – The anticipated difficult airway. *Can J Anesth* 2013;60:1119-1138.

## Advanced Cardiac Life Support Guidelines

**CPR Quality**

- Push hard (>2 inches (5 cm)) and fast (100-120/min) and allow complete chest recoil
- Minimize interruptions in compressions
- Avoid excessive ventilation
- Rotate compressor every 2 min, or sooner if fatigued
- If no advanced airway, 30:2 compression-ventilation ratio
- Quantitative waveform capnography
  - If P<sub>ETCO<sub>2</sub></sub> < 10 mmHg, attempt to improve CPR quality

**Shock Energy**

- **Biphasic:** Manufacturer recommendation (e.g. initial dose of 120-200 J); if unknown, use maximum available. Second and subsequent doses should be equivalent, and higher doses may be considered
- **Monophasic:** 360 J

**Drug Therapy**

- **Epinephrine IV/IO Dose:** 1 mg every 3-5 min
- **Amiodarone IV/IO Dose:**
  - First dose: 300 mg bolus
  - Second dose: 150 mg
- **Lidocaine IV/IO Dose:**
  - First dose: 1-1.5 mg/kg
  - Second dose: 0.5-0.75 mg/kg

**Advanced Airway**

- Endotracheal intubation or supraglottic advanced airway
- Waveform capnography or capnometry to confirm and monitor ET tube placement
- Once advanced airway in place, give 1 breath every 6 sec (10 breaths/min) with continuous chest compressions

**Return of Spontaneous Circulation (ROSC)**

- Pulse and blood pressure
- Abrupt sustained increase in P<sub>ETCO<sub>2</sub></sub> (typically >40 mmHg)
- Spontaneous arterial pressure waves with intra-arterial monitoring

**Reversible Causes**

- Hypovolemia
- Hypoxia
- Hydrogen ion (acidosis)
- Hypo-/hyperkalemia
- Hypothermia
- Tension pneumothorax
- Tamponade, cardiac
- Toxins
- Thrombosis, pulmonary
- Thrombosis, coronary

## Landmark Anesthesiology Trials

Trial Name	Reference	Clinical Trial Details
<b>INTRAOPERATIVE MANAGEMENT</b>		
Study of Wound Infection and Temperature	NEJM 1996; 334:1209-1216	<p><b>Title:</b> Perioperative Normothermia to Reduce the Incidence of Surgical-Wound Infection and Shorten Hospitalization</p> <p><b>Purpose:</b> To test if hypothermia increases susceptibility to surgical-wound infection and lengthens hospitalization.</p> <p><b>Methods:</b> Colorectal surgery patients (n= 200) were randomly assigned to routine intraoperative thermal care (hypothermia group) or additional warming (normothermia group in a double-blind protocol). Wounds evaluated daily until discharge and at 2 wk clinic visit. Wounds with pus and positive cultures were considered infected.</p> <p><b>Results:</b> Intraoperative core temperature was found to be significantly different in both groups. Normothermia group had fewer infected wounds, earlier suture removal, and prolonged hospital stay of 2.6 d (20%).</p> <p><b>Conclusion:</b> Hypothermia itself may delay healing and predispose patients to wound infections.</p>
MYRIAD	NEJM 2019;380:1214-1225	<p><b>Title:</b> Volatile Anesthetics vs. Total Intravenous Anesthesia for Cardiac Surgery</p> <p><b>Purpose:</b> Volatile agents have cardioprotective effects which could improve clinical outcomes in cardiac surgery patients.</p> <p><b>Methods:</b> Multicenter, single-blind, controlled trial. Patients scheduled to undergo elective CABG were randomly assigned to an intraoperative anesthetic regimen that included a volatile anesthetic (desflurane, isoflurane, or sevoflurane) or to TIVA. The primary outcome was all-cause mortality at 1 yr.</p> <p><b>Results:</b> A total of 5400 patients were randomized. No significant difference between the groups with respect to all-cause mortality was seen at 1 yr (2.8% in the volatile anesthetics group and 3.0% in the TIVA group; RR, 0.94; 95% CI, 0.69 to 1.29; P=0.71), or at 30 d (1.4% and 1.3%, respectively; RR, 1.11; 95% CI, 0.70 to 1.76). There were no significant differences between the groups in any of the secondary outcomes or in the incidence of prespecified adverse events, including MI.</p> <p><b>Conclusion:</b> Among patients undergoing elective CABG, anesthesia with a volatile agent did not result in significantly fewer deaths at 1 yr than TIVA.</p>
<b>POSTOPERATIVE MANAGEMENT</b>		
IMPACT	NEJM 2004; 350:2441-2451	<p><b>Title:</b> A Factorial Trial of Six Interventions for the Prevention of Postoperative Nausea and Vomiting</p> <p><b>Purpose:</b> To compare the efficacy of six well-established antiemetic strategies and to determine the extent to which efficacy could be improved by combining two or three interventions.</p> <p><b>Methods:</b> Patients (n=5199) were randomly assigned to receive prophylactic antiemetics independently, in combination or placebo. Primary outcome was nausea and vomiting within 24 h after surgery.</p> <p><b>Results:</b> Ondansetron, dexamethasone, and droperidol each reduced risk of postoperative nausea and vomiting by 26%. Propofol reduced risk by 19%, and nitroglycerin by 12%. Relative risks associated with combined interventions could be estimated by multiplying the relative risks associated with each intervention. Absolute risk reduction was a critical function of patients' baseline risk.</p> <p><b>Conclusion:</b> All interventions were similarly effective and acted independently. The safest or least expensive should be used first. Moderate-risk patients may benefit from a single intervention and high-risk patients from multiple interventions.</p>
DREAMS	BMJ 2017;357:j1455	<p><b>Title:</b> Dexamethasone vs. Standard Treatment for Postoperative Nausea and Vomiting in Gastrointestinal Surgery: Randomised Controlled Trial (DREAMS Trial)</p> <p><b>Purpose:</b> Whether preoperative dexamethasone reduces postoperative nausea and vomiting (PONV) in patients undergoing elective bowel surgery and whether it is associated with other measurable benefits during recovery from surgery.</p> <p><b>Method:</b> Pragmatic two-arm parallel-group randomized trial with blinded postoperative care and outcome assessment.</p> <p><b>Results:</b> Administration of 8 mg IV dexamethasone at induction was associated with lower rates of vomiting within 24 h of surgery (NNT=13) and reduced need for antiemetics up to 72 h (NNT=8) vs. standard of care.</p> <p><b>Conclusions:</b> A single dose of dexamethasone at induction of anesthesia significantly reduces incidence of PONV and need for rescue antiemetics postoperatively with no increase in adverse events.</p>
Comparison of Intraoperative Sedation With Dexmedetomidine vs. Propofol on Acute Postoperative Pain in Total Knee Arthroplasty Under Spinal Anesthesia: A Randomized Trial, Shin et al., 2019	Anesth Analg 2019;129:1512-1518	<p><b>Title:</b> Comparison of Intraoperative Sedation With Dexmedetomidine vs. Propofol on Acute Postoperative Pain in Total Knee Arthroplasty Under Spinal Anesthesia: A Randomized Trial</p> <p><b>Purpose:</b> Compare the postoperative analgesic effect of intraoperative sedation with dexmedetomidine (DEX) vs. propofol.</p> <p><b>Methods:</b> Patients (n = 48) were enrolled and randomly assigned to either DEX or propofol group. After the initial pre-determined loading dose, drug infusion rate was determined according to sedation level. Cumulative amounts of PCA fentanyl were recorded at 24-48 h postoperatively (primary outcome). The postoperative numerical rating scale for pain was assessed at 6, 12, 24, and 48 h (secondary outcome).</p> <p><b>Results:</b> DEX significantly reduced postoperative fentanyl consumption at all of the studies time points. The numerical rating scale for pain was significantly lower at all time points.</p> <p><b>Conclusion:</b> Intraoperative DEX sedation was associated with a small but clinically important reduction in postoperative opioid use after total knee arthroplasty.</p>
ENGAGES	JAMA 2019;321:473-483	<p><b>Title:</b> Effect of EEG-Guided Anesthetic Administration on Postoperative Delirium Among Older Adults Undergoing Major Surgery: The ENGAGES RCT</p> <p><b>Purpose:</b> To assess whether EEG-guided anesthetic administration decreases the incidence of postoperative delirium.</p> <p><b>Methods:</b> RCT of 1232 adults &gt;60 yr old undergoing major surgery and receiving guided anesthetic. Patients randomized 1:1 to receive EEG-guided anesthetic administration or usual care. Primary outcome was incident delirium during postoperative days 1-5.</p> <p><b>Results:</b> Delirium during postoperative days 1-5 occurred in 26.0% of the guided group and in 23.0% of the usual care group (P = .22). Median end-tidal volatile anesthetic concentration was significantly lower in the guided group than the usual care group, and median cumulative time with EEG suppression was significantly less (7 vs. 13 min; difference, -6.0 [95% CI, -9.9 to -2.1]).</p> <p><b>Conclusion:</b> There is no difference in postoperative delirium between EEG-guided anesthetic or usual care of older adults.</p>

Trial Name	Reference	Clinical Trial Details
<b>COMPLICATIONS</b>		
Association Between a Single General Anesthesia Exposure Before Age 36 Months and Neurocognitive Outcomes in Later Childhood. Sun et al., 2016	JAMA 2016;315:2312-2320	<b>Title:</b> Association Between a Single General Anesthesia Exposure Before Age 36 Months and Neurocognitive Outcomes in Later Childhood <b>Purpose:</b> To examine if a single anesthesia exposure in otherwise healthy young children was associated with impaired neurocognitive development and abnormal behaviour in later childhood. <b>Methods:</b> Sibling-matched cohort study. Included sibling pairs within 36 mo in age and currently 8-15 y/o with a single exposure to GA during inguinal hernia surgery in the exposed sibling and no anesthesia exposure in the unexposed sibling, before age 36 mo. The primary outcome was global cognitive function (IQ). Secondary outcomes included domain-specific neurocognitive functions and behaviour. <b>Results:</b> Sibling pairs (n=105) were included, with age of testing around 10 y/o. Mean IQ scores between exposed siblings and unexposed siblings were not significantly different. No significant differences in mean scores were found between sibling pairs in memory/learning, motor/processing speed, visuospatial function, attention, executive function, language, or behaviour. <b>Conclusions:</b> Among healthy children with a single anesthesia exposure before age 36 mo, compared with healthy siblings with no anesthesia exposure, there were no statistically significant differences in neurocognitive outcomes.
POISE-3	NEJM 2022;386(21):1986	<b>Title:</b> Tranexamic Acid in Patients Undergoing Noncardiac Surgery <b>Purpose:</b> To assess the efficacy of tranexamic acid in reducing bleeding in non-cardiac surgery. <b>Methods:</b> 9535 patients were randomized to receive tranexamic acid or a placebo during surgery. Life-threatening bleeding, major bleeding, and bleeding into a critical organ were assessed. <b>Results:</b> A bleeding event occurred in 433 of 4757 patients in the treatment group as opposed to 561 bleeding events in the placebo group. <b>Conclusion:</b> The use of tranexamic acid was shown to significantly reduce the number of bleeding events in non-cardiac surgery.

AKI	acute kidney injury	EDP	end diastolic pressure	MVP	mitral valve prolapse	RV	right ventricle
AR	aortic regurgitation	EF	ejection fraction	MUGA	multigated acquisition scan	RVAD	right ventricular assist device
ARB	angiotensin receptor blocker	EPS	electrophysiology studies	NSR	normal sinus rhythm	RVH	right ventricular hypertrophy
ARDS	acute respiratory distress syndrome	FEV <sub>1</sub>	forced expiratory volume in the first second	NSTEMI	non-ST elevation myocardial infarction	RVOT	right ventricular outflow trunk
ARNI	angiotensin receptor-neprilysin inhibitor	HCM	hypertrophic cardiomyopathy	NYHA	New York Heart Association	SA	sinoatrial
AS	aortic stenosis	HF	heart failure	OMT	optimal medical therapy	SAM	systolic anterior motion
ASA	acetylsalicylic acid (Aspirin <sup>®</sup> )	HFpEF	heart failure with preserved ejection fraction	OPCAB	off-pump coronary artery bypass	SAVR	surgical aortic-valve replacement
ASD	atrial septal defect	HFREF	heart failure with reduced ejection fraction	OS	opening snap	SCD	sudden cardiac death
AV	atrioventricular	HFSS	heart failure survival score	PAC	premature atrial contraction	SEM	systolic ejection murmur
AVNRT	atrioventricular nodal re-entrant tachycardia	HOCM	hypertrophic obstructive cardiomyopathy	PCI	percutaneous coronary intervention	SGLT2	sodium-glucose cotransporter 2
AVR	aortic valve replacement	HTN	hypertension	PCSK9	proprotein convertase subtilisin/kexin type 9	SNS	sympathetic nervous system
AVRT	atrioventricular re-entrant tachycardia	ICD	implantable cardioverter-defibrillator	PCWP	pulmonary capillary wedge pressure	SOBOE	shortness of breath on exertion
BIMA	bilateral internal mammary artery	IE	infective endocarditis	PDA	posterior descending artery	STEMI	ST elevation myocardial infarction
BBB	bundle branch block	IMA	internal mammary artery	PE	pulmonary embolism	SV	stroke volume
BNP	brain natriuretic peptide	ITA	internal thoracic artery	PEA	pulseless electrical activity	SVC	superior vena cava
BPM	beats per minute	JVP	jugular venous pressure	PFO	patent foramen ovale	SVR	systemic vascular resistance
BIVAD	biventricular assist device	LA	left atrium	PIV	posterior interventricular artery	SVT	supraventricular tachycardia
CABG	coronary artery bypass graft	LAD	left anterior descending artery	PMI	point of maximal impulse	SYNTAX	synergy between percutaneous coronary intervention with taxus and cardiac surgery
CAD	coronary artery disease	LAE	left atrial enlargement	PND	paroxysmal nocturnal dyspnea	TAVI	transcatheter aortic-valve implantation
CCB	calcium channel blocker	LBB	left bundle branch	PR	pulmonary regurgitation	TAVR	transcatheter aortic-valve replacement
CHD	coronary heart disease	LBBB	left bundle branch block	PS	pulmonary stenosis	TEE	transesophageal echocardiography
CM	cardiomyopathy	LCCA	left coronary artery	PT	pulmonary trunk	TIA	transient ischemic attack
CMR	cardiovascular magnetic resonance imaging	LCC	left coronary cusp	PTCA	percutaneous transluminal coronary angioplasty	TR	tricuspid regurgitation
CO	cardiac output	LCx	left circumflex artery	PUD	peptic ulcer disease	TS	tricuspid stenosis
COPD	chronic obstructive pulmonary disease	LIMA	left internal mammary artery	PVC	premature ventricular contraction	TTE	transthoracic echocardiography
CPB	cardiopulmonary bypass	LITA	left internal thoracic artery	PVD	peripheral vascular disease	UA	unstable angina
CRT	cardiac resynchronization therapy	LLSB	left lower sternal border	PVR	pulmonary vascular resistance	V	ventricle
CRT-P	cardiac resynchronization therapy pacemaker	LMWH	low molecular weight heparin	RA	right atrium	VAD	ventricular assist device
		LV	left ventricle	RAAS	renin-angiotensin-aldosterone system	VFib	ventricular fibrillation
		LVAD	left ventricular assist device	RAE	right atrial enlargement	VHD	valvular heart disease
		LVEF	left ventricular ejection fraction	RBB	right bundle branch	VSD	ventricular septal defect
		LVH	left ventricular hypertrophy			VT	ventricular tachycardia
						VTE	venous thromboembolism
						WPW	Wolff-Parkinson-White

## Basic Anatomy Review

### Coronary Circulation

- arterial supply to the heart arises from the right and left coronary arteries, which originate from the root of the aorta
  - RCA:
    - conus artery
    - acute marginal branches
    - AV nodal artery
    - PDA or PIV
  - LCA:
    - LAD
      - septal branches
      - diagonal branches
    - LCx
      - obtuse marginal branches
- dominance of circulation
  - determined by whether the RCA or the LCx supplies the PDA
    - right-dominant circulation: PDA and at least one posterolateral branch arise from RCA (80%)
    - left-dominant circulation: PDA and at least one posterolateral branch arise from LCx (15%)
    - balanced circulation: dual supply of posteroinferior LV from RCA and LCx (5%)
- the sinoatrial (SA) node is supplied by the SA nodal artery, which may arise from the RCA (60%) or LCA (40%)
- the AV node is supplied by the AV nodal artery, which may arise from the RCA (90%) or LCx (10%)
- most venous blood from the heart drains into the RA through the coronary sinus, although a small amount drains through Thebesian veins into all four chambers, contributing to the physiologic R-L shunt

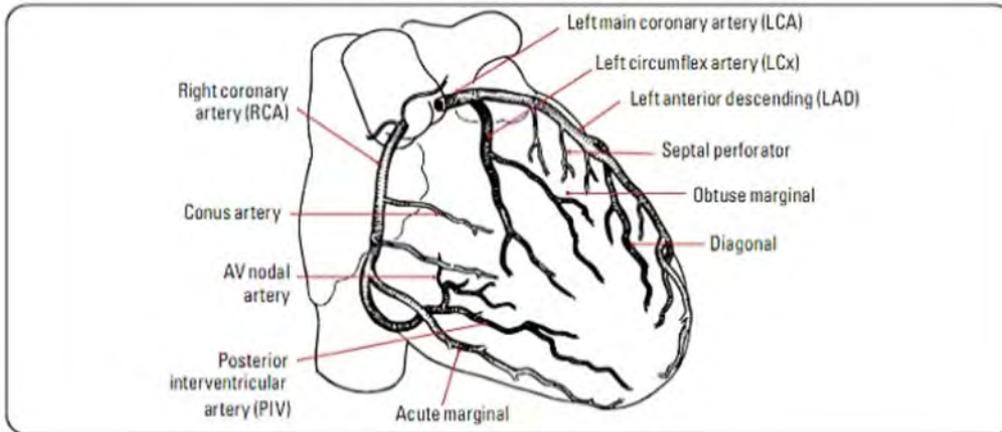

Figure 1. Anatomy of the coronary arteries (right anterior oblique projection)

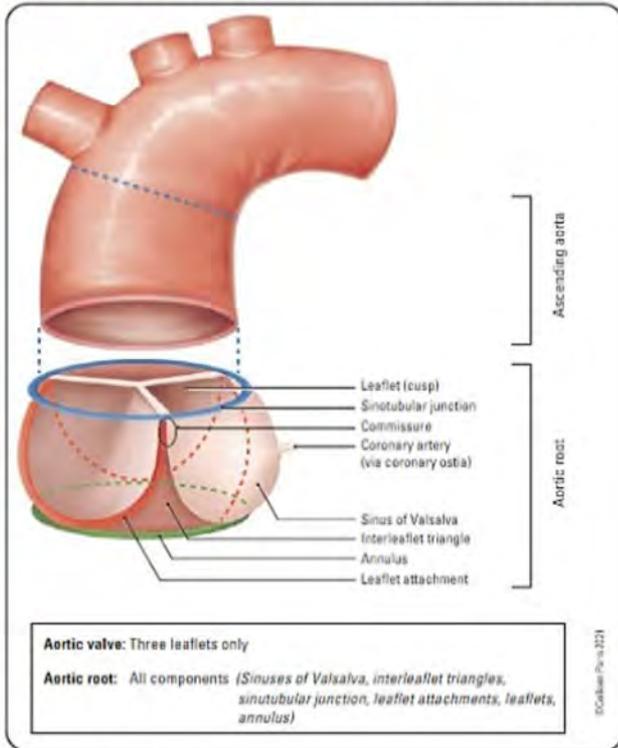

Figure 2a. Aortic root  
 Modified from Sievers H-H, Hemmer W, The everyday used nomenclature of the aortic root components: the tower of Babel?, European Journal of Cardio-Thoracic Surgery, 2012, 41, 3, 478-82, by permission of Oxford University Press

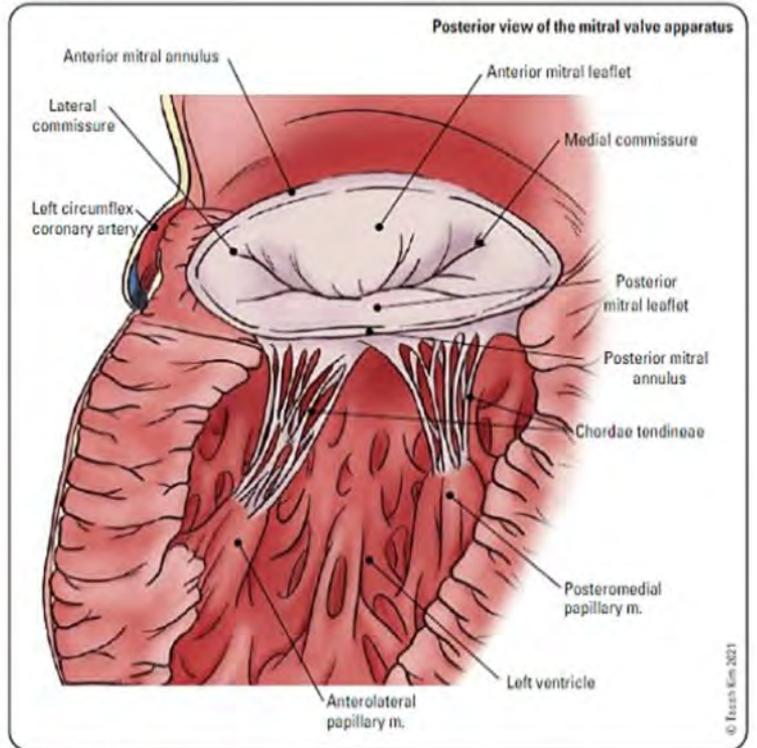

Figure 2b. Mitral valve apparatus

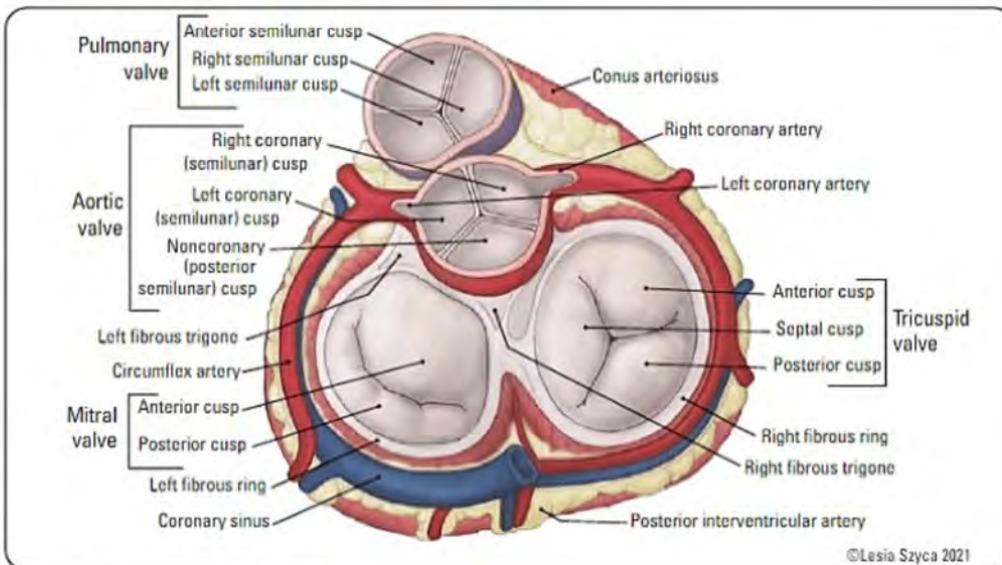

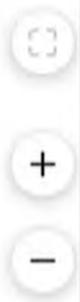

Figure 2c. Fibrous skeleton of the heart

## Cardiac Anatomy

- layers of the heart
  - endocardium, myocardium, epicardium, visceral pericardium, pericardial cavity, parietal pericardium
- valves
  - semilunar valves: 3 leaflets separating outflow tracts from the great arteries
    - aortic valve: noncoronary cusp, LCC, RCC; RCC and LCC have coronary ostia; separates LVOT and ascending aorta
    - pulmonary valve: anterior cusp, left cusp, right cusp; separates RVOT and PT
  - atrioventricular valves: subvalvular apparatus present in the form of chordae tendineae and papillary muscles
    - mitral valve: anterior (2/3 valve area, 1/3 valve circumference) and posterior leaflets (1/3 valve area, 2/3 valve circumference); separates LA and LV
    - tricuspid valve: anterior, posterior, and septal leaflets; separates RA and RV
- conduction system
  - SA node
    - located at the junction of SVC and roof of RA
    - governs pace-making; heartbeat originates here
    - anterior-, middle-, and posterior-internal nodal tracts carry impulses in the RA with the atrial impulses converging at the AV node and along Bachmann's bundle in the LA
  - AV node
    - located within the triangle of Koch which is demarcated by: superior margin of the coronary sinus, tendon of Todaro, and hinge of the septal leaflet of the tricuspid valve
    - AV node is the conduit for electrical impulses from atria to ventricles, unless an accessory AV pathway (e.g. WPW syndrome) is present
  - bundle of His
    - AV node connects to the bundle of His, which divides into LBB and RBB
      - LBB further splits into anterior and posterior fascicles
      - RBB and fascicles of LBB give off Purkinje fibres which conduct impulses into the ventricular myocardium

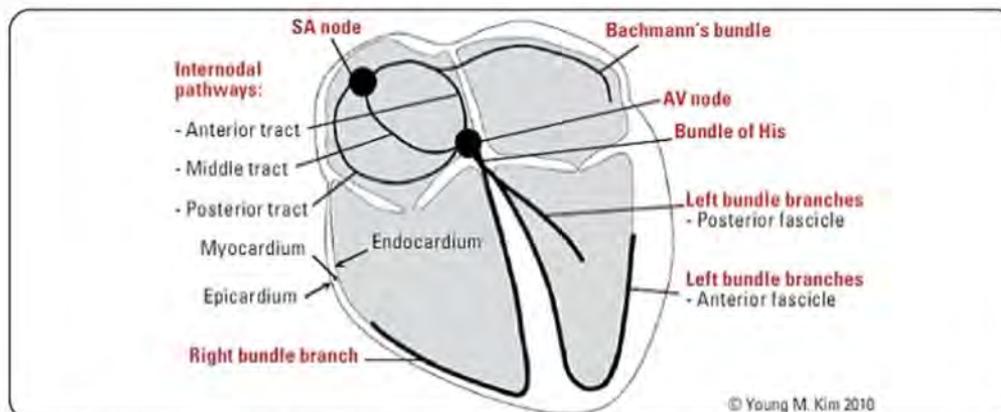

Figure 3. Conduction system of the heart

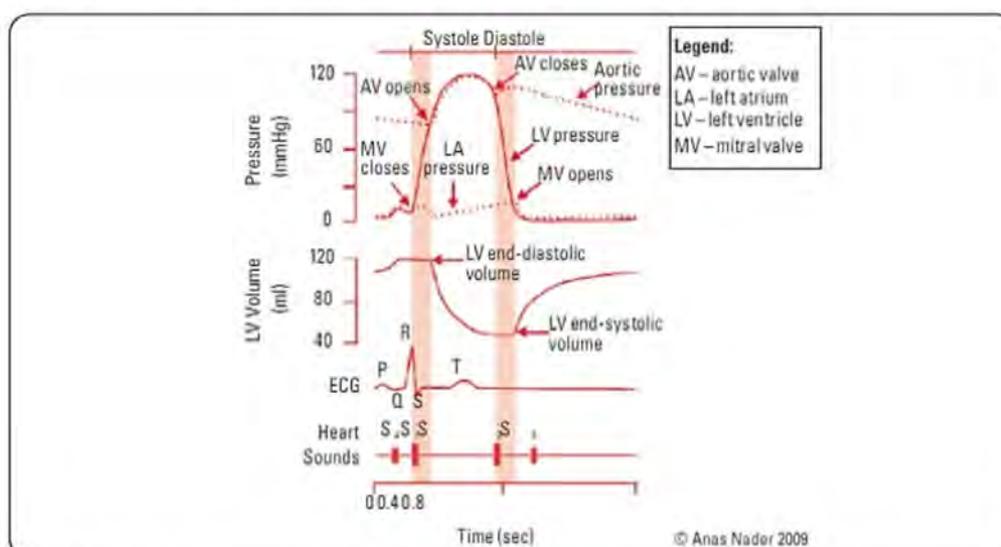

Figure 4. Cardiac cycle  
 Grey shaded bars indicate isovolumic contraction (left) and isovolumic relaxation (right)

- cardiovascular innervation
  - sympathetic nerves
    - innervate the SA node, AV node, ventricular myocardium, and vasculature
    - increased activity of the SA node via the  $\beta_1$  receptor leads to increased HR via more frequent impulse from pacemaking cells (increased chronotropy - increased HR)
    - cardiac muscle ( $\beta_1$ ) fibres increase contractility (inotropy - leads to increased SV)
    - stimulation of  $\beta_1$ - and  $\beta_2$ -receptors in the skeletal and coronary circulation causes vasodilatation
  - parasympathetic nerves
    - innervate the SA node, AV node, and atrial myocardium but few vascular beds
    - at rest, vagal tone dominates the tonic sympathetic stimulation of the SA node and AV node, resulting in slow AV conduction, and consequently a prolonged PR interval or second or third degree AV block (i.e. reduced dromotropy (if only affecting AV node conduction))
    - parasympathetics have very little impact on total peripheral vascular resistance

## Differential Diagnoses of Common Presentations

Note: **bold** text indicates most common, underlined text indicates life threatening condition

### Chest Pain

- often described as pressure, heaviness, discomfort
  - note: ischemic pain is usually dull and diffuse while chest wall and pericardial pain are often sharp, localized, and worse on inspiration (i.e. pleuritic)
- cardiac
  - MI, stable myocardial ischemia (angina), myocarditis, and pericarditis/Dressler's syndrome, tamponade, aortic valve disease
- pulmonary
  - PE, pneumothorax/hemothorax, tension pneumothorax, pneumonia, empyema, pulmonary neoplasm, bronchiectasis, pleuritis, asthma, COPD, pleuritis, sarcoidosis, pulmonary hypertension, and TB
- gastrointestinal
  - esophageal: **GERD**, esophageal rupture, spasm, esophagitis, ulceration, achalasia, neoplasm, and Mallory-Weiss syndrome
  - other structures: PUD, gastritis, pancreatitis, and biliary colic
- mediastinal
  - lymphoma, thymoma
- vascular
  - dissecting aortic aneurysm, aortic rupture
- drug use: methamphetamine or cocaine intoxication
- surface structures
- costochondritis
- rib fracture
- skin (bruising, herpes zoster)
- breast
- anxiety/psychosomatic
- referred pain
- trauma

### Loss of Consciousness

#### 1. causes of true syncope (impaired cerebral perfusion)

- reflex mediated/reflex dysfunction
  - vasovagal (most common; also known as reflex mediated syncope, neurocardiogenic syncope)
  - situational (micturition, cough, carotid hypersensitivity)
  - autonomic dysfunction (often associated with neurologic diseases)
  - postural hypotension (e.g. central nervous system disorders, antihypertensive drugs)
- inadequate circulating volume (bleeding, hypovolemia with orthostasis)
- obstruction to blood flow
  - tamponade
  - pulmonary embolism
  - severe pulmonary HTN
  - severe obstructive valve disease (MS and AS)
  - left ventricular outflow obstruction (HCM)
  - cerebrovascular events (e.g. cerebrovascular accident)
- arrhythmia leading to sudden loss of CO
  - tachyarrhythmia, (e.g. Afib, SVT, VT, VFib)
  - severe bradycardia (sinus arrest, AV block)

## 2. loss of consciousness NOT due to impaired cerebral perfusion

- seizure
- hypoglycemia
- severe hypoxia or hypercarbia
- psychiatric
- head trauma

## Local Edema

- venous or lymphatic obstruction
  - thrombophlebitis/deep vein thrombosis, venous insufficiency, chronic lymphangitis, lymphatic tumour infiltration, filariasis
- inflammation/infection
- trauma

## Generalized Edema

- increased hydrostatic pressure/fluid overload
  - HF, pregnancy, drugs (e.g. CCBs), iatrogenic (e.g. IV fluids)
- decreased oncotic pressure/hypoalbuminemia
  - liver cirrhosis, nephrotic syndrome, malnutrition
- increased interstitial oncotic pressure
  - myxedema
- increased capillary permeability
  - severe sepsis
- hormonal
  - hypothyroidism, exogenous steroids, pregnancy, estrogens

## Palpitations

- subjective sense of abnormal/irregular heartbeats
- palpitations that may have continuous rapid heart action:
  - conditions causing sinus tachycardia: endocrine (thyrotoxicosis, pheochromocytoma, and hypoglycemia), systemic (anemia, fever), drugs (stimulants and anticholinergics), and psychiatric (panic attacks, generalized anxiety disorder, and somatization)
  - conditions causing pathologic tachycardia: SVT (atrial tachycardia, AFib, and atrial flutter) and re-entrant SVT, VT
- palpitations that may have irregular/intermittent sensations (e.g. PACs, PVCs)

## Dyspnea

- exercise
  - elevated pulmonary venous pressure
  - poor Hb-oxygen dissociation curve kinetics
- cardiovascular
  - due to elevated pulmonary venous pressure: acute MI, CHF/LV failure, aortic/mitral stenosis, AS/MS, AR/MR, arrhythmia, cardiac tamponade, constrictive pericarditis, and left-sided obstructive lesions (e.g. left atrial myxoma)
- respiratory
  - airway disease
    - asthma, COPD exacerbation, and upper airway obstruction (anaphylaxis, foreign body, and mucus plugging)
  - parenchymal lung disease
    - pneumonia, interstitial lung disease
  - pulmonary vascular disease
    - PE, pulmonary HTN, and pulmonary vasculitis
  - pleural disease
    - pneumothorax, pleural effusion
- neuromuscular and chest wall disorders
  - cervical spine injury
    - polymyositis, myasthenia gravis, Guillain-Barré syndrome, and kyphoscoliosis
- anxiety/psychosomatic
- hematological/metabolic
  - anemia, acidosis, and hypercapnia

## Cardiac Diagnostic Tests

### Electrocardiography Basics

#### Description

- a graphical representation (amplitude of electrical vector projection over time) of the heart's electrical activity
- on the ECG graph
  - the horizontal axis represents time (at usual paper speed of 25 mm/s)
    - 1 mm (1 small square) = 40 msec
    - 5 mm (1 large square) = 200 msec
  - the vertical axis represents voltage (at usual standard gain setting of 10 mm/mV)
    - 1 mm (1 small square) = 0.1 mV
    - 10 mm (2 large squares) = 1 mV
- standard leads of 12-lead ECG
  - limb (bipolar) leads: I, II, III, aVL, aVR, aVF
  - precordial (unipolar) leads: V1-V6 (V1-V2 (septal), V3-V4 (anterior), and V5-V6 (lateral))
- additional leads
  - right-sided leads: V3R-V6R (useful in RV infarction and dextrocardia)
  - posterior leads: V7-V9 (useful in posterolateral infarction)
- leads that indicate specific regions of the heart:
  - lateral wall = I, aVL, V5, V6
  - inferior wall = II, III, aVF
  - anterior wall = V1-V4

#### Indications for brief (12-lead ECG) or prolonged (24 h or more) monitoring

- myocardial injury, ischemia, or history of prior infarction
- conditions associated with palpitations or risk of serious arrhythmias (e.g. WPW, long QT, HCM, heart block, and bradycardia)
- conduction abnormalities (e.g. LBBB/RBBB)
- electrolyte abnormalities (e.g. hyperkalemia/hypokalemia)
- investigation of syncope, near syncope, or palpitations ("symptom/rhythm correlation")
- can be used for:
  - recording of cardiac rhythm during symptoms or antiarrhythmic drug monitoring
  - assessment of cardiac structure and function (e.g. RVH/LVH and cardiomyopathy)
  - detection of non-sustained arrhythmias that require prophylactic intervention

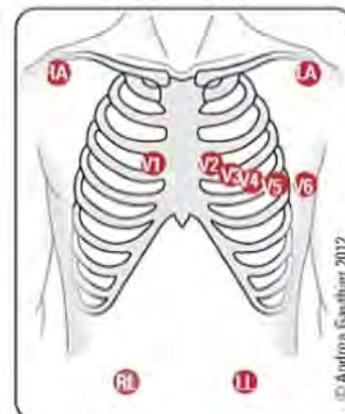

Figure 5. ECG lead placement

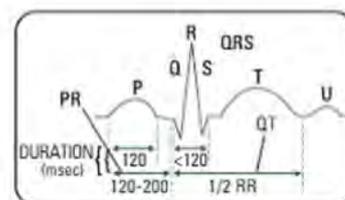

Figure 6. ECG waveforms and normal values

## Approach to ECGs

#### Introduction

Below, we are presenting both the classical approach and the newer PQRSTU approach to provide students with different ways to view the ECG. Despite methodological differences, the rigor and final result is the same.

### Classical Approach to ECGs

#### RATE

- normal = 60-100 bpm
- atrial rates above normal range:
  - 150-250 bpm = paroxysmal tachycardia
  - 250-350 bpm = atrial flutter
  - >350 bpm = AFib (note: atrial "rate" is not discernible)
- regular rhythm (defined by equal R-R or P-P intervals between beats)
  - rate can be calculated using either of the following two methods:
    - divide 300 by the number of large squares between 2 QRS complexes (there are 300 large squares in 1 min: 300 x 200 msec = 60 s)
    - use the square counting method by counting the number of big boxes between the R waves using the following sequence of numbers: 300 (1 box)-150 (2 boxes)-100 (3 boxes)-75 (4 boxes)-60 (5 boxes)-50 (6 boxes)
- irregular rhythm
  - rate = 6 x number of R-R intervals in 10 s (a standard ECG is 10 s)
- atrial escape rhythm in case of sinus node failure = 60-80 bpm, junctional escape rhythm = 40-60 bpm, ventricular escape rhythm = 20-40 bpm

For more examples and practice visit [www.ecgmadesimple.com](http://www.ecgmadesimple.com)

#### Classical Approach to ECG

- Rate
- Rhythm (defined by R-R or P-P intervals between beats)
- Axis
- Conduction abnormalities
- Hypertrophy/chamber enlargement
- Ischemia/infarction
- Miscellaneous ECG changes (e.g. QT interval)

#### Differential Diagnosis for Left Axis Deviation

- Normal variant (physiologic, often age-related change)
- Left anterior hemiblock
- LVH
- Inferior MI
- WPW
- RV pacing
- Elevated diaphragm
- Lead misplacement
- Congenital heart disease (e.g. primum ASD, endocardial cushion defect)
- Hyperkalemia
- Emphysema

**RHYTHM**

- regular: R-R interval is the same across the tracing
- irregular: R-R interval varies across the tracing
- regularly irregular: repeating pattern of varying R-R intervals (e.g. atrial flutter with variable block)
- irregularly irregular: R-R intervals vary erratically (e.g. AFib, VFib)
- normal sinus rhythm (NSR)
  - P wave precedes each QRS; QRS follows each P wave
  - P wave axis is normal (positive in 2 of the following 3 leads: I, II, aVF)
  - rate between 50-100 bpm

**AXIS**

- mean axis indicates the direction of the mean vector
- can be determined for any waveform (P, QRS, T)
  - the standard ECG reported QRS axis usually refers to the mean axis of the frontal plane it indicates the mean direction of ventricular depolarization forces
- QRS axis in the frontal plane
  - normal axis:  $-30^\circ$  to  $+90^\circ$  (i.e. positive QRS in leads I and II)
  - left axis deviation (LAD): axis  $< -30^\circ$
  - right axis deviation (RAD): axis  $> 90^\circ$
- QRS axis in the horizontal plane is not routinely calculated
  - transition from negative to positive is usually in lead V3

**Table 1. Conduction Abnormalities**

Left Bundle Branch Block (LBBB)	Right Bundle Branch Block (RBBB)
<b>Complete LBBB</b> QRS duration $>120$ msec Broad notched R waves in leads I, aVL, V5, and V6 Deep broad S waves in leads V1-2 Secondary ST-T changes (-ve in leads with broad notched R waves, +ve in V1-2) are usually present LBBB can mask ECG signs of MI LBBB: lead V1 negative, V6 positive and notched	<b>Complete RBBB</b> QRS duration $>120$ msec Positive QRS in lead V1 (rSR' or occasionally broad R wave) Broad S waves in leads I, V5-6 ( $>40$ msec) Usually secondary T wave inversion in leads V1-2 Frontal axis determination using only the first 60 msec RBBB: V1 is positive (rSR'), V6 has broad S wave
<b>Left Anterior Fascicular Block (LAFB) (Left Anterior Hemiblock)</b> <b>Left Axis Deviation (<math>-30^\circ</math> to <math>-90^\circ</math>)</b> Small Q and prominent R in leads I and aVL Small R and prominent S in leads II, III, and aVF	<b>Right Posterior Fascicular Block (LPFB) (Left Posterior Hemiblock)</b> <b>Right Axis Deviation (<math>110^\circ</math> to <math>180^\circ</math>)</b> Small R and prominent S in leads I and aVL Small Q and prominent R in leads II, III, and aVF
	<b>Bifascicular Block</b> <b>RBBB Pattern</b> Small Q and prominent R The first 60 msec (1.5 small squares) of the QRS shows the pattern of LAFB or LPFB Bifascicular block refers to impaired conduction in two of the three fascicles, most commonly a RBBB and left anterior hemiblock; the appearance on an ECG meets the criteria for both types of blocks

**Nonspecific Intraventricular Block**

- QRS duration  $>120$  msec
- absence of definitive criteria for LBBB or RBBB

**Table 2. Hypertrophy/Chamber Enlargement**

Left Ventricular Hypertrophy	Right Ventricular Hypertrophy
S in V1 + R in V5 or V6 $>35$ mm above age 40, ( $>40$ mm for age 31-40, $>45$ mm for age 21-30) R in aVL $>11$ mm R in I + S in III $>25$ mm Additional criteria LV strain pattern (asymmetric ST depression and T wave inversion in leads I, aVL, and V4-V6) Left atrial enlargement N.B. The greater the number of criteria, the more likely the diagnosis is LVH. If only one voltage criteria present, it is called minimal voltage criteria for LVH (may be a normal variant)	Right axis deviation R/S ratio $>1$ or qR in lead V1 RV strain pattern: ST segment depression and T wave inversion in leads V1-2
<b>Left Atrial Enlargement</b> Biphasic P wave with the negative terminal component of the P wave in lead V1 $\geq 1$ mm wide and $\geq 1$ mm deep P wave $>100$ msec, could be notched in lead II ("P mitrale")	<b>Right Atrial Enlargement</b> P wave $>2.5$ mm in height in leads II, III, or aVF ("P pulmonale")

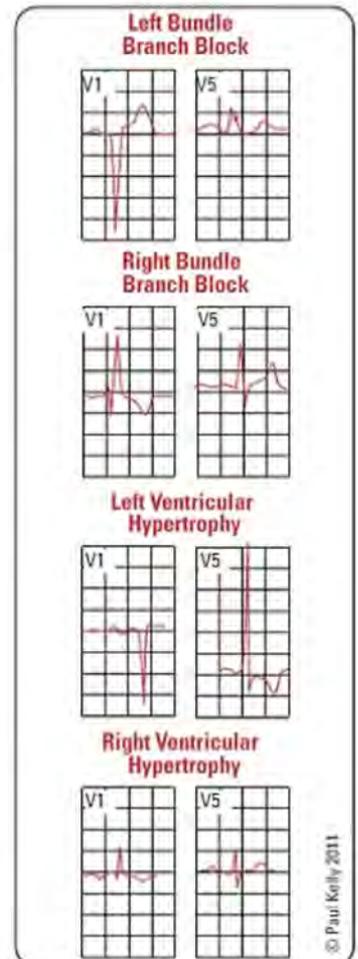

**Differential Diagnosis for Right Axis Deviation**

- Normal variant (vertical heart with an axis of  $90^\circ$ )
- RVH
- Left posterior hemiblock
- Pulmonary embolism
- COPD
- Lateral MI
- WPW
- Dextrocardia
- Septal defects

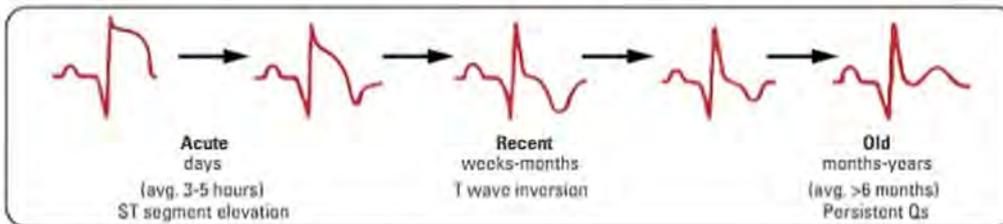

**Figure 7. Axial reference system**  
Each lead contains a (+) are a displayed by the bold arrows. Impulses traveling toward the positive region of the lead result in an upward deflection in that lead. Normal QRS axis is between  $-30^\circ$  and  $+90^\circ$

**Figure 8. Complete LBBB, RBBB, LVH, and RVH** (please see online examples for the full range of waveforms and the text for additional characteristics)

**ISCHEMIA/INFARCTION**

- look for the anatomic distribution of the following ECG abnormalities (see Table 3)
  - ischemia
    - ST segment depression
    - T wave inversion (most commonly in V1-V6)
  - injury/infarct
    - transmural (involving the epicardium)
      - ST elevation in the leads facing the injured/infarcted area
    - subendocardial
      - marked ST depression in the leads facing the affected area
  - may be accompanied by enzyme changes and other signs of MI

**Figure 9. Typical ECG changes with infarction**  
Note that Q waves may gradually appear over time (not shown here)

- ST elevation
  - new ST elevation in two contiguous leads of >0.1 mV (in all leads other than leads V2-V3)
  - for leads V2-V3: ≥0.2 mV in men ≥40 yr, ≥0.25 mV in men <40 yr, or ≥0.15 mV in women
- “typical” sequential changes of evolving MI
  1. hyperacute T waves (tall, symmetric T waves) in the leads facing the infarcted area, with or without ST elevation
  2. ST elevation (injury pattern) in the leads facing the infarcted area
    - usually in the first hours post-infarct
    - in acute posterior MI, there is ST depression in V1-V3 (reciprocal to ST elevation in the posterior leads that are not recorded in the standard 12-lead ECG) hence get a 15-lead ECG
  3. significant Q waves: >40 msec or >1/3 of the total QRS amplitude and present in at least 2 consecutive leads in the same territory (hours to days post-infarct)
    - Q waves of infarction may appear in the very early stages, with or without ST changes
    - non-Q wave infarction: there may be only ST or T changes despite clinical evidence of infarction
  4. inverted T waves (one day to weeks after infarction)
- completed infarction
  - abnormal Q waves (Q waves may be present in lead III in normal individuals due to initial septal depolarization)
  - duration >40 msec (>30 msec in aVF for inferior infarction)
  - Q wave is >1/3 of the total QRS amplitude
  - present in at least 2 consecutive leads in the same territory
  - abnormal R waves (R/S ratio >1, duration >40 msec) in V1, and occasionally in V2, are found in posterior infarction (usually in association with signs of inferior and/or lateral infarction)

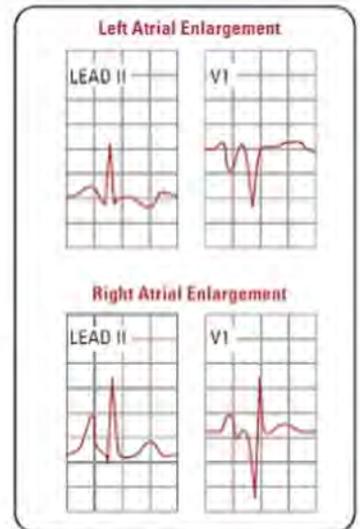

**Table 3. Areas of Infarction/Ischemia (right dominant anatomy)**

Vessel Usually Involved	Infarct Area (LAD and LCx)	Leads (LAD and LCx)
LAD	Anteroseptal	V1, V2
	Anterior	V3, V4
	Anterolateral	I, aVL, V3-6
	Extensive anterior	I, aVL, V1-6
RCA	Inferior	II, III, aVF
	Right ventricle	V3R, V4R (right-sided chest leads)
	Posterior MI (associated with inferior MI)	V1, V2 (prominent R waves)
LCx	Lateral	I, aVL, V5-6
	Isolated posterior MI	V1, V2 (prominent R waves)

**MISCELLANEOUS ECG CHANGES**

**Electrolyte Disturbances**

- hyperkalemia
  - mild to moderate (K<sup>+</sup> 5-7 mmol/L): tall, peaked T waves
  - severe (K<sup>+</sup> >7 mmol/L): progressive changes whereby P waves flatten and disappear, QRS widens and may show abnormal morphology, axis shifts left or right, ST shift with tall T waves, eventually becomes a “sine wave” pattern
- hypokalemia
  - ST segment depression, prolonged QT interval (with risk for Torsades de Pointes VT if extreme), low T waves, prominent U waves (U>T)
  - enhances the toxic effects of digitalis

**Figure 10. LAE, RAE** (please see online examples and the text for characteristics)

**Pacemakers**

- Atrial pacemaker has discharge (“spike”) prior to P wave
- Ventricular pacemaker has a pacemaker spike prior to the QRS which is usually broader with a LBBB morphology

- hypercalcemia
  - shortened QT interval (more extracellular  $\text{Ca}^{2+}$  means shorter plateau in cardiac action potential)
- hypocalcemia
  - prolonged QT interval (less extracellular  $\text{Ca}^{2+}$  means longer plateau in cardiac action potential)

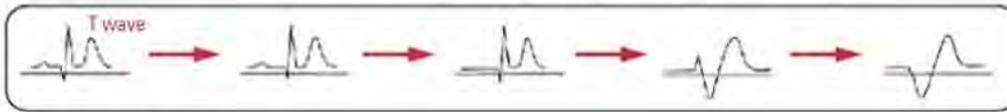

Figure 11. Hyperkalemia

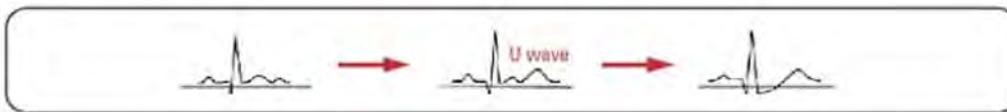

Figure 12. Hypokalemia

### Hypothermia

- sinus bradycardia
- when severe, prolonged QRS and QT intervals
- AFib with slow ventricular response and other atrial/ventricular dysrhythmias
- Osborne J waves: "hump-like" waves at the junction of the J point and the ST segment

### Pericarditis

- early: diffuse ST segment elevation  $\pm$  PR segment depression, upright T waves
- later: isoelectric ST segment, flat or inverted T waves
- $\pm$  tachycardia

### Drug Effects

- digitalis (cardiac glycoside) poisoning rare in 2021;  $<1/1000$  cardiac patients overall
  - therapeutic levels may be associated with "digitalis effect"
    - ST downsloping or "scooping"
    - T wave depression or inversion
    - QT shortening  $\pm$  U waves
    - slowing of ventricular rate in AFib
    - most common rhythm disturbance: PVCs
  - toxic levels associated with:
    - arrhythmias: paroxysmal atrial tachycardia (PAT) with conduction block, severe bradycardia in AFib, accelerated junctional rhythms, PVCs, VT (see *Arrhythmias, C19*)
    - "regularization" of ventricular rate in AFib due to complete heart block with junctional escape rhythm
- amiodarone, quinidine, phenothiazines, mood stabilizing medications (including tricyclic antidepressants and antipsychotics), some antihistamines, antifungals, and some antibiotics
  - prolonged QT interval, U waves

Figure 14. AFib, ST change due to digitalis ("digitalis effect")

### Pulmonary Disorders

- cor pulmonale (often secondary to COPD)
  - low voltage, right axis deviation (RAD), poor R wave progression in precordial leads
  - RAE and RVH with strain
  - multifocal atrial tachycardia
- massive pulmonary embolism
  - sinus tachycardia and AFib/atrial flutter are the most common arrhythmias
  - RAD, RVH with strain
  - most specific sign is S1Q3T3 (S in I, Q and inverted T wave in III) but rather uncommon

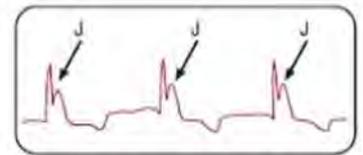

Figure 13. Osborne J waves of a hypothermic patient

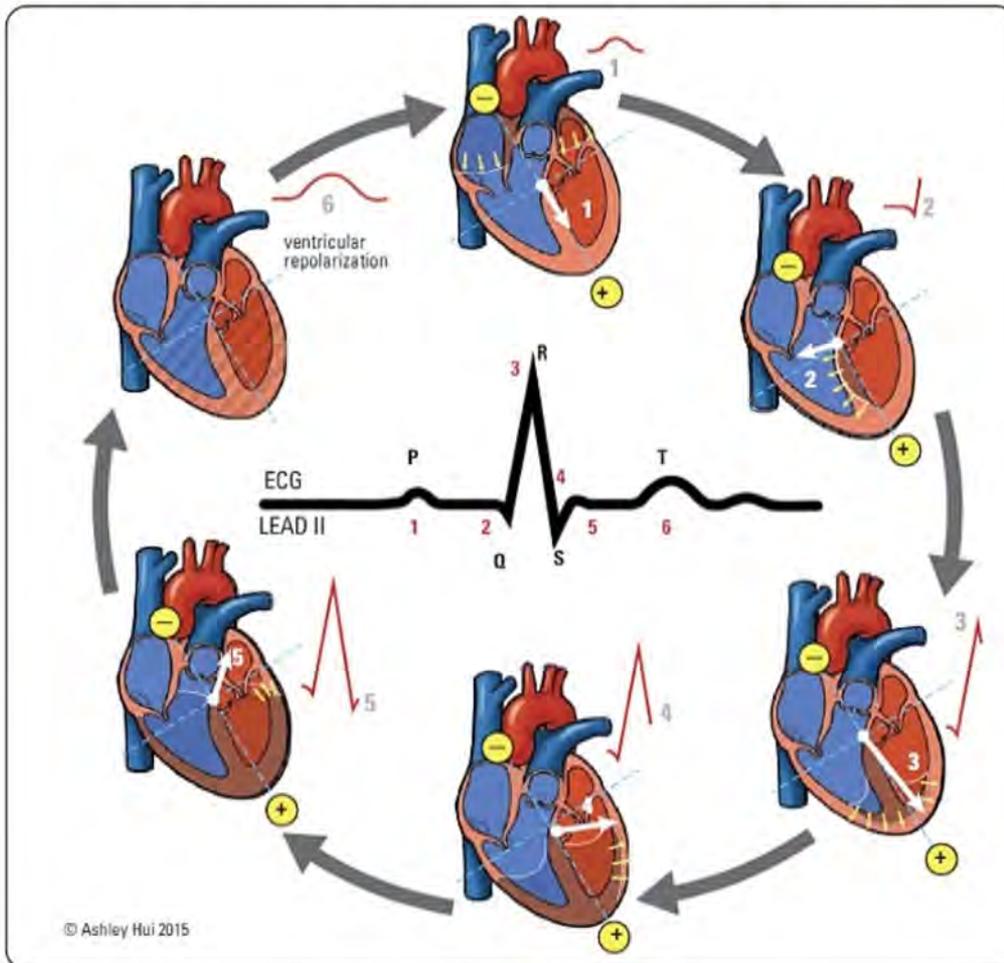

#### Digitalis Side Effects

Palpitations, fatigue, visual changes (yellow vision), decreased appetite, hallucinations, confusion, and depression

## Alternative PQRSTU Approach to ECGs

Note: the PQRSTU Approach is organized a different way based on the anatomy of the ECG

### PQRSTU Approach to ECGs

- P wave
- P-R interval
- QRS complex
- ST segment
- T wave
- Q-T interval
- U wave

Figure 15. ECG correlations with heart activity

### P WAVE

- the P wave represents atrial contraction, best seen in leads: II and V1
  - lead II: the P wave should be rounded, <120 msec and <2.5 mm in height
  - lead V1: the P wave is biphasic with a positive phase slightly greater than the negative phase
- atrial flutter: "sawtooth" P wave with continuous atrial activity at 300 bpm indicates the interval (Hints: flip the ECG upside-down and check inferior leads (II, III, and aVF) to see it better)
- AFib: absent P wave, may have fibrillatory wave, irregular rhythm
- RAE: tall P wave (>2.5 mm) in II or VI (P pulmonale)
- LAE: biphasic P wave with negative deflection >1 mm deep or >1 mm wide in V1, wide (>100 msec) notched P wave in II may be present (P mitrale)

### P-R INTERVAL

- the P-R interval indicates the interval between sinus node activation and the start of ventricular depolarization
  - includes the impulse traveling through the atria, the AV node, and the bundle of His. The magnitude of the conduction velocity is referred to as "dromotropy" (faster = positive dromotropy, slower = negative dromotropy)
  - positive dromotropy associated with increased conduction velocity (e.g. sympathetic stimulation), while negative dromotropy is associated with decreased velocity (e.g. vagal stimulation)
- P-R interval should be 120-200 msec
- long P-R interval (>200 msec)
  - heart block (may be due to disease, delay in the AV node, or delay in distal (His-Purkinje) conduction system)
    - first degree: fixed, prolonged P-R interval (though every P wave has a QRS following)
    - second and third degree AV block: some P waves are NOT followed by a QRS
    - second degree Mobitz I (Wenckebach): gradual prolongation of the P-R interval precedes a dropped P wave
    - second degree Mobitz II (Hay): fixed P-R interval with ratio of atrial to dropped ventricular beats (e.g. for every 3 atrial beats, there is one ventricular beat (3:1))
    - third degree/complete: constant P-P and R-R intervals but variable P-R intervals

### Significant ECG Changes

- Look for ST changes starting at 60 msec from J point
- J point = the junction between the QRS complex and the ST segment
- ST elevation: at least 1 mm in 2 adjacent limb leads, or at least 1-2 mm in adjacent precordial leads
- ST depression: downsloping or horizontal
- Q Wave: pathological if Q wave  $\geq 1$  small square ( $\geq 40$  msec) or  $>1/3$  of the total QRS amplitude

- hypokalemia
- "trifascicular" block: long PR segment (first degree AV block) and bifascicular block
- short P-R interval (<120 msec)
  - pre-excitation syndrome (delta wave: upsloping of the first part of the QRS complex) due to accessory pathways
  - low atrial rhythm, P waves inverted in II, III, and aVF

### QRS COMPLEX

- represents ventricular contraction
- rate: check if R-R interval matches the P-P interval
- amplitude: check for hypertrophy (see *Table 2, C8*)
- narrow QRS (<120 msec) means that the His-Purkinje system is being used
- wide QRS (>120 msec) means that the His-Purkinje system is being bypassed or is diseased
  - BBB, VT, ventricular hypertrophy, cardiomyopathy, WPW, ectopic ventricular beat, hyperkalemia, or drugs (e.g. tricyclic antidepressants, antiarrhythmics)
- Q wave: the first downward deflection of the QRS complex
  - significant Q wave (>40 msec or >1/3 of total QRS amplitude) indicates myocardial necrosis (new or old)
- R and S wave abnormalities typically show pathology in terms of BBB or intraventricular abnormalities

### ST SEGMENT

- located between QRS complex and the beginning of T wave
  - corresponds to the completion of ventricular depolarization
- normally at the same level as baseline (T-P segment)
- ST elevation: see *Infarction, C9*
- ST depression: ischemia
  - ischemia that causes ST depression can result in myocardial damage (NSTEMI)
  - lateral ST depression (leads I, aVL, V5, V6) may actually indicate a STEMI in the right heart
  - ST depression may be nonspecific, or associated with remote MI or ischemia

### T WAVE

- repolarization phase of ventricles (repolarization of the atria is obscured by the QRS complex)
- typically positive (except in aVR and V1) on ECG but normal isolated negative T waves may be present (especially in V1 and V2)
- T wave variation in consecutive leads may indicate pathology
  - inversion: BBB, ischemia, hypertrophy, drugs (e.g. digitalis), pulmonary embolism (lead III as part of S1Q3T3 sign)
  - elevation: infarction (STEMI, Prinzmetal, hyperacute), hyperkalemia (wider, peaked)
  - flattened: hypokalemia, pericarditis, drugs (e.g. digitalis), pericardial effusion
    - ♦ flat T waves are nonspecific with no clinical significance (common)
  - variations: T wave alternans; beat-to-beat variations due to PVC overlap (R on T phenomenon which may precipitate VT or VFib)
- appropriate T wave discordance: in BBB, T wave deflection should be opposite to that of the terminal QRS deflection (i.e. T wave negative if ends with R or R'; positive if ends with S)
  - inappropriate T wave concordance suggests ischemia or infarction

### Q-T INTERVAL

- duration of ventricular depolarization plus repolarization; often difficult to interpret
- corrected QT (QTc) corrects for the repolarization duration (since QT interval normally shortens with increased HR)
  - $QTc = QT \div \sqrt{RR}$  (Bazett's formula. NOTE: Bazett formula is inaccurate at rapid rates (e.g. > 100/min))
- normal QTc is 360-450 msec for males and 360-460 msec for females
  - increased (>450 msec for males and >460 msec for females): risk of Torsades de Pointes (lethal tachyarrhythmia; rare if <520 msec)
    - ♦ genetic long QT syndrome (often a channelopathy)
    - ♦ drugs: antiarrhythmics (classes I and III), antipsychotics (haloperidol, ziprasidone), antidepressants (citalopram), antibiotics (erythromycin, azithromycin)
    - ♦ electrolytes: low  $Ca^{2+}$ , low  $K^+$ , low  $Mg^{2+}$
    - ♦ others: hypothyroidism, hypothermia, cardiomyopathy
  - decreased (<360 msec): risk of VFib (very rare)
    - ♦ electrolytes: high  $Ca^{2+}$
    - ♦ drugs: digoxin
    - ♦ others: hyperthyroidism

### U WAVE

- origin unclear but may be repolarization of Purkinje fibres or delayed/prolonged repolarization of the myocardium
- more visible at slower heart rates
- deflection follows T wave with <25% of the amplitude
- variations from norm could indicate pathologic conditions
  - prominent (>25% of T wave): electrolyte (low  $K^+$ ), drugs (digoxin, antiarrhythmics)
  - inverted (from T wave): ischemia, volume overload

#### Insignificant Q Wave

- Septal depolarization by the left bundle
- Seen in leads I, II, III, aVL, V5, and V6
- <40 msec
- Q wave <1/3 of the total QRS amplitude

#### Differential Diagnosis of ST Segment Changes

**ST Elevation – I HELP A PAL**  
 Ischemia with reciprocal changes  
 Hypothermia (Osborne waves)  
 Early repolarization (normal variant, need old ECGs to confirm)  
 LBBB  
 Post-MI  
 Acute STEMI  
 Prinzmetal's (Vasospastic) angina  
 Acute pericarditis (diffuse changes)  
 Left/right ventricular aneurysm

#### ST Depression – WAR SHIP

WPW syndrome  
 Acute NSTEMI  
 RBBB/LBBB  
 STEMI with reciprocal changes  
 Hypertrophy (LVH or RVH) with strain  
 Ischemia  
 Post-MI

## Cardiac Biomarkers

- provide diagnostic and prognostic information in acute coronary syndromes and in HF

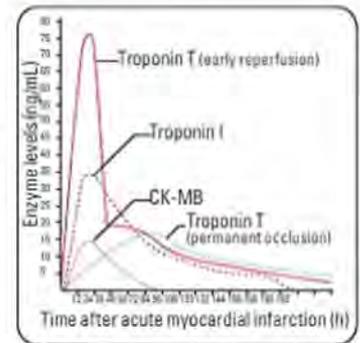

**Table 4. Cardiac Enzymes**

Enzyme	Peak	Duration Elevated	DDx of Elevation
Troponin I, Troponin T	12-24 h	Up to 2 wk	MI, CHF, AFib, acute PE, aortic dissection, myocarditis, pericarditis, endocarditis, cardiac defibrillation, myocardial damage, infiltrative cardiomyopathy, ischemic stroke, intracranial hemorrhage, acute hypotension, chronic renal insufficiency, sepsis, hypovolemia, acute respiratory distress syndrome, chronic hypertension, diabetes mellitus, hypothyroidism, rhabdomyolysis
Creatine Kinase-MB (CK-MB)	1 d	3 d	MI, myocarditis, pericarditis, muscular dystrophy, cardiac defibrillation, chronic renal insufficiency

- timing for troponin measurements is dependent on the assay used
  - high-sensitivity troponin I and T assays detect elevations in cardiac troponin earlier than traditional assays
- new CK-MB elevation can be used to diagnose re-infarction
- other biomarkers of cardiac disease
  - CK-MB, AST, and lactate dehydrogenase (LDH) also increases in MI (low specificity)
  - BNP and N-terminal prohormone of BNP (NT-proBNP): secreted by ventricles in response to increased end-diastolic pressure and volume
    - DDx of elevated BNP: CHF, AFib, PE, pulmonary HTN

## Ambulatory ECG

- description
  - provides a view of two or three leads of electrocardiographic data over an extended period of time
  - permits evaluation of changing dynamic cardiac electrical phenomena
  - the choice of monitor depends on the patient's reported symptom frequency
    - if daily symptoms, use a 24 h or 48 h continuous ECG (Holter) monitor
    - if less frequent (i.e. weekly or monthly), use prolonged continuous monitoring (1-2 wk) or an event monitor
  - continuous ambulatory monitor:** a small, lightweight, battery-operated recorder (box or patch) which records two or three channels of electrocardiographic data
    - patient activated event markers
    - minimum of 24-72 h, up to 14 d
  - implantable loop recorder (ILR):** subcutaneous monitoring device for the detection of cardiac arrhythmias
    - typically implanted in the left pectoral region and stores events when the device is activated automatically according to programmed criteria or manually with magnet application
    - generally used for months to years
    - note: devices implanted for bradyarrhythmias (pacemakers) or tachyarrhythmias (defibrillators) also record rhythm continuously and have algorithms for automatic rhythm detection and storage
  - external event monitor**
    - post-event monitoring device: placed on patient's chest after symptom onset and records "real-time" rhythm for a specified period (e.g. 30-150 s)
    - event/loop recorder: constantly records patient's rhythm for a period of time but only saves the data when the patient experiences symptoms and presses the event button (usually 30-60 s recall)
    - auto-triggered event recorder: uses programmed algorithms to auto-detect, capture, and save asymptomatic arrhythmias in addition to patient-triggered events
  - patient administered single lead ECG**
    - wrist or finger electrodes, commercially available direct to consumer (e.g. Apple Watch, Kardia Mobile)
- indications
  - evaluation of cardiac rhythm abnormalities, especially as they correlate with symptoms and provoking factors
  - has also been used for assessing pacemaker and implantable cardioverter-defibrillator function, evidence of myocardial ischemia, late potentials, and HR variability

**Figure 16. Cardiac enzymes**

## Echocardiography

### Transthoracic Echocardiography

- **description**
  - non-invasive ultrasound directed across the chest wall to obtain real time images of the heart
- **indications**
  - evaluation of cardiac anatomy and functioning including: chamber size, wall thickness, wall motion, valve morphology, proximal great vessel morphology, and LVEF
  - evaluation of clinical cardiac abnormalities including: chest pain with hemodynamic instability, peripheral edema with elevated JVP, murmurs, unexplained hypotension, and syncope with suspected structural cardiac cause
  - evaluation of suspected cardiac diseases including: aortic dissection, congenital heart disease, LV thrombus, MI, pericardial effusion, and pericardial tamponade

### Transesophageal Echocardiography

- **description**
  - ultrasound probe inserted into the esophagus to allow for better resolution of the heart and structures
  - better visualization of posterior structures, including LA, mitral, aortic valves, and inter-atrial septum
- **indications**
  - initial test in certain life-threatening situations (e.g. aortic dissection) when other tests contraindicated (e.g. CT angiography in patient with renal failure or when TTE is technically inadequate)
  - key indication is to evaluate valvular morphology, vegetation (e.g. infective endocarditis), and function (e.g. stenosis and regurgitation) especially of the aortic, mitral, and prosthetic valves if present
  - evaluate cardiac disease including: aortic dissection, aortic atheromas, intracardiac thrombi, tumours, and shunts
  - evaluation for left atrial thrombus/left atrial appendage thrombus in a patient with AFib/atrial flutter to facilitate clinical decision making regarding electrical cardioversion or ablation
- **risks**
  - serious complications are extremely rare (<1 in 5000)
  - esophageal perforation
  - gastrointestinal bleeding
  - pharyngeal hematoma

### Stress Echocardiography

- **description**
  - echocardiography using exercise (treadmill or bicycle) or pharmacologic agents (dobutamine or adenosine) as physiological stressor
- **indications**
  - when other stress imaging modalities are unequivocal or when ECG is non-diagnostic
  - intermediate pre-test probability with normal/equivocal exercise ECG
  - post-ACS to decide on potential efficacy of revascularization (i.e. myocardial viability)
  - evaluate the clinical significance of valvular heart disease: AS, MS, MR, or AR
  - evaluation of cardiac disease: LV systolic dysfunction of unclear etiology, latent or established pulmonary HTN, LVOT obstruction in HCM, and syncope of unclear etiology
  - dobutamine
    - pharmacologic stress for patients physically unable to exercise; same indications as exercise stress echo
    - low dose dobutamine stress echo can be used to assess myocardial viability and to assess AS with LV systolic dysfunction
- **contraindications**
  - absolute contraindications to exercise testing (see below)
  - contraindications to dobutamine stress echocardiography: tachyarrhythmias and systemic hypertension
  - relative contraindications to both exercise and dobutamine stress echocardiography: AAA, electrolyte abnormalities, left main CAD, and moderate stenotic valvular disease

### Contrast Echocardiography with Agitated Saline Contrast

- **description**
  - Improves visualization and provides real-time assessment of intracardiac blood flow
  - conventional agent is agitated saline (contains microbubbles of air)
  - visualization of right heart and intracardiac shunts, most commonly PFO and intrapulmonary shunt
  - in a normal heart, microbubbles are still seen but only in the right heart and eventually diffuse into lungs after travelling through pulmonary circulation

### • indications

- detection of right-to-left shunts the presence of microbubbles in the left heart chambers indicates a right-to-left intracardiac or extracardiac shunt
- Doppler signal enhancement agitated saline enhances tricuspid Doppler signals; this could be used to assess transvalvular velocity and to estimate right ventricular systolic pressure
- diagnosis of persistent left superior vena cava if contrast injected in left arm vein appears in the coronary sinus before the RA

### Contrast Echocardiography with Transpulmonary Contrast Agents

#### • description

- newer contrast agents such as Definity® contrast can cross the pulmonary bed and achieve left heart opacification following intravenous injection; these contrast agents improve visualization of endocardial borders and enhance evaluation of LVEF and wall motion abnormalities (in patients with technically inadequate echocardiograms) and intracardiac mass (e.g. LV thrombus)

#### • risks

- major complications (e.g. risk of non-fatal MI and death are rare)
- ultrasound contrast agents may cause back pain, headache, urticaria, and anaphylaxis
- caution in patients with significant intra-cardiac shunts

## Stress Testing

### EXERCISE TESTING

#### • description

- cardiovascular stress test that uses treadmill or bicycle exercise with electrocardiographic and blood pressure monitoring for the detection of inducible myocardial ischemia, exercise related symptoms (e.g. arrhythmias), or objective measures of exercise tolerance
- exercise test results stratify patients into 3 risk groups:
  1. low-risk: can treat medically without invasive testing
  2. intermediate-risk: may need additional testing in the form of exercise imaging studies or cardiac catheterization
  3. high-risk: refer for cardiac catheterization

#### • indications

- patients with intermediate (10-90%) pretest probability of myocardial ischemia (usually due to CAD) based on age, gender, and symptoms
- ST depression <1 mm at rest, LBBB, digoxin or estrogen use make the ST changes difficult to interpret however, graded exercise stress test can still be valuable
- important prognostic and diagnostic information (beyond ST changes) is obtained from symptoms, total exercise time, HR, and BP response to exercise, if arrhythmia is provoked
  - note: this is a diagnostic test with false positives and false negatives. Management needs to take into account symptoms and exercise tolerance

#### • absolute contraindications

- acute MI (within 2 d) or unstable angina pectoris
- uncontrolled arrhythmias causing symptoms of hemodynamic compromise
- symptomatic severe valvular stenosis
- uncontrolled symptomatic HF
- active endocarditis, acute myocarditis, or pericarditis
- acute aortic dissection
- acute pulmonary or systemic embolism
- acute non-cardiac disorders that may affect exercise performance or may be aggravated by exercise
- termination of exercise testing
  - target HR achieved
  - patient's desire to stop
  - drop in sBP of >10 mmHg from baseline despite an increase in workload, when accompanied by other evidence of ischemia
  - moderate to severe angina
  - ST elevation (>1 mm) in leads without diagnostic Q-waves (other than V1 or aVR)
  - increasing nervous system symptoms (e.g. ataxia, dizziness, or near syncope)
  - signs of poor perfusion (cyanosis or pallor)
  - technical difficulties in monitoring ECG or sBP
  - sustained VT

#### • risks

- death, MI, arrhythmia, hemodynamic instability, and orthopaedic injury (<1-5/10000 supervised tests)

#### Most Commonly Used Treadmill Stress Test Protocols

- The Bruce Protocol: 7 stage test with each successive stage, the treadmill increases in both speed (2.7 km/h to 9.6 km/h) and grade (10% with a 2% increase per stage up to 22%)
- The Modified Bruce, Modified Naughton Protocol: for older individuals or those with limited exercise capacity

#### Important Contraindications to Exercise Testing

- Acute MI, aortic dissection, pericarditis, myocarditis, PE
- Severe AS, arterial HTN
- Inability to exercise adequately

#### Important Prognostic Factor Duke Treadmill Score (DTS) Weighted Index Score

- Treadmill exercise time using standard Bruce protocol
  - Maximum net ST segment deviation (depression or elevation)
  - Exercise-induced angina provides diagnostic and prognostic information (such as 1 yr mortality)
- DTS = exercise time – (5 x MaxST) – (4 x angina index)
- Angina index: 0 (no angina), 1 (angina but not exercise-limiting), 2 (exercise-limiting angina)
- DTS ≥5: 0.25% 1 yr mortality  
 DTS 4 to -10: 1.25% 1 yr mortality  
 DTS ≤ -11: 5.25% 1 yr mortality
- Ann Intern Med 1987;106:793-800

Patients with normal imaging (nuclear perfusion or stress echo) studies at peak stress have a <1%/yr incidence of death or nonfatal MI and are thus often spared further invasive evaluation

**NUCLEAR CARDIOLOGY****• description**

- MPI with ECG-gated single photon emission computed tomography (SPECT), using radiolabelled tracer
- evaluates myocardial viability, detects ischemia, and assesses perfusion and LV function simultaneously
- predicts the likelihood of future cardiac events independent of the patient's history, examination, resting ECG, and stress ECG
- often denoted as MIBI scan with reference to radiolabelled tracer (sestamibi)
- stress with either treadmill or IV vasodilator stress (e.g. dipyridamole, adenosine, regadenoson)
- images of the heart obtained during stress and at rest 3-4 h later
- tracers
  - Thallium-201 ( $^{201}\text{Tl}$ , a  $\text{K}^+$  analogue)
  - Technetium-99 ( $^{99\text{Tc}}$ )-labeled tracer (sestamibi/Cardiolite<sup>®</sup> or hexamibi/Myoview<sup>®</sup>)

**• indications**

- to diagnose CAD in possible ACS patients with non-diagnostic ECG and negative serum biomarker
- exercise MPI
  - when ECG cannot be interpreted appropriately due to LBBB or abnormal baseline ECG
  - intermediate pre-test probability with normal/equivocal exercise ECG
  - in patients with previous imaging whose symptoms have changed
  - to diagnose ischemia
- dipyridamole/adenosine MPI
  - exercise testing is always preferred
  - pharmacological stress imaging test for patients who cannot exercise or do not want to hold cardiac medications ( $\beta$ -blockers/CCBs)
  - same indication as exercise MPI

**• contraindications**

- vasodilators (i.e. adenosine, regadenoson, and dipyridamole) are contraindicated in patients with hypotension, sick sinus syndrome, high-degree AV block (in the absence of backup pacemaker capability), and reactive airways disease
- pregnancy

**• risks**

- radiation exposure

**STRESS ECHOCARDIOGRAPHY**

- see *Echocardiography*, C14

**Cardiac Catheterization and Angiography****Right Heart Catheterization (Swan-Ganz Catheter)****• description**

- also known as pulmonary artery catheterization
- obtain direct measurements of central venous, right-sided intracardiac, pulmonary artery, and pulmonary artery occlusion pressures
- can estimate CO, SVR, and PVR as well as mixed venous oxyhemoglobin saturation, oxygen delivery, and oxygen uptake
- right atrial, right ventricular, and pulmonary artery pressures are recorded
- can also be used to measure the Cardiac Index (CI), a measure of cardiac function
  - $\text{CI} = \text{CO}/\text{body surface area}$
  - 2.6-4.2 L/min/m<sup>2</sup> is considered normal while <1.8 L/min/m<sup>2</sup> usually means cardiogenic shock
- PCWP
  - obtained by advancing the catheter to wedge in the distal pulmonary artery
  - records pressure measured from the pulmonary venous system
  - in the absence of pulmonary venous disease, reflects left atrial pressure

**• indications**

- unexplained or unknown volume status in shock
- severe cardiogenic shock (e.g. acute valvular disease, suspected pericardial tamponade)
- suspected or known pulmonary artery HTN
- severe underlying cardiopulmonary disease (e.g. congenital heart disease, left-to-right shunt, severe valvular disease, pulmonary HTN) and undergoing surgery (e.g. corrective)

**• contraindications**

- infection at the insertion site
- presence of a right VAD
- insertion during cardiopulmonary bypass

• risks

- complications for diagnostic catheterization: <1%
- inadequate diagnostic procedures occur in <1% of cases
- complications of insertion: atrial and/or ventricular arrhythmias (~3% of patients)
- catheter misplacement or knotting (uncommon)
- perforation of a cardiac chamber and rupture of a cardiac valve or the pulmonary artery (rare)
- complications of catheterization: pulmonary artery rupture, pulmonary infarction, thromboembolic events, infection, and data misinterpretation
- within 24 h of catheterization: death, MI, or stroke (0.2% to 0.3% of patients)

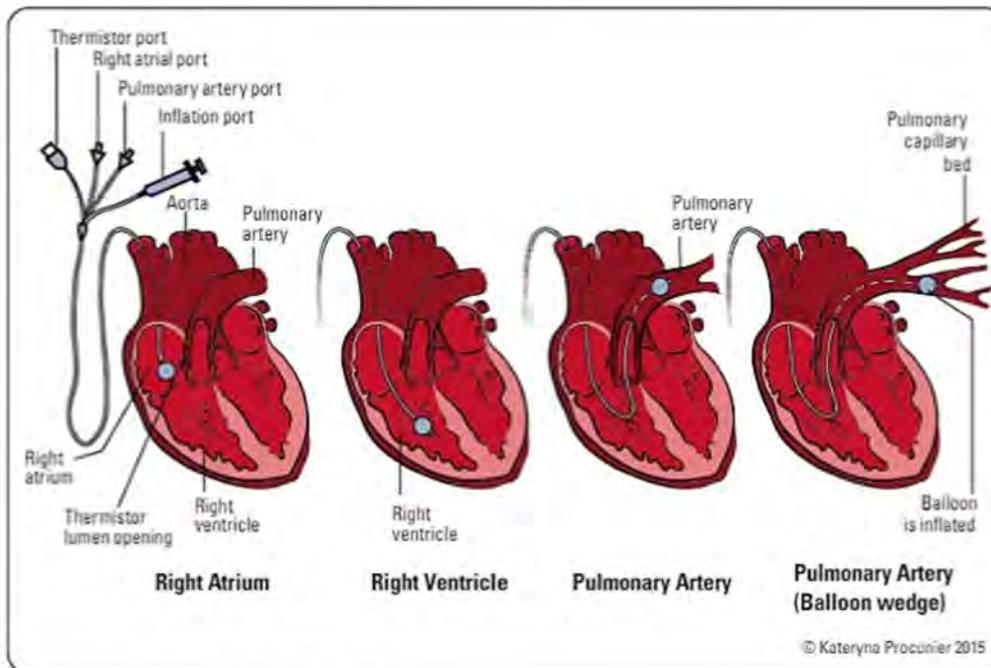

Figure 17. Swan-Ganz catheter placement

**Left Heart Catheterization**

• description

- accomplished by introducing a catheter into the radial, brachial, or femoral artery and advancing it through the aorta, across the aortic valve, and into the LV
- evaluates mitral and aortic valvular defects and myocardial disease
- systolic and end-diastolic pressure tracings recorded
- LV size, wall motion, and ejection fraction can be assessed by injecting contrast into the LV (left ventriculography) via femoral/radial artery catheterization

• indications

- identification of the extent and severity of CAD and evaluation of left ventricular function
- assessment of the severity of valvular or myocardial disorders (e.g. AS or insufficiency, MS or insufficiency, and various cardiomyopathies) to determine the need for surgical correction
- collection of data to confirm and complement non-invasive studies
- investigating CAD in patients with confusing clinical features or chest pain of uncertain origin

• contraindications

- severe uncontrolled HTN
- ventricular arrhythmias
- acute stroke
- severe anemia
- active gastrointestinal bleeding
- allergy to radiographic contrast
- acute renal failure
- uncompensated congestive failure (patient cannot lie flat)
- unexplained febrile illness or untreated active infection
- electrolyte abnormalities (e.g. hyperkalemia)
- severe coagulopathy

• risks

- major complications of diagnostic catheterization (i.e. death, MI, stroke): <3 in 1000
- minor complications (e.g. vascular access issue, kidney dysfunction): <1 in 100
- inadequate diagnostic procedures occur in <1% of cases

Chambers	Pressure (systolic; mmHg)
Right atrium/central venous	1-8
Right ventricle	1-8 (15-30)
Pulmonary artery	4-12 (15-30)
Left atrium/pulmonary capillary wedge	4-12
Left ventricle end diastolic	4-12

## Coronary Angiography

- **description**
  - radiographic visualization of the coronary vessels after injection of radiopaque contrast media
  - coronary vasculature accessed via the coronary ostia
- **indications**
  - to define the coronary anatomy and the degree of luminal obstruction of the coronary arteries
  - to determine the presence and extent of obstructive CAD
  - to assess the feasibility and appropriateness of various forms of therapy, such as revascularization by percutaneous or surgical interventions
  - can be used when the diagnosis of CAD is uncertain and cannot be excluded by non-invasive techniques
- **contraindications**
  - severe renal failure due to contrast agent toxicity (must check patient's renal status)
- **risks**
  - major complications of diagnostic catheterization (i.e. death, MI, stroke): <3 in 1000
  - minor complications (e.g. vascular access issue, kidney damage): <1 in 100

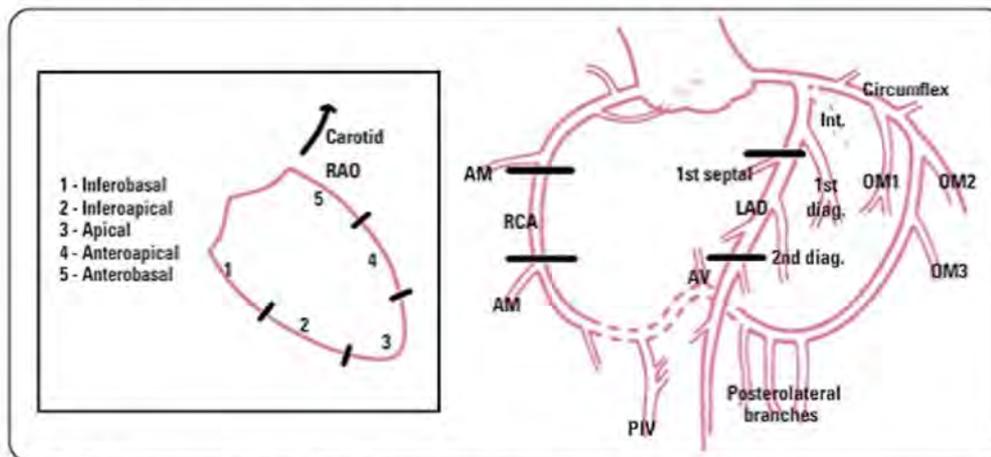

Figure 18. Coronary angiogram schematic

AM = acute marginal; LAD = left anterior descending; OM = obtuse marginal; RAO = right anterior oblique; RCA = right coronary artery

### Diagnostic Catheterization

- provocative pharmacological agents can be used to unmask pathology
  - fluid loading may unmask latent pericardial constriction
  - afterload reduction or inotropic stimulation may be used to increase the outflow tract gradient in HCM
  - coronary vasoreactive agents (e.g. methylergonovine, acetylcholine)
  - a variety of pulmonary vasoreactive agents in primary pulmonary HTN (e.g. oxygen, CCBs, adenosine, nitric oxide, prostacyclin)

### Contrast-Enhanced CT Coronary Angiography

- **description:** fast ECG-synchronized multi-slice CT image acquisition in the heart to enable non-invasive imaging of the coronary arterial tree
- **indications:** often used to assess coronary artery and previous graft stenosis/viability that could not be seen during coronary angiography
- sensitivity = 85%, specificity = 90% for the diagnosis of obstructive coronary disease with >50% stenosis
- **contraindications:** allergy to contrast dye; severe renal dysfunction; irregular heart rhythm or tachycardia which may impact image quality
- **risks:** radiation exposure; and contrast induced nephropathy

## Magnetic Resonance Imaging

- **description**
  - offers high spatial resolution, eliminates the need for iodinated contrast, and does not involve exposure to ionizing radiation
  - often used with gadolinium injection to assess myocardial scar
- **indications**
  - valuable in assessment of congenital cardiac anomalies, abnormalities of the aorta, assessment of viable myocardium, and assessment of cardiomyopathies
    - ♦ most accurate measure of ejection fraction
    - ♦ especially valuable for assessing RV

### ACC/AHA 2011 Recommended Indications for Coronary Angiography

- Disabling chronic stable angina (CCS classes II and IV) despite medical therapy
- High-risk criteria on clinical assessment or non-invasive testing
- Serious ventricular arrhythmia or CHF
- Uncertain diagnosis or prognosis after non-invasive testing
- Inability to undergo non-invasive testing

### Coronary Angiography Gold standard for localizing and quantifying CAD

Hemodynamically significant stenosis is defined as 70% or more narrowing of the luminal diameter

- **contraindications**
  - metallic foreign bodies/implants (e.g. pacemaker, ICD, CRT, cerebral aneurysm clips, metal shrapnel, piercings)
  - kidney dysfunction due to gadolinium contrast medium
- **risks**
  - hazards posed by certain metallic devices inside patients

## CARDIAC DISEASE

### Arrhythmias

#### Mechanisms of Arrhythmias

##### Alterations in Impulse Formation

###### A. Normal Automaticity

- impulses from the SA node, caused by spontaneous depolarization, result in the basic cardiac pacemaker function. "Downstream" cells in the AV node and Purkinje fibres also depolarize spontaneously, but at a slower rate; they serve as the "backup" pacemaking cells if the upstream rate is slower than the more distal spontaneous rate
- normal automaticity is influenced by:
  - neurohormonal tone (sympathetic tone increases and parasympathetic tone decreases spontaneous firing rate and thus HR)
  - myocardial ischemia/infarction or other cardiac pathology (e.g. HF) may alter HR via these mechanisms
  - abnormal metabolic conditions (e.g. hypoxia, acidosis, hypothermia)
  - electrolyte abnormalities, especially hyperkalemia which slows HR
  - drugs (e.g. digitalis,  $\beta$ -blockers, CCB)
  - athletic training: endurance athletes often have sinus bradycardia
  - age: elderly often have sinus bradycardia
  - increased circulatory demand can result in sinus tachycardia (e.g. pregnancy, anemia, exercise)

###### B. Abnormal Automaticity due to Triggered Activity (due to Afterdepolarizations)

###### 1. Early Afterdepolarizations

- during the terminal plateau or repolarization phases of action potential
- consequence of the membrane potential transiently becoming more positive during repolarization (depolarization interrupting repolarization)
  - these are called EADs and DADs (early and delayed afterdepolarization, respectively)
- may result in self-maintaining oscillations of depolarization, giving rise to action potentials thereby generating a tachyarrhythmia (e.g. new baseline voltage is greater than threshold, which automatically triggers a new action potential after the refractory period ends)
- EADs are the basis for the arrhythmias associated with QT prolongation, either congenital or acquired; termed "Torsades de Pointes"

###### 2. Delayed Afterdepolarizations

- occur after the action potential has fully repolarized, but before the next usual action potential
- commonly occurs in situations of high intracellular calcium (e.g. digitalis intoxication, ischemia) or during enhanced catecholamine stimulation (e.g. "twitchy" pacemaker cells)

##### Alterations in Impulse Conduction

###### A. Re-Entry Circuits

- the presence of self-sustaining re-entry circuit causes rapid repeated depolarizations in a region of myocardium (see Figure 27, C24, for an example in the context of AV nodal re-entrant tachycardia)
- the conditions necessary for re-entry include block of an impulse into a region of the heart that is refractory (non-excitabile tissue or because of local functional block, where the impulse encounters tissue still in its refractory period), followed by "re-entry" of the impulse around a region of block to the site of origin, forming a complete re-entry circuit
  - e.g. myocardium that is infarcted/ischemic will consist of non-excitabile and partially excitabile zones which will promote the formation of re-entry circuits
  - most sustained tachyarrhythmias are due to re-entry

###### Sinus Arrhythmia

- Normal P waves, with variation of the P-P interval, especially with respiration, due to varying rate of SA node depolarization

###### Respiratory SA

- Seen more often in young adults
- Normal, physiologic results from changes in autonomic tone during respiratory cycle
- Rate increases with inspiration, slows with expiration

###### Non-Respiratory SA

- Seen more often in the elderly
- Can occur in the normal heart; if marked may be due to sinus node dysfunction (e.g. in heart disease or after digitalis toxicity)
- Usually does not require treatment

**B. Conduction Block**

- ischemia, fibrosis, trauma, and drugs can cause transient or permanent, unidirectional or bidirectional block
- most common cause of block is "functional block" due to refractory myocardium (cardiomyocytes are in refractory period) or "anatomical block" (area of myocardium unexcitable due to fibrosis); cells in the conduction system distal to the block can assume pacemaking control if the block occurs along the specialized conduction system
- the consequence of conduction block are reentry arrhythmias (tachyarrhythmias - see above) or failure of impulses to conduct to ventricular cells (bradycardia)
- conduction block in the AV node or His Purkinje tissue can lead to bradycardia

**C. Bypass Tracts**

- normally, the only electrical connection between atria (As) and ventricles (Vs) is the AV node and connected penetrating Bundle of His;
- an accessory bypass tract is a direct connection between A and V, histologically similar to atrial tissue, through the valve ring which is normally impenetrable to electrical impulses (hence "accessory atrio-ventricular bypass tract")
  - see *Pre-Excitation Syndromes, C25*

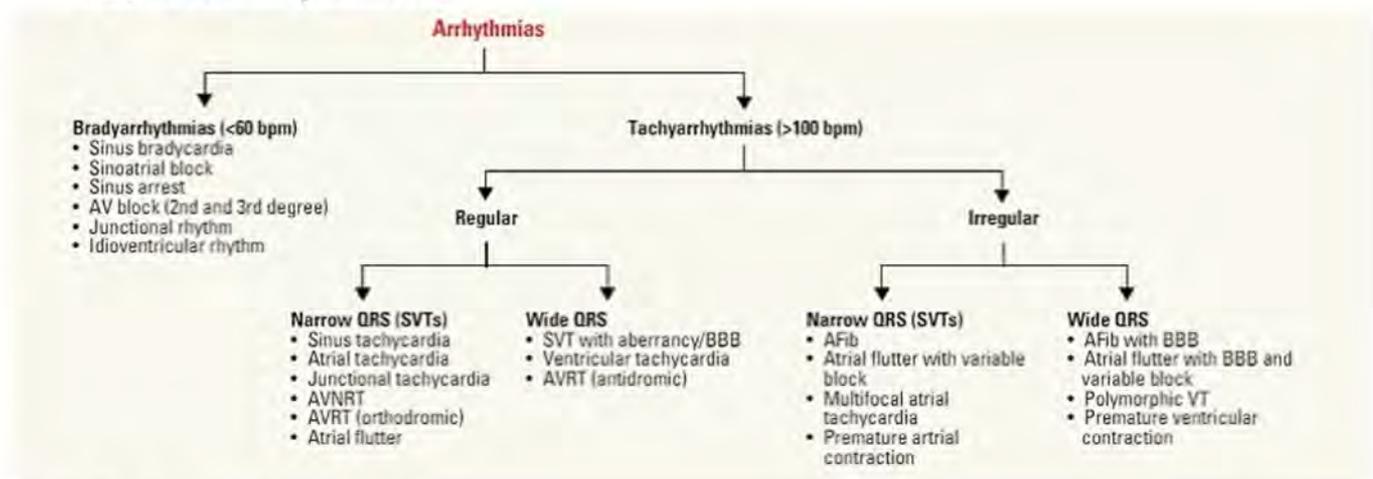

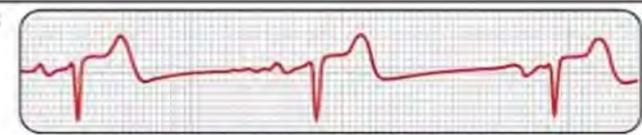

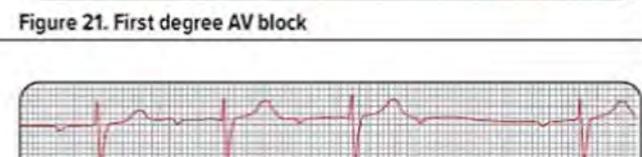

Figure 19. Clinical approach to arrhythmias

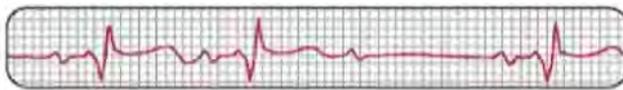

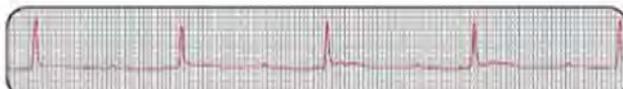

**Bradyarrhythmias**

Third degree AV block (complete heart block) (lead II)</b></p>

## Supraventricular Tachyarrhythmias

### Presentation for SVT (and Pre-Excitation Syndromes)

- presentation can include: palpitations, dizziness, dyspnea, chest discomfort, presyncope/syncope
- may precipitate CHF, hypotension, or ischemia in patients with underlying cardiovascular disease
- untreated tachycardias of long duration (i.e. days) can cause tachycardia-induced cardiomyopathy (rare, potentially reversible with treatment of SVTs)
- arrhythmias involving the AV node (i.e. AVNRT and AVRT) may terminate spontaneously, after vagal stimulation, or after adenosine treatment

### Supraventricular Tachyarrhythmias

- tachyarrhythmias that originate in the atria or involve the AV junction
- this term is used when a more specific diagnosis of mechanism and site of origin cannot be made
- characterized by narrow QRS unless there is pre-existing BBB or aberrant ventricular conduction (abnormal conduction due to a change in cycle length)

#### 1. Sinus Tachycardia

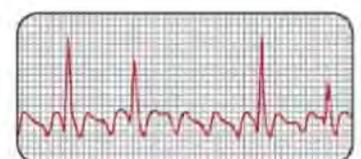

- sinus rhythm with rate >100 bpm
- causes:
  - anxiety, exercise
  - metabolic (e.g. thyrotoxicosis, pheochromocytoma)
  - systemic demand (e.g. pregnancy, anemia, exercise, pain, fever, hypotension, hypovolemia, anemia, CHF, MI, shock, PE)
  - pharmacologic (e.g. cocaine, caffeine, alcohol,  $\beta$ -adrenergic agonists, anticholinergic drugs)
  - idiopathic (i.e. IST- "idiopathic/inappropriate sinus tachycardia") or POT'S ( postural orthostatic tachycardia syndrome)
- treatment:
  - treat underlying disease; consider  $\beta$ -blocker if symptomatic, CCB if  $\beta$ -blockers contraindicated; ivabradine may be considered as an alternative agent for inappropriate sinus tachycardia

#### 2. Premature Beats

- premature atrial contraction
  - ectopic supraventricular beat originating in the atria
  - P wave morphology of the PAC usually differs from that of a normal sinus beat
- junctional premature beat
  - ectopic supraventricular beat that originates in the vicinity of the AV node
  - P wave is usually absent or inverted, which may come before or closely follow the QRS complex (referred to as a retrograde, or "traveling backward" P wave)
- treatment usually not required

#### 3. Atrial Flutter

- rapid, regular atrial depolarization from a macro re-entry circuit within the atrium (most commonly RA involving isthmus of tissue between tricuspid annulus and inferior vena cava (IVC))
- atrial rate 250-350 bpm, usually 300 bpm
- AV block usually occurs; it may be fixed (e.g. 2:1, 3:1, 4:1, etc.) or variable
- etiology: HTN, cardiomyopathy in association with AFib
  - less often: CAD, thyrotoxicosis, mitral valve disease, cardiac surgery, COPD, PE, pericarditis, in association with long term endurance sport/exercise
- ECG: "sawtooth" flutter waves (most common type of flutter, called "isthmus-dependent, typical flutter") in inferior leads, II, III, aVF; narrow QRS (unless aberrancy); commonly seen as 2:1 block with HR of 150

**Figure 25. Atrial flutter with variable block**

- in atrial flutter with 2:1 block, carotid sinus massage (after checking for bruits), Valsalva maneuver, or adenosine may decrease AV conduction and allow flutter waves to be more easily seen
- treatment of acute atrial flutter
  - if unstable (e.g. hypotension, CHF, angina): electrical cardioversion
  - if stable:
    1. rate control:  $\beta$ -blocker, diltiazem, verapamil, or digoxin
    2. chemical cardioversion: sotalol, amiodarone, type I antiarrhythmics, or electrical cardioversion
    3. anticoagulation guidelines same as for patients with AFib
- long-term treatment of atrial flutter to prevent recurrences includes antiarrhythmics and radiofrequency (RF) ablation (for isthmus dependent, typical flutter, treatment of choice is RF ablation)

#### 4. Multifocal Atrial Tachycardia (MAT)

- irregular rhythm caused by presence of 3 or more atrial foci (may mimic AFib)
- atrial rate 100-200 bpm
  - 3 or more distinct P wave morphologies
  - PR intervals vary
  - some P waves may not be conducted
- more common in patients with COPD or hypoxemia; less commonly in patients with hypokalemia, hypomagnesemia, sepsis, theophylline use, or digitalis toxicity
- treatment: treat the underlying cause; calcium channel blockers may be used (e.g. diltiazem, verapamil);  $\beta$ -blockers may be contraindicated because of severe pulmonary disease
- no role for electrical cardioversion, antiarrhythmics, or ablation

#### 5. Atrial Fibrillation

- see CCS Atrial Fibrillation Guidelines 2020 for details (free mobile app iCCS available on iOS and Android)
- the most common sustained arrhythmia
- risk factors include: older age, hypertension, heart failure, valvular disease (especially leading to dilated LA), recent cardiac surgery, lung disease, excessive alcohol consumption, sepsis (particularly pneumonia)
- symptoms: palpitations, exercise intolerance, fatigue, dyspnea, dizziness, syncope, may precipitate or worsen HF
- **classification**
  - "lone": generally occurs in persons <65 yr and in whom no clinical or echocardiographic causes are found
  - nonvalvular: not caused by valvular disease (usually MS), or prosthetic heart valves, or valve repair
    - ♦ valvular disease is observed in patients/people with MS, prosthetic heart valves, or those who have undergone valve repair
  - paroxysmal: episodes that terminate spontaneously
  - persistent: AFib sustained for more than 7 d or AFib that terminates only with cardioversion
  - permanent/chronic: continuous AFib that is unresponsive to cardioversion or in which clinical judgement has led to a decision not to pursue cardioversion
  - recurrent: two or more episodes of AFib
  - secondary: caused by a separate underlying condition or event (e.g. MI, cardiac surgery, pulmonary disease, hyperthyroidism)
- **initiation**
  - single circuit re-entry and/or ectopic foci, mostly arising from the pulmonary veins, act as aberrant generators producing atrial tachycardia (350-600 bpm)
    - ♦ this leads to multiple re-entry circuitry (micro-re-entry)
  - impulses are conducted irregularly across the atrial myocardium to give rise to fibrillation
  - in most cases, ectopic foci have also been mapped to the pulmonary vein ostia and can be ablated
- **maintenance**
  - the tachycardia causes atrial structural and electrophysiological remodelling changes that further promote AFib; the longer the patient is in AFib, the more difficult it is to restore normal sinus rhythm
- **consequences**
  - the AV node irregularly filters incoming atrial impulses producing an irregular ventricular response (usually <200 bpm); tachycardia leads to suboptimal CO
    - ♦ fibrillatory conduction of the atria promotes blood stasis increasing the risk of thrombus formation
      - AFib is an important risk factor for stroke or thromboembolic events (stroke risk can be assessed by CHADS2 score in AFib; CHADS2-VASc if the former gives a score of 0 or 1)
      - all valvular AFib (those with mechanical valves or MS) need anticoagulation but CHADS2 determines treatment for AS and MR

Table 6. CHADS2 Risk Prediction for Non-Valvular AFib

Risk Factor	Points	CHADS2 Score	Stroke Risk (%/Yr)
Congestive HF	1	0	1.9 (low)
HTN	1	1	2.8 (low-mod)
Age >75	1	2-3	4.0-5.9 (mod, need anticoagulation)
Diabetes	1	4-6	8.5-18.2 (high, need anticoagulation)
Stroke/TIA (prior)	2		

Can J Cardiol 2014;30:1114-30

- ECG findings

- no organized P waves due to rapid atrial activity (350-600 bpm) causing a chaotic fibrillatory baseline
- irregularly irregular ventricular response (typically 100-180 bpm), narrow QRS (unless aberrancy or previous BBB)
- wide QRS complexes due to aberrancy may occur following a long-short cycle sequence ("Ashman phenomenon")
- loss of atrial contraction, thus no "A" wave seen in JVP, no S4 on auscultation

Figure 26. AFib (lead II)

- management (adapted from CCS Atrial Fibrillation Guidelines 2020)

- primary goal is symptom control
- stroke prevention is crucial, since patients who are not anticoagulated for AFib have, on average, a 4-5% annual stroke risk
- all patients should be assessed for stroke risk and receive anticoagulation independent of the rate or rhythm treatment
- newly discovered AFib**
  - if the episode is self-limited and not associated with severe symptoms, no need for antiarrhythmic drugs
  - if AFib persists, consider one of the following:
    - rate control and anticoagulation (as indicated below)
    - cardioversion (as indicated below)
  - an initial rhythm control strategy for patients with newly diagnosed AFib (i.e. within past year), is associated with reduced cardiovascular death and stroke rate
- recurrent or permanent AFib**
  - if episodes are brief or minimally symptomatic, antiarrhythmic drugs may be avoided; rate control and anticoagulation are appropriate
  - patients who have undergone at least one attempt to restore sinus rhythm may remain in AFib after recurrence; permanent AFib may be accepted (with rate control and antithrombotics as indicated by CHADS2 score) in certain clinical situations
  - if symptoms are bothersome or episodes are prolonged, antiarrhythmic drugs should be used
- drug selection for rhythm control**
  - no or minimal heart disease: flecainide, propafenone once proven to have no underlying CAD (may consider exercise stress testing)
  - LV dysfunction: amiodarone
  - CAD:  $\beta$ -blockers, amiodarone
  - if antiarrhythmic drugs fail or are not tolerated, can consider RF ablation for rhythm/symptom control
- treatment of AFib (RACE):** all patients with AFib (paroxysmal, persistent, or permanent), should be stratified using a predictive index for stroke risk and risk of bleeding, and most patients should receive either an oral anticoagulant (OAC) or ASA
  - Rate control:  $\beta$ -blockers, diltiazem, verapamil (in patients with HF: digoxin, amiodarone)
    - digoxin can be used to achieve rate control in patients whose response to  $\beta$ -blockers and/or CCB is inadequate, contraindicated, or not tolerated
  - Anticoagulation: use either warfarin or DOACs (e.g. apixaban, dabigatran, rivaroxaban, edoxaban) to prevent thromboembolism
    - DOAC use is preferred to warfarin
    - for patients with non-valvular AFib (NVAf), OAC use is recommended for those >65 yr and/or with a CHADS2  $\geq 1$ . NVAf is defined as AF *not* due to mechanical valve or moderate-severe mitral stenosis
    - ASA 81 mg is recommended only for patients with none of the risks outlined in the CCS algorithm (age <65 and no CHADS2 risk factors) who also have arterial disease (coronary, aortic, or peripheral)

The 2020 Canadian Cardiovascular Society/  
Canadian Heart Rhythm Society Comprehensive  
Guidelines for the Management of Atrial  
Fibrillation

Can J Cardiol 2020;36:1847-1948

**Rate and Rhythm Control:** Long-term rate control therapy in AFib patients is recommended to reduce symptoms and prevent CV events. Based on the paucity of data informing HR targets, it is recommended to titrate rate-controlling agents to achieve a resting HR <100 bpm during AFib. Rhythm control with long-term antiarrhythmic drug therapy might not completely suppress AFib, and thus should be focused on symptom relief, improving functional capacity, and reducing healthcare utilization. Rhythm control strategies are recommended for patients with established AFib who remain symptomatic with rate control therapy, or in whom rate control therapy is unlikely to control symptoms. In patients with newly diagnosed AFib, an initial strategy of rhythm control has been associated with reduced CV death and reduced incidence of stroke. It is recommended to consider catheter ablation of AFib as a reasonable alternative to pharmacologic rate or rhythm control.

**Antithrombotic Therapy in AFib:** In patients with AFib and coronary or arterial vascular disease, the choice of antithrombotic therapy should be based on a balanced risk assessment of AFib-related stroke, ischemic coronary events, and clinically relevant bleeding. If an oral anticoagulant is indicated, non-Vitamin K antagonist oral anticoagulants (NOACs) are recommended over warfarin.

### 3. Cardioversion (electrical)

- if AFib <48 h, can usually cardiovert without anticoagulation (<12 h if high stroke risk)
- if AFib >48 h, anticoagulate 3 wk before and 4 wk after cardioversion due to risk of unstable intra-atrial thrombus
- if patient is unstable (hypotensive, active angina due to tachycardia, uncontrolled HF), cardiovert immediately

### 4. Etiology

- HTN, obesity, sleep apnea, CAD, heart failure, valvular disease, pericarditis, cardiomyopathy, myocarditis, ASD, postoperative, PE, COPD, thyrotoxicosis, sick sinus syndrome, alcohol ("holiday heart")
- may present in young patients without demonstrable disease ("lone AFib") and in the elderly without underlying heart disease
- studies of patients with AFib suggest that there is no difference in long-term survival when treating patients with a rhythm-control vs. rate-control strategy (recent large study suggests benefit of rhythm control for recent onset AF- see above)
- many patients with a significant underlying structural heart lesion (e.g. valve disease, cardiomyopathy) will not tolerate AFib well (since may be dependent on atrial kick) and these patients should be cardioverted (chemical or electrical) as soon as possible

### • surgical management in AFib ablation

- sutured lesion
  - Cox-maze III: definitive surgical treatment of chronic AFib; indicated in patients who have failed maximal medical therapy and have had embolic events or are symptomatically compromised by AFib; 90-95% postoperative freedom from AFib; less likely to be successful in patients with large left atria (>5 cm) or with longstanding AFib (>5 yr)
  - modified maze and pulmonary vein isolation: more limited patient sets but takes less time to perform than classical maze procedure; selected cases can be done off bypass with concomitant OPCAB; 60-75% postoperative freedom from AFib
- energy lesion
  - cryoablation: see *Catheter Ablation, C29*
  - radiofrequency ablation: see *Catheter Ablation, C29*
  - current experimental trials include use of laser ablation, microwave ablation, and ultrasound ablation

### 6. AV Nodal Re-Entrant Tachycardia

- re-entrant circuit using dual pathways (fast conducting  $\beta$ -fibres and slow conducting  $\alpha$ -fibres) within or near the AV node; often found in the absence of structural heart disease
  - cause is commonly idiopathic, although familial AVNRT has been reported
- sudden onset and offset with patients often describing "neck pounding" and "shirt flapping"
- fast regular rhythm of 150-250 bpm
- usually initiated by a supraventricular or ventricular premature beat
- AVNRT accounts for 60-70% of all paroxysmal SVTs
- retrograde P waves may be seen but are usually lost in the QRS complex
- treatment
  - acute: Valsalva maneuver or carotid sinus pressure technique, adenosine is first choice if unresponsive to vagal maneuvers; if no response, try metoprolol, digoxin, diltiazem, electrical cardioversion if patient hemodynamically unstable (hypotension, angina, or CHF)
  - long-term: 1st line radiofrequency ablation (>98% cure rate and < 1% complication rate),  $\beta$ -blocker, diltiazem, digoxin; 2nd line flecainide, propafenone

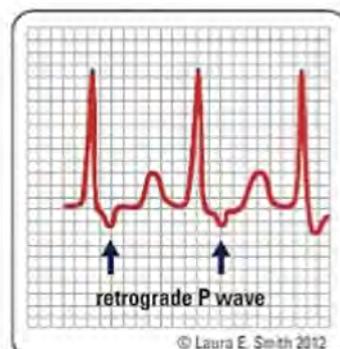

Figure 27. AVNRT

N.B. Refer to ECG Made Simple for further discussion and an animation of the mechanism ([www.ecgmadesimple.com](http://www.ecgmadesimple.com))

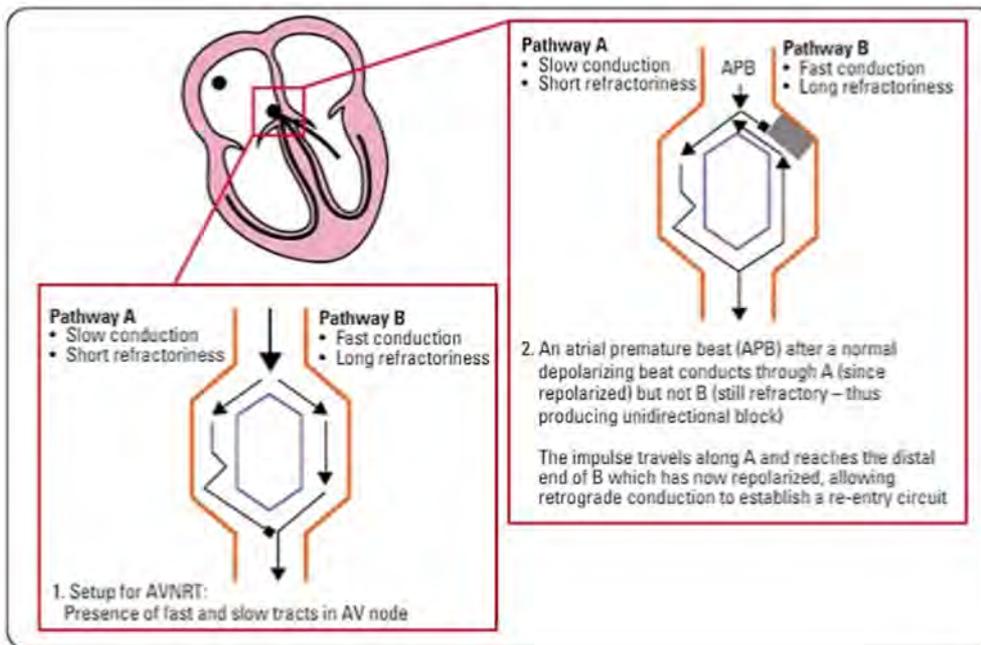

Figure 28. Mechanism for AVNRT

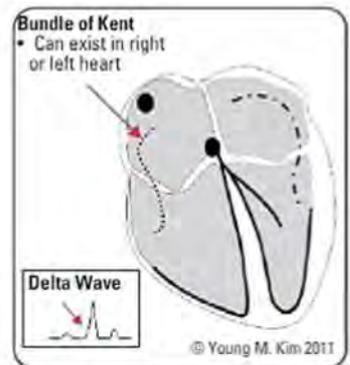

Figure 29. Accessory pathway conduction in WPW. Early ventricular activation leads to the appearance of a delta wave (slurred upstroke of the QRS) on the ECG before usual conduction across the AV node

## Pre-Excitation Syndromes

- refers to a subset of SVTs mediated by an accessory pathway which can lead to ventricular pre-excitation

### AV Re-Entrant Tachycardia (AVRT)

- re-entrant loop in antegrade via normal conduction system and retrograde via accessory pathway
- usually in patients with an antegradely conducting bypass tract (WPW); may also occur if there is an exclusively retrogradely conducting (i.e. concealed) bypass tract - in these cases the ECG is normal and there are no delta waves
- initiated by a premature atrial or ventricular complex
- treatment
  - acute: treatment is similar to AVNRT but avoid long-acting AV nodal blockers (e.g. digoxin and verapamil)
  - long-term: for recurrent arrhythmias, ablation of the bypass tract is recommended
  - drugs such as flecainide and procainamide can be used

### Wolff-Parkinson-White Syndrome

- congenital defect present in 1.5-2/1000 of the general population
- an accessory conduction tract (bundle of Kent; can be in RA or LA) abnormally allows early electrical activation of part of one ventricle
- impulses travel at a greater conduction velocity across the bundle of Kent thereby effectively 'bypassing' AV node
  - since the ventricles are activated earlier, the ECG shows early ventricular depolarization in the form of initial slurring of the QRS complex the so-called "delta wave"
- atrial impulses that conduct to the ventricles through both the bundle of Kent and the normal AV node/His-Purkinje system generate a broad "fusion complex"
- ECG features of WPW
  - PR interval <120 msec
  - delta wave: slurred upstroke of the QRS (the leads with the delta wave vary with site of bypass)
  - widening of the QRS complex due to premature activation
  - secondary ST segment and T wave changes
  - tachyarrhythmias may occur most often AVRT and AFib
- orthodromic AVRT: the most common arrhythmia in WPW stimulus from a premature complex travels up the bypass tract (ventricles to atria) and down the AV node (atria to ventricles) with narrow QRS complex (no delta wave because stimulus travels through normal conduction system)
  - comprises 95% of the re-entrant tachycardias associated with WPW syndrome
- antidromic AVRT: more rarely, the stimulus goes up the AV node (ventricles to atria) and down the bypass tract (atria to ventricles); wide and abnormal QRS as ventricular activation is only via bypass tract

### AFib in WPW Patients

- AFib is the index arrhythmia in up to 20% of patients with WPW syndrome
  - usually intermittent rather than persistent or permanent
- rapid atrial depolarizations in AFib are conducted antegradely through the bypass tract which is not able to filter impulses like the AV node can and thus the ventricular rate becomes extremely rapid (>200 bpm) and the QRS complex widens ("pre-excited AFib")
- treatment: electrical cardioversion, IV procainamide, or IV amiodarone
  - do not use drugs that slow AV node conduction during pre-excited AFib (e.g. digoxin,  $\beta$ -blockers) as this may cause preferential conduction through the bypass tract and increase the risk of VFib
    - note: even without drug administration, AFib with WPW can lead to VFib and would be an indication for an urgent EPS and ablation (especially with very rapid ventricular rates during AFib)
  - long-term: ablation of bypass tract

## Ventricular Tachyarrhythmias

### Premature Ventricular Contraction or Ventricular Premature Beat

- QRS width >120 msec, no preceding P wave, bizarre QRS morphology
- origin: LBBB morphology of VT = RV origin; RBBB morphology of VT = LV origin
- PVCs may be benign, but are usually significant in the following situations:
  - consecutive ( $\geq 3 = VT$ ) or multiform (varied origin)
  - PVC falling on the T wave of the previous beat ("R on T phenomenon"): may precipitate VT or VFib
- risk of sustained arrhythmia depends on the clinical situation (i.e. MI, HF), not the PVCs themselves
- treatment
  - lifestyle changes (e.g. limiting or eliminating alcohol, caffeine, and stimulants) may be sufficient in patients with mild symptoms
  - in patients with more severe symptoms or underlying structural disease,  $\beta$ -blockers, catheter ablation, or antiarrhythmic therapy may be indicated

### Accelerated Idioventricular Rhythm

- ectopic ventricular rhythm with rate of 50-100 bpm
- more frequently occurs in the presence of sinus bradycardia and is easily overdriven by a faster supraventricular rhythm
- frequently occurs in patients with acute MI or other types of heart disease (i.e. cardiomyopathy, HTN, valvular heart disease) but it does not affect prognosis and does not usually require treatment

### Ventricular Tachycardia

- 3 or more consecutive ectopic ventricular complexes
  - rate >100 bpm (usually 140-200)
  - ventricular flutter: if rate approximately 300 bpm and monomorphic sinusoidal pattern
  - "sustained VT" if it lasts longer than 30 s or requires termination due to hemodynamic instability
  - ECG characteristics: wide regular QRS tachycardia (QRS usually >140 msec)
  - AV dissociation, bizarre QRS pattern
  - also favour diagnosis of VT: left axis or right axis deviation, nonspecific intraventricular block pattern, monophasic or biphasic QRS in V1 with RBBB, QRS concordance in V1-V6
  - occasionally, during VT, supraventricular impulses may be conducted to the ventricles; these impulses generate QRS complexes with normal/aberrant supraventricular morphology (i.e. "ventricular capture") or summation pattern (i.e. "fusion complexes")
  - by itself, nonsustained VT (<30 s without hemodynamic collapse) independently increases mortality and cardiovascular events such as stroke; it can also indicate higher than usual risk of subsequent sustained VT, especially with structural heart disease
- monomorphic VT
  - identical complexes with uniform morphology
  - more common than polymorphic VT
  - can degenerate into polymorphic VT or VFib
  - typically result from intraventricular re-entry circuit, may be idiopathic without any structural heart disease
  - potential causes: chronic infarct related scarring, cardiomyopathies, myocarditis, arrhythmogenic right ventricular dysplasia, idiopathic, drugs (e.g. cocaine), electrolyte disturbances
- polymorphic VT
  - complexes with constantly changing morphology, amplitude, and polarity
  - more frequently associated with hemodynamic instability due to faster rates (typically 200-250 bpm)
  - potential causes: acute MI, severe or silent ischemia, valvular heart disease, HCM, dilated cardiomyopathies, myocarditis, congenital heart disease, WPW with anterograde accessory pathway, electrolyte or acid-base disturbances, and predisposing factors for QT prolongation

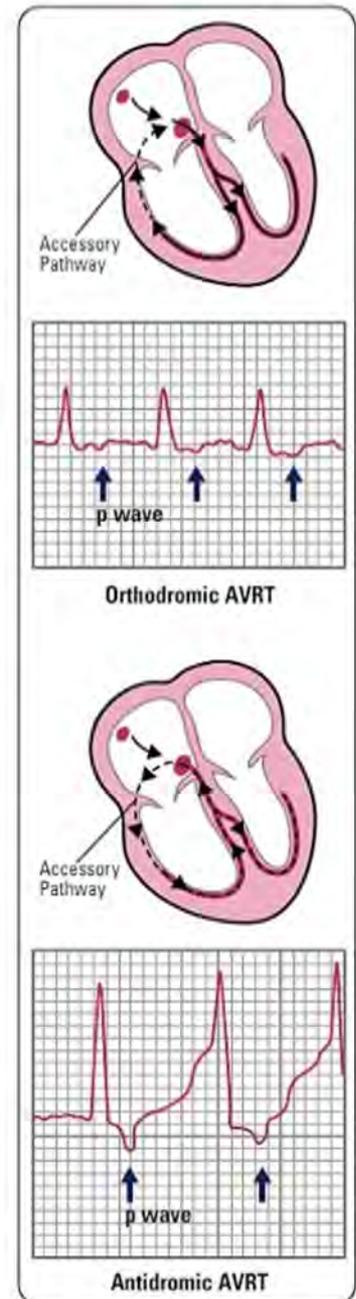

Figure 30. Orthodromic vs. antidromic AVRT

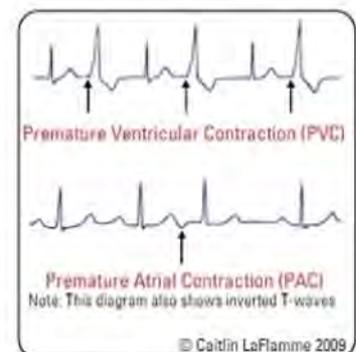

Figure 31. PVC (with bigeminy pattern) and PAC. Note the difference between the normal QRS/T wave and the PVC-generated QRS/T wave

### • treatment

- sustained VT (>30 s) is an emergency requiring immediate treatment
- hemodynamic compromise: treat VT with electrical cardioversion and ACLS
- no hemodynamic compromise: treat VT with electrical cardioversion, amiodarone, Type IA agents (e.g. procainamide, quinidine)
- every patient with sustained VT/VFib and comorbid structural heart disease, in the absence of reversible causes, should be considered for ICD implantation to prevent SCD

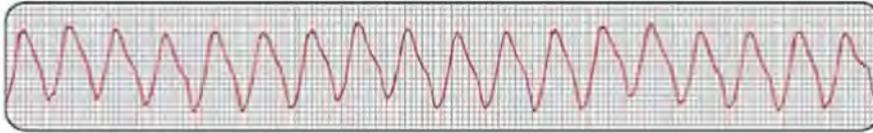

Figure 32. VT (monomorphic)

Table 7. Wide Complex Tachycardia: Clues for Differentiating VT vs. SVT with Aberrancy\*

Clinical Clues		ECG Clues	
Presenting symptoms	Not helpful	AV dissociation	VT
History of CAD and previous MI	VT	Capture or fusion beats	VT
Physical exam		QRS width >140 msec	VT
Cannon "a" waves	VT	Extreme axis deviation (left or right superior axis)	VT
Variable ST		Positive QRS concordance (R wave across chest leads)	VT
Carotid sinus massage/adenosine terminates arrhythmia	SVT**	Negative QRS concordance (S wave across chest leads)	May suggest VT
		Axis shift during arrhythmia	VT (polymorphic)

\*If patient >65 yr and previous MI or structural heart disease, then chance of VT >95%

\*\*May terminate VT in some patients with no structural heart disease

### Arrhythmias that may present as a Wide QRS Tachycardia

- VT (this is most common, especially in older patients or those with structural heart disease)
- SVT with aberrant conduction (rate related)
- SVT with preexisting BBB or nonspecific intraventricular conduction defect
- AV conduction through a bypass tract in WPW patients during an atrial tachyarrhythmia (e.g. atrial flutter, atrial tachycardia)
- Antidromic AVRT in WPW patients (see *Pre-Excitation Syndromes, C25*)

### Torsades de Pointes

- a variant of polymorphic VT that occurs in patients with baseline QT prolongation "twisting of the points"
- looks like usual VT except QRS complexes "rotate around the baseline," changing their axis and amplitude
- usually starts following a post extrasystolic pause ("pause dependent")
- ventricular rate >100 bpm, usually 150-300 bpm
  - usual onset after a post-PVC pause associated with "pause dependent" QT prolongation)
- etiology: occurs in association with prolonged QT intervals
  - congenital long QT syndromes
  - drugs: e.g. class IA (quinidine), class III (sotalol), phenothiazines (TCAs), erythromycin, quinolones, antihistamines
  - electrolyte disturbances: hypokalemia, hypomagnesemia
  - nutritional deficiencies causing above electrolyte abnormalities
- treatment: IV magnesium, temporary pacing  $\beta$  blocker, correct the underlying cause of prolonged QT
  - electrical cardioversion and ACLS if hemodynamic compromise

Figure 33. Torsades de pointes

### Ventricular Fibrillation

- chaotic ventricular arrhythmia, with very rapid irregular ventricular fibrillatory waves of varying morphology without clear QRS complexes
- terminal event, unless advanced cardiac life-support (ACLS) procedures are promptly initiated to maintain ventilation and CO, and electrical defibrillation is carried out
- most frequent cause of sudden death
- refer to ACLS algorithm for complete therapeutic guidelines

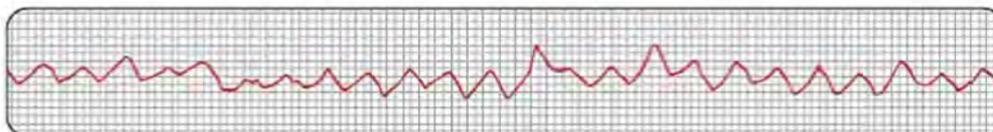

Figure 34. VFib

## Sudden Cardiac Arrest

### Definition

- cessation of cardiac electrical activity with circulatory collapse (loss of pulses) and gasping respirations or lack of spontaneous breathing
- patient becomes suddenly unresponsive
- presenting rhythms may be PEA, asystole, VFib (less commonly pulseless VT)

### Etiology

- the likelihood of an underlying cardiac cause is proportional to age at time of arrest
  - cardiac causes (especially CAD) are more likely in older adults
  - non-cardiac causes are more likely in children and young adults (<35 yr)

**Table 8. Etiology of Cardiac Arrest**

Cardiac Causes		Non-Cardiac Causes	
myocardial Ischemia	STEMI NSTEMI Coronary spasm coronary dissection Anomalous coronary artery	Vascular	Pulmonary embolism Aortic dissection Aortic rupture Stroke
Ischemic Cardiomyopathy	HF Scar	Neurologic	Sudden unexplained death in epilepsy Neurogenic
Non-Ischemic Cardiomyopathy	Dilated CM Hypertrophic CM Infiltrative CM myocarditis Arrhythmogenic RV CM Hypertensive CM VHD with LV failure	Hemorrhagic	Subarachnoid Intracranial Gastrointestinal
Valvular Heart Disease	AS MR	Infection	Sepsis Pneumonia
Heritable ion channel disorders	Long QT syndrome Brugada syndrome	Respiratory	Respiratory arrest Tension pneumothorax
Primary Arrhythmogenic	Acquired QT prolongation Idiopathic Complete heart block WPW	Other	Substance overdose Ketoacidosis Trauma
Congenital Heart Disease	Tetralogy of Fallot VSD Post-Surgical scar		

### Management

- acute: resuscitate according to ACLS guidelines (see [Anesthesia, A 32](#))
  - resuscitation can be grouped into those with and without shockable rhythms
  - activation of emergency systems and high-quality chest compressions are essential for any bystander
- investigate underlying causes using cardiac catheterization, electrophysiologic studies, echocardiography
  - patients with ST-elevation require emergent coronary angiography and revascularization
  - patients without ST-elevation can still have clinically relevant coronary lesions and therefore benefit from coronary angiography on a non-emergent basis
- initiate targeted temperature management to optimize neurologic recovery regardless of presenting rhythm
- treat underlying cause
- antiarrhythmic drug therapy: amiodarone, lidocaine,  $\beta$ -blockers
- ICD for secondary prevention

See Landmark Cardiac Trials for more information on COACT, which details the 1-yr clinical outcomes of angiography timing on survival in resuscitated cardiac arrest patients without STEMI.

## Electrophysiologic Studies

- invasive test for the investigation and treatment of cardiac rhythm disorders using intracardiac catheters
- provide detailed analysis of the arrhythmia mechanism and precise site of origin when ECG data are nondiagnostic or unobtainable
- bradyarrhythmias: define the mechanisms of SA node dysfunction and localize site of AV conduction block (rarely performed)
- tachyarrhythmias: map for possible ablation, assess inducibility of VT prior to ICD implant

## Electrical Pacing

- the decision to implant a pacemaker usually is based on symptoms of a bradyarrhythmia or tachyarrhythmia with intermittent bradycardia precluding rate limiting medications

### Pacemaker Indications

- SA node dysfunction (most common): symptomatic bradycardia  $\pm$  hemodynamic instability
- common manifestations include: syncope, presyncope, or severe fatigue
- SA node dysfunction is commonly caused by: intrinsic disease within the SA node (e.g. idiopathic degeneration, fibrosis, ischemia, or surgical trauma), abnormalities in autonomic nervous system function, and drug effects
- AV nodal-infranodal block: Mobitz II, complete heart block

### Pacemaker Complications

- complications related to surgical implantation include venous access (pneumothorax, hemothorax, air embolism), pacemaker leads (perforation, malposition), pocket hematomas, and infection; rarer complications include venous stenosis or thrombosis, and tricuspid regurgitation
- complications specific to the pacemaker include a failure to pace, failure to sense, pulse generator failure, pacemaker syndrome, lead fractures, and pacemaker-mediated tachycardia

### Pacing Techniques

- temporary: transvenous (jugular, subclavian, femoral) or external (transcutaneous) pacing
- permanent: transvenous into RA, apex of RV, or both
- single or dual chamber: can sense and pace atrium, ventricle, or both
- rate responsive, able to respond to physiologic demand
- biventricular pacing (cardiac resynchronization therapy): leads are guided to RV and LV to stimulate both ventricles

## Implantable Cardioverter Defibrillators

- SCD usually results from VFib, sometimes preceded by monomorphic or polymorphic VT
- ICDs detect ventricular tachyarrhythmias and are highly effective in terminating VT/VFib and in aborting SCD
- mortality benefit vs. antiarrhythmics in secondary prevention and selected patients for primary prevention
- CRT-D may be of benefit in patients with LBBB, prolonged QRS, and LVEF <35%
- see *Heart Failure, C40* for current treatment recommendations

## Catheter Ablation

### Modalities

- radiofrequency (RF) ablation: a low-voltage high-frequency form of electrical energy (similar to cautery); RF ablation produces small, homogeneous, necrotic lesions approximately 5-7 mm in diameter and 3-5 mm in depth
- cryoablation: technology which uses a probe with a tip that decreases in temperature to  $-20^{\circ}\text{C}$  and  $-70^{\circ}\text{C}$ ; small necrotic lesions are produced in a similar fashion to RF ablation; when brought to  $-20^{\circ}\text{C}$ , the catheter tip reversibly freezes the area; when brought to  $-70^{\circ}\text{C}$  for 5 min, it permanently scars the tissue
  - advantage: can "test" areas before committing to an ablation
  - disadvantage: takes much longer than RF (5 min per cryoablation vs. 1 min per RF ablation)
  - cryoablation is most commonly used for AFib

### Indications

- paroxysmal SVT
  - AVNRT: accounts for more than half of all cases; slow AV nodal pathway is targeted for ablation in these cases
- accessory pathway (orthodromic reciprocating tachycardia): 30% of SVT
  - re-entrant rhythm with an accessory AV connection as one of the limbs
  - corrected by targeting the accessory pathway
- atrial flutter: re-entry circuit in RA
- AFib: primarily isolation of pulmonary vein triggers, usually with additional ablation in the atrial chambers
- idiopathic VT: focus arises from the right ventricular outflow tract or left ventricular outflow tract and less commonly originates in the inferoseptal LV near the apex
  - scar mediated VT most commonly due to scarring from previous MI or other cardiomyopathies; ablation less often successful and not first line therapy
  - significant benefit was seen with catheter ablation vs. antiarrhythmic drug escalation among patient with amiodarone-resistant VT, in contrast to non-amiodarone resistant VT

**Major Complications**

- cardiac: high grade AV block requiring permanent pacemaker (less risk with cryoablation), new or worsening arrhythmia, tamponade, pericarditis
- vascular: hematoma, vascular injury, thromboembolism, TIA/stroke
- pulmonary: PE

# Ischemic Heart Disease

**Epidemiology**

- refer to CCS guidelines - 2014 Stable Ischemic Heart Disease Guidelines for Diagnosis and Management for more information
- most common cause of cardiovascular morbidity and mortality
- patients may have asymptomatic or symptomatic disease
- silent myocardial ischemia may be a predictor of adverse coronary events and cardiac mortality
  - needs to be monitored via intracardiac monitoring of physiological and hemodynamic parameters, metabolic indicators of ischemia in the coronary sinus, and hemodynamic factors
  - optimal medical therapy (reduction of HR and BP) and myocardial revascularization
- atherosclerosis and thrombosis are the most important pathogenetic mechanisms
- M:F=2:1 with all age groups included (Framingham study), 8:1 for age <40, 1:1 for age >70
  - CHD incidence in women triples shortly after menopause
- peak incidence of symptomatic IHD is age 50-60 (men) and 60-70 (women)
- for primary prevention of ischemic heart disease see [Family Medicine, FMS](#)

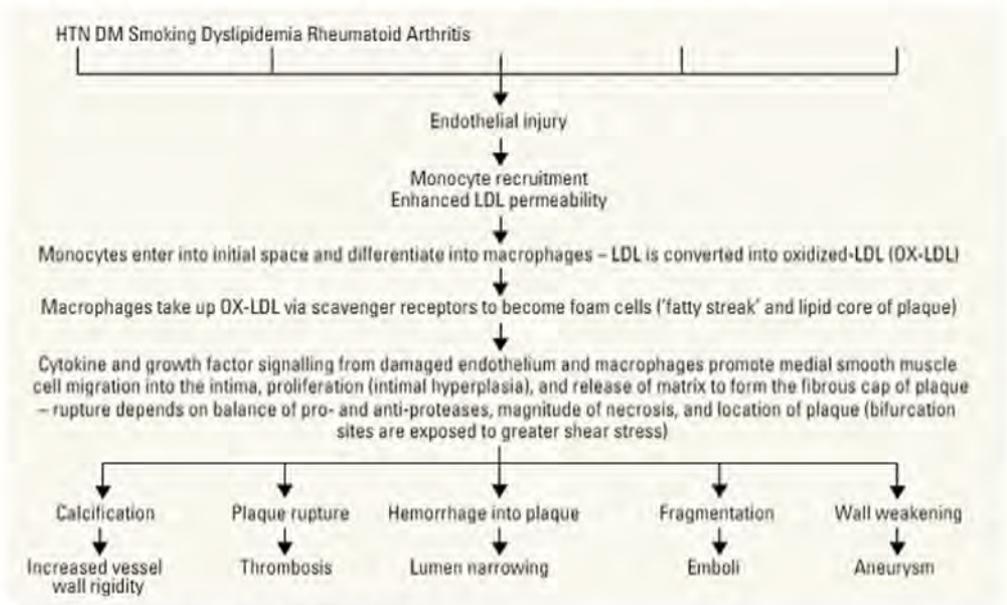

Figure 35. Pathophysiology of atherosclerosis

Table 9. Risk Factors and Markers for Atherosclerotic Heart Disease

Non-Modifiable Risk Factors	Modifiable Risk Factors §	Markers of Disease
Age	Hyperlipidemia*	Elevated high-sensitivity C-reactive protein (hsCRP)
Male, postmenopausal female	HTN*	Coronary artery calcification
Family history (FHx) of MI*	DM*	Carotid IMT/plaque
First degree male relative <55 yr	Cigarette smoking*	Ankle-brachial index
First degree female relative <65 yr	Psychosocial stress	
	Abdominal obesity	
	Sedentary lifestyle	
	Heavy alcohol intake	
	Not consuming fruits and vegetables daily	
	Elevated lipoprotein[a]	
	Hyperhomocysteinemia	

\* Major risk factors

§ Modifiable risk factors account for >90% of MIs

## Chronic Stable Angina

### Definition

- symptom complex resulting from an imbalance between oxygen supply and myocardial oxygen demand in the myocardium

### Etiology and Pathophysiology

- factors that decrease myocardial oxygen supply:
  - decreased luminal diameter: atherosclerosis, vasospasm
  - decreased duration of diastole: tachycardia (decreased duration of diastolic coronary perfusion)
  - decreased hemoglobin: anemia
  - decreased SaO<sub>2</sub>: hypoxemia
  - congenital anomalies
- factors that increase myocardial oxygen demand:
  - increased HR: hyperthyroidism, exercise, anemia, pregnancy
  - increased contractility: hyperthyroidism
  - increased wall stress: myocardial hypertrophy, AS

### Signs and Symptoms

- typical
  1. retrosternal chest pain, tightness or discomfort radiating to left (± right) shoulder/arm/neck/jaw, associated with diaphoresis, nausea, anxiety
  2. predictably precipitated by the "3 Es": exertion, emotion, eating
  3. brief duration, lasting <10-15 min and typically relieved by rest and nitrates
- atypical/probable angina (meets 2 of the above)
- non-cardiac chest pain (meets none or 1 of the above)
- Levine's sign: clutching fist over sternum when describing chest pain
- anginal equivalents: dyspnea, acute LV failure, flash pulmonary edema
- ischemia may present differently in understudied populations

### Clinical Assessment

- history including directed risk factor assessment and physical exam
- labs: Hb, fasting glucose, fasting lipid profile, HbA1c, renal function tests, liver function tests, and thyroid function test
- 12-lead ECG (at rest and during episode of chest pain if possible)
- CXR (suspected HF, valvular disease, pericardial disease, aortic dissection/aneurysm, or signs/symptoms of pulmonary disease)
- stress testing (see *Stress Testing, C15*) or angiography
- echo for other causes of chest pain:
  - aortic dissection
  - valvular heart disease
  - HCM
  - LV dysfunction and/or wall motion abnormality
  - Pericardial disease/effusion

### Differential Diagnosis

- see *Differential Diagnoses of Common Presentations, C5*

### Treatment of Chronic Stable Angina

- refer to 2019 European Society of Cardiology guidelines for more information

#### 1. General Measures

- goals: to reduce myocardial oxygen demand and/or increase oxygen supply
- lifestyle modification (diet, exercise, smoking cessation)
- treatment of risk factors: e.g. statins (see *Endocrinology, E5, Family Medicine, FM11* for target lipid guidelines), antihypertensives
- pharmacological therapy to stabilize the coronary plaque which will prevent rupture and thrombosis

#### 2. Antiplatelet Therapy (first-line therapy)

- ASA
- clopidogrel when ASA contraindicated
- low dose rivaroxaban in combination with ASA (based on COMPASS trial)

#### 3. β-blockers (first-line therapy improves survival in patients with HTN)

- increase coronary perfusion and decrease demand (HR, contractility) and BP (afterload)
- cardioselective agents preferred (e.g. metoprolol, atenolol) to avoid peripheral effects (inhibition of vasodilation and bronchodilation via β<sub>2</sub> receptors)
- avoid intrinsic sympathomimetics (e.g. acebutolol) which increase demand

Chronic stable angina is most often due to a fixed stenosis caused by an atheroma  
ACSs are the result of plaque rupture which causes a cascade resulting in thrombosis

#### Canadian Cardiovascular Society (CCS) Functional Classification of Angina

- **Class I:** ordinary physical activity (walking, climbing stairs) does not cause angina; angina with strenuous, rapid, or prolonged activity
- **Class II:** slight limitation of ordinary activity: angina brought on at >2 blocks on level or climbing >1 flight of stairs, or by emotional stress
- **Class III:** marked limitation of ordinary activity: angina brought on at <2 blocks on level or climbing <1 flight of stairs
- **Class IV:** inability to carry out any physical activity without discomfort; angina may be present at rest

#### Initial Invasive or Conservative Strategy for Stable Coronary Disease (ISCHEMIA)

NEJM 2020;382:1395-1407

**Purpose:** Assess clinical outcomes in stable coronary disease treated with invasive plus medical therapy vs. medical therapy alone.

**Methods:** 5179 patients were randomized to invasive therapy (angiography and revascularization) plus medical therapy or medical therapy alone plus angiography upon failure of initial conservative approach. The primary outcome was a composite of mortality from CV causes, MI, hospitalization for UA, HF or resuscitated cardiac arrest.

**Results:** Over a median of 3.2 yr, 318 and 352 primary outcome events occurred in the invasive-strategy and conservative-strategy groups, respectively. At 5 yr, the cumulative event rate was 16.4% and 18.2% in the invasive-strategy and conservative-strategy groups, respectively.

**Conclusion:** In patients with chronic stable coronary disease, there was no evidence that an initial invasive strategy reduced ischemic CV events or death from any cause over a median of 3.2 yr, compared with initial conservative medical therapy.

**4. Nitrates (symptomatic control, no clear impact on survival)**

- decrease preload (venous dilatation) and afterload (arteriolar dilatation), and increase coronary perfusion
- maintain daily nitrate-free intervals to prevent tolerance (tachyphylaxis)

**5. Calcium Channel Blockers (CCBs, second-line or combination)**

- increase coronary perfusion and decrease demand (HR, contractility) and BP (afterload)
- caution: verapamil/diltiazem combined with  $\beta$ -blockers may cause symptomatic sinus bradycardia or AV block
- contraindicated in patients with LV systolic dysfunction

**6. Renin-Angiotensin-Aldosterone System Blockade**

- angina patients tend to have risk factors for CV disease which warrant use of an ACEI (e.g. HTN, DM, proteinuric renal disease, previous MI with LV dysfunction)
- ARB can be considered in patients intolerant to ACEI
- benefit in all patients at high-risk for CV disease (e.g. those with concomitant DM, renal dysfunction, or LV systolic dysfunction)

**7. Invasive Strategies**

- revascularization (see *Coronary Revascularization, C37*)

**VARIANT ANGINA (PRINZMETAL'S ANGINA)**

- myocardial ischemia secondary to coronary artery vasospasm with or without atherosclerosis
- uncommonly associated with infarction or LV dysfunction
- typically occurs between midnight and 8 am, unrelated to exercise, relieved by nitrates
- typically ST elevation is observed on ECG
- diagnosed by provocative testing with ergot vasoconstrictors (rarely done)
- treat with nitrates and CCBs
- strongly recommend patient to stop smoking

**SYNDROME X**

- typical symptoms of angina but normal angiogram
- may show definite signs of ischemia with exercise testing
- thought to be due to inadequate vasodilator reserve of coronary resistance vessels
- better prognosis than overt epicardial atherosclerosis

## Acute Coronary Syndromes

**Definition**

- ACS includes the spectrum of UA, NSTEMI, and STEMI; this distinction aids in providing the appropriate therapeutic intervention
  - UA is clinically defined by any of the following:
    - accelerating pattern of pain: increased frequency, increased duration, decreased threshold of exertion, decreased response to treatment
    - angina at rest
    - new-onset angina
    - angina post-MI or post-procedure (e.g. PCL, CABG)
  - MI (STEMI/NSTEMI) is defined by evidence of myocardial necrosis and is diagnosed by a rise/fall of serum markers plus any one of:
    - symptoms of ischemia (chest/upper extremity/mandibular/epigastric discomfort; dyspnea)
    - ECG changes (ST-T changes, new BBB, or pathological Q waves)
    - imaging evidence (myocardial loss of viability, wall motion abnormality, or intracoronary thrombus)
    - if biomarker changes are unattainable, cardiac symptoms combined with new ECG changes is sufficient
  - NSTEMI meets criteria for MI without ST elevation or BBB
  - STEMI meets criteria for MI characterized by ST elevation or new BBB
- possible ACS in women, diabetics, and older adults is more likely to present with "atypical" symptoms such as dyspnea or weakness even in the presence of acute coronary-related ischemia

**Investigations**

- history and physical
  - note that up to 30% of MIs are unrecognized or "silent" due to atypical symptoms more common in women, patients with DM, elderly, post-heart transplant (because of denervation)
- ECG
- CXR

**Efficacy and Safety of Low-Dose Colchicine after Myocardial Infarction (COLCOT)**

NEJM 2019;381:2497-2505

**Purpose:** To determine if colchicine lowers risk of future CV events following MI.**Methods:** Patients (n=4745) who had an MI within the last 30 d were randomized to colchicine once daily or placebo. The primary efficacy endpoint was a composite of death from CV causes, resuscitated cardiac arrest, MI, stroke, or urgent hospitalization for angina.**Results:** Median follow-up was 22.6 mo. The primary endpoint occurred in 5.5% and 7.1% of patients in the colchicine and placebo groups, respectively (P=0.02). Pneumonia was observed in 0.9% of the patients in the colchicine group and in 0.4% of patients in the placebo group (P=0.03).**Conclusion:** In patients with recent MI, colchicine lowered the risk of subsequent CV events as compared to placebo.

- labs

- serum cardiac biomarkers for myocardial damage (use of high-sensitive cardiac troponin (hs-cTn) with a validated 0 h/2 h algorithm recommended blood sampling at 0 h and 2 h) (see *Cardiac Biomarkers, C13*)
- CBC, International Normalized Ratio (INR)/prothrombin time test (PTT), electrolytes, magnesium, creatinine, urea, glucose, and serum lipids
- draw serum lipids within 24-48 h because values are unreliable from 2-48 d post-MI

## MANAGEMENT OF ACUTE CORONARY SYNDROMES

### 1. General Measures

- ABCs: assess and correct hemodynamic status first
- bed rest, cardiac monitoring, oxygen
- nitroglycerin sublingual (SL) followed by IV
- morphine IV

### 2. Antiplatelet and Anticoagulation Therapy

- see also 2018 CCS/CAIC Antiplatelet Guidelines, 2012 and 2010 CCS Antiplatelet Guidelines, and 2009 CCS Position Statement on Dual Antiplatelet Therapy in Patients Requiring Urgent CABG for details (free mobile apps available on iOS and Android platforms in the CCS app stores). Also see 2020 ESC guidelines on ACS management in patients without persistent ST-segment elevation, 2017 ESC guidelines on STEMI management, and 2019 CCS guidelines on acute STEMI management (focused update on regionalization and reperfusion)
- ASA chewed
- NSTEMI
  - ticagrelor + ASA + LMWH/IV unfractionated heparin (UFH), unless contraindications
    - LMWH, except in renal failure or if CABG is planned, within 24 h
    - fondaparinux also commonly used in Canada for initial medical management of NSTEMI/UA based on OASIS-5 results
  - clopidogrel used if patient ineligible for ticagrelor
- if PCI is planned: ticagrelor or prasugrel and consider IV glycoprotein IIb/IIIa inhibitor (e.g. eptifibatid, tirofiban)
  - clopidogrel used if patient ineligible for ticagrelor and prasugrel
  - prasugrel contraindicated in those with a history of stroke/TIA, and its avoidance or lower dose is recommended for those >75 yr or weighing <60 kg (TRITON-TIMI 38)
- anticoagulation options depend on reperfusion strategy:
  - primary PCI: UFH during procedure; bivalirudin is a possible alternative
  - thrombolysis: LMWH (enoxaparin) until discharge from hospital; can use UFH as alternative because of possible rescue PCI
  - no reperfusion: LMWH (enoxaparin) until discharge from hospital
- continue LMWH or UFH followed by oral anticoagulation at discharge if at high-risk for thromboembolic event (large anterior MI, severe LV dysfunction, CHF, previous DVT or PE, or echo evidence of mural thrombus)
  - in patients with AFib (CHA2DS2-VASc score  $\geq 1$  in men and  $\geq 2$  in women), use triple antithrombotic therapy for up to 1 wk and then transition to dual antithrombotic therapy (using a NOAC and an antiplatelet agent (preferably clopidogrel))

### 3. $\beta$ -blockers

- STEMI: contraindications include signs of HF, low output states, risk of cardiogenic shock, heart block, asthma, or airway disease; initiate orally within 24 h of diagnosis when indicated
- if  $\beta$ -blockers are contraindicated or if  $\beta$ -blockers/nitrates fail to relieve ischemia, non-dihydropyridine CCB (e.g. diltiazem, verapamil) may be used as second-line therapy in the absence of severe LV dysfunction or pulmonary vascular congestion (CCB do not prevent MI or decrease mortality)

### 4. Invasive Strategies and Reperfusion Options

- UA/NSTEMI: early coronary angiography  $\pm$  revascularization if possible is recommended with any of the following high-risk indicators:
  - diagnosis of NSTEMI
  - recurrent angina/ischemia at rest despite intensive anti-ischemic therapy
  - CHF or LV dysfunction
  - hemodynamic instability
  - high ( $\geq 3$ ) Thrombolysis in Myocardial Infarction (TIMI) risk score (tool used to estimate mortality following an ACS)
  - GRACE risk score >140
  - sustained ventricular tachycardia
  - dynamic ECG changes, transient ST-elevation
  - high-risk findings on non-invasive stress testing
  - PCI within the previous 6 mo
  - repeated presentations for ACS despite treatment and without evidence of ongoing ischemia or high-risk features
  - note: thrombolysis is NOT administered for UA/NSTEMI

#### Complete Revascularization with Multivessel PCI for Myocardial Infarction (COMPLETE)

NEJM 2019;381:1411-1421

**Purpose:** To determine if PCI of non-culprit lesions, in addition to culprit lesions, further reduces the risk of CV events or MI in patients with STEMI.

**Methods:** Patients with STEMI and multivessel CAD who had undergone culprit-lesion PCI (n=404) were randomized to either complete revascularization with PCI (of significant non-culprit lesions) or no further revascularization. The two main outcomes measured included: 1) the composite of CV death or MI, and 2) the composite of CV death, MI, or ischemia-driven revascularization.

**Results:** The first outcome was observed in 7.8% of the complete revascularization group and 10.5% of the culprit-lesion-only PCI group (P=0.004). The second outcome was observed in 8.9% of the complete revascularization group and 16.7% of the culprit-lesion-only PCI group (P<0.001).

**Conclusions:** In patients with STEMI and multivessel CAD, complete revascularization by PCI further reduced the risk of CV death or MI as compared to culprit-lesion-only PCI.

#### TIMI Risk Score for UA/NSTEMI

Characteristics	Points
<b>Historical</b>	
Age $\geq 65$ yr	1
$\geq 3$ risk factors for CAD	1
Known CAD (stenosis $\geq 50\%$ )	1
Aspirin <sup>®</sup> use in past 7 d	1
<b>Presentation</b>	
Recent (<24 h) severe angina	1
ST-segment deviation $\geq 0.5$ mm	1
Increased cardiac marker	1

Risk Score = Total Points  
If TIMI risk score  $\geq 3$ , consider early LMWH and angiography

TIMI = thrombolysis in myocardial infarction  
UA = unstable angina  
JAMA 2000;284:835-842

Newer, more accurate risk quantification scores for UA/NSTEMI exist, such as the GRACE Risk Score; however, TIMI is still used most often

- STEMI
  - after diagnosis of STEMI is made, do not wait for results of further investigations before implementing reperfusion therapy
  - goal is to re-perfuse artery: thrombolysis ("EMS-to-needle") within 30 min or primary PCI ("EMS-to-balloon") within 90 min (if available)
  - PCI
    - early PCI ( $\leq 12$  h after symptom onset and  $< 90$  min after presentation) improves mortality vs. thrombolysis with fewer intracranial hemorrhages and recurrent MIs
    - primary PCI: without prior thrombolytic therapy method of choice for reperfusion in experienced centres
    - rescue PCI: following failed thrombolytic therapy (diagnosed when ST segment elevation fails to resolve below half its initial magnitude after thrombolysis and patient still has chest pain)
- thrombolysis
  - assuming no contraindications, use if  $< 12$  h since symptom onset and primary PCI cannot be conducted within 120 min of STEMI diagnosis
  - note: benefit of thrombolysis is inversely proportional to time from symptom onset; in patients meeting the above criteria, the later the presentation ( $> 3$  h), the more one should consider using primary PCI instead (depending on clinical circumstances)

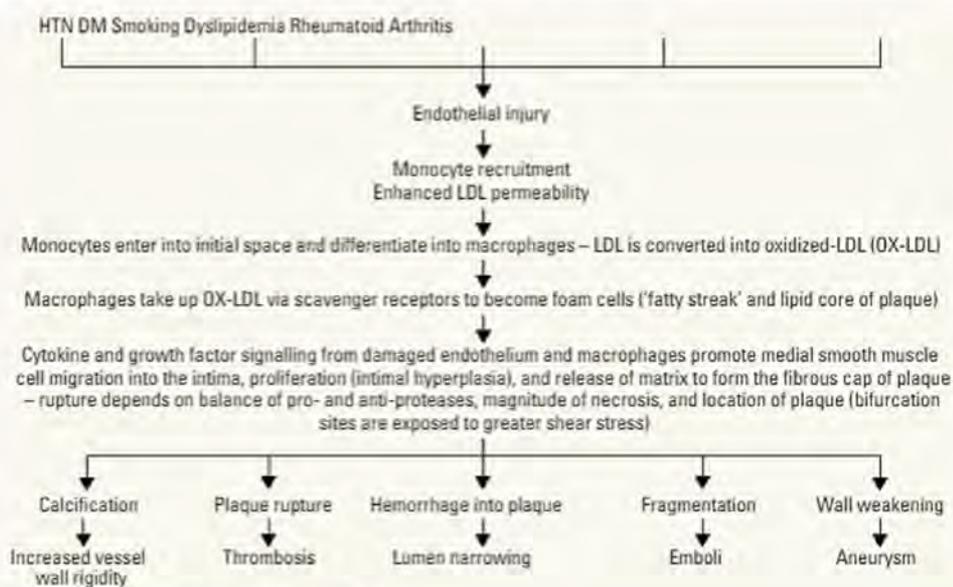

Figure 36. Reperfusion strategy in STEMI

Table 10. Contraindications for Thrombolysis in STEMI

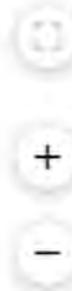

Absolute	Relative
Prior intracranial hemorrhage	Chronic, severe, poorly controlled HTN
Known structural cerebral vascular lesion	Uncontrolled HTN (sBP $> 180$ , dBP $> 110$ )
Known malignant intracranial neoplasm	Current anticoagulation
Significant closed-head or facial trauma ( $\pm 3$ mo)	Noncompressible vascular punctures
Ischemic stroke ( $\leq 3$ mo)	Ischemic stroke ( $\geq 3$ mo)
Active bleeding	Recent internal bleeding ( $\pm 2-4$ wk)
Suspected aortic dissection	Prolonged CPR or major surgery ( $\pm 3$ wk)
	Pregnancy
	Active peptic ulcer disease

**Long-Term Management of ACS**

- risk of progression to MI, or recurrence of MI, or death is highest within 1 mo
- at 1-3 mo after the acute phase, most patients resume a clinical course similar to that in patients with chronic stable coronary disease
- pre-discharge workup: ECG and echo to assess residual LV systolic function
- drugs required in hospital to control ischemia should be continued after discharge in all patients
- other medications for long-term management of ACS are summarized below

**I. General Measures**

- education
- risk factor modification

**2. Antiplatelet and Anticoagulation Therapy**

- see also CCS Antiplatelet Guidelines 2018 for details (free mobile apps available on iOS and Android platforms in the CCS app stores)
- ECASA 81 mg daily
- ticagrelor 90 mg BID or prasugrel 10 mg daily (at least 1 mo, up to 9-12 mo; if stent placed at least 12 mo)
- clopidogrel 75 mg daily can be used as alternatives to ticagrelor and prasugrel when indicated
- ± warfarin x 3 mo if high-risk (high-risk patients include those with large anterior MI, LV thrombus, LVEF <30%, history of VTE, chronic AFib)
- rivaroxaban 2.5 mg BID (based on COMPASS trial)

**3. β-Blockers** (e.g. metoprolol 25-50 mg BID or atenolol 50-100 mg daily)

**4. Nitrates**

- alleviate ischemia but do not improve outcome
- use with caution in right-sided MI patients who have become preload dependent

**5. Calcium Channel Blockers** (NOT recommended as first line treatment, consider as alternative to β-blockers)

**6. ACEIs**

- prevent adverse ventricular remodelling
- recommended for asymptomatic high-risk patients (e.g. diabetics), even if LVEF >40%
- recommended for symptomatic CHF, reduced LVEF (<40%), anterior MI
- use ARBs in patients who are intolerant of ACEI; avoid combining ACEI and ARB

**7. ± Aldosterone Antagonists**

- if already on ACEI and β-blockers, with and LVEF <40% and CHF or DM
- significant mortality benefit shown with eplerenone by 30 d

**8. Lipid Lowering Therapy Statins** (early, intensive, irrespective of cholesterol level; e.g. atorvastatin 80 mg daily)

- atorvastatin 80 mg daily (ezetimibe or PCSK9 inhibitor if LDL <2 mmol/L)

**9. Invasive Cardiac Catheterization if indicated** (risk stratification)

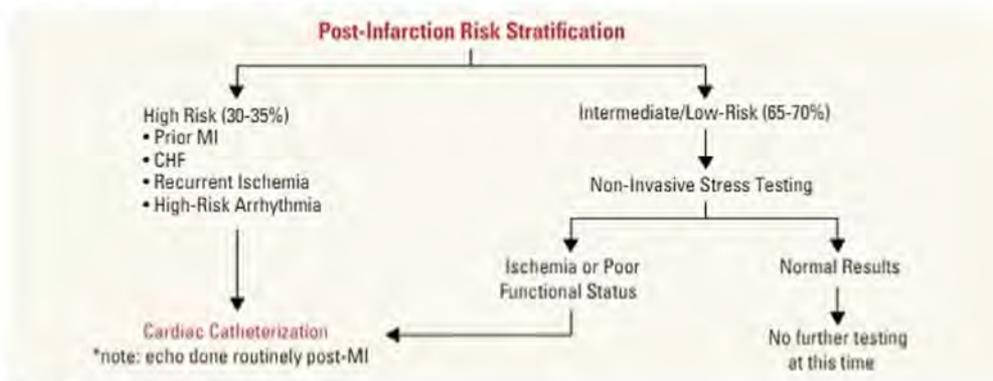

Figure 37. Post-MI risk stratification

**Prognosis following STEMI**

- 5-15% of hospitalized patients will die
  - risk factors
    - infarct size/severity
    - age
    - comorbid conditions
    - development of HF or hypotension
- post-discharge mortality rates
  - 6-8% within first year, half of these within first 3 mo
  - 4% per year following first yr
  - risk factors
    - LV dysfunction
    - residual myocardial ischemia
    - ventricular arrhythmias
    - history of prior MI

**Is this Patient having a MI?**

From The Rational Clinical Examination  
JAMA 1998;381(14):1256-1263

**Study:** Systematic review of articles assessing the accuracy and precision of the clinical exam in the diagnosis of an acute MI.

**Results:** In patients with normal or non-diagnostic ECG, no established CAD, and prolonged or recurrent chest pain typical of their usual discomfort, radiation of pain to the shoulder OR both arms had the highest positive likelihood ratio (+LR) of 4.1 and a negative likelihood ratio (-LR) of 0.68. Radiation to the right arm had a +LR of 3.8 and -LR of 0.86, vomiting had a +LR of 3.5 and -LR of 0.87, while radiation to the left arm only had a +LR of 1.3 and a -LR of 0.9.

**Conclusions:** The most compelling features that increase likelihood of an MI are ST-segment and cardiac enzyme elevation, new Q-wave, and presence of an S3 heart sound. In patients where the diagnosis of MI is uncertain, radiation of pain to the shoulder OR both arms, radiation to the right arm, and vomiting had the best predictive values, while radiation to the left arm is relatively non-diagnostic.

**Complications of MI**

- CRASH PAD**
- Cardiac Rupture
  - Arrhythmia
  - Shock
  - Hypertension/Heart failure
  - Pericarditis/Pulmonary embolism
  - Aneurysm
  - DVT

Resting LVEF is a useful prognostic factor

**Table 11. Complications of MI**

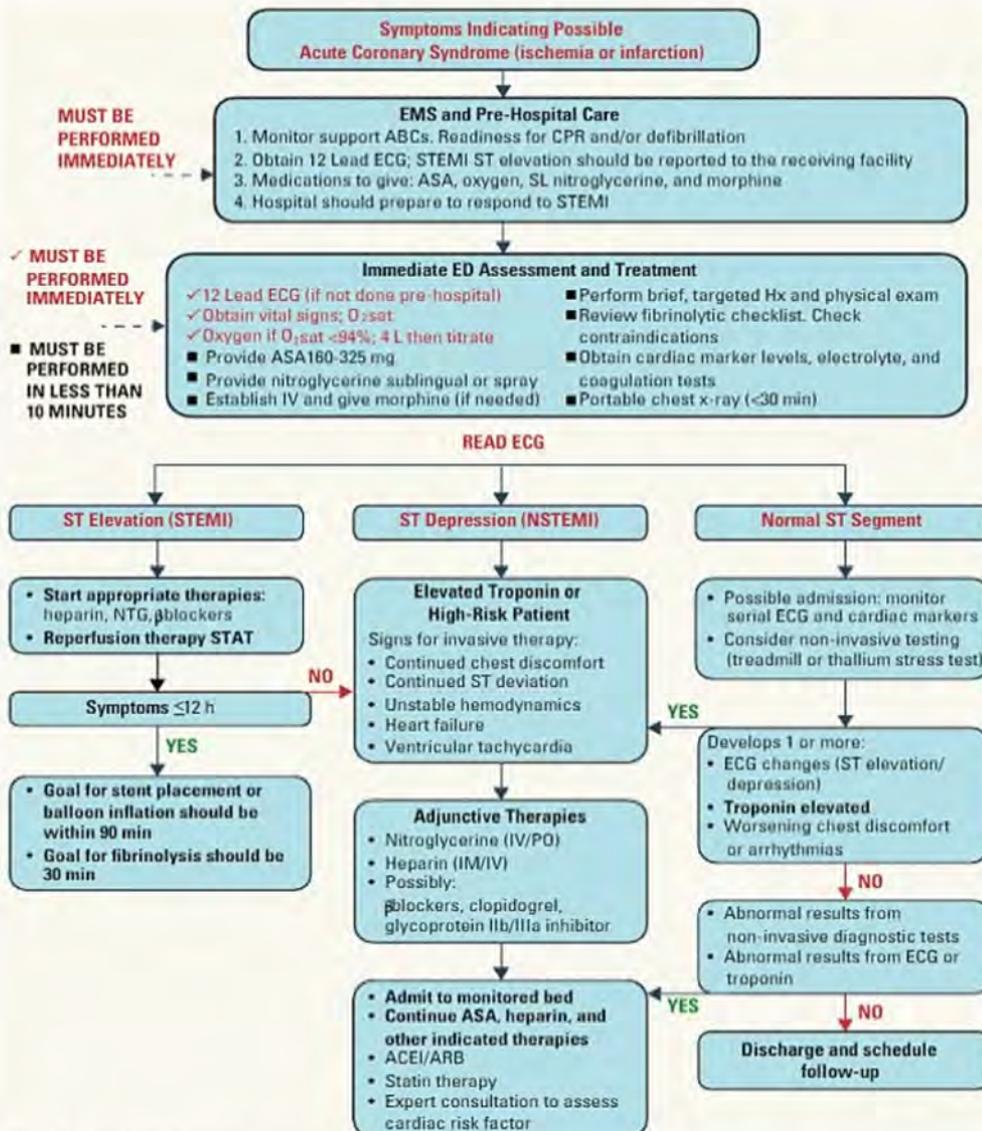

Complication	Etiology	Presentation	Therapy
<b>Arrhythmia</b>			See <i>Arrhythmias</i> , C19
1. Tachycardia	Sinus, AFib, VT, VFib	First 48 h	
2. Bradycardia	Sinus, AV block	First 48 h	
<b>Myocardial Rupture</b>			
1. LV free wall	Transmural infarction	1-7 d	Surgery
2. Papillary muscle (→ MR)	Inferior infarction	1-7 d	Surgery
3. Ventricular septum (→ VSD)	Septal infarction	1-7 d	Surgery
<b>Shock/CHF</b>	Infarction or aneurysm	Within 48 h	Inotropes, intra-aortic balloon pump
<b>Post-Infarct Angina</b>	Persistent coronary stenosis Multivessel disease	Anytime	Aggressive medical therapy PCI or CABG
<b>Recurrent MI</b>	Reocclusion	Anytime	Aggressive medical therapy PCI or CABG
<b>Thromboembolism</b>	Mural/apical thrombus DVT	7-10 d, up to 6 mo	Anticoagulation
<b>Pericarditis</b>	Inflammatory	1-7 d	ASA
<b>Dressler's Syndrome</b>	Autoimmune	2-8 wk	

**Treatment of NSTEMI**

- BEMOAN**
- β- blocker
- Enoxaparin
- Morphine
- O<sub>2</sub>
- ASA
- Nitrates

**Treatment Algorithm for Acute Coronary Syndrome**

Contraindications to nitrates: severe aortic stenosis, hypertrophic cardiomyopathy, suspected right ventricular infarct, hypotension, marked bradycardia or tachycardia, and recent use of phosphodiesterase 5 inhibitors.

**Figure 38. AHA ACLS acute coronary syndrome algorithm**

Adapted from: Jeffery Media Productions 2016, Amsterdam EA, Wenger NK, Brindis RG, et al. 2014 AHA/ACC guideline for the management of patients with non-ST-elevation acute coronary syndromes. *Circulation*. 2014 Jan 7;129:1-35. doi:10.1161/01.CIR.0000000000000134

## Coronary Revascularization

### PERCUTANEOUS CORONARY INTERVENTION

- interventional cardiology technique aimed at relieving significant coronary artery stenosis
- main techniques: balloon angioplasty, stenting
- less common techniques: rotational/directional/extraction atherectomy

#### Indications

- medically refractory angina
- NSTEMI/UA with high-risk features (e.g. high TIMI risk score)
- primary/rescue PCI for STEMI
  - UA/NSTEMI if not a CABG candidate
  - STEMI when PCI can be performed more rapidly and safely than CABG

#### Balloon Angioplasty and Intracoronary Stenting

- coronary lesions dilated with balloon inflation
- major complication is restenosis (approximately 15% at 6 mo), thought to be due to elastic recoil and neointimal hyperplasia
- majority of patients receive intracoronary stent(s) to prevent restenosis
  - bare metal stent (BMS) vs. drug-eluting stents: PRAMI trial demonstrated stenting non-culprit lesions results in 14% absolute risk reduction of cardiac death, nonfatal MI, or refractory angina
  - coated with antiproliferative drugs (sirolimus, paclitaxel, everolimus, zotarolimus)
  - reduced rate of neointimal hyperplasia and restenosis compared to BMS (5% vs. 20%)
  - complication: late stent thrombosis (5 events per 1000 stents implanted)

#### Adjunctive Therapies

- ASA and heparin decrease post-procedural complications
- further reduction in ischemic complications has been demonstrated using GPIIb/IIIa inhibitors (abciximab, eptifibatid, tirofiban) in coronary angiography and stenting
- following stent implantation
  - dual antiplatelet therapy (ASA and clopidogrel) for 6 mo (and up to 1 yr)
  - consider short-duration DAPT for 1 mo with BMS or 3 mo with DES followed by monotherapy for 12 mo among patients with high ischemic or bleeding risk
  - ASA and prasugrel can be considered for those at increased risk of stent thrombosis

#### Procedural Complications

- mortality and emergency bypass rates <1%
- nonfatal MI: approximately 2-3%

### CORONARY ARTERY BYPASS GRAFT SURGERY

- objective of CABG is complete revascularization of the myocardium

#### Indications

- $\geq 50\%$  diameter stenosis in the left main coronary artery
- $\geq 70\%$  diameter stenosis in three major coronary arteries
- $\geq 70\%$  diameter stenosis in the proximal LAD artery plus one other major coronary artery
- survivors of sudden cardiac arrest with presumed ischemia-mediated VT caused by significant ( $\geq 70\%$  diameter) stenosis in a major coronary artery
- $\geq 70\%$  diameter stenosis in two major coronary arteries (without proximal LAD disease) and evidence of extensive ischemia
- $\geq 70\%$  diameter stenosis in the proximal LAD artery and evidence of extensive ischemia
- multivessel CAD in patients with diabetes
- LV systolic dysfunction (LVEF 35% to 50%) and with significant multivessel CAD or proximal LAD stenosis where viable myocardium is present in the region of intended revascularization
- one or more significant ( $\geq 70\%$  diameter) coronary artery stenosis amenable to revascularization and unacceptable angina despite medical therapy

#### Contraindications

- CABG may be contraindicated in patients who are: elderly/frail, have multiple comorbidities or, for any other reason, may not survive surgery
- CABG may be contraindicated in patients who do not have myocardial viability
- CABG is contraindicated in patients that lack bypassable vessels

#### Results

- perioperative and in-hospital mortality rate after CABG: ~1% for the lowest risk elective patients, and 2% for all patients (depends on patient characteristics and heart function)
- predictive variables for early hospital mortality include older age (>80 yr), female sex, urgency of operation, left main stem disease, increasing extent of CAD, increasing LV dysfunctions, redo CABG

See Landmark Cardiac Trials for more information on EXCEL which details the long-term efficacy profile of CABG vs. PCI in patients with left main CAD.

**Ticagrelor with or without Aspirin<sup>®</sup> in High-Risk Patients after PCI**  
NEJM 2019;381:2032-2042

**Purpose:** To determine if monotherapy with ticagrelor, a P2Y<sub>12</sub> inhibitor, after a period of dual antiplatelet therapy reduces the risk of bleeding following PCI.

**Methods:** Patients who were at high-risk for bleeding or an ischemic event underwent PCI and 3 mo of treatment with ASA plus ticagrelor. Patients (n=7119) were then randomized to receive either ticagrelor plus ASA or ticagrelor plus placebo for a year. The primary endpoint was Bleeding Academic Research Consortium (BARC) type 2, 3, or 5 bleeding.

**Results:** The primary endpoint was observed in 4.0% of patients in the ticagrelor plus placebo group and 7.1% of patients in the ticagrelor plus ASA group (P<0.001). The incidence of death from any cause, nonfatal MI, or nonfatal stroke was 3.9% in both groups (P=0.001 for noninferiority).

**Conclusion:** Among high-risk bleed patients who received PCI and 3 mo of dual antiplatelet therapy, additional ticagrelor monotherapy was associated with lower incidence of bleeding and the same risk of death, as compared to ticagrelor plus ASA therapy.

**Safety and Efficacy Outcomes of Double vs. Triple Antithrombotic Therapy in Patients with Atrial Fibrillation Following Percutaneous Coronary Intervention**

Eur Heart J 2019; 40:3757-3767

**Purpose:** To evaluate the safety and efficacy of double vs. triple antithrombotic therapy (DAT vs. TAT) in patients with AFib and ACS following PCI.

**Methods:** Systematic review and meta-analysis of 4 trials with a total of 10234 patients.

**Conclusions:** DAT was associated with lower risk of bleeding, but higher risk of stent thrombosis and MI compared to TAT. There was no significant difference in all-cause and cardiovascular death, stroke, and major adverse cardiovascular events.

See Landmark Cardiac Trials for more information on SYNTAX, which details all-cause mortality, stroke, MI or repeat revascularization 12 mo following PCI vs. CABG

Table 12. Choice of Revascularization Procedure

	PCI	CABG
<b>Advantages</b>	Less invasive technique Decreased periprocedural morbidity and mortality Shorter periprocedural hospitalization	Greater ability to achieve complete revascularization Decreased need for repeated revascularization procedures
<b>Factors favouring Revascularization Procedure</b>	<b>Clinical characteristics</b> Severe comorbidity Advanced age/frailty/reduced life expectancy Restricted mobility and conditions that affect rehabilitation  <b>Anatomical and technical aspects</b> MVD with SYNTAX score <23 Anatomy likely resulting in incomplete revascularization with CABG due to poor quality or missing conduits Severe chest deformation or scoliosis Sequelae of chest radiation Porcelain aorta	<b>Clinical characteristics</b> Diabetes Reduced LV function (EF <35%) Contraindications to DAPT Recurrent diffuse in-stent restenosis  <b>Anatomical and technical aspects</b> MVD with SYNTAX score >23 Anatomy likely resulting in incomplete revascularization with PCI Severely calcified coronary artery lesions limiting lesion expansion Need for concomitant interventions Ascending aortic pathology with indication for surgery Concomitant cardiac surgery

Note: Table reflects guidelines from the European Society of Cardiology that have been taught to Canadian cardiac surgery residents

Table 13. Conduits for CABG

Graft	Occlusion/Patency Rate	Considerations
<b>Saphenous Vein Grafts (SVG)</b>	At 10 yr: 50% occluded, 25% stenotic, 25% angiographically normal	Used to be commonly used, but arterial conduits have proven to be superior
<b>Left Internal Thoracic/Mammary Artery (LITA/LIMA to LAD)</b>	90-95% patency at 15 yr	Considered the standard conduit for CABG Excellent patency Almost always used to bypass LAD Improved event-free survival (angina, MI) Decreased late cardiac events
<b>Right Internal Thoracic/Mammary Artery (RITA/RIMA)</b>	Pedicled RIMA patency comparable to LIMA Lower rate of free RIMA patency	Used in bilateral ITA/IMA grafting Patients receiving bilateral ITAs/IMAs have less risk of recurrent angina, late MI, angioplasty
<b>Radial Artery (free graft)</b>	85-95% patency at 5 yr	Prone to severe vasospasm postoperatively due to vascular muscular wall
<b>Right Gastroepiploic Artery</b>	80-90% patency at 5 yr	Primarily used as an <i>in situ</i> graft to bypass the RCA Use limited because of the fragile quality of the artery, technical issues, increased operative time (laparotomy incision), and incisional discomfort with associated ileus
<b>Complete Arterial Revascularization</b>		For younger patients (<60 y/o) Preferred due to longer term graft patency
<b>Redo Bypass Grafting</b>		Indications for redo CABG: symptomatic patients (disabling angina) who have failed medical therapy, have stenotic vessels, have viable myocardium, have suitable distal targets Risk factors for redo CABG: poor control of HTN/hypercholesterolemia/smoking, normal LV, 1 or 2 vessel disease, no use of IMA/ITA in initial CABG, incomplete revascularization in initial CABG, young age Operative mortality 2-3 times higher than first operation 10% perioperative MI rate Reoperation undertaken only in symptomatic patients who have failed medical therapy and in whom angiography has documented progression of the disease Increased risk with redo-sternotomy secondary to adhesions which may result in laceration to aorta, RV, IMA/ITA, and other bypass grafts, uncontrollable hemorrhage, arterial bleeding and VFib, venous bleeding, or failure to arrest heart

Adapted from: Chikwe J, Beddow E, Glenville B. *Cardiothoracic Surgery*, 1st ed. Oxford, UK: Oxford UP; 2006.

### Operative Issues

- LV function is an important determinant of outcome for all heart diseases
- patients with severe LV dysfunction usually have poor prognosis, but surgery can sometimes dramatically improve LV function
- assess viability of non-functioning myocardial segments in patients with significant LV dysfunction using delayed thallium myocardial imaging, stress echo, positron emission tomography (PET) scanning, or MRI

### Percutaneous Coronary Intervention Versus Coronary Artery Bypass Grafting in Patients with Three-vessel or Left Main Coronary Artery Disease

Lancet 2019;394:1325-34

**Purpose:** Report 10-yr all-cause mortality results as a 10-yr follow-up to the 2009 SYNTAX trial.

**Methods:** Adult patients with established left main CAD or three-vessel coronary disease were randomized to receive either PCI or CABG in a 1:1 ratio. Patients with a prior history of MI, PCI or CABG were excluded. The primary study endpoint was 10-yr all-cause mortality.

**Results:** 10-yr all-cause mortality rates were 28% and 24% for PCI- and CABG-treated patients, respectively (hazard ratio 1.19; 95% CI 0.99 to 1.43;  $p=0.066$ ). In subgroup analysis, 10-yr all-cause mortality was 28% and 21% in PCI and CABG patients with three-vessel disease, respectively (hazard ratio 1.42; 95% CI 1.11 to 1.81). The same primary endpoint occurred in patients with left main coronary disease at a rate of 27% and 28% in PCI and CABG patients, respectively (hazard ratio 0.92; 0.69 to 1.22;  $P=0.023$ ).

**Conclusions:** CABG provided a significant all-cause survival benefit in patients with three-vessel disease, compared to PCI in the same population. This effect was not observed in patients with left main CAD or in the pooled study sample.

### Duration of Dual Antiplatelet Therapy Following Drug-eluting Stent Implantation: A Systematic Review and Meta-Analysis of Randomized Controlled Trials with Longer Follow-up

Catheter Cardiovasc. Interv. 2017; 90:31-7

**Purpose:** Conduct an updated meta-analysis to compare the efficacy and safety of short-term dual antiplatelet therapy (S-DAPT) vs. long-term DAPT (L-DAPT) in patients who underwent drug-eluting stent (DES) implantation.

**Methods:** RCTs comparing efficacy and/or safety outcomes for different DAPT durations after coronary DES implantation were searched in PubMed, CINAH, Cochrane CENTRAL, EMBASE, Scopus, and Web of Science. S-DAPT was defined as <12 mo duration of aspirin plus P2Y12 receptor inhibitor, while L-DAPT was defined as the same combination for >12 mo duration after DES implantation.

**Results:** 5 RCTs met all eligibility criteria and were included in the final meta-analysis. Outcomes of interest included all-cause mortality, cardiac mortality, myocardial infarction, stent thrombosis, target vessel revascularization, stroke, or major bleeding. Compared with L-DAPT, S-DAPT did not significantly increase the rate of stent thrombosis (OR 1.59; 95% CI 0.77 to 3.27). All-cause mortality, cardiac mortality, target vessel revascularization and stroke were also not significantly different between groups. However, S-DAPT was associated with an increased risk of MI (OR 1.48; 95% CI 1.04 to 2.10) and a lowered risk of major bleeding (OR 0.64; 95% CI 0.41 to 0.99).

**Conclusions:** In this meta-analysis with a longer follow-up time of >24 months, S-DAPT compared to L-DAPT was associated with increased risk of MI but lower rates of major bleeding. No significant differences were found for all-cause mortality, cardiac mortality, stent thrombosis, target vessel revascularization, or stroke.

### CABG and Antiplatelet Regimens

- refer to CCS guidelines 2018 update on antiplatelet therapy for more information
- prior to CABG, clopidogrel and ticagrelor should be discontinued for 5 d, and prasugrel for 7 d before surgery
- dual antiplatelet therapy should be continued for 12 mo in patients with ACS within 48-72 h after CABG
- ASA (81 mg) continued indefinitely (can be started 6 h after surgery)
- patients requiring CABG after PCI should continue their dual antiplatelet therapy as recommended in the post-PCI guidelines

**Table 14. Risk Factors for CABG Mortality and Morbidity**

Risk Factors for CABG Mortality	Risk Factors for CABG Postoperative Morbidity or Increased Length of Stay
Urgency of surgery (emergent or urgent)	Reoperation
Reoperation	Emergent procedure
Older age	Preoperative intra-aortic balloon pump (IABP)
Poor LV function (see below)	CHF
Female gender	CABG + valve surgery
Left main disease	Older age
Others include catastrophic conditions (cardiogenic shock, ventricular septal rupture, ongoing CPR), dialysis-dependent renal failure, end-stage COPD, DM, cerebrovascular disease, and peripheral vascular disease	Renal dysfunction
	COPD
	DM
	Cerebrovascular disease

Note: risk factors are listed in decreasing order of significance

### Procedural Complications

- CABG using CPB (see *Cardiopulmonary Bypass, C68*)
  - stroke and neurocognitive defects (microembolization of gaseous and particulate matter)
  - immunosuppression
  - deep sternal wound infection
  - bleeding
  - systemic inflammatory response leading to:
    - myocardial dysfunction
    - renal dysfunction
    - neurological injury
    - respiratory dysfunction
    - coagulopathies

### OFF-PUMP CORONARY ARTERY BYPASS SURGERY

#### Procedure

- avoids the use of CPB by allowing surgeons to operate on a beating heart
  - stabilization devices (e.g. Genzyme Immobilizer<sup>®</sup>) hold heart in place allowing operation while positioning devices (Medtronic Octopus<sup>®</sup> and Starfish<sup>®</sup> system) allow the surgeon to lift the beating heart to access the lateral and posterior vessels
  - procedure is safe and well tolerated by most patients; however, this surgery remains technically more demanding

#### Indications/Contraindications

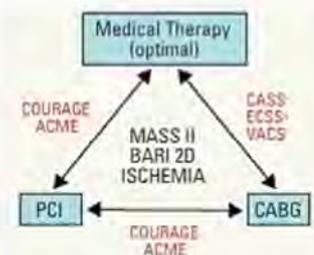

- used in poor candidates for CPB who have: calcified aorta, poor LVEF, severe PVD, severe COPD, chronic renal failure, coagulopathy, transfusion objections (e.g. Jehovah's Witness), good target vessels, anterior/lateral wall revascularization, target revascularization in older, sicker patients
- absolute contraindications: hemodynamic instability, poor quality target vessels including intramyocardial vessels, diffusely diseased vessels, and calcified coronary vessels
- relative contraindications: cardiomegaly/CHF, critical left main disease, small distal targets, recent or current acute MI, cardiogenic shock, LVEF <35%

#### Outcomes

- OPCAB surgery decreases in-hospital morbidity (decreased incidence of chest infection, inotropic requirement, supraventricular arrhythmia), blood product transfusion, ICU stay, length of hospitalization, and CK-MB and troponin I levels
  - OPCAB has been associated with lower graft patency

See Landmark Cardiac Trials for more information on ROOBY, which details the 5-year clinical outcomes in patients undergoing on-pump vs. off-pump CABG

### Dichotomies of HF

- Forward vs. backward
- Left-sided vs. right-sided
- Systolic vs. diastolic dysfunction
- Low output vs. high output

### Use EF to Grade LV Dysfunction

- Grade I (EF >60%) (Normal)
- Grade II (EF = 40-59%)
- Grade III (EF = 21-39%)
- Grade IV (EF ≤20%)

**Table 15. Signs and Symptoms of Left vs. Right HF**

	Left Failure	Right Failure
<b>Low CO (Forward)</b>	Fatigue Syncope Systemic hypotension Cool extremities Slow capillary refill Peripheral cyanosis Pulsus alternans MR S3	Left failure symptoms if decreased RV output leads to LV underfilling TR S3 (right-sided)
<b>Venous Congestion (Backward)</b>	Dyspnea, orthopnea, PND Cough Crackles	Peripheral edema Elevated JVP with abdominojugular reflux, and ± Kussmaul's sign Hepatomegaly Pulsatile liver

**Pathophysiology**

- most common causes are ischemic heart disease, risk factors for CAD, LVH (HTN), valvular heart disease, and tachyarrhythmia
- myocardial insult causes pump dysfunction/impaired filling leading to myocardial remodeling and the following maladaptive changes:
  - pressure overload (e.g. AS or HTN) leads to compensatory hypertrophy (i.e. concentric remodeling) and eventually interstitial fibrosis
  - volume overload (e.g. aortic insufficiency) leads to dilatation (i.e. eccentric remodeling)
- remodeling results in decreased forward CO resulting in activation of the SNS and RAAS
- SNS causes tachycardia
- RAAS causes Na<sup>+</sup> and water retention to increase preload and afterload
- net result is increased cardiac demand leading to eventual decompensation

**Heart Failure with Reduced Ejection Fraction (HFrEF: LVEF ≤40%)**

- impaired myocardial contractile function → decreased LVEF and SV → decreased CO
- volume overload is the typical phenotype
- findings: apex beat displaced, S3, cardiothoracic ratio >0.5, decreased LVEF, LV dilatation
- causes
  - ischemic (e.g. extensive CAD, previous MI)
  - non-ischemic
    - HTN
    - DM
    - EtOH (and other toxins)
    - myocarditis
    - DCM (multiple causes see *Dilated Cardiomyopathy, C47*)
    - tachycardia-induced

**Heart Failure with Mid-Range Ejection Fraction (HF-mrEF: LVEF 41-49%)**

- includes patients who are recovering from HFrEF, declining from HFpEF, and transitioning to HFpEF
- characterization of HF-mrEF ongoing; guideline management does not currently exist

**Heart Failure with Preserved Ejection Fraction (HFpEF: LVEF ≥50%)**

- previously known as "diastolic HF"
- concentric remodelling with a "stiff" LV is the typical phenotype
- 50% of patients with HF have preserved EF; confers similar prognosis to HFrEF; more common in the elderly and females
- reduced LV compliance causes increased LV filling pressures, increased LA pressure/volume, and pulmonary congestion
- findings: HTN, apex beat sustained, S4, normal-sized heart on CXR, LVH on ECG/echo, normal EF
- causes
  - transient: ischemia (e.g. CAD, MI)
  - permanent: severe hypertrophy (HTN, AS, HCM), RCM (e.g. amyloid), MI

**High-Output Heart Failure**

- caused by demand for increased CO
- often exacerbates existing HF or decompensates a patient with other cardiac pathology
- DDX: anemia, thiamine deficiency (beriberi), hyperthyroidism, arteriovenous (A-V) fistula or left to right (L-R) shunting, Paget's disease, renal disease, hepatic disease

**Precipitants of Symptomatic Exacerbations**

- consider natural progression of disease vs. new precipitant
- always search for reversible cause

See Landmark Cardiac Trials for more information on **DAPA-HF** which details the efficacy of SGLT2 inhibition in patients with HF rEF and without T2DM.

See Landmark Cardiac Trials for more information on **PARADIGM-HF** which details the survival outcomes of HFrEF patients treated with an ACEI or an angiotensin-neprilysin inhibitor.

**A Validated Clinical and Biochemical Score for the Diagnosis of Acute Heart Failure: the ProBNP Investigation of Dyspnea in the Emergency Department (PRIDE) Acute Heart Failure Score**  
Am Heart J 2006;151:48-54

Predictor	Possible Score
Age >75 yr	1
Orthopnea present	2
Lack of cough	1
Current loop diuretic use (before presentation)	1
Rales on lung exam	1
Lack of fever	2
Elevated NT-proBNP (>450 pg/ml, if <50 yr, >900 pg/ml, if >50 yr)	4
Interstitial edema on CXR	2
<b>Total</b>	<b>14</b>
Likelihood of HF	
Low = 0-5	
Intermediate = 6-8	
High = 9-14	

BNP is secreted by V<sub>1</sub> due to LV stretch and wall tension. Cardiomyocytes secrete BNP precursor that is cleaved into proBNP. After secretion into V<sub>s</sub>, proBNP is cleaved into the active C-terminal portion and the inactive NT-proBNP. The above scoring algorithm developed by Baggish et al. is commonly used. A score of <6 has a negative predictive value of 98%, while scores ≥6 had a sensitivity of 96% and specificity of 84% (P<0.001) for the diagnosis of acute HF

**NYHA Functional Classification of HF**

- **Class I:** ordinary physical activity does not cause symptoms of HF
- **Class II:** comfortable at rest; ordinary physical activity results in symptoms
- **Class III:** marked limitation of ordinary activity; less than ordinary physical activity results in symptoms
- **Class IV:** inability to carry out any physical activity without discomfort; symptoms may be present at rest

- DDX can also be organized as follows:
  - new cardiac insult/disease: MI, arrhythmia, valvular disease, cardiotoxic chemotherapy
  - new demand on CV system: HTN, anemia, thyrotoxicosis, infection
  - medication non-compliance
  - dietary indiscretion (e.g. salt intake)
  - obstructive sleep apnea

### Investigations

- identify and assess precipitating factors and treatable causes of CHF
- blood work: CBC, electrolytes (including calcium and magnesium), blood urea nitrogen (BUN), Cr, fasting blood glucose, hemoglobin A1c, lipid profile, LFTs, serum TSH ± ferritin, BNP (>100 pg/mL), NT-ProBNP (>300 pg/ml), uric acid
- urinalysis
- ECG: look for chamber enlargement, arrhythmia, ischemia/infarction
- CXR: cardiomegaly, pleural effusion, redistribution, Kerley B lines, bronchiolar-alveolar cuffing
- echo: systolic function (LVEF), diastolic function (E/A ratio, E/e'), cardiac dimensions, wall motion abnormalities, RV systolic pressure (from TR jet), valvular disease, pericardial effusion
- radionuclide angiography: LVEF
- myocardial perfusion scintigraphy (thallium or sestamibi SPECT)

### Additional Diagnostic Investigations

- cardiac catheterization
- cardiopulmonary exercise testing
- other tests (CMR, MPI, MUGA, CT scan)

### Acute Treatment of Pulmonary Edema

- treat acute precipitating factors (e.g. ischemia, arrhythmias)
  - L Lasix® (furosemide) 40-500 mg IV
  - M morphine 2-4 mg IV: decreases anxiety and preload (venodilation)
  - N nitroglycerin: topical/IV/SL - use with caution in preload-dependent patients (e.g. right HF or RV infarction) as it may precipitate CV collapse
  - O oxygen: in hypoxemic patients
  - P positive airway pressure (continuous positive airway pressure (CPAP)/bilevel positive airway pressure (BiPAP)): decreases preload and need for ventilation when appropriate
  - P position: sit patient up with legs hanging down unless patient is hypotensive
- in ICU setting or failure of LMNOPP: other interventions may be necessary
  - nitroprusside IV
  - hydralazine PO
  - sympathomimetics
    - dopamine
      - low dose: selective renal vasodilation (high potency D1 agonist)
      - medium dose: inotropic support (medium potency  $\beta$ 1 agonist)
      - high dose: increases SVR (low potency  $\beta$ 1 agonist), which is undesirable
    - dobutamine
      - $\beta$ 1-selective agonist causing inotropy, tachycardia, hypotension (low dose) or HTN (high dose); most serious side effect is arrhythmia, especially AFib
  - phosphodiesterase inhibitors (milrinone)
    - inotropic effect and vascular smooth muscle relaxation (decreased SVR), similar to dobutamine
- consider pulmonary artery catheter to monitor PCWP if patient is unstable or a cardiac etiology is uncertain (PCWP >18 indicates likely cardiac etiology)
- mechanical ventilation as needed
- rarely used, but potentially life-saving measures:
  - IABP - reduces afterload via systolic unloading and improves coronary perfusion via diastolic augmentation
  - LVAD/RVAD
  - cardiac transplant

### Long-Term Management

- overwhelming majority of evidence-based management applies to HFrEF
- currently no proven pharmacologic therapies shown to reduce mortality in HFpEF; control risk factors for HFpEF (e.g. HTN)
- prevent fluid overload with appropriate diuretic strategies

### Conservative Measures

- symptomatic measures: oxygen in hospital, bedrest, elevate the head of bed
- lifestyle measures: diet, exercise, DM control, smoking cessation, decrease EtOH consumption, patient education, sodium, and fluid restriction
- multidisciplinary HF clinics: for management of individuals at higher risk, or with recent hospitalization

### Five Most Common Causes of CHF

- CAD (60-70%)
- HTN
- Idiopathic (often DCM)
- Valvular (e.g. AS, AR, and MR)
- EtOH (DCM)

### Precipitants of HF

#### HEART FAILED

- HTN (common)
- Endocarditis/environment (e.g. heat wave)
- Anemia
- Rheumatic heart disease and other valvular disease
- Thyrotoxicosis
- Failure to take medications (very common)
- Arrhythmia (common)
- Infection/Ischemia/Infarction (common)
- Lung problems (PE, pneumonia, COPD)
- Endocrine (pheochromocytoma, hyperaldosteronism)
- Dietary indiscretions (common)

The most common cause of right HF is left HF

### Measuring NT-proBNP

BNP is secreted by V<sub>s</sub> due to LV stretch and wall tension  
 Cardiomyocytes secrete BNP precursor that is cleaved into proBNP  
 After secretion into V<sub>s</sub>, proBNP is cleaved into the active C-terminal portion and the inactive NT-proBNP portion

	NT-proBNP levels (pg/mL)
Age	HF very likely
<50	>450
50-75	>900
>75	>1800

Limitations: Age, body habitus, renal function, PE

### Features of HF on CXR

#### HERB-B

- Heart enlargement (cardiothoracic ratio >0.50)
- Pleural Effusion
- Re-distribution (alveolar edema)
- Kerley B lines
- Bronchiolar-alveolar cuffing

Patients on  $\beta$ -blocker therapy who have acute decompensated HF should continue  $\beta$ -blockers where possible (provided they are not in cardiogenic shock or in severe pulmonary edema)

### Non-Pharmacological Management

- from 2021 CCS guidelines
- restrict salt intake to 2-3 g/d
- monitor daily weight for patients with HF, fluid retention, or congestion that is difficult to control with diuretics or renal dysfunction
- restrict daily fluid intake to approximately 2 L/d for patients with fluid retention or congestion that is difficult to control with diuretics
- cardiac rehabilitation: participation in a structured exercise program for NYHA class I-III after clinical status assessment to improve quality of life (HF-ACTION trial)

### Pharmacological Therapy

- **ACEI/ARB: RAAS blockade**
  - ACEI: slows progression of LV dysfunction and improves survival
    - all symptomatic patients functional class II-IV
    - all asymptomatic patients with LVEF <40%
    - post-MI
  - angiotensin II receptor blockers
    - second-line to ACEI (if ACEI not tolerated), or as adjunct to ACEI if  $\beta$ -blockers not tolerated
    - combination of  $\beta$ -blockers with ACEI is not routinely recommended and should be used with caution as it may precipitate hyperkalemia, renal failure, and the need for dialysis (CHARM, ONTARGET)
- **antiarrhythmic drugs:** for use in CHF with arrhythmia
  - can use amiodarone,  $\beta$ -blocker, or digoxin
- **anticoagulants:** DOACs or vitamin K antagonist (warfarin) for prevention of thromboembolic events
  - prophylactic indications:
    - AFib
    - LV thrombus
    - Prior thromboembolic event
- **ARNI:** combination angiotensin receptor-neprilysin inhibitors - slows down progression of LV dysfunction and improves survival
  - RAAS inhibitor prevents volume overload and neprilysin inhibitor enhances effects of BNP
  - first line therapy or if switching from an ACEI or ARB among patients with residual NYHA II-IV symptoms and LVEF <40%
- **$\beta$ -blockers:** slow progression and improve survival
  - $\beta$ -adrenergic blocking agents blocks effects of epinephrine to reduce rate and force of myocardial contraction
  - indicated for class I-III with LVEF <40% and stable class IV patients
  - carvedilol improves survival in class IV HF (COMET)
  - caution: should be used cautiously; titrate slowly because may initially worsen CHF
- **diuretics:** management of fluid overload and symptom control (e.g. dyspnea and PND)
  - furosemide (40-500 mg QD) for potent diuresis
  - metolazone once weekly may be used with furosemide to increase diuresis if patient becomes refractory to furosemide
  - furosemide, metolazone, and thiazides oppose the hyperkalemia that can be induced by  $\beta$ -blockers, ACEI, ARBs, and aldosterone antagonists
- **digoxin and cardiac glycosides:** increase myocardial contractility but decrease rate
  - improves symptoms and decreases hospitalizations; no effect on mortality
  - indications: patient in sinus rhythm and symptomatic on ACEI or CHF and AFib
  - caution: patients on digitalis glycosides may worsen if these are withdrawn
- **hydralazine plus isosorbide dinitrate:** combination antihypertensive and vasodilator
  - consider for symptom control and mortality benefit in Black patients with symptomatic HFrEF despite guideline-directed medical therapy (GDMT)
  - also consider for HFrEF patients with drug intolerance to ACEIs, ARBs, or ARNI
- **ivabradine:** selective inhibition of the If current
  - recommended for CV death and hospitalization prevention in patients with HFrEF and symptomatic despite:
    - treatment with appropriate doses of GDMT, resting HR >70 bpm, and in sinus rhythm
  - weaker level of evidence than either ARNI or SGLT2 inhibitor
- **mineralocorticoid receptor (aldosterone) antagonists:** spironolactone or eplerenone
  - mortality benefit in symptomatic HF and severely depressed EF
  - for symptomatic HF in patients already on ACEI,  $\beta$ -blocker, and loop diuretic
  - caution: potential for life threatening hyperkalemia
    - monitor K<sup>+</sup> after initiation and avoid if Cr >220  $\mu$ mol/L or K<sup>+</sup> >5.2 mmol/L

**CCS/CHFS Heart Failure Guidelines Update: Defining a New Pharmacologic Standard of Care for Heart Failure with Reduced Ejection Fraction**  
Can J Cardiol 2021;37:531-46

**Management of HFrEF:** It is recommended that, in the absence of contraindications, HFrEF patients be treated with combination therapy including 1 drug from each of the following categories: ARNI (or ACEI/ARB),  $\beta$ -blocker, mineralocorticoid receptor antagonist (MRA) and SGLT2 inhibitor. It is recommended that patients admitted with acute decompensated HFrEF should be switched to an ARNI, from an ACEI/ARB when stabilized. It is recommended that  $\beta$ -blockers be initiated as soon as possible after HF diagnosis, not waiting until hospital discharge to initiate treatment in stabilized patients. MRA treatment is recommended for patients with acute MI and LVEF <40%, and HF symptoms or DM, to reduce CV mortality and hospitalization for CV events. SGLT2 inhibitors should be used in patients with HFrEF, with or without concomitant T2DM, to improve symptoms and reduce hospitalizations.

See Landmark Cardiac Trials for more information on DAPA-HF which details the efficacy of SGLT2 inhibition in patients with HFrEF and without T2DM.

See Landmark Cardiac Trials for more information on PARADIGM-HF which details the survival outcomes of HFrEF patients treated with an ACEI or an angiotensin-neprilysin inhibitor.

- **SGLT2 inhibitor:** empagliflozin, canagliflozin, dapagliflozin
  - recommended for treatment of patients with stable HFrEF, irrespective of T2 DM
  - recommended in mild to moderate HFrEF with concomitant T2DM to improve symptoms and reduce mortality

### HFrEF Management

1. ARNI (or if on ACEI/ARB substitute to ARNI)
2.  $\beta$ -blockers
3. MRA
4. SGLT2 inhibitor

### HFpEF Management

1. ARB
2. Systolic/Diastolic Hypertension Management according to CHEP Guidelines (2017)
3. MRA (if serum  $K^+$   $<5.0$  mmol/L and eGFR  $>30$  mL/min)

### Surgical Management

- revascularization is the most frequently performed operation in HF patients with the aim to restore blood flow to hibernating myocardium ( $<10\%$  operative mortality in some patient groups)
- mitral valve surgery for the treatment of MR secondary to ischemic LV dilation
- LV remodeling (Batista procedure - partial left ventriculectomy; Dor procedure - left ventricular restoration) improves ventricular function by reducing ventricular radial dimensions and thus decreasing wall tension via Laplace's law
- VADs (see *Cardiac Transplantation, C50*)
- heart transplantation (see *Cardiac Transplantation, C50*)

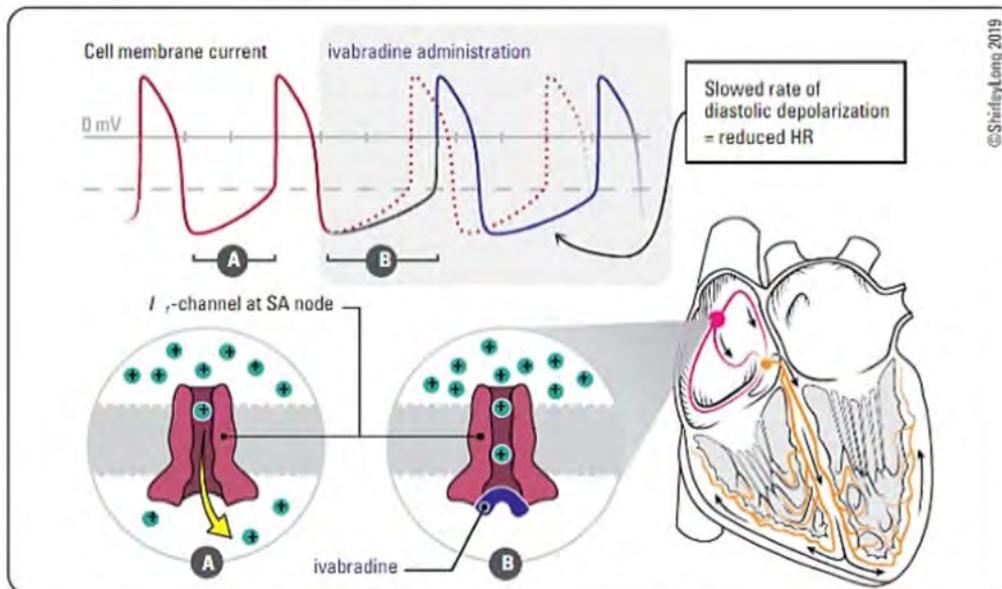

Figure 42. Ivabradine mechanism of action

### Procedural Interventions

- resynchronization therapy: symptomatic improvement with CRT-P or CRT-D
  - consider if QRS  $>130$  msec with LBBB morphology, LVEF  $<35\%$ , and persistent symptoms despite OMT
  - greatest benefit likely with marked LV enlargement, MR, QRS  $>150$  msec
  - CRT-P is indicated for patients eligible for resynchronization therapy but not ICD; if the patient is also eligible for an ICD the decision for CRT-D is individualized in accordance with overall goals of care
- ICD: mortality benefit in 1<sup>o</sup> prevention of SCD
  - consider if: prior MI, OMT, LVEF  $<30\%$ , clinically stable
  - consider if: prior MI, non-sustained VT, LVEF 30-40%, EPS inducible VT
- LVAD/RVAD (see *Ventricular Assist Devices, C52*)
- cardiac transplantation (see *Cardiac Transplantation, C50*)
- valve repair if patient is surgical candidate and has significant valve disease contributing to CHF (see *Valvular Heart Disease, C54*)

### Chronic Treatment of CHF

- ACEI\*
  - $\beta$ -blockers\*
  - $\pm$  Mineralocorticoid receptor antagonists\*
  - Diuretic
  - ARNI
  - $\pm$  Inotrope
  - $\pm$  Antiarrhythmic
  - $\pm$  Anticoagulant
- \*Mortality benefit

### Ivabradine and Outcomes in Chronic Heart Failure (SHIFT): A Randomized Placebo-Controlled Study

Lancet 2010;376:11-17

**Study:** Randomised, double-blind, placebo-controlled, parallel-group trial.

**Population:** Patients with symptomatic HF and LVEF of 35% or lower, in sinus rhythm with HR greater than or equal to 70 bpm, had been admitted to hospital for HF within previous year, on stable background treatment including  $\beta$ -blocker if tolerated.

**Intervention:** Ivabradine titrated to a maximum of 7.5 mg BID vs. placebo.

**Outcome:** Primary endpoint was composite of CV death or hospital admission for worsening HF.

**Results:** 793 (24%) patients in the ivabradine group and 937 (29%) of those taking placebo had a primary endpoint event (HR 0.82, 95% CI 0.75-0.90,  $P<0.0001$ ).

Fewer serious adverse events occurred in the ivabradine group (3388 events) than in the placebo group (3847;  $P=0.025$ ).

150 (5%) of ivabradine patients had symptomatic bradycardia vs. 32 (1%) of the placebo group ( $P<0.0001$ ).

Median follow-up was 22.9 mo (interquartile range 18-28).

**Conclusions:** Results support the importance of HR reduction with ivabradine for improvement of clinical outcomes in HF and confirm the important role of HR in the pathophysiology of this disorder.

**Note:** Limitation of this study was that only 26% of patients were on target  $\beta$ -blocker doses.

Ivabradine currently recommended in these patients when HR is not controlled on maximum tolerated  $\beta$ -blocker dose or there is a contraindication to  $\beta$ -blocker use.

### Higher New York Heart Association Classes and Increased Mortality and Hospitalization in Patients with Heart Failure and Preserved Left Ventricular Function

Am Heart J 2006;151:444-450

**Purpose:** To establish the association between NYHA class and outcomes with HF and preserved systolic function.

**Methods:** Retrospective follow-up study (median 38.5 mo) of 988 patients with HF with EF  $>45\%$ . Estimated risks of various outcomes using Cox proportional hazard models.

**Results:** Adjusted HR for all-cause mortality for NYHA class II, III, IV patients was 1.54, 2.56, and 8.46, respectively. Adjusted HR for all-cause hospitalization for NYHA class II, III, IV patients was 1.23, 1.71, and 3.4, respectively.

**Conclusions:** Higher NYHA classes were associated with poorer outcomes in patients with HF and preserved systolic function.

Proportions of NYHA I, II, III, and IV patients who died of all causes during the study were 14.3%.

NYHA	Proportion of All-Cause Hospitalization	Proportion of All-Cause Mortality
I	60.7%	14.3%
II	65.2%	21.3%
III	77.7%	35.9%
IV	75.0%	58.3%

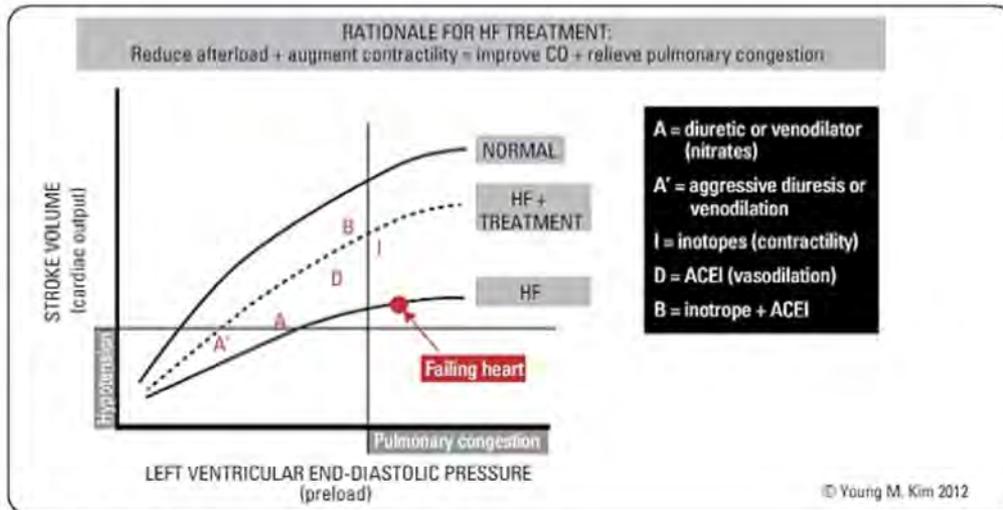

Figure 43. Effect of HF treatment on the Frank-Starling curve

### Sleep-Disordered Breathing

- patients with CHF can have sleep disturbances; 40% of patients have central sleep apnea with Cheyne-Stokes breathing and 11% of patients have obstructive sleep apnea
- associated with a worse prognosis and greater LV dysfunction
- nasal CPAP may be effective to treat symptoms of sleep apnea with secondary benefits to cardiac function

### Cardio-oncology

- cardiotoxicity of chemotherapeutic agents is a leading cause of long-term morbidity and mortality among cancer survivors
- dose-dependent LV systolic dysfunction with anthracyclines and potentially reversible decline in LVEF with trastuzumab
- evaluate CV risk factors and optimize treatment of pre-existing CV disease before, during, and after receiving cardiotoxic cancer therapy
- follow patient using same imaging modality and methods (e.g. echo with contrast, echocardiographic global longitudinal strain (GLS), 3 dimensional echo, or multiple-gated acquisition (MUGA) scan) to assess LV function before, during, and upon completion of chemotherapy
- recommended that clinical HF or an asymptomatic decline in LVEF (>10% decrease in LVEF from baseline or LVEF <53%) during or after treatment is managed according to CCS guidelines

## Myocardial Disease

### Definition of Cardiomyopathy

- intrinsic or primary myocardial disease not secondary to congenital, hypertensive, coronary, valvular, or pericardial disease
  - results in both morphologic and functional abnormalities
- functional classification: dilated, hypertrophic, or restrictive
- LV dysfunction secondary to MI, often termed "ischemic cardiomyopathy," is not a true cardiomyopathy (i.e. primary myocardial disorder) since the primary pathology is obstructive CAD

Table 16. Comparison of Cardiomyopathies, Secondary Causes, and Consequent HF Phenotypes

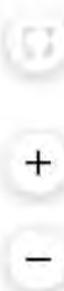

Heart Failure Reduced Ejection Fraction (HFrEF)		Heart Failure Preserved Ejection Fraction (HFpEF)		
<b>Dilated Cardiomyopathy (DCM)</b>	<b>Secondary Causes</b>	<b>Hypertrophic Cardiomyopathy (HCM)</b>	<b>Restrictive Cardiomyopathy (RCM)</b>	<b>Secondary Causes</b>
Idiopathic, infectious (e.g. myocarditis), ETOH, familial, collagen vascular disease	CAD, MI, DM, valvular (e.g. AR, MR)	Genetic disorder affecting cardiac sarcomeres (most common cause of SCD in young athletes)	Amyloidosis, sarcoidosis, scleroderma, hemochromatosis, Fabry's, Pompe's Disease, Loeffler's	HTN, DM, valvular (e.g. AS), post-MI, transiently by ischemia

#### Cardiomyopathy

#### HARD

- Hypertrophic cardiomyopathy (HCM)
- Arrhythmogenic right ventricular cardiomyopathy
- Restrictive cardiomyopathy (RCM)
- Dilated cardiomyopathy (DCM)

## Myocarditis

### Definition

- inflammatory process involving the myocardium ranging from acute to chronic
- important cause of DCM
- spectrum of severity ranging from non-specific symptoms such as fatigue to cardiogenic shock

### Etiology

- idiopathic
- infectious
  - viral (most common overall cause): coxsackie A and B, parvovirus B19, adenoviruses, influenza, coxsackie B, echovirus, poliovirus, HIV, mumps, coronavirus disease 2019 (COVID-19)
  - bacterial: *S. aureus*, *Streptococcus*, *C. perfringens*, *C. diphtheriae*, *Mycoplasma*, *Rickettsia*
  - fungi
    - spirochetal (Lyme disease *Borrelia burgdorferi*)
    - Chagas disease (*Trypanosoma cruzi*), *Toxoplasma gondii*
- toxic: catecholamines, chemotherapy, cocaine
- hypersensitivity/eosinophilic: drugs (e.g. antibiotics, diuretics, lithium, clozapine), insect/snake bites
- systemic diseases: collagen vascular diseases (e.g. SLE, rheumatoid arthritis), sarcoidosis, autoimmune
- other: giant cell myocarditis, acute rheumatic fever

### Signs and Symptoms

- constitutional symptoms
- acute CHF: dyspnea, tachycardia, elevated JVP
- cardiogenic shock
- chest pain: due to pericarditis or cardiac ischemia
- arrhythmias
- systemic or pulmonary emboli
- presyncope/syncope/sudden death

### Investigations

- ECG: non-specific ST-T changes and/or conduction defects (used for initial screening and risk stratification)
  - echocardiography: lack of cardiac dilation and increased thickness of septum (fulminant myocarditis), spherical ventricle that remodels to elliptical after some months (acute myocarditis)
- blood work
  - increased creatine kinase (CK), cardiac troponins (cTnI and cTnT), NT-proBNP (if LV dysfunction occurs), LDH, and AST with acute myocardial necrosis ± increased WBC, C-reactive protein (CRP), erythrocyte sedimentation rate (ESR), antinuclear antibody test (ANA), rheumatoid factor, complement levels
  - blood culture, viral titres, and cold agglutinins for Mycoplasma
- CXR: enlarged cardiac silhouette
- TTE: systolic dysfunction (dilated, hypokinetic chambers, segmental wall motion abnormalities) and/or diastolic dysfunction
- CMR: functional and morphological abnormalities as well as tissue pathology (gadolinium enhancement)
- endomyocardial biopsy: only done in certain clinical scenarios (e.g. on inotropic and/or mechanical circulatory support)
- coronary angiography: to exclude ischemic heart disease

### Management

- supportive care
- mechanical circulatory support and inotropic support if cardiogenic shock
- restrict physical activity during early recovery
- treat CHF per current HF guidelines
  - guideline-directed medical therapy
  - advanced therapies such as ventricular assist and transplantation
- treat arrhythmias
- anticoagulation
- treat underlying cause if possible

### Prognosis

- often unrecognized and may be self-limited
- myocarditis treatment trial showed 5 yr mortality between 25-50%
- giant cell myocarditis, although rare, can present with fulminant CHF and be rapidly fatal, with 5 yr mortality >80%
- sudden death in young adults
- may progress to DCM

## Dilated Cardiomyopathy

### Definition

- unexplained dilation and impaired systolic function of one or both ventricles
- if present, comorbid CAD is unable to fully account for extent of dysfunction observed

### Etiology

- familial/genetic ~60%
- EtOH ~20-30%
- myocarditis
- infectious: viral (coxsackie B, HIV, COVID-19), Chagas disease, Lyme disease, Rickettsial diseases, acute rheumatic fever, toxoplasmosis
- collagen vascular disease: SLE, polyarteritis nodosa, dermatomyositis, progressive systemic sclerosis
- idiopathic (presumed viral or idiopathic)
- uncontrolled tachycardia (e.g. persistent, rapid AFib)
- neuromuscular disease: Duchenne muscular dystrophy, myotonic dystrophy, Friedreich's ataxia
- metabolic: uremia, nutritional deficiency (thiamine, selenium, carnitine)
- endocrine: hyper/hypothyroidism, DM, pheochromocytoma
- peripartum
- toxic: cocaine, heroin, organic solvents
- drugs: chemotherapies (doxorubicin, cyclophosphamide), anti-retrovirals, chloroquine, clozapine, TCA
- radiation

### Signs and Symptoms

- may present as:
  - systolic HF
  - systemic or pulmonary emboli
  - arrhythmias
  - sudden death (major cause of mortality due to fatal arrhythmia)

### Investigations

- blood work: CBC, electrolytes, Cr, bicarbonate, BNP, CK, troponin, LFTs, TSH, total iron binding capacity (TIBC)
- ECG: variable ST-T wave abnormalities, poor R wave progression, conduction defects (e.g. BBB), arrhythmias (e.g. non-sustained VT)
- CXR: global cardiomegaly (i.e. globular heart), signs of CHF, pleural effusion
- echo: systolic dysfunction (chamber enlargement, global hypokinesis, depressed LVEF, MR and TR, mural thrombi)
- cardiac MRI: myocardial fibrosis
- endomyocardial biopsy: not routine, used to rule out a treatable cause
- coronary angiography: in select patients to exclude ischemic heart disease

### Management

- treat underlying disease: e.g. abstinence from EtOH
- treat CHF as per current guidelines (see *Heart Failure, C40*)
  - includes medical management and devices (ICD and CRT)
- advanced therapies considered for medication-refractory disease
  - e.g. LVAD, transplant, and volume reduction surgery
- thromboembolism prophylaxis: anticoagulation with warfarin
  - indicated for: AFib, history of thromboembolism or documented thrombus
- treat symptomatic or serious arrhythmias
- immunize against influenza and *S. pneumoniae*
- indication to screen first-degree relatives when unclear etiology

### Prognosis

- depends on etiology, often parallels prognosis of systolic HF
- better with reversible underlying cause; worst with infiltrative diseases, HIV, drug-induced
- early reverse remodelling with optimal HF management (i.e. medications and devices) improves prognosis
- myocardial fibrosis increases SCD risk
- cause of death usually CHF (due to pump failure) or sudden death secondary to ventricular arrhythmias
- systemic emboli are significant source of morbidity
- 20% mortality in first yr, 10% per year thereafter

**Major Risks Factors for DCM**  
FMHx, EtOH, cocaine,

**Abnormal Labs in DCM**

- High BNP
- High Cr
- High LFTs
- Low bicarbonate
- Low Na+

## Hypertrophic Cardiomyopathy

- see 2020 American Heart Association (AHA)/American College of Cardiology (ACC) Guideline for the Diagnosis and Treatment of Patients With Hypertrophic Cardiomyopathy for details

### Definition

- unexplained left ventricular hypertrophy (LVH)
- LVH can occur in any distribution
  - asymmetric septal hypertrophy is most common
- systolic anterior motion of mitral valve and hyperdynamic LV are common but non-diagnostic

### Etiology

- cause is felt to be a genetic defect involving one of the cardiac sarcomeric proteins
  - >400 mutations associated with autosomal dominant inheritance, incomplete penetrance, variable age of onset
  - 70% of pathogenic variants occur within 2 genes: beta myosin heavy chain 7 (MYH7) and myosin-binding protein C3 (MYBPC3)
- prevalence of 1 in 500 to 1 in 1000 in general population
  - equally prevalent in men and women although women are diagnosed less often
- generally presents in early adulthood

### Pathophysiology

- histopathologic features include myocyte disarray, myocyte hypertrophy, dysplastic arterioles and interstitial fibrosis
- dynamic obstruction of LVOT (LVOTO) due to both septal hypertrophy and systolic anterior motion (SAM) of mitral leaflets
- diastolic dysfunction due to LVH, ischemia, and interstitial fibrosis
- myocardial ischemia due to supply-demand mismatch
- autonomic dysfunction in inappropriate vasodilation during exercise and abnormal HR recovery

### Hemodynamic Classification

- HOCM (hypertrophic obstructive cardiomyopathy): defined as peak LVOT gradient of at least 30 mmHg either at rest or with provocation
  - peak LVOT gradient of at least 50 mmHg at rest or provoked is the typical threshold for considering invasive septal reduction in patients with insufficient response to medical management
- non-obstructive HCM (one-third): no LVOT obstruction

### Signs and Symptoms

- clinical manifestations: asymptomatic (common, therefore screening is important), SOB/angina, presyncope/syncope (due to LV outflow obstruction or arrhythmia), CHF, arrhythmias, SCD
- pulses: rapid upstroke, "spike and dome" pattern in carotid pulse (in HCM with outflow tract obstruction)
- precordial palpation: PMI localized, sustained, double impulse, 'triple ripple' (triple apical impulse in HOCM), LV lift
- precordial auscultation: normal or paradoxically split S2, S4, harsh systolic diamond-shaped murmur at LLSB or apex, enhanced by squat to standing or Valsalva (murmur secondary to LVOTO as compared to AS); often with pansystolic murmur due to MR

### Investigations

- 3-generation family history
  - first-degree relatives receive directed cascade genetic testing and routine TTE and ECG screening
  - first-degree relatives are screened every 1-3 yr as children and every 3-5 yr as adults provided they are asymptomatic and initial assessment is negative
- TTE for initial diagnosis, monitoring every 1-2 yr and evaluating clinical concerns
  - for patients not meeting LVOTO criteria (LVOT gradient of at least 50mmHg) at rest, a provocative maneuver and/or exercise stress test is performed to assess for dynamic LVOTO development
- TEE for preoperative planning of septal reduction, assessment of MR etiology, SAM and LVOTO
- cardiac MRI to clarify inconclusive echocardiogram results or determine method of septal reduction
- ECG/holter monitor for initial workup, regular follow-up, and assessment of SCD risk
  - LVH, high voltages across precordium, prominent Q waves (lead I, aVL, V5, V6), tall R wave in V1, P wave abnormalities
- cardiac catheterization (only when patient being considered for invasive therapy)
- genetic studies to clarify uncertain diagnoses and facilitate screening of family members

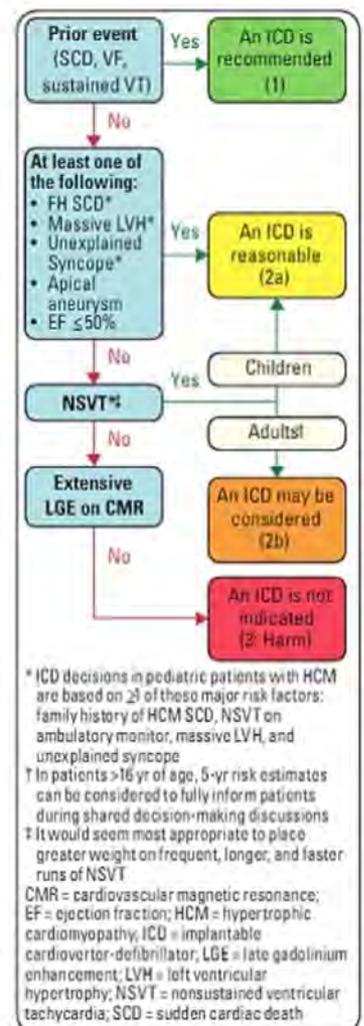

Figure 44. ICD implantation in HCM

### Management

- avoid factors which increase obstruction (e.g. volume depletion)
  - avoidance of high-intensity competitive sports unless exceptional circumstances
  - mild-to-moderate-intensity exercise is safe
- treatment of HOCM
  - medical agents:  $\beta$ -blockers, verapamil or diltiazem (started only in monitored settings), disopyramide, phenylephrine (in setting of cardiogenic shock)
  - avoid digoxin and vasodilators (e.g. nitrates, dihydropyridine calcium channel blockers, and ACEi/ARB) as they are inotropic and afterload reducing, respectively
- patients with HOCM and drug-refractory symptoms require septal reduction therapy at experienced centres
  - surgical myectomy
  - alcohol septal ablation - percutaneous intervention that ablates the hypertrophic septum with 100% ethanol via the septal artery
  - dual chamber pacing (rarely done)
- treatment of non-obstructive HCM
  - symptomatic:  $\beta$ -blockers or non-dihydropyridine calcium channel blockers and diuretics if refractory symptoms
- comorbid atrial fibrillation: direct oral anticoagulant or warfarin regardless of CHA<sub>2</sub>DS<sub>2</sub>-VASc score
- consequent systolic dysfunction: consider candidacy for transplant
- treatment of patients at high-risk of sudden death: ICD (see *Figure 44, ICD implantation in HCM, C48*)
  - history of survived cardiac arrest/sustained VT
  - FMHx of premature sudden death
  - other factors associated with increased risk of SCD
    - syncope (presumed to be arrhythmic in origin)
    - LVEF <50%
    - LV apical aneurysm
    - non-sustained VT on ambulatory monitoring
    - marked LVH (maximum wall thickness  $\geq 30$  mm)

### Prognosis

- life expectancy may or may not be reduced
  - the majority of those with HCM do not experience severe symptoms or require aggressive treatments
- potential complications: AFib, stroke, CHF (diastolic and systolic), VT, SCD (1% risk/yr; most common cause of SCD in young athletes)

## Restrictive Cardiomyopathy

### Definition

- impaired ventricular filling with preserved systolic function in a non-dilated, non-hypertrophied ventricle secondary to factors that decrease myocardial compliance (fibrosis and/or infiltration)
- biatrial enlargement is often present despite normal AV valve functioning

### Etiology

- most commonly: amyloidosis, sarcoidosis, and hemochromatosis
- infiltrative: amyloidosis, sarcoidosis
- non-infiltrative: scleroderma, idiopathic myocardial fibrosis, diabetic cardiomyopathy
- storage diseases: hemochromatosis, Fabry's disease, Gaucher's disease, glycogen storage diseases
- endomyocardial
  - endomyocardial fibrosis (late presentation), Loeffler's endocarditis, or eosinophilic endomyocardial disease
  - radiation heart disease
  - carcinoid syndrome (may have associated tricuspid valve or pulmonary valve dysfunction)

### Clinical Manifestations

- CHF (usually with preserved LV systolic function), arrhythmias
- elevated JVP with prominent x and y descents, Kussmaul's sign
- S3, S4, MR, TR
- thromboembolic events

### Investigations

- ECG: low voltage, non-specific, diffuse ST-T wave changes  $\pm$  non-ischemic Q waves
- CXR: mild cardiomegaly due to biatrial enlargement
- echo: LAE, RAE; specific Doppler findings with no significant respiratory variation
- cardiac MRI: assessment of myocardial fibrosis, determination of etiology and exclusion of constrictive pericarditis
- cardiac catheterization: increased end-diastolic ventricular pressures
- endomyocardial biopsy: to determine etiology (especially for infiltrative RCM)

#### Mavacamten for Treatment of Symptomatic Obstructive Hypertrophic Cardiomyopathy (EXPLORER-HCM: A Randomized, Double Blind, Placebo-Controlled, Phase 3 Trial)

The Lancet 2020 Sep 12;396(10253):759-69.

**Purpose:** Assess the safety and efficacy of mavacamten, a cardiac myosin inhibitor, in symptomatic HOCM.

**Methods:** Patients with HOCM (LVOT  $> 50$  mmHg, NYHA II-III) from 68 clinical centers in 13 countries were randomized to mavacamten or placebo for 30 wk.

The primary endpoint was a  $>1.5$  mL/kg/min increase in peak O<sub>2</sub> consumption and at least one NYHA class reduction, or  $>3.0$  mL/kg/min increase in peak O<sub>2</sub> consumption with no NYHA class reduction.

**Results:** 45 (37%) of 123 patients on mavacamten vs. 22 (17%) of 128 on placebo met the primary endpoint. Patients on mavacamten had greater reductions in post-exercise LVOT gradient and greater increase in peak O<sub>2</sub> consumption. 34% more patients in the mavacamten group improved by at least 1 NYHA class. Safety and tolerability were comparable to placebo.

**Conclusion:** Mavacamten improved exercise capacity, LVOT obstruction, NYHA functional class, and health status in patients with HOCM.

#### RCM vs. Constrictive Pericarditis

Present similarly but constrictive pericarditis is treatable with surgery

RCM	Constrictive Pericarditis
• family history	• prior surgical history
• no pulsus paradoxus	• in some cases
• systolic murmurs	• pulsus paradoxus may be present
• LVH	• pericardial rub
• normal pericardium (intracardiac pathology)	• no LVH
• myo- and endocardial later gadolinium enhancement (LGE)	• pericardial calcification and pericardial thickening
• elevated BNP	• pericardial late gadolinium enhancement (LGE)
	• reduced BNP

**Management**

- exclude constrictive pericarditis
- control HR, anticoagulate if AFib
- treat underlying disease: (e.g. cardiac amyloidosis, cardiac sarcoidosis, hemochromatosis)
- supportive care and treatment for CHF, arrhythmias, and prevention of SCD when indicated
  - judicious use of diuretics (excess volume reduction reduces filling pressures versus pathologic requirements triggering hypoperfusion)
- cardiac transplant: might be considered for CHF refractory to medical therapy

**Prognosis**

- depends on etiology

**Key Investigations**

- **Echo:** may show respiratory variation in blood flow in constrictive pericarditis
- **CT:** may show very thickened pericardium and calcification in constrictive pericarditis
- **MRI:** best modality to directly visualize pericardium and myocardium

## Left Ventricular Noncompaction Cardiomyopathy

**Definition**

- failure of LV compaction leading to endomyocardial trabeculations that increase in number and prominence
- characterized by abnormal trabeculations in the LV, most frequently at the apex

**Etiology**

- genetics are incompletely understood
- mutations have been mainly observed in genes coding sarcomeric, cytoskeletal and mitochondrial proteins
- can occur in healthy individuals (e.g. athletes and pregnancy) as well as concomitantly with congenital heart diseases and other cardiomyopathies (i.e. HCM, RCM, DCM, ARVC)
- can be reversible

**Clinical Manifestations**

- if occurring in absence of concomitant cardiomyopathy and congenital heart disease, LV non-compaction can be benign
- symptoms range from SOBOE to rest symptoms
  - many patients are asymptomatic
- ventricular arrhythmias or complete AV block (presents as syncope and sudden death)
- thromboembolic events
  - more likely when systolic dysfunction and LV dilatation are present

**Investigations**

- directed by primary pathology when LV non-compaction is comorbid with congenital disease or other cardiomyopathies
- TTE and cardiac MRI
  - most common diagnostic method is the ratio of the thickness of the non-compacted layer to that of the compacted layer (greater than 2:1 at the end of diastole)
- role of routine genetic screening remains in question
  - typically performed in the setting of LV non-compaction with comorbid cardiomyopathy

**Management**

- at-risk first-degree relatives are recommended to undergo screening
- therapy is largely driven by concomitant myocardial dysfunction, arrhythmias, and congenital heart disease
- ICD is an option if patients have syncope or documented VT
- antiplatelets or systemic anticoagulation should be considered in adults, especially when the LV or atria are dilated

**Prognosis**

- dependent on LV function and presence of comorbid conditions (e.g. congenital heart disease and cardiomyopathy)

## Cardiac Transplantation

- treatment for end-stage heart failure
- median survival is 12 yr
- matching is according to blood type, body size and weight (should be within 25%), HLA tissue matching, and geographical considerations (to minimize ischemic time)

**Indications for Surgery**

- severe cardiac disability despite maximal medical therapy (e.g. recurrent hospitalizations for CHF, NYHA III or IV, peak metabolic oxygen consumption  $<14$  mL/kg/min in absence of  $\beta$ -blocker) with a life expectancy of 12-18 mo
- symptomatic cardiac ischemia refractory to conventional treatment (e.g. unstable angina not amenable to CABG or PCI with LVEF  $<20$ -25%; recurrent, symptomatic ventricular arrhythmias)

- high-risk HFSS
  - HFSS is an algorithm that incorporates the patient's HR, serum sodium, ischemic cardiomyopathy, LVEF, peak myocardial oxygen consumption, MAP, interventricular conduction delay
  - patients with medium-risk (HFSS 7.2-8.1, 73% 1-yr survival) and high-risk (HFSS <7.2, 43% 1-yr survival) benefit from cardiac transplant
- cardiogenic shock requiring IV inotropic agents or mechanical circulatory support to sustain organ perfusion
- exclusion of all surgical alternatives to cardiac transplantation

#### Absolute Contraindications

- active alcohol use disorder or substance use disorder
- actively smoking
- coagulopathy
- incurable malignancy
- irreversible major organ disease
- irreversible pulmonary HTN (i.e. >5 Wood units, transpulmonary gradient <18 mmHg, or systolic pulmonary artery pressure >60 mmHG)
- major systemic illness
- mental illness or other cognitive factors likely to affect ability to adhere to post-transplant regimens
- repeated non-adherence to medications
- severe COPD (i.e. FEV1 <1L)
- severe symptomatic cerebrovascular disease

#### Relative Contraindications

- active systemic infection
- acute PUD
- age >70 yr
- DM with end-organ disease
- lack of family/social support
- obesity (>35 kg/m<sup>2</sup>)
- significant symptomatic carotid disease or PVD

#### Prerequisites

- psychosocial stability
- medically compliant and motivated

#### Complications

- rejection
  - declining incidence with improved post-transplant immunosuppression regimens: <13% experience an episode that needs to be treated and <5% have serious hemodynamic compromise
  - gold standard to detect rejection: endomyocardial biopsy
  - risk of acute rejection is greatest during the first 3 mo after transplant
  - hyperacute rejection (minutes to hours after transplant) due to ABO mismatch, acute rejection (days to months after transplant), or chronic rejection (years after transplant)
- infection
  - leading cause of morbidity and mortality after cardiac transplantation
  - risk peaks early during the first few months after transplantation and then declines to a low persistent rate
- allograft vasculopathy
  - approximately 50% develop graft vasculopathy within 10 yr of transplantation
  - most common cause of late death following transplantation
- malignancy
  - develops in 15% of cardiac transplant recipients due to immunosuppressive medication
  - second most common cause of late death following transplantation
  - cutaneous neoplasms most common, followed by non-Hodgkin lymphoma and lung cancer
- medication side effects
  - immunosuppressives (e.g. prednisone, cyclosporine nephrotoxicity, tacrolimus) may have nephrotoxic effects
- cardiac denervation
  - as the donor heart is completely denervated, it does not receive parasympathetic vagal stimulation or intrinsic postganglionic sympathetic stimulation so it will not respond to anticholinergics like atropine
- RV dysfunction
  - RV dysfunction with TR, particularly in patients with preoperative pulmonary HTN, due to myocardial dysfunction caused by long ischemic time and/or reperfusion injury
  - requires aggressive management for treatment using agents that dilate the pulmonary vasculature or, rarely, RVAD support

#### Effects of Donor Pre-Treatment with Dopamine on Survival after Heart Transplantation: A Cohort Study of Heart Transplant Recipients Nested in a Randomized Controlled Multicentre Trial

J Am Coll Cardiol 2010;58:1768-1777

Treatment of brain-dead donors with dopamine of 4 µg/kg/min will not harm cardiac allografts but appears to improve the clinical course of the heart allograft recipient.

#### Long-Term Use of a Left Ventricular Assist Device for End-Stage Heart Failure

NEJM 2001;345:1435-1443

Increased survival of 23% vs. 8% with LVAD vs. medical management of HF after 2 yr. Heartmate VAD has a biologic surface and, therefore, does not require long-term anticoagulation but confers a higher risk of infection.

#### Canadian Cardiovascular Society Focused Position Statement Update on Assessment of the Cardiac Patient for Fitness to Drive: Fitness following Left Ventricular Assist Device Implantation

Can J Cardiol 2012;28:137-140

Patients with a continuous flow LVAD (NYHA class I-III) who are stable 2 mo post-LVAD implantation qualify for private driving (only) and are disqualified from commercial driving.

#### Canadian Cardiovascular Society/ Canadian Cardiac Transplant Network Position Statement on Heart Transplantation: Patient Eligibility, Selection, and Post-Transplantation Care

Can J Cardiol 2020;36:335-56

**Selection Criteria:** Cardiac transplantation is recommended for consideration in HF patients >70 yr old. For all patients being considered, an assessment of frailty with a validated tool is recommended. Caution is recommended for patients with BMI >35. LVAD implantation is recommended for eligible patients with pulmonary hypertension on right heart catheterization. Finally, cardiac transplantation is not recommended for patients who show repeated nonadherence to medications, alcohol or illicit drug use, mental illness, and/or cognitive concerns that will render patients unlikely to adhere to post-transplantation regimens.

## Ventricular Assist Devices

- work to unload the ventricle while maintaining output; also results in decreased myocardial oxygen consumption permitting recovery of the myocardium that is not irreversibly injured
- can support the left (LVAD), right (RVAD), or both ventricles (BiVAD); typical circuit is comprised of a pump, an outflow graft, and a driveline to connect to an external power source and controller (see Figure 45)
- indications:
  - bridge to transplantation, bridge to decision (for transplant), or long term permanent therapy ("destination therapy")
  - postoperative mechanical support when unable to separate from CPB despite inotropic and IABP support
    - IABP is a catheter-based device inserted into the femoral artery and advanced to the descending aorta that decreases afterload, thus myocardial O<sub>2</sub> demand and increases blood flow to coronary arteries
    - inflation of the balloon occurs during diastole to increase ascending aorta and coronary artery perfusion pressure; deflation occurs at systole to reduce intra-aortic pressure thus reducing afterload
  - cardiogenic shock

## Extracorporeal Membrane Oxygenation

- circuit includes: centrifugal pump, membrane oxygenator, venous and arterial cannulas (see Figure 46)
- venoatrial (VA) ECMO is treatment for cardiogenic shock due to broad availability, technical simplicity, and rapid deployment
- outcomes for ECMO poor with 35% survival
- indications: postcardiotomy shock, allograft failure, fulminant myocarditis, decompensated HF
- extracorporeal life support through ECMO use is an effective method of resuscitation in moribund patients

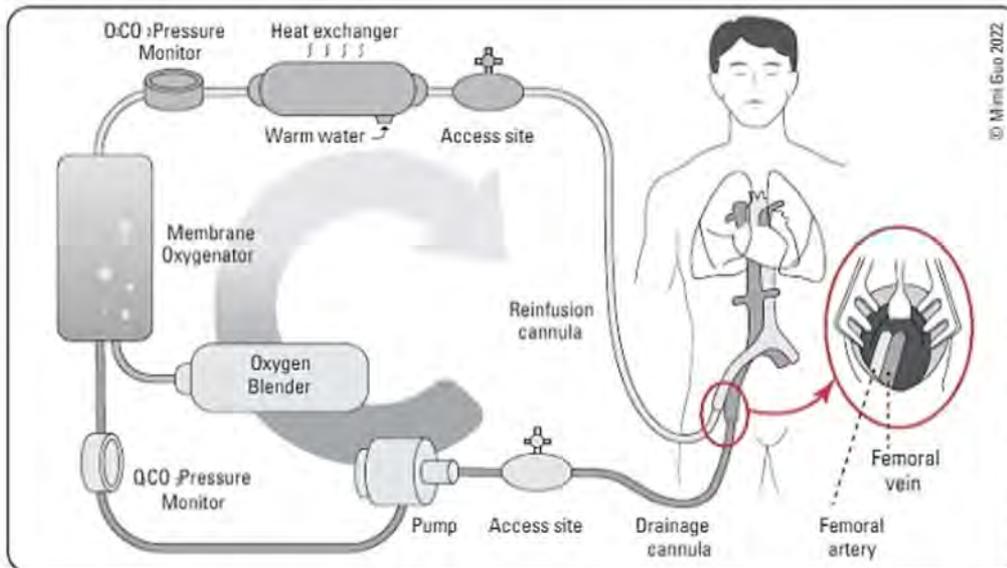

Figure 46. ECMO

## Cardiac Tumours

### Incidence

- cardiac tumours are more commonly derived from metastases than primary tumours
  - primary cardiac tumours have an estimated incidence of 1-30 in 100000 people per year
  - metastatic involvement of the heart is much more common and is present in 10-20% of autopsies of patients who die from cancer

### Diagnosis

- TTE, TEE, MRI, PET and/or CT scan can be used to detect cardiac tumours
  - transvenous and open biopsy offer definitive diagnosis when required
- once detected, CT or PET scans screen for distant metastasis while cardiac MRI helps determine suitability for surgery
  - coronary angiography determines presence of concomitant CAD and neoplastic involvement of coronary vasculature

### Advanced Heart Failure Treated with Continuous-Flow Left Ventricular Assist Device

NEJM 2009;361:2241-51

**Purpose:** Assess quality of life in patients with advanced HF treated with implanted pulsatile-flow LVAD or new continuous-flow devices.

**Methods:** Patients with advanced medically-refractory HF were randomized (in a 2:1 ratio) to implantation of a continuous-flow LVAD or a pulsatile-flow LVAD. Quality-of-life tests and 6-min walk test data were collected at baseline, 1 month, 3 mo, 6 mo, then every 6 mo until study completion. The primary endpoint was a composite of 2-yr survival free of disabling stroke (Rankin score >3), or device reoperation for replacement.

**Results:** 86% of patients with the continuous-flow device and 76% of patients with the pulsatile-flow device were discharged from the hospital with the device in-place. The primary endpoint was achieved in 46% of patients implanted with the continuous-flow device, compared to 11% with the pulsatile-flow device (hazard ratio 0.38; 95% CI 0.27 to 0.54; P<0.001). The Kaplan-Meier estimates of survival revealed significantly better outcomes for patients with the continuous-flow devices compared with the pulsatile-flow device (RR 0.54; 95% CI 0.34 to 0.86; P=0.008).

**Conclusions:** Implantation of a continuous-flow device, compared to a pulsatile-flow device improved stroke-free survival and quality of life in patients with advanced medically-refractory HF.

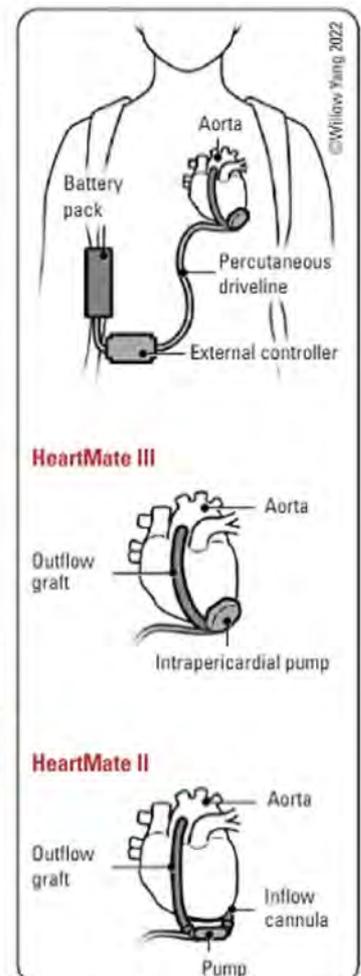

Figure 45. LVAD

### Physiological Consequences of Cardiac Tumours

- systemic or pulmonic embolization
- symptoms of HF due to obstruction of circulation
- regurgitation due to interference with heart valves
- myocardial invasion causing impaired left ventricular function, arrhythmias, heart block, or pericardial effusion
- constitutional or systemic symptoms

### Subtypes of Cardiac Tumours by Location

- right atrial tumours
  - may obstruct blood flow and present with symptoms similar to those of TS and right HF
  - fragments from right atrial tumours may cause pulmonary emboli
  - tumours affecting the AV node can cause heart block
  - myxomas are one of the most common
- right ventricular tumours
  - can induce right-sided HF by interfering with filling or outflow from the RV
  - may obstruct blood flow or beget TR and, as a result, simulate mitral valve disease and produce HF or secondary pulmonary HTN
- left atrial tumours
  - may release tumour fragments or thrombi into the systemic circulation
  - myxomas are one of the most common
- left ventricular tumours
  - intramural left ventricular tumours may induce arrhythmias or conduction defects
  - intracavitary tumours can present with systemic embolization or outflow obstruction
  - may ultimately result in left ventricular failure
- valvular tumours
  - papillary fibroelastomas are most common, equal incidence at AV and semilunar valves
  - asymptomatic until sentinel events such as distal embolization and coronary ostial obstruction
  - resection and repair of the valvular tissue is preferred over valve replacement
- pericardial tumours
  - includes lipomas and metastatic tumours
  - external compression of the heart as a result of both mass effect and propensity to generate pericardial effusions

### Subtypes of Cardiac Tumours by Histopathology

- benign tumours
  - roughly 75% of cardiac tumours are benign
  - myxomas make up the majority of benign cardiac tumours and they most commonly arise in the LA
  - in patients over age 16, the three most common primary tumours are myxomas (50%), lipomatous tumours (21%), and papillary fibroelastomas (16%)
  - in patients under age 16, the four most common tumours are rhabdomyomas (55%), teratomas (16%), fibromas (10%), and myxomas (10%)
  - myxomas should be surgically resected to minimize the risk of cardiovascular complications, including embolization
- primary malignant cardiac tumours
  - sarcomas are the most common form of primary malignant cardiac tumours (75%)
  - these tumours progress rapidly and can infiltrate the myocardium, obstruct circulation, and release metastatic cells
  - prognosis dictated by anatomic location as opposed to histopathology
  - right-sided tumours are more invasive and metastasize earlier than left-sided ones
  - although the recommended treatment strategy is surgical resection when possible, these tumours are likely to recur
  - a combination of chemotherapy and surgical resection for primary cardiac sarcomas prolongs survival as compared with either surgery or chemotherapy alone
- metastatic involvement of the heart
  - metastatic cancer cells may reach the heart through hematogenous spread, direct invasion, or tumour growth through the venae cavae into the RA
  - incidence is highest in external layers of heart and reduced toward luminal layers, reflecting seeding through the coronary arteries and direct extension of adjacent thoracic tumours
  - when a cancer patient develops cardiovascular symptoms, cardiac or pericardial metastases should be suspected
  - although most metastases are asymptomatic, the most common symptom is pericardial effusion with or without tamponade

# Valvular Heart Disease

- see the 2020 American College of Cardiology (ACC)/American Heart Association (AHA) Guideline for the Management of Patients with Valvular Heart disease and the 2017 AHA/ACC Focused Update of the 2014 AHA/ACC Guidelines for the Management of Patients with Valvular Heart disease for details

## Infective Endocarditis

- see [Infectious Diseases, ID15](#)
- American Heart Association (AHA) 2007 guidelines recommend IE prophylaxis
  - only for patients with:
    - prosthetic valve material
    - past history of IE
    - cyanotic CHD
    - cardiac transplant recipients who develop valvulopathy
  - only for the following procedures:
    - dental
    - respiratory tract
    - procedures on infected skin/skin structures/MSK structures
    - not GI/GU procedures specifically

## Rheumatic Fever

- see [Paediatrics, P65](#)

### Prognosis

- acute complications: myocarditis (DCM/CHF), conduction abnormalities (sinus tachycardia, AFib), valvulitis (acute MR), acute pericarditis (not constrictive pericarditis)
- chronic complications: rheumatic valvular heart disease fibrous thickening, adhesion, calcification of valve leaflets resulting in stenosis/regurgitation, increased risk of IE ± thromboembolism
- onset of symptoms usually after 10-20 yr latency from acute carditis of rheumatic fever
- mitral valve most commonly affected

## Valve Repair and Valve Replacement

- indication for valve surgery depends on the severity of the pathology; typically recommended when medical management has failed to adequately clear the infection or improve symptoms
- surgical valve repair: surgical valvuloplasty (commissurotomy, annuloplasty), chordae tendineae repair, tissue patch
- surgical valve replacement: typically for aortic or mitral valves only; mitral valve repair is favoured in younger individuals (and patients with MVP with severe MR)
- surgical decision between mechanical vs. bioprosthetic prosthesis for patients 50-70 y/o remains uncertain as valve techniques evolve

## Choice of Valve Prosthesis

**Table 17. Mechanical Valve vs. Bioprosthetic Valve vs. Pulmonary Autograft-Ross Procedure**

Mechanical Valve	Bioprosthetic Valve	Pulmonary Autograft in Aortic Position (Ross Procedure*)
Good durability	Limited long-term durability (mitral-aortic)	Only aortic valve replacement that restores life expectancy to the age- and sex-matched general population
Less preferred in small aortic root sizes	Good flow in small aortic root sizes	Closest flow profile to native aortic roots
Increased risk of thromboembolism (1-3%/yr); requires long-term anticoagulation with coumadin	Decreased risk of thromboembolism; long-term anticoagulation not needed for aortic valves	Low risk of thromboembolism
Target INR - aortic valves: 2.0-3.0 (mean 2.5); mitral valves: 2.5-3.5 (mean 3.0)	Some recommendation for limited anticoagulation for mitral valves	No anticoagulation required, enables higher activity and straightforward pregnancies
Increased risk of hemorrhage: 1-2%/yr	Decreased risk of hemorrhage	Low risk of hemorrhage
<50 yr for aortic valves and <65 for mitral valves	>65 yr for both aortic and mitral valves	Classically in children and young adults <50 yr

\*should only be performed in high volume centers with extensive experience in aortic root procedures and the Ross operation

### Twenty-Year Outcome After Mitral Repair Versus Replacement for Severe Degenerative Mitral Regurgitation: Analysis of a Large, Prospective, Multicenter, International Registry

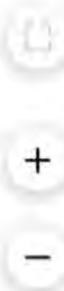

Circulation 2017;135:410-22

**Purpose:** Analyze very-long term outcomes after MV repair and replacement for degenerative MR with a flail leaflet.

**Methods:** Employing the Mitral Regurgitation International Database, outcomes after MV repair and replacement were analyzed by propensity score matching and by inverse probability-of-treatment weighting.

**Results:** Operative mortality was lower after MV repair than replacement in the propensity-matched population (0.2% vs. 4.4%; P<0.001) and 20-yr survival was better after MV repair than replacement in the same population (41% vs. 24%; P<0.001). MV repair was also associated with a reduced rate of valvular complications.

**Conclusions:** MV repair was associated with lower operative mortality, better 20-yr survival and lower complication rates than MV replacement, in patients with degenerative mitral regurgitation with a flail leaflet.

## Prosthetic Valve Management

### Management and Follow-Up

- follow-up: dependent on valve type, residual heart disease, and clinical factors
  - TTE after prosthetic valve implantation to assess hemodynamics and ventricular function
    - if/when clinical symptoms or signs of prosthetic valve dysfunction arise, repeat TTE; additional investigations may be warranted if high clinical suspicion is present
    - TTE at 5 yr, 10 yr, and then annually thereafter is reasonable in otherwise asymptomatic patients with a surgically implanted bioprosthetic valve (if transcatheter implantation was used, annual TTE following the procedure is reasonable)
  - optimal dental care and endocarditis prophylaxis are required
- antithrombotic therapy: risk of bleeding must be considered and balanced whenever using/increasing any antithrombotic therapy
  - for patients with a mechanical valve, use anticoagulation with a vitamin K antagonist and INR monitoring
  - for patients with a bioprosthetic TAVI, bioprosthetic SAVR, or mitral valve replacement, short term other antithrombotic oral anticoagulation or antiplatelet therapies may be indicated

### Prosthetic Valve-Related Complications

- prosthetic valve dysfunction
  - no known medical therapies to prevent bioprosthetic or mechanical valve degeneration
  - etiology: tissue degeneration, pannus formation, IE, thrombosis
  - presentation: prosthetic vascular stenosis or regurgitation
  - investigations and treatment: depend on the type/severity of pathology, as well as patient characteristics (see below)
- thromboembolic events
  - ensure to assess anticoagulation adequacy, time spent in therapeutic range; rule out infective endocarditis; screen for new-onset AF; consider other sources of a potentially underlying hypercoagulable state
  - patients with a mechanical aortic/mitral valve that were in therapeutic INR range on a vitamin K antagonist at the time of event: consider increasing INR goal or adding low-dose daily aspirin
  - patients with a bioprosthetic aortic/mitral valve that were on antiplatelet therapy at time of event: consider switching to vitamin K antagonist anticoagulation
- valve thrombosis
  - mechanical valve thrombosis (generally a subacute-acute event):
    - often associated with inadequate anticoagulation; leads to rapid valve dysfunction
      - recurrent thrombosis can be associated with pannus ingrowth
    - symptoms/signs/presentation: rapid onset of symptoms, acute pulmonary edema, stenotic murmur, muffled closing clicks
    - investigations: urgent multimodal imaging (TTE, TEE, fluoroscopy and/or multidetector CT imaging)
    - treatment: if thrombosed valve is left-sided and symptoms of valve obstruction are present, treat urgently with either fibrinolytic therapy or emergency surgery
  - bioprosthetic valve thrombosis
    - most common in first 3 mo post-implantation; bioprosthetic valves are less thrombogenic than mechanical valves
    - investigations: TTE or TEE or 4D CT imaging in suspected patients
    - treatment: if suspected or confirmed, treatment with a vitamin K antagonist is reasonable (assuming hemodynamically stable and no contraindications)
- graft dysfunction after Ross operation
  - etiology: autograft dilatation and RVOT conduit stenosis and/or regurgitation
    - autograft within LVOT requires reintervention more often than pulmonary homograft within RVOT
  - presentation: aortic regurgitation, pulmonary stenosis, pulmonary regurgitation, aortic root aneurysm
  - investigations: echocardiography, MRI if aneurysmal root
  - treatment: when done in expert centers reintervention results in low mortality
    - autograft dilatation: reoperation (autograft is spareable in majority of cases and survival advantage is still preserved)
    - RVOT graft dysfunction: transcatheter pulmonary valve replacement or surgical pulmonary valve replacement (transcatheter is preferred)

### Ross Operation

- En bloc removal of a patient's native pulmonary root with valve (autograft) and transposition of the autograft into the aortic position to replace a diseased aortic valve that cannot be spared
- The RVOT is then reconstructed with a prosthetic valve, most commonly a cryopreserved pulmonary homograft (human donor)
- With proper technique, mitigation of risk factors for early graft failure, and strict postoperative blood pressure control, the pulmonary autograft adapts to the hemodynamics of the LVOT and left heart with low rates of reintervention
- Despite being more complex than isolated aortic valve replacement, morbidity and mortality are comparable to AVR with bioprostheses or mechanical valves when done in experienced centres

### Mechanical or Biological Prostheses for Aortic-Valve and Mitral-Valve Replacement

NEJM 2013;377:1847-57

**Purpose:** To elucidate differences in mechanical vs. biological prostheses in aortic- and mitral-valve replacements.

**Methods:** Patients who underwent primary aortic-valve or mitral-valve replacement in California in the period from 1996-2013 were analyzed. Outcomes included long-term mortality and rates of re-operation, stroke, and bleeding.

**Results:** In aortic-valve replacement, biologic prosthesis was associated with higher 15-yr mortality than mechanical prosthesis among patients aged 45-54 yr (30.6% vs. 26.4%), but not among patients aged 55-64 yr. In mitral-valve replacement, biologic prosthesis was associated with higher mortality than mechanical prosthesis among patients aged 40-49 yr (44% vs. 21%), and among those aged 50-69 yr (50.0% vs. 45.3%).

**Conclusion:** The long term mortality benefit from mechanical versus biologic prosthesis persisted until 70 yr among mitral-valve replacement patients, and until 55 yr among aortic-valve replacement patients.

## Summary of Valvular Disease

### General Principles for Evaluating Valvular Heart Disease

- initial evaluation
  - history and physical: symptom severity, valve disease, comorbidities, HF presence and severity
  - TTE (standard initial investigation): chamber size/function, valve morphology, severity of valvular heart disease, impacts to pulmonary/systemic circulations
  - ECG: rhythm, LVH, LV function
- further testing if indicated/needed
  - CXR: particularly useful for symptomatic patient; assesses for aortic and pericardial calcification, intrinsic pulmonary disease, heart size and congestion of the pulmonary vessels
  - TEE: assessment of mitral and prosthetic valve
  - CMR: LV volume/function, aortic disease, severity of valvular disease
  - PET CT: identification of infection/inflammation
  - stress testing: exercise capacity
  - catheterization: exercise- and drug-related hemodynamic responses, severity of valvular disease, pressures within the heart and pulmonary circulation
- future risk stratification
  - biomarkers: surrogate measure for myocardial damage and filling pressures
  - TTE strain: myocardial function
  - CMR: fibrosis
  - stress testing
  - procedural risk: The Society of Thoracic Surgeons (STS) and TAVI scores
  - frailty score
- preprocedural testing
  - dental exam: rule out sources of infection
  - invasive coronary angiogram or CT coronary angiogram
  - CT peripheral and cardiac (for transcatheter procedures)

### Stages of Valvular Heart Disease

- stage A: at-risk (asymptomatic)
- stage B: progressive (mild-moderate severity; asymptomatic)
- stage C: asymptomatic, severe
  - C1: compensated LV or RV
  - C2: decompensated LV or RV
- stage D: symptomatic severe

**Table 18. Valvular Heart Disease**

**Aortic Stenosis**

**Etiology**

Congenital (bicuspid, unicuspid valve), calcification (wear and tear), rheumatic disease

**Definition/Stages**

Stage A: asymptomatic; congenital abnormality, bicuspid or sclerotic valve; aortic Vmax <2 m/s  
 Stage B: asymptomatic; can be mild AS (Vmax 2.0-2.9 m/s or mean pressure gradient <20 mm Hg) or moderate AS (Vmax 3.0-3.9 m/s or mean pressure gradient 20-39 mm Hg)  
 Stage C: asymptomatic; can be severe AS (Vmax ≥4 m/s or mean pressure gradient ≥40 mm Hg) or very severe AS (Vmax ≥5 m/s or mean pressure gradient ≥60 mm Hg) ± LV dysfunction  
 Stage D: symptomatic; can be severe AS or very severe AS; criteria also exist for low-flow, low-gradient AS with reduced LVEF and for low-gradient AS with either normal LVEF or paradoxical low-flow severe AS

**Pathophysiology**

Outflow obstruction → increased EDP → concentric LVH → LV failure → CHF, subendocardial ischemia

**Symptoms**

Exertional angina, syncope, dyspnea, PND, orthopnea, peripheral edema, exertional dyspnea, decreased exercise tolerance, HF symptoms, presyncope, syncope

**Physical Exam**

Narrow pulse pressure, brachial-radial delay, pulsus parvus et tardus, sustained PMI  
 Auscultation: crescendo-decrescendo SEM radiating to right clavicle and carotid, musical quality at apex (Gallavardin phenomenon), S4, soft S2 with paradoxical splitting, S3 (late)

**Investigations**

ECG: LVH and strain, LBBB, LAE, AFib  
 CXR: post-stenotic aortic root dilatation, calcified valve, LVH, LAE, CHF  
 echo: etiology, valve area, valve morphology, hemodynamics, LV size, systolic function, prognosis, timing of intervention  
 Other: low-dose dobutamine stress testing, CT imaging/aortic valve calcium score, and exercise testing (contraindicated if symptomatic)

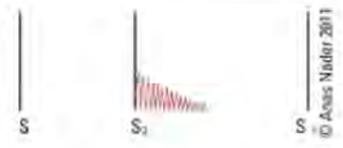

**Treatment**

Calcific AS: statin based on standard risk score for atherosclerotic prevention  
 Stages A-C: treat HTN  
 Asymptomatic: serial echos (repeated based on severity), avoid exertion  
 Symptomatic: avoid nitrates/arterial dilators and ACEI in severe AS  
 Procedural intervention considered in stage D, stage C, and other specific situations

**Procedural Options**

SAVR: if <65 yr old and >20 yr life expectancy, or if TAVR contraindication  
 - Conduct prior to pregnancy (if AS significant)  
 TAVR: if >80 yr old, if <10 yr life expectancy, or if high/prohibitive surgical risk  
 If patient between 65-80 yr old, decision between SAVR or TAVR is catered to specific patient  
 Percutaneous aortic balloon dilation: bridge to AVR in critical patients

**Aortic Regurgitation**

**Definition**

Leakage of blood across the aortic valve into the LV (i.e. aortic insufficiency). May be primary or secondary AR

**Etiology**

Supravalvular: aortic root disease (Marfan syndrome, atherosclerosis and dissecting aneurysm, connective tissue disease)

Valvular: congenital (bicuspid aortic valve, large VSD), IE

Acute Onset: IE, aortic dissection, trauma, failed prosthetic valve

**Pathophysiology**

Volume overload → LV dilatation → increased SV, high sBP and low dBP → increased wall tension → pressure overload → LVH (low dBP → decreased coronary perfusion)

**Symptoms**

Usually only becomes symptomatic late in disease when HF symptoms, SOB/DE, dyspnea, orthopnea, PND, syncope, and/or angina develop as a result of LV failure

**Physical Exam**

Waterhammer pulse, bisferiens pulse, femoral-brachial sBP >20 mmHg (Hill's test: wide pulse pressure), hyperdynamic apex, displaced PMI, heaving apex  
 Auscultation: early decrescendo diastolic murmur at LLSB (cusp pathology) or RLSB (aortic root pathology); best heard sitting, leaning forward, on full expiration; soft S1, absent S2, present S3 (late)

**Investigations**

ECG: LVH, LAE  
 CXR: LVH, LAE, aortic root dilatation  
 echo/TTE: etiology/severity, quantify AR, leaflet or aortic root anomalies, LV size, systolic function, prognosis, timing of intervention  
 TEE, CMR, or cardiac catheterization if ≥ moderate AR, suboptimal/inconsistent TTE: systolic function, heart volumes, aortic size, AR severity  
 Cardiac catheterization lab (Cath lab): if >40 yr and surgical candidate – to assess for ischemic heart disease  
 Exercise testing: hypotension with exercise

**Treatment**

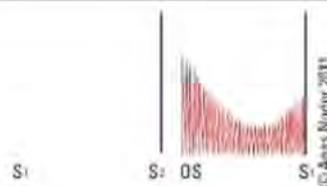

Asymptomatic: serial echos, afterload reduction (e.g. ACEI, nifedipine, hydralazine)  
 Symptomatic: avoid exertion, treat CHF  
 Surgery if: symptomatic severe AR; chronic, severe AR with LVEF ≥55%; severe AR and otherwise undergoing cardiac surgery; other specific situations

**Surgical Options**

Valve replacement  
 Valve repair  
 Bentall procedure: replacement of aortic root and valve

Table 18. Valvular Heart Disease

## Mitral Stenosis

## Etiology

rheumatic disease (most common), non-rheumatic calcification, congenital

## Definition

Severe MS: mitral valve area (MVA) <1.5cm<sup>2</sup>, diastolic pressure half-time ≥150 ms

## Pathophysiology

MS → fixed CO and LAE → increased LA pressure → PVR and CHF; worse with AFib (no atrial kick), tachycardia (decreased atrial emptying time) and pregnancy (increased preload)

## Symptoms

SOBOL, orthopnea, fatigue, decreased exercise tolerance, palpitations, peripheral edema, malar flush, pinched and blue facies (severe MS)

## Physical Exam

AFib, left parasternal lift, palpable diastolic thrill at apex; if AFib, no "a" wave on JVP; if sinus, prominent "a" wave may be found on JVP

Auscultation: mid-diastolic rumble at apex; best heard with bell in left lateral decubitus position following exertion; loud S1, OS following loud P2 (heard best during expiration), long diastolic murmur, and short A2-O2 interval correlate with worse MS

## Investigations

ECG: NSR/AFib, LAE (P mitrale), RVH, RAD

CXR: LAE, CHF, mitral valve calcification

echo/TTE: diagnosis/severity, hemodynamics, valvular lesions, valve anatomy/morphology, LA thrombus if percutaneous mitral balloon commissurotomy being considered

Exercise testing: rheumatic MS and resting echo inconsistent with symptoms

Cath lab: if concurrent CAD and patient >40 yr (male) or >50 yr (female)

## Treatment

Avoid exertion, fever (increased LA pressure); treat AFib and CHF; increase diastolic filling time (β-blockers, digitalis)

Vitamin K antagonist anticoagulation: in rheumatic MS if AF, previous embolism, or LA thrombus

Heart rate control (for some patients)

Intervention if: symptomatic, severe MS

## Invasive Options

Percutaneous mitral balloon commissurotomy (PMBC): symptomatic, severe rheumatic MS with acceptable morphology, < moderate MR, and no LA thrombus (may be reasonable in other specific situations)

Mitral valve surgery (repair, commissurotomy, or replacement): symptomatic, severe rheumatic MS with contraindication/limited access for PMBC, previous failure of PMBC, or otherwise undergoing cardiac surgery (note: restenosis in 50% of patients in 8 yr after open mitral commissurotomy)

Nonrheumatic, calcific MS: if severe MS and severe symptoms, valve intervention can be contemplated pending discussion with patient about high procedural risk

## Mitral Regurgitation

## Etiology

MVP, congenital cleft leaflets, LV dilation/aneurysm (CHF, DCM, myocarditis), IE abscess, Marfan's syndrome, HOCM, acute MI, myxoma, mitral valve annulus calcification, chordae/papillary muscle trauma/ischemia/rupture (acute), rheumatic disease, leaflet perforation

## Definition

Leakage of blood across the mitral valve from the LV into the LA; can be primary or secondary. Can use Carpentier's classification

## Pathophysiology

Reduced CO → increased LV and LA pressure → LV and LA dilation → and pulmonary HTN

## Symptoms

Dyspnea, PND, orthopnea, palpitations, peripheral edema, decreased exercise tolerance, SOBOL

## Physical Exam

Displaced hyperdynamic apex, left parasternal lift, apical thrill

Auscultation: holosystolic murmur at apex radiating to axilla ± mid-diastolic rumble, loud S2 (if pulmonary HTN), S3

Acute MR: sudden acute and hemodynamic instability (possibility during/post MI)

## Investigations

ECG: LAE, left atrial delay (bifid P waves), ± LVH

CXR: LVH, LAE, pulmonary venous HTN

echo/TTE: etiology and severity of MR, LV/RV function, leaflets, pulmonary artery pressure, vegetations/abscesses, papillary muscle/chordal rupture, LA size, mitral valve apparatus, extent of remodelling

TEE: can be helpful with acute MR or if considering transcatheter interventions; also used when TTE findings are insufficient/inconsistent: assess for MR severity/mechanism and LV function

Swan-Ganz Catheter: prominent LA "v" wave

Other: CMR, exercise testing, stress nuclear/PET, stress echo, and serum biomarkers/novel measurement of LV function

## Treatment

Acute MR: vasodilator therapy (use limited by systemic hypotension); intra-aortic balloon counterpulsation or percutaneous circulatory assist device may be employed

Asymptomatic: serial echos

Guideline-directed management and therapy for patients with severe MR and LV systolic dysfunction or HFrEF (e.g. ACEi, ARBs, beta blockers, aldosterone antagonists, ARNis, biventricular pacing)

Intervention if: acute MR with CHF, papillary muscle rupture; severe MR with symptoms or LV systolic dysfunction; AFib; increasing LV size/presence of LV dilatation; pulmonary hypertension; decreasing exercise tolerance; can be reasonable in other situations if low mortality risk (<1%) and high probability of successful/durable repair (>95%) or if otherwise undergoing CABG

## Procedural Options

Mitral valve surgery (preferably repair) is indicated and lifesaving in acute, severe, symptomatic, primary MR

Valve repair (preferred over replacement if degenerative disease is the etiology): >75% of patients with MR and myxomatous MVP – annuloplasty rings, leaflet repair, chordae transfers/shortening/ replacement

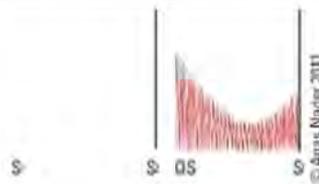

Valve replacement if: failure of repair, heavily calcified annulus

Advantage of repair: low rate of endocarditis, no anticoagulation, less chance of re-operation

Transcatheter edge-to-edge repair (TEER): reasonable in patients with severe, symptomatic primary MR with high/prohibitive surgical risk or in severe, symptomatic secondary MR if associated with LV dysfunction

**Table 18. Valvular Heart Disease**

**Tricuspid Stenosis**

**Etiology**

Rheumatic disease, congenital, carcinoid syndrome, fibroelastosis; usually accompanied by MS (in rheumatic heart disease), autoimmune disorders, atrial myxomas, blunt trauma, metastases, congenital, drug-associated valvulopathy

**Definition**

Tricuspid orifice narrowing; blood flow from the RA into the RV is obstructed

**Pathophysiology**

Increased RA pressure → right HF → CO decreased and fixed on exertion

**Symptoms**

Peripheral edema, fatigue, palpitations

**Physical Exam**

Prominent "a" waves in JVP, positive abdominojugular reflux, Kussmaul's sign, diastolic rumble 4th left intercostal space

**Investigations**

ECG: RAE

CXR: dilatation of RA without pulmonary artery enlargement

echo: diagnostic

Cardiac catheterization: large RA "a" wave (12-20 mm Hg); diastolic, mean pressure gradient of 4-8 mm Hg (increased RA pressure with a slow decrease in early diastole + diastolic pressure gradient is classic for TS)

CMR: RV size/function

**Treatment**

Preload reduction (diuretics) for severe, symptomatic TS (caution: may exacerbate low output)

Treat underlying etiology

Slow HR

Surgery: usually performed at time of other cardiac surgery (e.g. mitral valve surgery for rheumatic MS)

**Surgical Options**

Valvotomy using 1-3 balloons

Valve surgery: repair or replacement (open or transcatheter options for replacement)

Usually tricuspid surgery favoured over percutaneous balloon tricuspid commissurotomy or valvuloplasty

**Tricuspid Regurgitation**

**Etiology**

RV dilatation, IE (particularly due to IV drug use), rheumatic disease, iatrogenic (device leads, endomyocardial biopsy), congenital (Ebstein's anomaly), pulmonary HTN, RV overload, DCM, annular dilatation, leaflet tethering, RA dilatation, ischemic heart diseases, other (trauma, carcinoid, drugs, irradiation)

**Definition**

Leakage of blood across the tricuspid valve (i.e. tricuspid insufficiency); can be primary or secondary

**Pathophysiology**

RV dilatation → TR (and further RV dilatation) → right HF

**Symptoms**

Peripheral edema, fatigue, palpitations, SOB, ascites

**Physical Exam**

elevated JVP, "cv" waves in JVP, positive abdominojugular reflux, holosystolic murmur at LLSB accentuated by inspiration, left parasternal lift,

**Investigations**

ECG: RAE, RVH, AFib

CXR: RAE, RV enlargement

echo/TTE: diagnostic – assess for etiology/severity of TR, IVC and right heart size, RV systolic function, left-sided disease and pulmonary artery systolic pressure

Invasive measurements (to address inconsistencies): cardiac index, right-sided diastolic pressure, pulmonary artery pressures, pulmonary vascular resistance, ventriculography

**Treatment**

Preload reduction (diuretics): reasonable if right-sided HF related to severe TR

Therapies to treat HF etiology reasonable if right-sided HF related to severe secondary TR

Surgery if: severe TR (stages C and D) and undergoing cardiac surgery for a left-sided valve; can be reasonable in other specific situations.

**Surgical Options**

Annuloplasty (i.e. repair; rarely replacement)

**Pulmonary Stenosis**

**Etiology**

Usually congenital, rheumatic disease (rare), carcinoid syndrome

**Definition**

Stiffening/narrowing of the pulmonic valve; blood flow into the pulmonary artery from the RV is obstructed

**Pathophysiology**

Increased RV pressure → RVH → right HF

**Symptoms**

Chest pain, syncope, fatigue, peripheral edema

**Physical Exam**

Systolic murmur at 2nd left intercostal space accentuated by inspiration; pulmonary ejection click; right-sided S4

**Investigations**

ECG: RVH

CXR: prominent pulmonary arteries, enlarged RV

echo: diagnostic

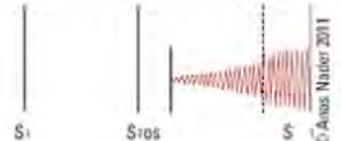

**Treatment**

Balloon valvuloplasty if severe symptoms

**Surgical Options**

Percutaneous or open balloon valvuloplasty

**Pulmonary Regurgitation**

**Etiology**

Pulmonary HTN, IE, rheumatic disease, tetralogy of Fallot (post-repair), defective valvular coaptation, annular dilatation, fibrinoid deposits

**Definition**

Insufficient closure of the pulmonic valve during diastole; reversal of flow into the RV

**Pathophysiology**

Increased RV volume → increased wall tension → RVH → right HF

**Symptoms**

Chest pain, syncope, fatigue, peripheral edema

**Physical Exam**

Early diastolic murmur at LLSB; Graham Steell (diastolic) murmur at 2nd and 3rd left intercostal space (increasing with inspiration)

**Investigations**

ECG: RVH

CXR: prominent pulmonary arteries if pulmonary HTN; enlarged RV

echo: diagnostic

**Treatment**

Rarely requires treatment; valve replacement (rarely done)

**Surgical Options**

Pulmonary valve replacement

**Table 18. Valvular Heart Disease**

**Mitral Valve Prolapse**

**Etiology**

Myxomatous degeneration of chordae; thick, bulky leaflets that crowd orifice; associated with connective tissue disorders; pectus excavatum; straight back syndrome, other MSK abnormalities; <3% of population

**Definition**

Valve leaflet(s) prolapse into the LA; common cause of MR. (i.e. click-murmur syndrome, Barlow's syndrome, billowing mitral valve leaflets, or floppy valve syndrome)

**Pathophysiology**

Mitral valve displaced into LA during systole; no causal mechanisms found for symptoms. Generally benign; however, presentation may be with sudden cardiac death, infective endocarditis, or cerebrovascular accident

**Symptoms**

Can be asymptomatic. May have prolonged, stabbing chest pain or atypical chest discomfort; dyspnea; anxiety/panic attacks; palpitations; fatigue; presyncope, SOB/E, exercise intolerance; low blood pressure; syncope; orthostasis; mood changes; syncope

**Physical Exam**

Auscultation: mid-systolic click (diagnostic - due to billowing of mitral leaflet into LA and tensing of redundant valve tissue); followed by a mid to late systolic murmur at apex (murmur accentuated by Valsalva and diminished when patient squatting)

**Investigations**

ECG: non-specific ST-T wave changes, paroxysmal SVT, ventricular ectopy

echo: diagnostic - systolic displacement of mitral valve leaflets above mitral annulus into LA; assess mitral valve leaflet thickness

Cardiac catheterization/left ventriculography: if inconsistent clinical and echo findings; sometimes picks up MVP incidentally

**Treatment**

Asymptomatic: often no treatment; reassurance, if MR associated, follow-up annually; if not, follow-up q3-5 yr

Sinus rhythm and high-risk MVP: aspirin may be considered

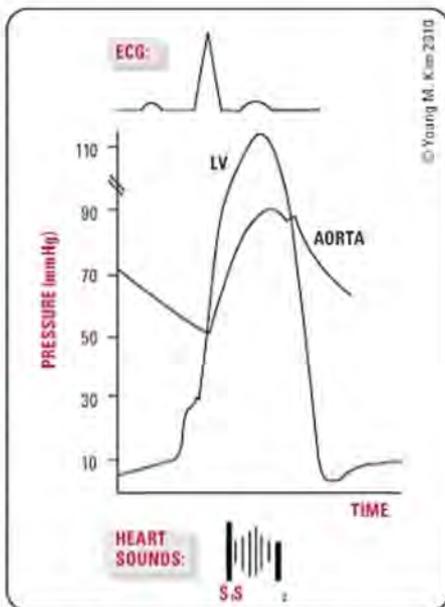

Systemic embolism, recurrent TIAs despite aspirin, ischemic stroke, or AFib: anticoagulation

Symptomatic:  $\beta$ -blockers and avoidance of stimulants (e.g. caffeine) of significant palpitations; anticoagulation if AFib

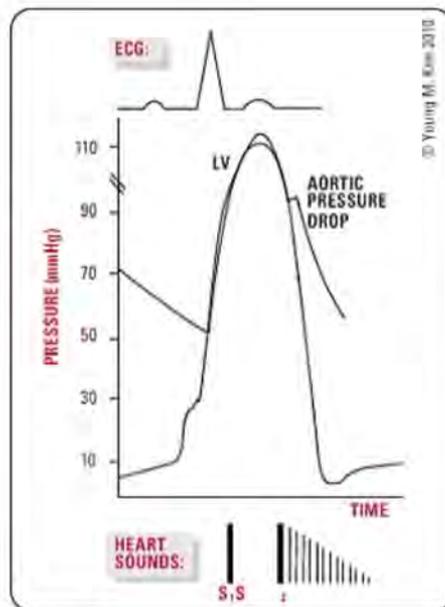

**Surgical Options**

Mitral valve surgery (repair favoured over placement); if symptomatic and significant MR; may be reasonable if asymptomatic with MR and systolic HF

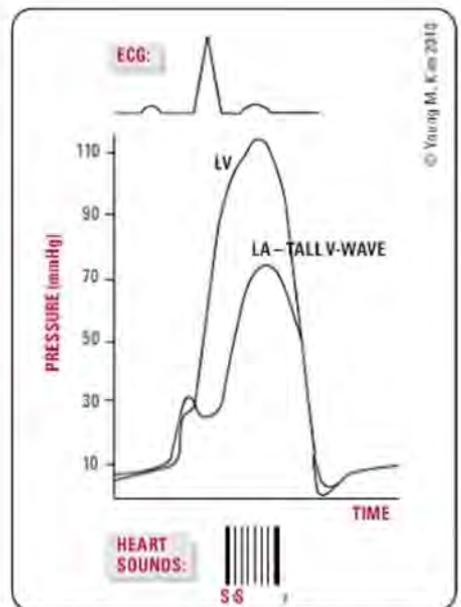

Transcatheter mitral valve repair considered if high/prohibitive surgical risk

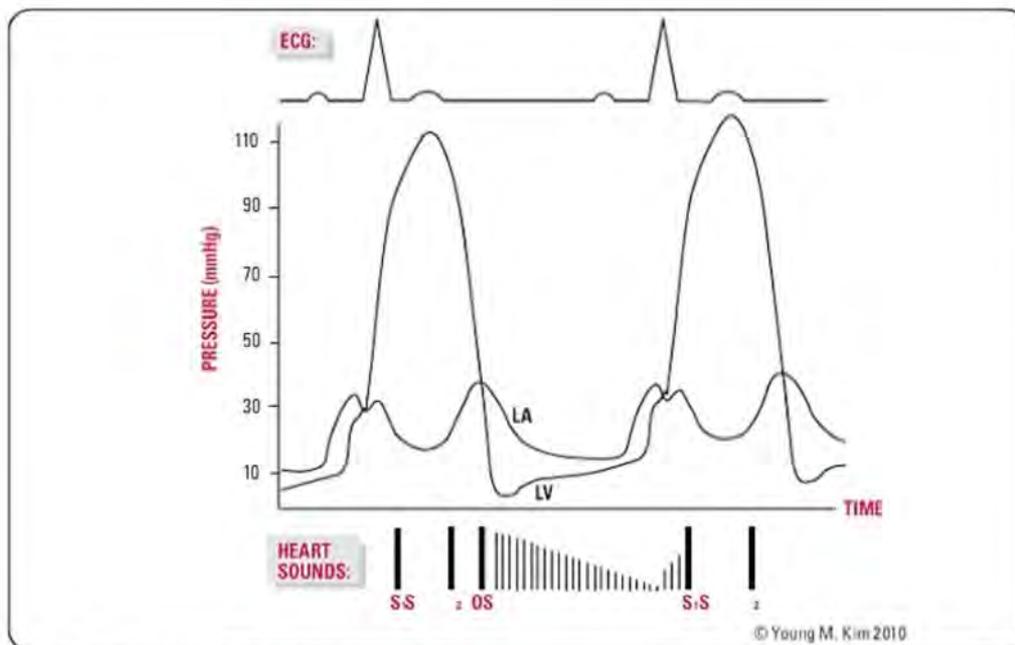

**Figure 47. Hemodynamics of aortic stenosis**  
Stenosis across the aortic valve results in the generation of a significant pressure gradient between the LV and the aorta, as well as a crescendo-decrescendo murmur during systolic contraction. The stenosis decreases the intensity of aortic valve closure, hence diminishing S2

**Figure 48. Hemodynamics of aortic regurgitation**  
Regurgitation across the aortic valve during diastole causes the aortic pressure to rapidly decrease and a decrescendo murmur can be heard at the onset of diastole (after S2). The presence of regurgitant blood from the aorta increases LV end diastolic volume

**Figure 49. Hemodynamics of acute mitral regurgitation**  
During systolic contraction, blood regurgitates from the LV into the LA across the incompetent mitral valve resulting in a short but audible holosystolic murmur between S1 and S2. The portion of left ventricular end diastolic volume that regurgitates into the LA myocardium increases left atrial pressures resulting in a tall V-wave (in the JVP). Severe, acute MR usually results in acute hemodynamic decompensation

**Figure 50. Hemodynamics of mitral stenosis**

First note that the left atrial pressure exceeds the left ventricular pressure during diastole due to MS and there is a consequent generation of a pressure gradient across the LA and LV. In diastole, the stenotic mitral valve opens (which corresponds to the OS) and the passage of blood across the MS results in an audible decrescendo murmur. Left atrial contraction prior to S1 increases the pressure gradient resulting in accentuation of the murmur before S1 is audible

**Transcatheter (TAVR) or Surgical (SAVR) Aortic Valve Replacement in Intermediate-Risk Patients (PARTNER II Trial)**

NEJM 2016;374:1609-1620

**Purpose:** To determine if TAVR and SAVR result in different survival rates among intermediate-risk patients with AS.

**Methods:** Patients with AS were randomized to either TAVR (N=1011) or to SAVR (n=1021). The primary endpoint was death from any cause or disabling stroke at 2 yr.

**Results:** The death rate from any cause or disabling stroke was similar in the TAVR and SAVR groups (P=0.001 for noninferiority).

In the transfemoral-access cohort, TAVR resulted in a lower rate of death or disabling stroke than SAVR did (P=0.05).

In the transthoracic-access cohort, similar outcomes were observed in the TAVR and SAVR groups.

TAVR resulted in larger aortic valve areas and lower rates of AKI, severe bleeding, and new onset AFib.

Fewer major vascular complications and less paravalvular AR were observed in patients who underwent SAVR.

**Conclusion:** In intermediate-risk patients with AS, TAVR and SAVR resulted in similar rates of all-cause mortality and disabling stroke.

See Landmark Cardiac Trials for more information on PARTNER III which details the outcomes of low-risk patients who underwent TAVR or surgical aortic valve replacement.

**Anterior Leaflet Laceration to Prevent Ventricular Outflow Tract Obstruction During Transcatheter Mitral Valve Replacement (LAMPPOON)**

J Am Coll Cardiol. 2019 Jul 30;74(4):595

**Background:** Transcatheter mitral valve replacement (TMVR) is routinely employed in patients with valvular disease who are unsuitable for open surgical interventions.

The primary complication of this procedure is LVOT obstruction as a result of the anterior mitral leaflet impinging on the interventricular septum.

**Purpose:** To study intentional laceration of the anterior mitral valve leaflet (LAMPPOON) alongside TMVR to prevent the complication of LVOT obstruction.

**Methods:** Between June 2017 and June 2018, 30 patients with severe MR/MS, high surgical risk, and prohibitive risk of LVOT obstruction, underwent TMVR with LAMPPOON.

The primary outcomes were technical success for TMVR and LAMPPOON (successful laceration) procedures, LVOT gradient <30 mmHg, freedom from emergent re-intervention, and procedural mortality.

**Results:** The LAMPPOON laceration was deemed successful in 100% of enrolled patients.

100% of patients survived immediately post-procedure, with 93% surviving 30-d after discharge.

90% of patients had an LVOT gradient <30 mmHg (optimal range) after TMVR, with 100% of patients showing LVOT gradient <50 mmHg (acceptable range).

The procedural success rate was 73% from the remaining 22 subjects.

**Conclusions:** In the studied population, LAMPPOON mitigates the risk of LVOT obstruction with TMVR.

LAMPPOON is technically feasible and serves to enable TMVR in patients otherwise deemed ineligible due to prohibitive risk of LVOT obstruction.

## Pericardial Disease

### Acute Pericarditis

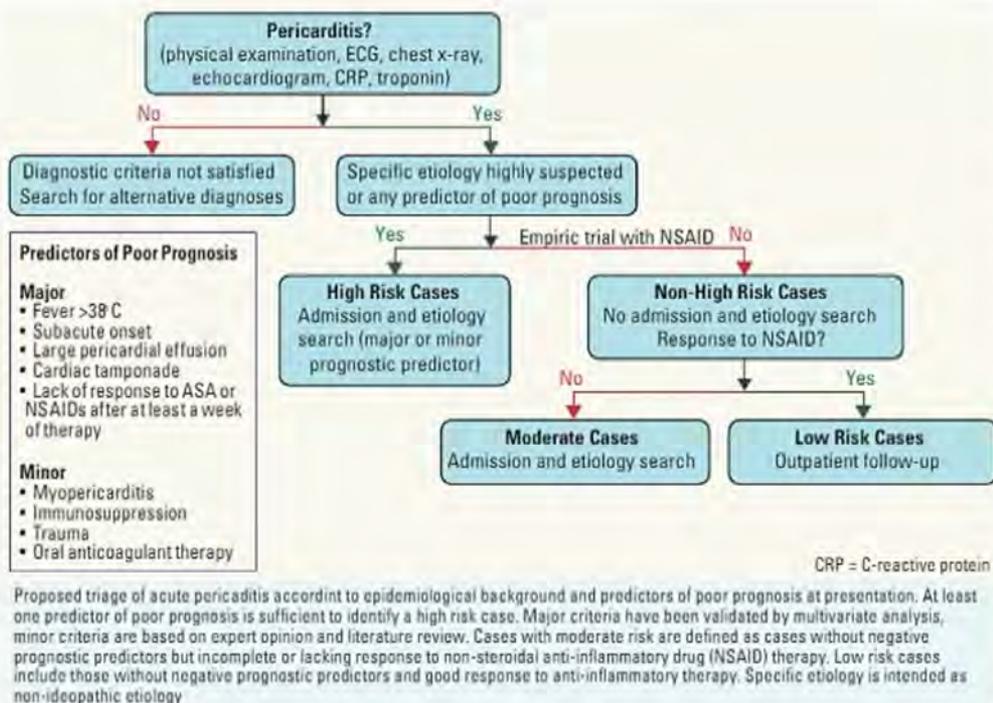

**Definition**

- syndrome involving the inflammation of the pericardium that may present with or without a pericardial effusion
- pericarditis can be divided into:
  - acute (<4-6 wk)
  - incessant (>4-6 wk with no remission)
  - recurrent (symptom-free remission period of 4-6 wk followed by new onset of pericarditis-associated signs and symptoms)
  - chronic (>3 mo)

**Etiology of Pericarditis/Pericardial Effusion**

- idiopathic is most common (presumed to be viral)
  - searching for and identifying the etiology is not required in all patients; in nations with low TB prevalence, the most common causes of pericarditis are generally benign
    - infectious only approximately 14%
  - viral: Coxsackie virus A, B (most common), echovirus, Parvovirus B19, Epstein-Barr virus
  - bacterial: *S. pneumoniae*, *S. aureus*, *B. burgdorferi*, *M. tuberculosis*
  - HIV
- fungal: histoplasmosis, blastomycosis
- post-MI: acute (direct extension of myocardial inflammation, 1-7 d post-MI), Dressler's syndrome (autoimmune reaction, 2-8 wk post-MI)
- post-cardiac surgery (e.g. CABG), other cardiac procedures (e.g. pacemaker insertion or TAVR), or other trauma
- metabolic: uremia (common), hypothyroidism
- neoplasm: Hodgkin's, breast, lung, renal cell carcinoma, melanoma, lymphoma
- collagen vascular disease: SLE, polyarteritis, rheumatoid arthritis, scleroderma
- vascular: dissecting aneurysm
- other: drugs (e.g. hydralazine), radiation, infiltrative disease (e.g. sarcoidosis), vaccination (e.g. smallpox)
- autoimmune diseases
- immune checkpoint-inhibitor-associated pericarditis (severe; requires immunosuppressive therapy)
- see Figure 51, C62 for a proposed approach to triaging pericarditis

**Phase 3 Trial of Interleukin-1 Trap Rilonacept in Recurrent Pericarditis (RHAPSODY)**  
N. EJM 2021;38:4:31-41

**Purpose:** Evaluate the efficacy and safety of rilonacept, an interleukin-1a and 1b cytokine trap, as a mediator of recurrent pericarditis.

**Methods:** Patients with acute symptoms of recurrent pericarditis and systemic inflammation (elevated CRP level) were enrolled in a 12-wk run-in period, during which rilonacept was initiated and background medications discontinued. Patients were randomized (1:1 ratio) to receive continued rilonacept monotherapy or placebo, administered SQ once weekly. The primary endpoint was recurrence of pericarditis symptoms.

**Results:** During the randomized-withdrawal period, there were too few recurrences in the rilonacept group to calculate median recurrence time. In the placebo group, median recurrence time was 8.6 wk (95% CI 4.0 to 11.7; hazard ratio 0.04; 95% CI 0.01 to 0.18; P=0.001). During this period, 2 of 30 patients (7%) in the rilonacept group had a pericarditis recurrence, as compared to 23 of 32 patients (74%) in the placebo group.

**Conclusion:** Among patients with recurrent pericarditis, rilonacept led to faster resolution of the current episode and lower recurrence.

Figure 51. Proposed triage of pericarditis

### Clinical Presentation, Investigations, and Diagnosis

- 2 of the following 4 needed for diagnosis
  1. chest pain
    - sharp, rapid onset (may be dull or throbbing)
    - pain commonly radiates to the trapezius ridge
    - pleuritic; pain related to inspiration, coughing, and potentially hiccoughs
    - improves with sitting up/leaning forward
  2. pericardial friction rub
    - with patient leaning forward or on elbows and knees, friction rub heard on left sternal border
    - classically triphasic; may be mono- or biphasic
    - varies in intensity over time; repeated examinations necessary
    - highly specific finding
  3. ECG changes (only about 60% of patients have sequential changes)
    - stage 1: PR depression and generalized ST elevation (a generally specific finding but up to 40% have nondiagnostic and atypical changes)
    - stage 2: stage 1 findings reversed; J points on baseline prior to flattening of T waves
    - stage 3: inversion of T-waves
    - stage 4: all changes normalized
    - changes noted on ECG can be localized or diffuse; PR depression may be the only sign
  4. pericardial effusion (new or worsening)
- other physical exam findings: ± malaise, ± sinus tachycardia, ± low-grade fever, ± non-cardiac findings if the acute pericarditis is related with a systemic condition (e.g. rash, arthritis, weight loss, night sweats)
- other investigations may aid in diagnosis/monitoring
  - biomarkers/inflammatory markers
    - cardiac-specific troponin I or T elevation (≥30% of patients) –evidence of myocardial involvement (could be myopericarditis or perimyocarditis). Imaging modalities such as echo or CMR may also provide evidence of myocardial involvement
    - elevated CRP, ESR, and/or WBC count found in majority of patients, but not sensitive or specific (elevated high-sensitivity CRP can predict recurrence risk)
  - imaging
    - CXR
      - usually normal heart size (effusion >300 mL needed to increase cardiothoracic index)
      - patients with a new/unexplained increase in heart size should be worked up for acute pericarditis (especially when lung fields are clear)
      - may demonstrate evidence of pleuropericardial involvement in the setting of pleuropulmonary disease
      - cause of pericarditis can sometimes be identified

- echo: often the only necessary modality for imaging (TEE > TTE) → normal in 40%
  - applications include:
    - identifying pericarditis-associated complications (e.g. cardiac tamponade, constrictive pericarditis) or components of myocarditis (e.g. ventricular dysfunction)
    - monitoring pericardial effusion and efficacy of therapy
    - providing real-time evaluation during pericardial drainage
- CMR, CT may also have applications in the setting of pericarditis; assess for inflammation of pericardium
- differential diagnosis includes: Takotsubo syndrome, MI, myocarditis

### Prognosis

- based on etiology (e.g. overall good prognosis = idiopathic/viral pericarditis (although significant recurrence risk), pericarditis with myocardial involvement; purulent and neoplastic pericarditis have a reported mortality rate between 20-30%)
  - negative prognostic factors: subacute onset, fever  $\geq 38^{\circ}\text{C}$ , >20mm pericardial effusion on echo, tamponade, lack of response following 1 wk of anti-inflammatory treatment → hospitalize patients with these factors and those with an elevated tamponade and/or constriction risk
    - minor negative prognostic factors: oral anticoagulation, trauma, immunosuppression

### Treatment

- treat the underlying disease
- anti-inflammatory agents remain the mainstay for treatment (e.g. NSAIDs/ASA)
  - ketorolac may be employed in patients with severe pain or patients unable to take oral medication; use should be limited to 5 d
- colchicine may reduce symptom persistence and recurrent rates
- corticosteroid use is controversial but may be indicated in patients with incomplete response, failure of other anti-inflammatory medications, and/or other indicated situations (e.g. autoimmune disease-associated or immune checkpoint inhibitor-associated pericarditis)
- purulent pericarditis (rare but life-threatening): pericardial drainage and antimicrobial therapy catered to the culprit etiologic agent and/or local fibrinolytic therapy
- tuberculous pericarditis: multidrug regimen for several months (corticosteroids and pericardiectomy sometimes considered)
- pericarditis in the setting of viremia (particularly in immunocompromised patients): antiviral treatment
  - physical activity restriction until symptom resolution

### Complications

- recurrent episodes of pericarditis, atrial arrhythmia, pericardial effusion, tamponade, constrictive pericarditis

## Pericardial Effusion

### Definition

- fluid accumulation in the pericardial sac (note: the pericardial sac normally hosts 10-50 mL of lubricating pericardial fluid). The composition of the fluid can include exudate, transudate, blood, and rarely air/gas

### Etiology and Classification

- effusion is found incidentally on x-ray or echo for a significant proportion of patients
  - for these patients in developed countries, etiologies include:
    - idiopathic (up to 50%)
    - cancer (10-25%)
    - infections (15-30%)
    - iatrogenic causes (15-20%)
    - connective tissue diseases (5-15%)
  - in developing countries, TB is the predominant cause (>60%)
- for pericardial effusion with pericarditis, the prevalence of malignant/infectious etiologies is 15-50%
- transudative causes
  - increased systemic venous pressure or hydrostatic pressure: CHF, pulmonary HTN
  - decreased plasma oncotic pressure: cirrhosis, nephrotic syndrome, hypoalbuminemia/hypoproteinemia
- exudative causes (serosanguinous or bloody)
  - pathologic process → inflammation → possible increased production of pericardial fluid
  - causes similar to the causes of acute pericarditis
  - may develop acute effusion secondary to hemopericardium (trauma, post-MI myocardial rupture, aortic dissection)
- can be classified according to onset, distribution, hemodynamic impact, composition, and size
- physiologic consequences depend on type and volume of effusion, rate of effusion development, and underlying cardiac disease

### Signs and Symptoms

- rate of development of pericardial effusion determines clinical presentation
- may be asymptomatic or similar to acute pericarditis
- classic symptoms: dyspnea on exertion (progressing to orthopnea), chest pain and/or fullness
- symptoms related to local compression of extracardiac structures may include: nausea, dysphagia, hoarseness, hiccoughs; may cause esophageal/recurrent laryngeal nerve/trachea-bronchial/phrenic nerve irritation
- non-specific symptoms related to compression of related structures or reduced blood pressure and secondary sinus tachycardia: cough, weakness, fatigue, anorexia, palpitations, fever (may be associated with pericarditis)
- physical exam findings:
  - JVP increased with dominant "x" descent
  - arterial pulse normal-to-decreased volume; decreased pulse pressure
  - auscultation: distant heart sounds  $\pm$  rub
  - Ewart's sign
  - often normal in patients without compromise to hemodynamic status; if tamponade present, findings can include fatigue, dyspnea, elevated JVP, neck vein distension, edema, pulsus paradoxus, muffled heart sounds (in moderate-large effusions). Rarely friction rubs heard (usually appreciated with concomitant pericarditis)

#### Ewart's Sign

Egophony, bronchial breathing, and dullness to percussion at the lower angle of the left scapula in pericardial effusion due to effusion compressing left lower lobe of lung

### Investigations

- ECG: sinus tachycardia, low voltage (should raise concern for effusion with tamponade when present with sinus tachycardia; however, not specific for pericardial effusion), flat T waves, electrical alternans (highly specific for pericardial effusion (generally with tamponade), but not a sensitive sign to exclude effusion/tamponade)
  - be cautious in diagnosing STEMI in a patient with pericarditis and an effusion as antiplatelets may precipitate hemorrhagic effusion
- CXR:  $\pm$  cardiomegaly with clear lung fields,  $\pm$  rounded cardiac contour
- emergency room: bedside U/S with subxiphoid view showing fluid in pericardial sac
- echo/TTE (procedure of choice): fluid in pericardial sac; assess effusion size and hemodynamic effects, and assist in needle placement in pericardiocentesis
- pericardiocentesis: definitive method of determining transudate vs. exudate, identify infectious agents, and investigating neoplastic involvement
- CT/CMR: compared with echo, provide greater field of view  $\rightarrow$  enable loculated effusion detection, identification of masses or thickening associated with the pericardium, assessment for chest abnormalities (however, echo still preferred due to availability/portability/low cost)
- biomarkers: assessment of inflammation markers (e.g. CRP) recommended

### Treatment (see Figure 52, C65)

- triage: based on size, hemodynamic effects (particularly assess for tamponade), inflammatory markers, concomitant pathologies  $\rightarrow$  high risk patients should be admitted
- treat underlying etiology (60% of effusions associated with known disease)
- if inflammatory signs are present, or if associated with pericarditis, treat as if pericarditis; if elevated markers of inflammation, can try NSAIDs/colchicine/low-dose corticosteroids; if associated with systemic inflammation, Aspirin<sup>†</sup>/NSAIDs/colchicine recommended
- pericardiocentesis or cardiac surgery if: cardiac tamponade, symptomatic moderate-large effusion and unresponsive to medical therapy, or unknown bacterial/neoplastic etiology suspected
  - prolonged drainage using pericardiocentesis should also be considered if symptomatic effusion without evidence of inflammation or unresponsive to anti-inflammatory agents
  - if no inflammation and large, isolated effusion, pericardiocentesis alone may be required (no evidence for medical therapy), but recurrences are common
  - consider pericardiectomy or pericardial window (subxiphoid or video assisted thoracoscopic) if: re-accumulation of fluid, loculated effusion, biopsy required
- follow-up/frequent observation if no evidence/suspicion of:
  - tamponade
  - bacterial/neoplastic etiology
  - elevated inflammatory markers
  - associated pathology
  - large effusion (>20 mm)
    - ♦ Note: follow-up based on symptoms, effusion size and evolution, inflammatory markers, etc.

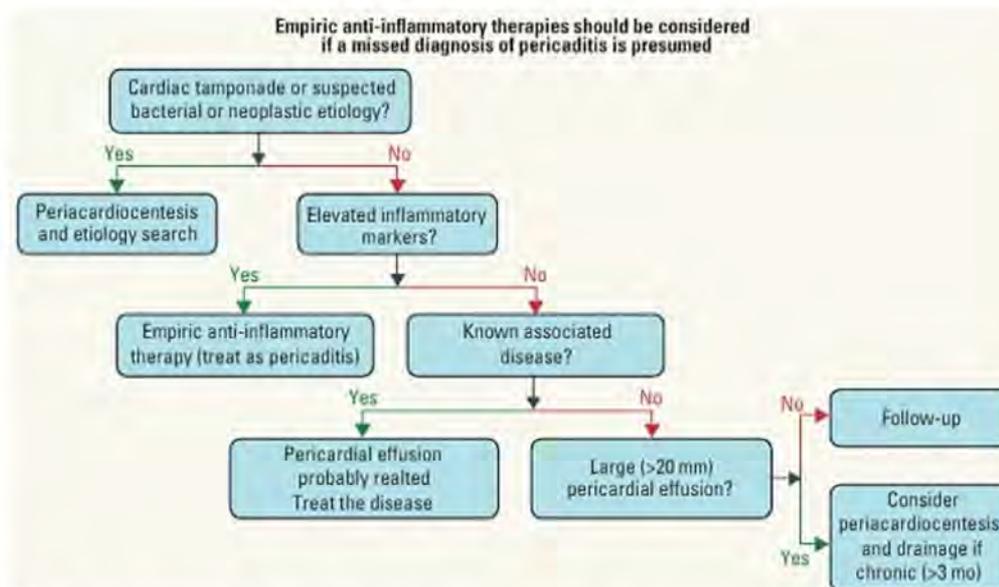

Figure 52. Triage/management algorithm for pericardial effusion

## Cardiac Tamponade

### Definition

- accumulation of fluid, pus, blood, clots or gas in the pericardium leading to life-threatening, slow or rapid compression of the heart

### Etiology

- can be caused by inflammation, trauma, rupture of the heart or aortic dissection
- major complication of rapidly accumulating pericardial effusion
- cardiac tamponade is a clinical diagnosis
- common causes: pericarditis, TB, iatrogenic, trauma, neoplasm/malignancy
- uncommon causes: collagen vascular diseases (e.g. SLE, rheumatoid arthritis, scleroderma), radiation, post-MI, uremia, aortic dissection, bacterial infection, pneumopericardium

### Pathophysiology

- high intra-pericardial pressure → decreased venous return → decreased diastolic ventricular filling → decreased CO → hypotension and venous congestion

### Signs and Symptoms

- tachycardia, hypotension, increased JVP
- tachypnea, dyspnea, shock, muffled heart sounds
- pulsus paradoxus (inspiratory fall in sBP >10 mmHg during quiet breathing)
- JVP "x" descent only, blunted "y" descent
- hepatic congestion/peripheral edema
- severity of signs/symptoms depend on rate of accumulation, volume of pericardial contents, pericardial distensibility, cardiac filling pressures, and chamber compliance

### Investigations

- ECG: electrical alternans (pathognomonic variation in R wave amplitude), low voltage
- CXR: enlarged cardiac silhouette; slow-accumulating effusions
- CT/CMR: less available; usually only necessary if Doppler echo is infeasible
- echo (diagnostic modality of choice): pericardial effusion (size, location, hemodynamic impact), swinging of the heart, compression of cardiac chambers (RA and RV) in diastole, etc. → echo also used for the purpose of guiding pericardiocentesis
- cardiac catheterization (rare)

### Treatment

- urgent drainage: needle pericardiocentesis recommended (with echo or fluoroscopic guidance); surgery (i.e. pericardiectomy) is an alternative drainage approach (e.g. with purulent pericarditis or in an urgent situation involving bleeding into the pericardium)
- avoid diuretics and vasodilators (these decrease venous return to already under-filled RV → decrease LV preload → decrease CO) as well as mechanical ventilation
- IV fluid may increase CO
- treat underlying cause

#### Classic Quartet of Tamponade

- Hypotension
- Increased JVP
- Tachycardia
- Pulsus paradoxus

#### Beck's Triad

- Hypotension
- Increased JVP
- Muffled heart sounds

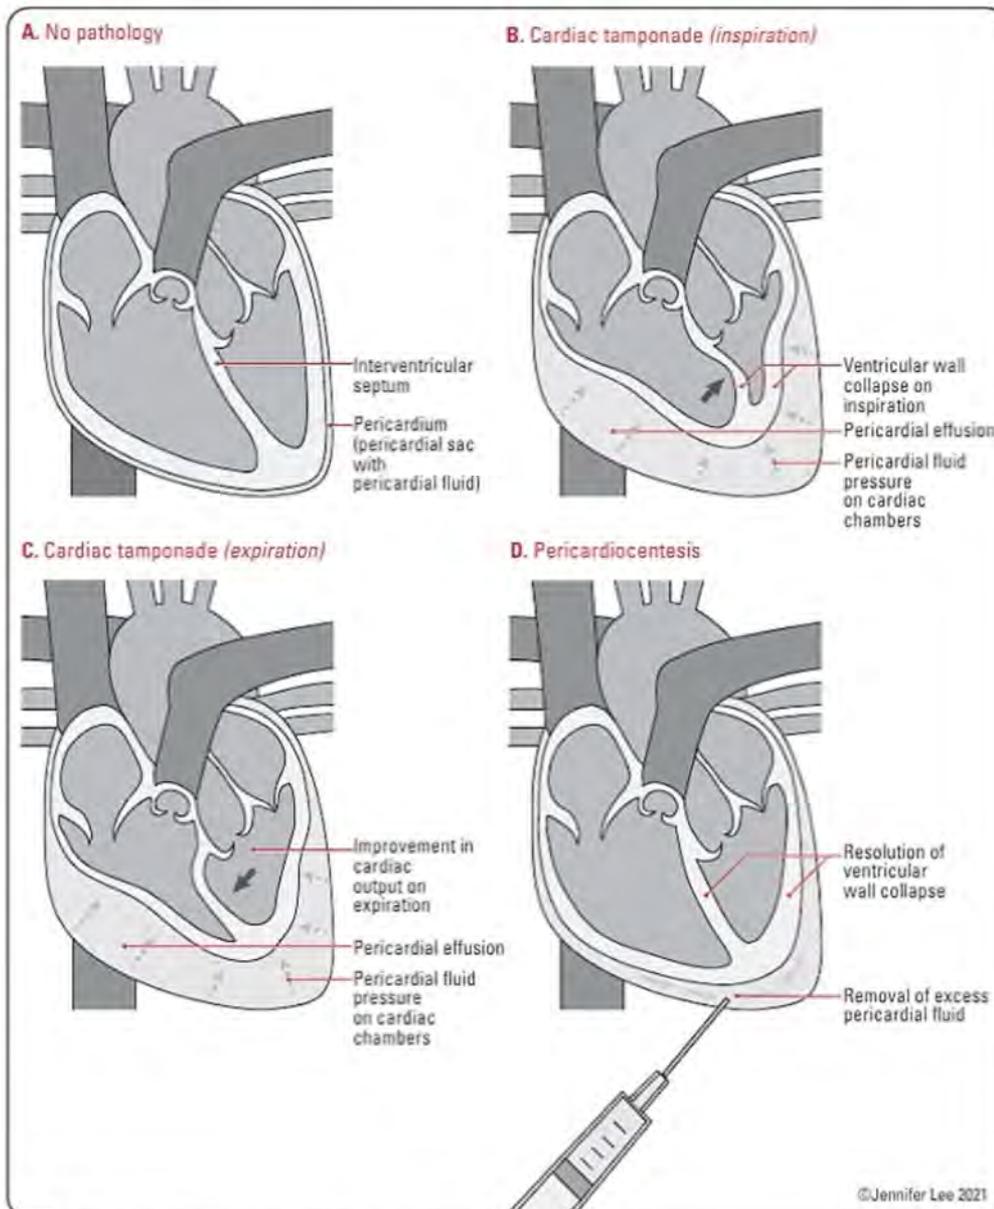

Figure 53. Cardiac tamponade pathophysiology

## Constrictive Pericarditis

### Definition

- loss of pericardial elasticity caused by granulation tissue formation; leads to restricted ventricular filling

### Etiology

- chronic pericarditis resulting in fibrosed, thickened, adherent, and/or calcified pericardium
- any cause of acute pericarditis may result in chronic pericarditis
- major causes are idiopathic, post-infectious (viral, bacterial pericarditis/purulent pericarditis, TB), radiation, post-cardiac surgery, uremia, MI, collagen vascular disease
- any pericardial disease process can cause constrictive pericarditis; risk of progression to constrictive pericarditis is based on the etiology of the pericardial disease

### Pathophysiology

- rigid, fibrous pericardium impairs ventricular filling during diastole → decreased venous return to the heart → rise in systemic venous pressure → signs and symptoms of right-sided HF (classically with preserved ventricular function and otherwise no myocardial disease)
  - in advanced cases, there can be systolic dysfunction if myocardial fibrosis or atrophy present

### Signs and Symptoms

- dyspnea, fatigue, palpitations
- abdominal pain
- may mimic CHF (especially right-sided HF)
  - venous congestion, ascites, hepatosplenomegaly, edema, pleural effusions
- increased JVP, Kussmaul's sign (paradoxical increase in JVP with inspiration), Friedreich's sign (prominent "y" descent)
- BP usually normal (and usually no pulsus paradoxus)
- precordial examination:  $\pm$  pericardial knock (early diastolic sound)
- see Table 19 for differentiation from cardiac tamponade

### Investigations

- ECG: non-specific findings low voltage, flat T wave,  $\pm$  AFib
- CXR: pericardial calcification, effusions
- echo/CT/CMR: pericardial thickening, calcification  $\pm$  characteristic echo-Doppler findings (Note: CMR is discouraged if patient is hemodynamically impaired)
- cardiac catheterization: indicated if other, non-invasive imaging modalities are insufficient to make diagnosis; assess for equalization of end-diastolic chamber pressures
- diagnosis: right HF symptoms + diastolic filling impairment caused by constriction (documented on  $\geq 1$  imaging modality including echo, CT, CMR, and/or catheterization)
- note: in up to 20% of patients, constriction can occur even with normal thickness of the pericardium (pericardiectomy equally efficacious in these patients)

### Treatment

- surgery (pericardiectomy): mainstay treatment for chronic, permanent constrictive pericarditis
- medical therapy: can be used in 3 situations
  1. for specific pathologies/etiologies (e.g. TB)
  2. for transient constriction that is temporarily caused by pericarditis, or new constriction diagnosis with evidence of inflammation of the pericardium (use anti-inflammatories)
  3. supportive when high/prohibitive surgical risk (goal is to relieve congestive symptoms with diuretics, salt restriction)
- prognosis best with idiopathic or infectious cause and worst in post-radiation
- death may result from HF

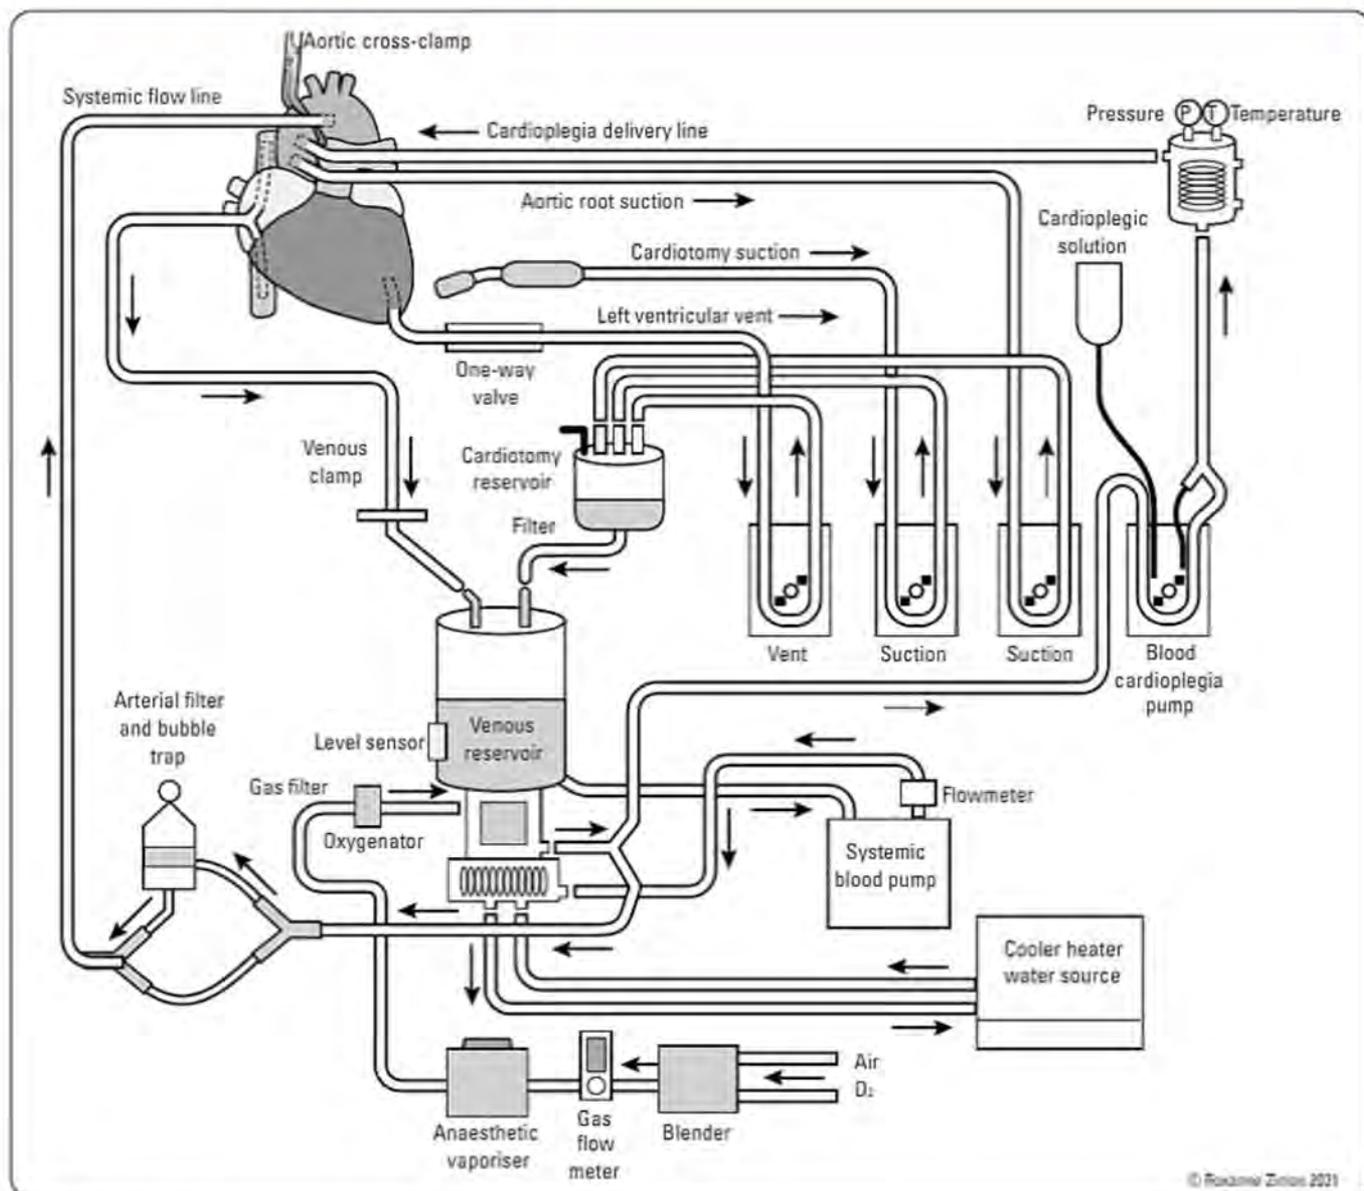

#### DDx Pulsus Paradoxus

- Most etiologies of RV failure except restrictive cardiomyopathy (e.g. acute RV MI)
- Constrictive pericarditis (rarely)
- Severe obstructive pulmonary disease (e.g. asthma)
- Pneumothorax
- PE
- Cardiogenic shock
- Cardiac tamponade
- Effusive-Constrictive pericarditis

**Table 19. Differentiation of Constrictive Pericarditis vs. Cardiac Tamponade**

Characteristic	Constrictive Pericarditis	Cardiac Tamponade
JVP	"γ" > "x"	"x" > "γ"
Kussmaul's sign	Present	Absent
Pulsus paradoxus	Uncommon	Always
Pericardial knock	Present	Absent
Hypotension	Variable	Severe

# Extracorporeal Circulation

**Figure 54. Cardiopulmonary bypass schematic**

## Cardiopulmonary Bypass

### Overview

- CPB is commonly used in cardiac and thoracic aortic surgeries to obtain a still, bloodless surgical field by circumventing the heart and lungs while supplying blood to the systemic circulation
- essential functions of CPB: oxygenation, ventilation, circulation, temperature control

### Components

- the standard components of a CPB circuit:
  - arterial cannula (aortic, femoral, or axillary) and line (3/8" heparin-coated tubing)
  - oxygenator (membrane oxygenator, defoamer, and heat exchanger)
  - pump (peristaltic/roller or centrifugal)
  - venous cannula (RA, SVC and IVC, or femoral) and line (1/2" heparin-coated tubing)
  - venous reservoir (rigid high capacitance reservoir or closed soft reservoir)

### Mechanics

- venous blood is drained into venous reservoir. The blood is oxygenated, and CO<sub>2</sub> is eliminated, heated, or cooled (if applicable) and returned to the systemic circulation via the arterial cannula
  - heparin is first administered so that pump suckers can be turned on when the patient's ACT is >400 s and CPB initiated when ACT is >480 s
    - ♦ ACT is measured every 30 min while on CPB and additional heparin boluses are administered to maintain ACT >480 s
    - ♦ anticoagulation is reversed following separation of CPB by administering protamine which neutralizes heparin
  - the rate of blood draining into the venous reservoir is determined by the: CVP, height differential between venous cannula and venous reservoir, luminal radius of venous cannula and tubing, presence of air within the tubing
  - arterial cannulation is typically performed at the distal ascending aorta, distal to the aortic cross clamp, with alternative sites for cannulation including the aortic arch, innominate artery, subclavian artery, axillary artery, femoral artery, and LV apex
  - optimal flow rate is calculated to achieve a cardiac index of 2.4 L/min/m<sup>2</sup>
  - patient parameters measured during CPB: ECG, BP, CVP, SaO<sub>2</sub>, ET/CO<sub>2</sub>, peripheral and core temperature, urine output, ABG
  - CPB pump parameters measured during CPB: blood flow rate, roller pump/centrifugal speed, gas flow, pump blood temperature, heat exchanger water temperature, arterial line pressure, arterial and venous line O<sub>2</sub> saturations, delivered O<sub>2</sub> concentration

### Complications

- reaction to non-endothelialized foreign surfaces: systemic inflammatory response, hemolysis, coagulopathy
- vessel injury from cannulation: aortic dissection and embolization of aortic debris (e.g. porcelain aorta)
- heparin-related: heparin-associated thrombocytopenia, heparin-induced thrombocytopenia (HIT)
- systemic embolization: cerebrovascular accident, renal and splanchnic hypoperfusion
  - includes biologic and nonbiologic microemboli as well as air/gas/bubble emboli
  - cardiectomy reservoir must be filtered to reduce risk of microemboli

## Cardiac and Neurological Protection during Cardiopulmonary Bypass

### Myocardial Protection Techniques

- myocardial protection reduces myocardial ischemia during CPB by reducing myocardial oxygen consumption and maintaining oxygenated myocardial perfusion
- methods of myocardial protection to reduce oxygen demands include: unloading the heart (CPB), stopping the heart (cardioplegic diastolic arrest), cooling the heart (core hypothermia, cold saline external washing, hypothermic cardioplegia solutions)
- cardioplegia (given continuously or intermittently) induces diastolic arrest by altering myocytes' resting potential and ionic gradients via concentrated K<sup>+</sup> solutions
  - crystalloid cardioplegia
    - ♦ extracellular solutions (high sodium) (e.g. St. Thomas' solution, del Nido solution) increase extracellular K<sup>+</sup> concentration to prevent cardiomyocyte repolarization
    - ♦ intracellular solutions (low sodium) lower extracellular Na<sup>+</sup> concentration thereby blocking depolarization
  - blood cardioplegia: autologous cold blood combined with tailored crystalloid solutions in various ratios
    - ♦ blood typically comprises majority of overall solution (e.g. 8:1, 4:1, 2:1)

#### Special Consideration of Blood Conservation for Jehovah's Witness Patients

- Preoperatively:
  - Administer erythropoietin
  - Stop all anticoagulant and antiplatelet medications for 7 d, if possible
- Intraoperatively:
  - Continuous cell salvage circuit
  - Meticulous hemostasis
  - OPCAB
  - Pharmacological adjuncts (tranexamic acid or aprotinin)
- Postoperatively:
  - Low threshold for reexploration due to bleeding

**Cerebral Protection**

- cerebral protection techniques are required when CPB cannot supply the head vessels, such as during surgery on the aortic arch
- methods of cerebral protection to reduce oxygen demands include: hypothermia (most important) and antegrade/retrograde cerebral perfusion

**Deep Hypothermic Circulatory Arrest**

- deep hypothermic circulatory arrest reduces cerebral metabolism and oxygen consumption to the point that CPB can be discontinued
  - (30-40 min safe circulatory arrest at 20°C; 45-60 min safe circulatory arrest at 16°C)
    - concurrent ACP enables circulatory arrest at higher temperatures than DHCA alone
  - EEG monitoring occurs throughout to confirm adequate cerebral protection
  - mannitol (reduces cerebral edema) and steroids (decrease cerebral inflammation) are used adjunctively
  - complications related to deep hypothermic circulatory arrest include: coagulopathy and platelet dysfunction, systemic inflammatory response, neurological injury secondary to ischemia in watershed areas (neurologic dysfunction may be persistent or transient depending on etiology)

**Common Medications**

**Table 20. Commonly Used Cardiac Therapeutics**

Drug Class	Examples	Mechanism of Action	Indications	Contraindications	Side Effects
<b>ANGIOTENSIN CONVERTING ENZYME INHIBITORS (ACEI)</b>					
	enalapril (Vasotec <sup>®</sup> ), perindopril (Coversyl <sup>®</sup> ), ramipril (Altace <sup>®</sup> ), lisinopril (Zestril <sup>®</sup> )	Inhibit ACE-mediated conversion of angiotensin I to angiotensin II (AT II), causing peripheral vasodilation and decreased aldosterone synthesis	HTN, CAD, CHF, post-MI, DM	Bilateral renal artery stenosis, pregnancy, caution in decreased GFR	Dry cough (10%), hypotension, fatigue, hyperkalemia, renal insufficiency, angioedema
<b>ANGIOTENSIN II RECEPTOR BLOCKERS (ARBs)</b>					
	candesartan, irbesartan, losartan, olmesartan, telmisartan, valsartan	Block AT II receptors, causing similar effects as ACEI	Same as ACEI, although evidence is generally less for ARBs; often used when ACEI are not tolerated	Same as ACEI	Similar to ACEI, but do not cause dry cough
<b>ANGIOTENSIN RECEPTOR-NEPRILYSIN INHIBITOR (ARNI)</b>					
	sacubitril/valsartan (Entresto <sup>®</sup> )	Sacubitril inhibits neprilysin which leads to vasodilation and natriuresis Valsartan (ARB) - see above	HFrEF	Angioedema, pregnancy	Angioedema, hyperkalemia, hypotension, renal insufficiency
<b>DIRECT RENIN INHIBITORS (DRIs)</b>					
	aliskiren	Directly blocks renin thus inhibiting the conversion of angiotensinogen to angiotensin I; this also causes a decrease in AT II	HTN (exact role of this drug remains unclear) Not recommended as initial therapy	Pregnancy, severe renal impairment	Diarrhea, hyperkalemia (higher risk if used with an ACEI), rash, cough, angioedema, reflux, hypotension, rhabdomyolysis, seizure
<b>β-BLOCKERS</b>					
β1 antagonists	atenolol, metoprolol, bisoprolol,	Block β-adrenergic receptors, decreasing HR, BP, contractility, and myocardial oxygen demand; also slow conduction through the AV node	HTN, CAD, acute MI, post-MI, CHF (start low and go slow), AFib, SVT	Sinus bradycardia, 2nd or 3rd degree heart block, hypotension Caution in asthma, claudication, Raynaud's phenomenon, and decompensated CHF	Hypotension, fatigue, light-headedness, depression, bradycardia, hyperkalemia, bronchospasm, impotence, depression of counterregulatory response to hypoglycemia, exacerbation of Raynaud's phenomenon, and claudication
β1/β2 antagonists	propranolol,				
α1/β1/β2 antagonists	labetalol, carvedilol,				
β1 antagonists with intrinsic sympathomimetic activity	acebutolol				
<b>CALCIUM CHANNEL BLOCKERS</b>					
Benzothiazepines Phenylalkylamines (non-dihydropyridines)	diltiazem verapamil	Block smooth muscle and myocardial calcium channels causing effects similar to β-blockers Also vasodilate	HTN, CAD, SVT, AFib, diastolic dysfunction	Sinus bradycardia, 2nd or 3rd degree heart block, hypotension, CHF	Hypotension, bradycardia, edema
Dihydropyridines	amlodipine (Norvasc <sup>®</sup> ), nifedipine (Adalat <sup>®</sup> ), felodipine (Plendil <sup>®</sup> )	Block smooth muscle calcium channels causing peripheral vasodilation	HTN, CAD	Severe AS and liver failure	Hypotension, edema, flushing, headache, light-headedness

Table 20. Commonly Used Cardiac Therapeutics

Drug Class	Examples	Mechanism of Action	Indications	Contraindications	Side Effects
<b>SODIUM-GLUCOSE COTRANSPORTER-2 (SGLT2) INHIBITORS</b>					
	canagliflozin dapagliflozin empagliflozin ertugliflozin	Proposed mechanisms include: osmotic diuresis and natriuresis reducing preload; vasodilation leading to reduced afterload; myocardial metabolic stabilization	Dapagliflozin trial (DAPA-HF) indicates potential use in HFrEF with DM/non-DM, with multiple other SGLT2 inhibitors trials underway. Although dapagliflozin has received guideline recommendations in Canada, US and EU for use in HFrEF, no SGLT2 inhibitors have formal approval for HFrEF without DM by Health Canada HFpEF (see EMPEROR-Preserved trial)	Severe CKD (dapagliflozin contraindicated in patients with eGFR <30 mL/min/1.73m <sup>2</sup> ), T1DM, history of DKA, advise holding during sick days	Yeast infections, urinary tract infections, hypoglycemic episodes, diabetic ketoacidosis, decreased bone mineral density
<b>DIURETICS</b>					
Thiazides	hydrochlorothiazide, chlorthalidone, metolazone	Reduce Na <sup>+</sup> reabsorption in the distal convoluted tubule (DCT)	HTN (drugs of choice for uncomplicated HTN)	Sulfa allergy, pregnancy	Hypotension, hypokalemia, polyuria
Loop diuretics	furosemide (Lasix <sup>®</sup> )	Blocks Na <sup>+</sup> /K <sup>+</sup> -ATPase in thick ascending limb of the loop of Henle	CHF, pulmonary or peripheral edema	Hypovolemia, hypokalemia	Hypovolemia, hypokalemic metabolic alkalosis
Aldosterone receptor antagonists	spironolactone eplerenone	Antagonize aldosterone receptors	HTN, CHF, hypokalemia	Renal insufficiency, hyperkalemia, pregnancy	Edema, hyperkalemia, gynecomastia
<b>INOTROPES</b>					
	digoxin (Lanoxin <sup>®</sup> )	Inhibit Na <sup>+</sup> /K <sup>+</sup> -ATPase, leading to increased intracellular Na <sup>+</sup> and Ca <sup>2+</sup> concentration, and increased myocardial contractility. Also slows conduction through the AV node	CHF, AFib	2nd or 3rd degree AV block, hypokalemia	AV block, junctional tachycardia, bidirectional VT, bradyarrhythmias, blurred or yellow vision (van Gogh syndrome), anorexia, N/V
<b>ANTICOAGULANTS</b>					
Coumarins	warfarin (Coumadin <sup>®</sup> )	Antagonizes vitamin K, leading to decreased synthesis of clotting factors II, VII, IX, and X	AFib, LV dysfunction, prosthetic valves, venous thrombosis	Recent surgery or bleeding, bleeding diathesis, pregnancy	Bleeding (by far the most important side effect), paradoxical thrombosis, skin necrosis
Heparins	Unfractionated heparin LMWHs: dalteparin, enoxaparin, tinzaparin	Antithrombin III agonist, leading to decreased clotting factor activity	Acute MI/ACS; (when immediate anticoagulant effect needed), PE, venous thrombosis	Recent surgery or bleeding, bleeding diathesis, thrombocytopenia, renal insufficiency (for LMWHs)	Bleeding, osteoporosis, heparin-induced thrombocytopenia (less in LMWHs)
Direct thrombin inhibitors	dabigatran	Competitive, direct thrombin inhibitor, thrombin enables fibrinogen conversion to fibrin during the coagulation cascade	AFib, venous thrombosis, PE	Severe renal impairment, recent surgery, active bleeding Idarucizumab: FDA approved agent for reversal of dabigatran for bleeding	Bleeding, GI upset
Direct factor Xa inhibitors	rivaroxaban apixaban edoxaban	Direct, selective and reversible inhibition of factor Xa in both the intrinsic and extrinsic coagulation pathways	AFib, venous thrombosis, PE	Hepatic disease, active bleeding, bleeding diathesis, pregnancy, lactation Andexanet alfa FDA approved agent for reversal of apixaban and rivaroxaban for bleeding	Bleeding, elevated liver enzymes
<b>ANTIPLATELETS</b>					
Salicylates	ASA (Aspirin <sup>®</sup> )	Irreversibly acetylates platelet COX-1, preventing thromboxane A <sub>2</sub> -mediated platelet aggregation	CAD, acute MI, post-MI, post-PCI, CABG	Active bleeding or PUD	Bleeding, GI upset, GI ulceration, impaired renal perfusion
Thienopyridines	clopidogrel (Plavix <sup>®</sup> ), ticlopidine (Ticlid <sup>®</sup> )	P2Y <sub>12</sub> antagonist (block platelet ADP receptors)	Acute MI, post-MI, post-PCI, CABG	Active bleeding or PUD	Bleeding, thrombotic thrombocytopenic purpura, neutropenia (ticlopidine)
Nucleoside analogues	ticagrelor (Brilinta <sup>®</sup> )	P2Y <sub>12</sub> antagonist (but different binding site than thienopyridines)			
Glycoprotein IIb/IIIa inhibitors	eptifibatid, tirofiban, abciximab	Block binding of fibrinogen to 6p IIb/IIIa	Acute MI, particularly if PCI is planned	Recent surgery or bleeding, bleeding diathesis	Bleeding
<b>THROMBOLYTICS</b>					
	alteplase, reteplase, tenecteplase, streptokinase	Convert circulating plasminogen to plasmin, which lyses cross-linked fibrin	Acute STEMI	See Table 10, C24	Bleeding

**Table 20. Commonly Used Cardiac Therapeutics**

Drug Class	Examples	Mechanism of Action	Indications	Contraindications	Side Effects
<b>NITRATES</b>					
	nitroglycerin	Relax vascular smooth muscle, producing venous and arteriolar dilation	CAD, MI, CHF (isosorbide dinitrate plus hydralazine)	Concurrent use of cyclic guanosine monophosphate phosphodiesterase inhibitors, angle closure glaucoma, increased intracranial pressure	Headache, dizziness, weakness, postural hypotension
<b>LIPID LOWERING AGENTS</b>					
Statins	atorvastatin (Lipitor <sup>®</sup> ), pravastatin (Pravachol <sup>®</sup> ), rosuvastatin (Crestor <sup>®</sup> ), simvastatin (Zocor <sup>®</sup> ), lovastatin (Meracor <sup>®</sup> )	Inhibit hydroxy $\beta$ -methylglutaryl-CoA (HMG-CoA) reductase, an enzyme which catalyzes the rate-limiting step in cholesterol synthesis	Dyslipidemia (1 <sup>o</sup> prevention of CAD), CAD, post-MI (2 <sup>o</sup> prevention of CV events)	Liver or muscle disease	Myalgia, rhabdomyolysis, abdominal pain
Cholesterol absorption inhibitor	ezetimibe (Ezetrol <sup>®</sup> )	Inhibits gut absorption of cholesterol	Decreases low-density lipoprotein but does not reduce mortality	Liver or renal impairment	Myalgia, rhabdomyolysis, abdominal pain
Miscellaneous	fibrates, bile acid sequestrates, nicotinic acid		Primarily in familial hypercholesterolemia		GI side effects common
PCSK9 inhibitor	evolocumab, alirocumab	Monoclonal antibody that inhibits PCSK9's inhibitory action on the recycling of LDL receptors, thereby increasing the number of LDL receptors on the surface of liver cells	Hypercholesterolemia	Hypersensitivity reaction to drug	Mild reactions to site of injection, nasopharyngitis

## Antiarrhythmics

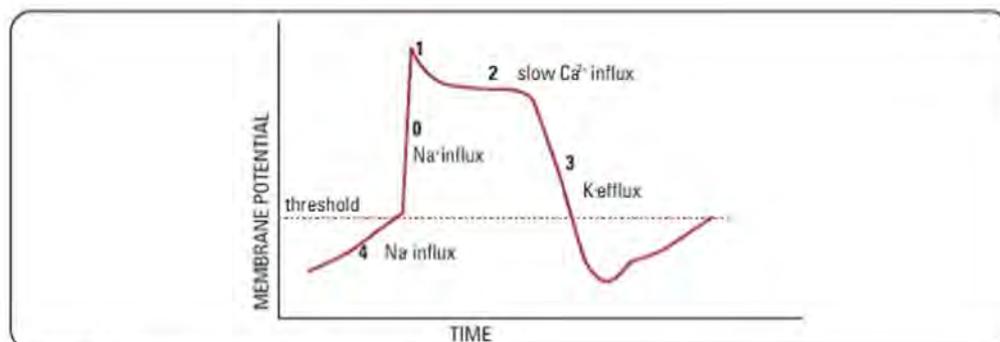

Figure 55. Representative cardiac action potential

**Table 21. Antiarrhythmic\* Drugs (Vaughan-Williams Classification)**

Class	Agent	Indications	Side Effects	Mechanism of Action
Ia	quinidine, procainamide, disopyramide	SVT, VT	Torsades de Pointes (all Ia), diarrhea, Lupus-like syndrome, Anticholinergic effects	Moderate Na <sup>+</sup> channel blockade, Slows phase 0 upstroke, Prolongs repolarization, slowing conduction
Ib	lidocaine, mexiletine	VT	Confusion, stupor, seizures, GI upset, tremor	Mild Na <sup>+</sup> channel blockade, Shortens phase 3 repolarization
Ic	propafenone, flecainide, encainide	SVT, VT, AFib	Exacerbation of VT (all Ic), Negative inotropy (all Ic), Bradycardia and heart block (all Ic)	Upstroke
II	propranolol, metoprolol, etc.	SVT, AFib	Bronchospasm, negative inotropy, bradycardia, AV block, impotence, fatigue	$\beta$ -blocker, Decreases phase 4 depolarization
III	amiodarone <sup>**</sup> , sotalol	SVT, VT, AFib, SVT, VT	Amiodarone: photosensitivity, pulmonary toxicity, hepatotoxicity, thyroid disease, increased INR. Amiodarone and sotalol: Torsades de Pointes, bradycardia, heart block, $\beta$ -blocker side effects	Blocks K <sup>+</sup> channel, Prolongs phase 3 repolarization, which prolongs refractory period
IV	verapamil, diltiazem	SVT, AFib	Bradycardia, AV block, Hypotension	CCB, Slows phase 4 spontaneous depolarization, slowing AV node conduction

\*All antiarrhythmics have potential to be proarrhythmic  
 \*\*Amiodarone has class I, II, III, and IV properties

**Table 22. Actions of  $\alpha$  and  $\beta$  Adrenergic Receptors**

Target System	$\alpha$ RECEPTORS		$\beta$ RECEPTORS	
	$\alpha 1$	$\alpha 2$	$\beta 1$	$\beta 2$
<b>Cardiovascular</b>	Constriction of vascular smooth muscle Constriction of skin, skeletal muscle, and splanchnic vessels Increase myocardial contractility Decrease HR	Same as $\alpha 1$ Peripherally act to modulate vessel tone Vasoconstrict and dilate; oppose $\alpha 1$ vasoconstrictor activity	Increased myocardial contractility Accelerate SA node conduction Accelerate ectopic pacemakers	Decreased vascular smooth muscle tone
<b>Respiratory</b>				Bronchodilation
<b>Dermal</b>	Pilomotor smooth muscle contraction Apocrine constriction			
<b>Ocular</b>	Radial muscle contraction		Ciliary muscle relaxation	
<b>Gastrointestinal</b>	Inhibition of myenteric plexus Anal sphincter contraction			
<b>Genitourinary</b>	Pregnant uterine contraction Penile and seminal vesicle ejaculation Urinary bladder contraction	Smooth muscle wall relaxation	Stimulation of renal renin release	Bladder wall relaxation Uterine relaxation
<b>Metabolic</b>	Stimulate liver gluconeogenesis and glycogenolysis at the liver	Same as $\alpha 1$ Fat cell lipolysis	Fat cell lipolysis Glycogenolysis	Gluconeogenesis Fat cell lipolysis

Adapted from the Family Practice Notebook ([www.fpnotebook.com/NEU194.htm](http://www.fpnotebook.com/NEU194.htm))

**Table 23. Commonly Used Drugs that Act on  $\alpha$  and  $\beta$  Adrenergic Receptors**

Mechanism of Action	$\alpha$ RECEPTORS			$\beta$ RECEPTORS		
	$\alpha 1$	$\alpha 1$ and $\alpha 2$	$\alpha 2$	$\beta 1$	$\beta 1$ and $\beta 2$	$\beta 2$
<b>Agonist</b>	Phenylephrine Methoxamine	Epinephrine Norepinephrine	Clonidine Methyldopa	Norepinephrine Dobutamine	Isoproterenol Epinephrine	Albuterol Terbutaline
<b>Antagonist</b>	Prazosin Phenoxylbenzamine	Phentolamine	Yohimbine Mirtazapine	Metoprolol Acebutolol Alprenolol Atenolol Esmolol	Propranolol Timolol Nadolol Pindolol Carvedilol	Butoxamine

Adapted from the Family Practice Notebook ([www.fpnotebook.com/NEU194.htm](http://www.fpnotebook.com/NEU194.htm))

# Landmark Cardiac Trials

Trial Name	Reference	Clinical Trial Details
<b>ISCHEMIC HEART DISEASE</b>		
ACME	NEJM 1992;326:10-16	<p><b>Title:</b> A Comparison of Angioplasty with Medical Therapy in the Treatment of Single-Vessel Coronary Artery Disease</p> <p><b>Purpose:</b> Compare the effects of percutaneous transluminal coronary angioplasty (PTCA) on angina and exercise tolerance in patients with stable single-vessel disease</p> <p><b>Methods:</b> Patients with exercise-induced myocardial ischemia and epicardial artery stenosis were randomized to PTCA or medical therapy, and repeat exercise testing performed at 6 mo.</p> <p><b>Results:</b> PTCA was successful in 80% of patients, reducing mean % stenosis from 76% to 36%. At 6 mo, 64% PTCA patients were angina-free, compared with 46% of medically treated patients. PTCA-treated patients had longer exercise durations (2.1 vs. 0.5 min, <math>P &lt; 0.0001</math>) than medically treated patients.</p> <p><b>Conclusions:</b> PTCA offers earlier and better relief of angina than medical therapy in patients with single-vessel disease.</p>
ARRIVE	Lancet 2018;392:1036-46	<p><b>Title:</b> Use of Aspirin to Reduce Risk of Initial Vascular Events in Patients at Moderate Risk of Cardiovascular Disease (ARRIVE): A Randomised, Double-blind, Placebo-controlled Trial</p> <p><b>Purpose:</b> Assess efficacy and safety of ASA versus placebo in patients with moderate risk of a first CV event.</p> <p><b>Methods:</b> Patients with moderate CV risk were randomized to receive ECASA or placebo tablets, once daily. The primary endpoint was a composite of time to CV death, MI, UA, stroke, or TIA.</p> <p><b>Results:</b> The primary endpoint occurred in 4.29% of ASA-treated patients versus 4.48% of placebo-treated patients (hazard ratio 0.96; 95% CI 0.81 to 1.13; <math>P = 0.6</math>). The overall incidence of adverse events was similar between groups (82.01% in ASA group versus 81.72% in placebo group).</p> <p><b>Conclusions:</b> Among patients at moderate risk of CHD, the use of ASA was not beneficial. ASA was not associated with a reduction in adverse CV events.</p>
ASCOT-LLA	Lancet 2003;361:1149-58	<p><b>Title:</b> Prevention of Coronary and Stroke Events with Atorvastatin in Hypertensive Patients who have Average or Lower-than-Average Cholesterol Concentrations, in the Anglo-Scandinavian Cardiac Outcomes Trial-Lipid Lowering Arm (ASCOT-lla): A Multicentre Randomised Controlled Trial</p> <p><b>Purpose:</b> Assess benefits of cholesterol lowering in primary prevention of CHD in hypertensive patients.</p> <p><b>Methods:</b> Hypertensive patients aged 40-79 were randomized to atorvastatin 10 mg or placebo. The primary endpoint was non-fatal MI and fatal CHD after 5-yr follow-up.</p> <p><b>Results:</b> 100 primary events occurred in the atorvastatin group compared to 154 events in the placebo group at a median follow-up of 3.3 yr (hazard ratio 0.64; 95% CI 0.50 to 0.83; <math>P = 0.0005</math>). Fatal and non-fatal stroke, total CV events and total coronary events were also lowered in the atorvastatin group.</p> <p><b>Conclusions:</b> In hypertensive patients with risk factors for CHD and average cholesterol levels, atorvastatin reduced non-fatal MI, fatal CHD, fatal/non-fatal stroke, coronary events but not all-cause mortality.</p>
BARI 2D	NEJM 2009;360:2503-15	<p><b>Title:</b> A Randomized Trial of Therapies for Type 2 Diabetes and Coronary Artery Disease</p> <p><b>Purpose:</b> Determine optimal treatment for patients with T2DM and stable ischemic heart disease.</p> <p><b>Methods:</b> Patients with T2DM and heart disease were randomized to prompt revascularization with intensive medical therapy, or intensive medical therapy alone. Primary endpoints were mortality, MI, or stroke</p> <p><b>Results:</b> 5-yr survival did not differ significantly between groups (88.3% in revascularization group vs. 87.8% in the medical therapy group; <math>P = 0.97</math>). In the PCI group, there were no significant differences in primary endpoints, while in the CABG group, rates of CV events were significantly lower with revascularization than medical therapy (22.4% vs. 30.5%; <math>P = 0.01</math>).</p> <p><b>Conclusions:</b> There was no significant difference in the rates of death and major CV events between prompt revascularization and medical therapy.</p>
CAPRIE	Lancet 1996;348:1329-39	<p><b>Title:</b> A Randomised, Blinded, Trial of Clopidogrel Versus Aspirin in Patients at Risk of Ischaemic Events (CAPRIE)</p> <p><b>Purpose:</b> Assess the relative efficacy of clopidogrel and ASA in reducing risk of clinical thrombotic events.</p> <p><b>Methods:</b> Patients with atherosclerotic vascular disease were randomized to clopidogrel 75 mg once daily or ASA 325 mg once daily. Primary endpoints were a composite of ischemic stroke, MI, or vascular death.</p> <p><b>Results:</b> Patients treated with clopidogrel had a 5.32% annual risk of stroke, MI or death, compared with 5.83% of ASA patients (<math>p = 0.043</math>). There were no major differences in terms of safety.</p> <p><b>Conclusions:</b> In atherosclerotic vascular disease, clopidogrel reduced the rates of stroke, MI, or vascular death compared to ASA.</p>
CARE	NEJM 1996;335:1001-09	<p><b>Title:</b> The Effect of Pravastatin on Coronary Events after Myocardial Infarction in Patients with Average Cholesterol Levels</p> <p><b>Purpose:</b> Determine the effects of cholesterol-lowering in patients with coronary disease and average cholesterol levels.</p> <p><b>Methods:</b> Patients with MI who had plasma cholesterol levels <math>&lt; 240</math> mg were administered either 40 mg pravastatin or placebo. The primary endpoint was a fatal coronary event or fatal MI.</p> <p><b>Results:</b> The primary endpoint occurred in 10.2% of the pravastatin-treated patients and 13.2% of placebo-treated patients (95% CI 9% to 36%; <math>P = 0.003</math>). There were no significant differences in overall mortality or mortality from nonvascular causes. Pravastatin lowered the rate of coronary events more among men than women.</p> <p><b>Conclusions:</b> Pravastatin reduced MI and stroke in patients with previous MI and average cholesterol.</p>
COURAGE	NEJM 2007;356:1503-16	<p><b>Title:</b> Optimal Medical Therapy with or without PCI for Stable Coronary Disease</p> <p><b>Purpose:</b> Compare initial strategy of PCI plus intensive pharmacological therapy and lifestyle intervention against optimal medical therapy alone, in patients with stable coronary disease.</p> <p><b>Methods:</b> 2287 patients with myocardial ischemia and significant CAD were randomized to PCI with optimal medical therapy, or optimal medical therapy alone. The primary outcome was all-cause mortality and non-fatal MI.</p> <p><b>Results:</b> There were 211 primary events in the PCI group and 202 in the optimal medical therapy group (hazard ratio for PCI, 1.05; 95% CI 0.87 to 1.27; <math>P = 0.62</math>). There were no significant differences between groups in the composite of death, MI, stroke, or hospitalizations for ACS.</p> <p><b>Conclusions:</b> Compared with optimal medical therapy alone, PCI plus medical therapy did not reduce all-cause mortality and non-fatal MI, and it did not reduce the incidence of major CV events.</p>
CURE	NEJM 2001;345:494-502	<p><b>Title:</b> Effects of Clopidogrel in Addition to Aspirin in Patients with Acute Coronary Syndromes without ST-Segment Elevation</p> <p><b>Purpose:</b> Evaluate efficacy and safety of clopidogrel with ASA in patients with ACS without ST-elevation.</p> <p><b>Methods:</b> 12562 patients who presented within 24 h of symptom onset were randomized to clopidogrel or placebo in addition to ASA for 3-12 mo. The primary endpoint was a composite of CV mortality, non-fatal MI, or stroke.</p> <p><b>Results:</b> The primary endpoint occurred in 9.3% of clopidogrel patients and 11.4% of patients in the placebo group (RR 0.80; 95% CI 0.72 to 0.90; <math>P = 0.001</math>). There were significantly more patients with bleeding in the clopidogrel group than the placebo group (3.7% vs. 2.7%; RR 1.38; <math>P = 0.001</math>).</p> <p><b>Conclusions:</b> Clopidogrel plus ASA reduced death from CV causes, non-fatal MI, or stroke but increased bleeding complications.</p>

Trial Name	Reference	Clinical Trial Details
EUROPA	Lancet 2003;362:782-88	<p><b>Title:</b> Efficacy of Perindopril in Reduction of Cardiovascular Events Among Patients with Stable Coronary Artery Disease: Randomised, Double-blind, Placebo-controlled, Multicentre Trial (The EUROPA Study)</p> <p><b>Purpose:</b> Assess whether ACEI reduced CV risk in a low-risk population with stable coronary disease.</p> <p><b>Methods:</b> After a run-in of 4 wk, in which all patients received perindopril, 12218 patients were randomized to perindopril 8 mg OD or matching placebo. The primary endpoint was CV death, MI, or cardiac arrest</p> <p><b>Results:</b> 8% of perindopril patients experienced a primary endpoint, compared with 10% of placebo patients. These benefits were consistent in all subgroups and secondary endpoints.</p> <p><b>Conclusions:</b> With stable CAD and no CHF, perindopril reduced CV death, MI, and total mortality.</p>
European Coronary Surgery Study	NEJM 1988;319:332-37	<p><b>Title:</b> Twelve-Year Follow-up of Survival in the Randomized European Coronary Surgery Study</p> <p><b>Purpose:</b> Evaluate survival rates in men with good LVEF after CABG or medical therapy.</p> <p><b>Methods:</b> 767 men were randomized to early CABG or medical therapy.</p> <p><b>Results:</b> At the projected 5-yr follow-up period, there was a significantly higher survival rate in the surgical group than in the medical treatment group (92.4% vs. 83.1%, <math>P=0.0001</math>).</p> <p><b>Conclusions:</b> CABG resulted in higher survival than medical therapy at 5-yr follow-up but not at 12-yr follow-up.</p>
EXCEL	NEJM 2019;381:1820-30	<p><b>Title:</b> Five-Year Outcomes after PCI or CABG for Left Main Coronary Disease</p> <p><b>Purpose:</b> Assess long-term outcomes after PCI with contemporary drug-eluting stents, as compared with CABG, in patients with left main CAD.</p> <p><b>Methods:</b> 1905 patients with left main CAD of low/intermediate anatomical complexity were randomized to PCI or CABG. The primary outcome was a composite of death, stroke or MI.</p> <p><b>Results:</b> At 5 yr, the primary outcome occurred in 22.0% of PCI patients and 19.2% of CABG patients (2.8% difference; 95% CI -0.9 to 6.5; <math>P=0.13</math>). Rates of CV death and MI were not significantly different between groups. All cerebrovascular events were less frequent after PCI than CABG (3.3% vs. 5.2%; 95% CI -3.8 to 0).</p> <p><b>Conclusions:</b> Among patients with left main CAD, there was no significant difference between PCI and CABG in terms of the composite outcome of death, stroke, or MI at 5 yr.</p>
HPS	Lancet 2002;360:7-22	<p><b>Title:</b> MRC/BHF Heart Protection Study of Cholesterol Lowering with Simvastatin in 20,536 High-risk Individuals: A Randomised Placebo-controlled Trial</p> <p><b>Purpose:</b> Assess effect of LDL-lowering with simvastatin on vascular disease, in patients of normal LDL-C.</p> <p><b>Methods:</b> 20536 adults with coronary disease or DM were randomized to simvastatin 40 mg daily or placebo. Primary outcomes were mortality, and fatal or non-fatal vascular events.</p> <p><b>Results:</b> All-cause mortality was significantly reduced (12.9% in simvastatin patients vs. 14.7% in placebo). There were significant reductions in the first event rate for non-fatal MI (8.7% vs. 11.8%; <math>P&lt;0.0001</math>). There were no significant effects on cancer incidence or hospitalization for a non-vascular cause.</p> <p><b>Conclusions:</b> In high-risk patients with ranging LDL-C values, simvastatin reduced all-cause mortality, coronary deaths, and major vascular events.</p>
IMPROVE-IT	NEJM 2015;372:2387-97	<p><b>Title:</b> Ezetimibe Added to Statin Therapy after Acute Coronary Syndromes</p> <p><b>Purpose:</b> Assess the effects of adding ezetimibe to statin therapy in reducing the rate of CV events.</p> <p><b>Methods:</b> 18144 patients who were hospitalized with ACS were randomized to combination (simvastatin 40 mg plus ezetimibe 10 mg), simvastatin 40 mg alone, or placebo. Primary endpoint was a composite of CV death, non-fatal MI, UA, or non-fatal stroke.</p> <p><b>Results:</b> The Kaplan-Meier event rates for the primary endpoint were 32.7% in the combination group and 34.7% in the statin monotherapy group (<math>P=0.001</math>). Rates of pre-specified muscle, gallbladder, and hepatic adverse effects were similar.</p> <p><b>Conclusions:</b> Ezetimibe added to statin reduces mortality in ACS patients.</p>
JUPITER	NEJM 2008;359:2195-207	<p><b>Title:</b> Rosuvastatin to Prevent Vascular Events in Men and Women with Elevated C-Reactive Protein</p> <p><b>Purpose:</b> Evaluate the effects of statin treatment on CV events in patients with elevated CRP without hyperlipidemia.</p> <p><b>Methods:</b> 17802 apparently healthy patients with LDL levels &lt;130 mg/dL and CRP levels &gt;2.0 mg were randomized to rosuvastatin 20 mg daily or placebo. The primary endpoint was a composite of MI, stroke, revascularization, hospitalization for UA, or CV death.</p> <p><b>Results:</b> The rates of the primary endpoint were 0.77 and 1.36 per 100 person-years in the statin and placebo groups respectively (hazard ratio 0.56; 95% CI 0.46 to 0.69; <math>P&lt;0.00001</math>). The rosuvastatin group did not have a significant increase in myopathy or cancer, but a higher rate of diabetes.</p> <p><b>Conclusions:</b> With low to normal LDL and elevated high CRP, treatment with rosuvastatin significantly reduced major CV events.</p>
MASS II	Circulation 2010;122:949-57	<p><b>Title:</b> Ten-Year Follow-Up Survival of the Medicine, Angioplasty, or Surgery Study (MASS II)</p> <p><b>Purpose:</b> Compare 10-yr follow-up of PCI, CABG, and medical treatment in patients with multivessel coronary disease, UA, and preserved ventricular function.</p> <p><b>Methods:</b> 611 patients were randomized to CABG, PCI, or medical treatment. The primary endpoints were overall mortality, Q-wave MI, or refractory angina requiring revascularization.</p> <p><b>Results:</b> 10-yr survival was 74.9% with CABG, 75.1% with PCI, and 13.3% with medical treatment (<math>P=0.089</math>). 10-yr rates of MI were 10.3% with CABG, 13.3% with PCI, and 20.7% with medical treatment (<math>P&lt;0.010</math>). 10-yr freedom from angina was 64% with CABG, 59% with PCI, and 43% with medical treatment (<math>P&lt;0.001</math>).</p> <p><b>Conclusions:</b> Compared to medical therapy, CABG resulted in greater relief of angina symptoms and lower rates of subsequent MI, additional revascularization, and cardiac death. Compared to PCI, CABG resulted in decreased need for further revascularization, a lower incidence of MI, and lower risk of combined events.</p>
ODYSSEY OUTCOMES	NEJM 2018;379:2097-107	<p><b>Title:</b> Alirocumab and Cardiovascular Outcomes after Acute Coronary Syndrome</p> <p><b>Purpose:</b> Determine whether alicumab would improve CV events after ACS in patients receiving high-intensity statin therapy</p> <p><b>Methods:</b> 18924 patients receiving high-intensity statins for ACS 1-12 prior were randomized to alicumab 50 at 75 mg or placebo, every 2 wk. The primary endpoint was a composite of death from CHD, non-fatal MI, fatal or non-fatal stroke, or UA</p> <p><b>Results:</b> The primary endpoint occurred in 9.5% of patients in the alicumab group and in 11.1% of patients in the placebo group (hazard ratio 0.85; 95% CI 0.78 to 0.93; <math>P&lt;0.001</math>). The incidence of adverse events was similar in the two groups.</p> <p><b>Conclusions:</b> Among patients with ACS in the preceding 1-12 mo, use of alicumab significantly reduces all-cause mortality and MI.</p>
ROOBY	NEJM 2017;377:623-32	<p><b>Title:</b> Five-Year Outcomes after On-Pump and Off-Pump Coronary-Artery Bypass</p> <p><b>Purpose:</b> Reporting of 5-yr outcomes in patients included in the Veterans Trial of on-pump vs. off-pump CABG.</p> <p><b>Methods:</b> 2203 patients were randomly assigned to undergo either on-pump or off-pump CABG. The primary 5-yr outcomes were all-cause mortality and a composite of major CV events or non-fatal MI.</p> <p><b>Results:</b> 5-yr mortality was 15.2% in the off-pump group, compared with 11.9% in the on-pump group (RR 1.28; 95% CI 1.03 to 1.58; <math>P=0.02</math>). The rate of major CV events in the off-pump group was 31.0% compared to 27.1% in the on-pump group (RR 1.14; 95% CI 1.00 to 1.30; <math>P=0.046</math>).</p> <p><b>Conclusions:</b> Off-pump CABG led to lower rates of 5-yr survival and event-free survival when compared to on-pump CABG.</p>

Trial Name	Reference	Clinical Trial Details
SYNTAX	NEJM 2009;360:961-72	<p><b>Title:</b> Percutaneous Coronary Intervention versus Coronary-Artery Bypass Grafting for Severe Coronary Artery Disease</p> <p><b>Purpose:</b> Compare PCI and CABG for treating patients with previously untreated three-vessel or left main CAD.</p> <p><b>Methods:</b> 1800 patients with three-vessel or left main coronary disease were randomized to CABG or PCI (1:1 ratio). The primary outcomes were a major adverse cardiac or cerebrovascular event.</p> <p><b>Results:</b> Rates of primary outcomes at 12 mo were significantly higher in the PCI group (17.8% vs. 12.4%; <math>P=0.002</math>). At 12 mo, rates of death and MI were similar between groups and stroke was significantly more likely with CABG.</p> <p><b>Conclusions:</b> CABG had a lower rate of major cardiac or cerebrovascular events, however the rate of stroke was increased with CABG whereas the rate of repeat revascularization was increased with PCI.</p>
TNT	NEJM 2005;352:1425-35	<p><b>Title:</b> Intensive Lipid Lowering with Atorvastatin in Patients with Stable Coronary Disease</p> <p><b>Purpose:</b> Assess the efficacy and safety of LDL-lowering below 100 mg/dL in patients with stable CHD.</p> <p><b>Methods:</b> 10001 patients with stable CHD and LDL &lt;130 mg/dL were randomized to double blind therapy of atorvastatin 10 mg or 80 mg daily. The primary endpoint was the occurrence of a first major CV event.</p> <p><b>Results:</b> A primary endpoint occurred in 8.7% of patients treated with atorvastatin 80 mg, as compared with 10.9% in patients receiving atorvastatin 10 mg. There was no difference in overall mortality between groups.</p> <p><b>Conclusions:</b> Lipid-lowering therapy with atorvastatin 80 mg/d in patients with stable CHD provides clinical benefit beyond atorvastatin 10 mg/d.</p>
<b>MYOCARDIAL INFARCTION</b>		
BHAT	JAMA 1982;247:1707-14	<p><b>Title:</b> A Randomized Trial of Propranolol in Patients with Acute Myocardial Infarction</p> <p><b>Purpose:</b> Study the effects on mortality of administering propranolol hydrochloride in patients who experienced at least one M.</p> <p><b>Methods:</b> 3387 patients were randomized to either propranolol or placebo for 21 d post-infarction. The primary outcome was all-cause mortality.</p> <p><b>Results:</b> Total mortality during the average 25-mo follow-up was 7.2% in the propranolol group and 9.2% in the placebo group.</p> <p><b>Conclusions:</b> In acute MI, propranolol reduced all-cause mortality, CV death, and sudden death from atherosclerotic heart disease.</p>
COLCOT	NEJM 2019;381:2497-505	<p><b>Title:</b> Efficacy and Safety of Low-Dose Colchicine after Myocardial Infarction</p> <p><b>Purpose:</b> Assess the efficacy and safety of low-dose colchicine after MI.</p> <p><b>Methods:</b> Patients were randomized to receive 0.5 mg colchicine once daily or placebo. The primary endpoint was a composite of CV death, resuscitated cardiac arrest, MI, stroke, or UA leading to revascularization.</p> <p><b>Results:</b> The primary endpoint occurred in 5.5% of colchicine-treated patients and 7.1% in the placebo group (hazard ratio 0.77; 95% CI 0.61 to 0.96; <math>P=0.02</math>). The hazard ratios were 0.84 for CV death, 0.83 for resuscitated cardiac arrest, 0.91 for MI, 0.26 for stroke, and 0.50 for UA.</p> <p><b>Conclusions:</b> In patients with recent MI, colchicine lowered the risk of subsequent CV events as compared to placebo.</p>
COMPLETE	NEJM 2019;381:1411-21	<p><b>Title:</b> Complete Revascularization with Multivessel PCI for Myocardial Infarction</p> <p><b>Purpose:</b> To assess whether PCI of nonculprit lesions reduced rates of CV death or MI in STEMI patients.</p> <p><b>Methods:</b> Patients with STEMI and successful PCI of culprit lesions were randomized to complete revascularization with PCI or no further revascularization. The primary outcome was a composite of CV death or MI.</p> <p><b>Results:</b> At 3 yr, the primary outcome occurred in 7.8% of patients in the complete-revascularization group, compared with 10.5% in the culprit-lesion PCI only group (hazard ratio 0.74; 95% CI 0.60 to 0.91; <math>P=0.004</math>). The benefit was observed regardless of the intended timing of nonculprit lesion PCI.</p> <p><b>Conclusions:</b> In patients with STEMI and multivessel CAD, complete revascularization by PCI further reduced the risk of CV death or MI as compared to culprit-lesion-only PCI.</p>
DAPT	NEJM 2014;371:2155-66	<p><b>Title:</b> Twelve or 30 Months of Dual Antiplatelet Therapy after Drug-Eluting Stents</p> <p><b>Purpose:</b> Study the effects of dual antiplatelet therapy beyond 1 yr, to prevent thrombotic complications after drug-eluting stents.</p> <p><b>Methods:</b> After 12 mo treatment with clopidogrel or prasugrel, patients were randomized to continuing this therapy or receiving placebo. The primary endpoints were stent thrombosis and major adverse CV events from 12-30 mo.</p> <p><b>Results:</b> Continued treatment reduced the rates of stent thrombosis (0.4% vs. 1.4%; 95% CI 0.17 to 0.48; <math>P&lt;0.001</math>), and major CV and cerebrovascular events (4.3% vs. 5.9%; 95% CI 0.59 to 0.85; <math>P&lt;0.001</math>). The rate of moderate-severe bleeding was increased in the continued treatment group (2.5% vs. 1.65%; <math>P=0.001</math>).</p> <p><b>Conclusions:</b> Dual antiplatelet therapy beyond 1 yr confers additional benefit.</p>
OASIS-5	NEJM 2006;354:1464-76	<p><b>Title:</b> Comparison of Fondaparinux and Enoxaparin in Acute Coronary Syndromes</p> <p><b>Purpose:</b> Assess whether fondaparinux would reduce bleeding risk while retaining the anti-ischemic benefits of enoxaparin.</p> <p><b>Methods:</b> 20078 patients were randomized to receive either fondaparinux 2.5 mg daily, or enoxaparin 1 mg/kg twice daily. The primary outcomes were death, MI, refractory ischemia at 9 d, or bleeding.</p> <p><b>Results:</b> The primary outcome rates were similar between the two groups (hazard ratio 1.01; 95% CI 0.90 to 1.13). The rate of 9-d major bleeding was lower in the fondaparinux group than the enoxaparin group (2.2% vs. 4.1%; hazard ratio 0.52; <math>P&lt;0.001</math>).</p> <p><b>Conclusions:</b> Compared to enoxaparin, fondaparinux reduced mortality rates, major bleeds at 9 d, and MI at 30 and 180 d.</p>
PEGASUS-TIMI 54	NEJM 2015;372:1791-800	<p><b>Title:</b> Long-Term Use of Ticagrelor in Patients with Prior Myocardial Infarction</p> <p><b>Purpose:</b> Investigate the safety and efficacy of ticagrelor after an ACS.</p> <p><b>Methods:</b> 21162 patients who had a prior MI were randomized to ticagrelor 90 mg BID, or placebo. The primary endpoints were a composite of CV death, MI, or stroke. The primary safety endpoint was thrombolysis in MI and major bleeding.</p> <p><b>Results:</b> Kaplan-Meier event rates showed that ticagrelor reduced event rates at 3 yr, at 7.77% for the treatment group and 9.04% in the placebo group (hazard ratio 0.85; 95% CI 0.75 to 0.96; <math>P=0.008</math>). Rates of major bleeding were higher with ticagrelor than with placebo (<math>P&lt;0.001</math>).</p> <p><b>Conclusions:</b> Ticagrelor on top of ASA reduces CV events in patients with a history of MI.</p>
PLATO	NEJM 2009;361:1045-57	<p><b>Title:</b> Ticagrelor vs. Clopidogrel in Patients with Acute Coronary Syndromes</p> <p><b>Purpose:</b> Evaluate the efficacy of ticagrelor vs. clopidogrel in patients with an ACS.</p> <p><b>Methods:</b> 18624 patients admitted to hospital with ACS, with or without ST-elevation, were randomized to ticagrelor (180 mg loading, 90 mg twice daily after) or clopidogrel (300-600 mg loading; 75 mg daily after). The primary endpoint was a composite of vascular death, MI, or stroke.</p> <p><b>Results:</b> The primary endpoint occurred in 9.8% of patients receiving ticagrelor, compared with 11.7% of patients receiving clopidogrel (hazard ratio 0.84; 95% CI 0.77 to 0.92; <math>P&lt;0.001</math>). The rate of death was also reduced with ticagrelor (4.5% vs. 5.9%; <math>P&lt;0.001</math>). There were no significant differences in the rates of major bleeding.</p> <p><b>Conclusions:</b> In ACS patients with either STEMI or NSTEMI, regardless of reperfusion strategy, ticagrelor reduced mortality, MI, and stroke without increased bleeding compared to clopidogrel.</p>

Trial Name	Reference	Clinical Trial Details
PROVE IT – TIMI 22	NEJM 2004;350:1495-504	<p><b>Title:</b> Intensive vs. Moderate Lipid Lowering with Statins after Acute Coronary Syndromes</p> <p><b>Purpose:</b> Determine the optimal LDL-C level in patients undergoing statin therapy for reduction in risk of CV events.</p> <p><b>Methods:</b> 4162 patients hospitalized with ACS in the preceding 10 d were assigned to pravastatin 40 mg daily or atorvastatin 80 mg daily. The primary end point was a composite of all-cause mortality MI, UA, revascularization, and stroke.</p> <p><b>Results:</b> Event rates were 26.3% in the pravastatin group and 22.4% in the atorvastatin group (P=0.005; 95% CI 5 to 26%). The study established the superiority of the more intensive regimen.</p> <p><b>Conclusions:</b> In patients hospitalized for ACS, high-dose atorvastatin reduced all-cause mortality, MI, unstable angina, revascularization, and stroke compared with pravastatin.</p>
TRITON-TIMI 38	NEJM 2007;357:2001-15	<p><b>Title:</b> Prasugrel vs. Clopidogrel in Patients with Acute Coronary Syndromes</p> <p><b>Purpose:</b> Compare clopidogrel and prasugrel in preventing thrombotic complications of ACS and PCI.</p> <p><b>Methods:</b> 13608 patients with ACS and scheduled PCI were randomized to prasugrel (60 mg loading, 10 mg maintenance) or clopidogrel (300 mg loading, 75 mg maintenance). The primary endpoint was CV death, non-fatal MI, or non-fatal stroke. The safety endpoint was major bleeding.</p> <p><b>Results:</b> The primary endpoint occurred in 12.1% of clopidogrel patients and 9.9% of prasugrel patients (hazard ratio 0.81; 95% CI 0.73 to 0.90; P&lt;0.001). Major bleeding was observed in 2.4% of prasugrel patients and 1.8% of clopidogrel patients (hazard ratio 1.32; 95% CI 1.03 to 1.68; P=0.03.)</p> <p><b>Conclusions:</b> In ACS patients scheduled for PCI, prasugrel reduced ischemic events but increased major bleeding compared to clopidogrel.</p>
<b>TRANSCATHETER AORTIC VALVE REPLACEMENT</b>		
PARTNER II	NEJM 2016;374:1609-20	<p><b>Title:</b> Transcatheter or Surgical Aortic-Valve Replacement in Intermediate-Risk Patients</p> <p><b>Purpose:</b> Evaluate survival rates between TAVR and surgical aortic valve replacement, in intermediate risk patients.</p> <p><b>Methods:</b> 2032 intermediate risk patients were randomized to TAVR or surgical replacement. The primary endpoint was all-cause mortality or disabling stroke at 2 yr.</p> <p><b>Results:</b> The rates of primary outcomes were similar between TAVR and surgical replacement groups (P=0.001). At 2 yr, the Kaplan-Meier event rates were 19.3% in the TAVR group and 21.1% in the surgical group (hazard ratio 0.89; 95% CI 0.73 to 1.09; P=0.25). Surgery resulted in fewer major vascular complications and less paravalvular aortic regurgitation.</p> <p><b>Conclusions:</b> In intermediate-risk patients with AS, TAVR and SAVR resulted in similar rates of all-cause mortality and disabling stroke.</p>
PARTNER III	NEJM 2019;380:1695-705	<p><b>Title:</b> Transcatheter Aortic-Valve Replacement with a Balloon-Expandable Valve in Low-Risk Patients</p> <p><b>Purpose:</b> Compare major outcomes in low-risk patients between TAVR and surgical aortic-valve replacement.</p> <p><b>Methods:</b> 1000 patients with severe aortic stenosis and low surgical risk were randomized to TAVR or surgical aortic valve replacement. The primary endpoint was a composite of death, stroke, or rehospitalization at 1 yr.</p> <p><b>Results:</b> The Kaplan-Meier event rates were significantly lower in the TAVR group than the surgery group (8.5% vs. 15.1%; 95% CI -10.8 to -2.5; P&lt;0.001). At 30 d, TAVR resulted in lower stroke rates and new-onset atrial fibrillation. There were no significant differences in major vascular complications, new pacemaker insertion, or paravalvular regurgitation.</p> <p><b>Conclusions:</b> Among low-surgical risk patients with severe AS, the rate of the composite of death, stroke, or rehospitalization was significantly lower with TAVR compared to surgical aortic-valve replacement.</p>
<b>HEART FAILURE</b>		
COAPT	NEJM 2018;379:2307-18	<p><b>Title:</b> Transcatheter Mitral-Valve Repair in Patients with Heart Failure</p> <p><b>Purpose:</b> Assess improvement in outcomes in patients with MR due to LV dysfunction, from transcatheter mitral valve repair.</p> <p><b>Methods:</b> Patients with HF and secondary mitral regurgitation were randomized to transcatheter mitral-valve repair plus medical therapy, or to medical therapy alone. The primary endpoint was hospitalization for HF at 24 mo.</p> <p><b>Results:</b> The primary endpoint was 35.8% in the intervention group, compared to 67.9% in the control group (hazard ratio 0.53; 95% CI 0.40 to 0.70; P&lt;0.001). Death from any cause occurred at 29.1% in the intervention group compared with 46.1% in the control group (hazard ratio 0.62; 95% CI 0.46 to 0.82; P&lt;0.001).</p> <p><b>Conclusions:</b> Among patients with HF and secondary MR who remained symptomatic despite medical therapy, transcatheter mitral-valve repair resulted in a lower rate of hospitalization for HF and lower mortality than medical therapy alone.</p>
CHARM	Lancet 2003;362:759-66	<p><b>Title:</b> Effects of Candesartan on Mortality and Morbidity in Patients with Chronic Heart Failure: The Charm-Overall Programme</p> <p><b>Purpose:</b> Determine whether ACEI use could reduce mortality and morbidity in patients with CHF.</p> <p><b>Methods:</b> Patients with LVEF &lt;40% not receiving ACEIs were randomized to candesartan or placebo. The primary outcome was all-cause mortality, CV death, or hospital admission for CHF.</p> <p><b>Results:</b> Mortality was 23% in the candesartan group and 25% in the placebo group (hazard ratio 0.91; 95% CI 0.83 to 1.00; P=0.055), with fewer CV deaths (18% vs. 20%; P=0.012).</p> <p><b>Conclusions:</b> Candesartan reduced overall mortality, CV death, and CHF hospitalizations.</p>
CIBIS II	Lancet 1999;353:9-13	<p><b>Title:</b> The Cardiac Insufficiency Bisoprolol Study II (CIBIS-II): A Randomised Trial</p> <p><b>Purpose:</b> Investigate the efficacy of bisoprolol in decreasing all-cause mortality in CHF.</p> <p><b>Methods:</b> 2647 patients with LVEF &lt;35% receiving standard therapy were randomized to bisoprolol or placebo. The primary outcome was all-cause mortality.</p> <p><b>Results:</b> All-cause mortality was significantly lower with bisoprolol than placebo (11.8% vs. 17.3%, hazard ratio 0.66; 95% CI 0.54 to 0.81; P&lt;0.0001). Treatment effects were independent of etiology or severity of HF/</p> <p><b>Conclusions:</b> Bisoprolol reduced all-cause mortality, CV death, all-cause hospitalization, and CHF hospitalization/</p>
COMET	Lancet 2003;362:7-13	<p><b>Title:</b> Comparison of Carvedilol and Metoprolol on Clinical Outcomes in Patients with Chronic Heart Failure in the Carvedilol or Metoprolol European Trial (Comet): Randomised Controlled Trial</p> <p><b>Purpose:</b> Compare outcomes of chronic HF patients on carvedilol or metoprolol.</p> <p><b>Methods:</b> 1511 patients with CHF were randomized to carvedilol 25 mg twice daily, and 1518 randomized to metoprolol 50 mg twice daily. The primary endpoints were all-cause mortality, and the composite of all-cause mortality or all-cause admission.</p> <p><b>Results:</b> The all-cause mortality was 34% for carvedilol patients and 40% for metoprolol patients (hazard ratio 0.83; 95% CI 0.74 to 0.93; P=0.0017). Incidence of side effects and withdrawal did not differ significantly between groups.</p> <p><b>Conclusions:</b> Carvedilol was associated with a reduction in all-cause mortality compared with metoprolol.</p>
COPERNICUS	NEJM 2001;344:1651-58	<p><b>Title:</b> Effect of Carvedilol on Survival in Severe Chronic Heart Failure</p> <p><b>Purpose:</b> Assess the effects of <math>\beta</math>-blockade on hospitalization and mortality in patients with severe HF.</p> <p><b>Methods:</b> 2289 patients with HF symptoms at rest and an EF &lt;25% were randomized to carvedilol or placebo. Primary endpoints were rates of hospitalization and mortality.</p> <p><b>Results:</b> There was a 35% reduction in mortality risk in patients treated with carvedilol than placebo (95% CI 19% to 48%; P=0.0018).</p> <p><b>Conclusions:</b> Carvedilol in addition to standard treatment significantly reduced the risk of death or hospitalization in patients with severe CHF.</p>

Trial Name	Reference	Clinical Trial Details
DAPA-HF	NEJM 2019;381:1995-2008	<p><b>Title:</b> Dapagliflozin in Patients with Heart Failure and Reduced Ejection Fraction</p> <p><b>Purpose:</b> Assess the efficacy of the SGLT2 inhibitor dapagliflozin in patients with HFrEF, independent of T2DM status.</p> <p><b>Methods:</b> 4744 patients with HF and EF &lt;40% were randomized to receive dapagliflozin 10 mg once daily, or placebo, in addition to recommended therapy. The primary outcome was worsening HF or CV death.</p> <p><b>Results:</b> The primary outcome occurred in 16.3% of dapagliflozin-treated patients and 21.2% of placebo patients (hazard ratio 0.74; 95% CI 0.65 to 0.85; P&lt;0.001). A worsening of HF occurred at 10.0% in the dapagliflozin group and 13.7% in the placebo group (hazard ratio 0.70; 95% CI 0.59 to 0.83). Findings in patients with DM were comparable to those in patients without DM.</p> <p><b>Conclusions:</b> In patients with HFrEF, the risk of worsening HF or death from CV causes was lower among those who received dapagliflozin than those who received placebo.</p>
EMPEROR-Preserved	NEJM 2021;385:1451-1461	<p><b>Title:</b> Empagliflozin in Heart Failure with a Preserved Ejection Fraction</p> <p><b>Purpose:</b> Assess the efficacy of the SGLT2 inhibitor empagliflozin in patients with HFmrEF and HFpEF, irrespective of diabetes status.</p> <p><b>Methods:</b> 5988 patients with symptomatic HF and an EF &gt;40% were randomized to receive empagliflozin 10 mg once daily, or placebo, in addition to usual therapy. The primary outcome was a composite of CV mortality or hospitalization for HF.</p> <p><b>Results:</b> Empagliflozin was associated with a lower risk of CV mortality or hospitalization for HF (13.8% vs. 17.1%; HR 0.79; 95% CI 0.69 to 0.90; P&lt;0.001), which was mainly related to fewer HF hospitalization events in the empagliflozin group. The effects of empagliflozin appeared consistent in patients with or without diabetes.</p> <p><b>Conclusions:</b> In patients with HFmrEF and HFpEF, empagliflozin was associated with a lower risk of the CV mortality or hospitalization for HF, and this effect was primarily driven by fewer HF hospitalizations.</p>
EMPEROR-Reduced	NEJM 2020;383:1413-1424	<p><b>Title:</b> Cardiovascular and Renal Outcomes with Empagliflozin in Heart Failure</p> <p><b>Purpose:</b> Assess the efficacy of the SGLT2 inhibitor empagliflozin in patients with HFrEF, irrespective of diabetes status.</p> <p><b>Methods:</b> 3730 patients with symptomatic HF and an EF &lt;40% were randomized to receive empagliflozin 10 mg once daily, or placebo, in addition to usual therapy. The primary outcome was a composite of CV mortality or hospitalization for worsening HF.</p> <p><b>Results:</b> Empagliflozin was associated with a lower risk of CV mortality or hospitalization for HF (19.4% vs. 24.7%; HR 0.75; 95% CI 0.65 to 0.86; P&lt;0.001). The effect of empagliflozin on the primary outcome was consistent in patients regardless of diabetes status.</p> <p><b>Conclusions:</b> In patients with HFrEF, empagliflozin was associated with a lower risk of CV mortality or hospitalization for HF, independent of diabetes status.</p>
I-PRESERVE	NEJM 2008;359:2456-67	<p><b>Title:</b> Irbesartan in Patients with Heart Failure and Preserved Ejection Fraction</p> <p><b>Purpose:</b> Study the effects of irbesartan in patients with HF and EF &gt;45%.</p> <p><b>Methods:</b> 4128 patients with HF and EF &gt;45% were randomized to irbesartan 300 mg daily, or matching placebo. The primary outcome was a composite of all-cause mortality or CV hospitalization.</p> <p><b>Results:</b> The primary outcome occurred in 742 patients in the irbesartan group and 763 placebo patients (hazard ratio 0.95; 95% CI 0.86 to 1.05; P=0.35). Overall, rates of death were 52.6 and 52.3 per 1000-patient-yr, respectively.</p> <p><b>Conclusions:</b> In patients with CHF and normal LVEF, treatment with ARB (irbesartan) did not improve mortality or CV morbidity compared to placebo.</p>
PARADIGM-HF	NEJM 2014;371:993-1004	<p><b>Title:</b> Angiotensin–Neprilysin Inhibition vs. Enalapril in Heart Failure</p> <p><b>Purpose:</b> Compare survival in HFrEF patients treated with enalapril or an angiotensin-neprilysin inhibitor.</p> <p><b>Methods:</b> 8442 patients with HF and EF &lt;40% were randomized to LCZ696 200 mg twice daily, or enalapril 10 mg twice daily. The primary endpoint was a composite of CV death and HF hospitalization.</p> <p><b>Results:</b> The primary outcome occurred in 21.8% of LCZ696-treated patients and 26.5% of enalapril patients (hazard ratio 0.80; 95% CI 0.73 to 0.87; P&lt;0.001). 13.3% and 16.5% of patients treated with LCZ696 and enalapril, respectively, died of CV causes (hazard ratio 0.80; 95% CI 0.71 to 0.89; P&lt;0.001).</p> <p><b>Conclusions:</b> Novel drug (LCZ696) containing valsartan and a neprilysin inhibitor (prevents degradation of natriuretic peptides) reduces hospitalization and mortality.</p>
RALES	NEJM 1999;341:709-17	<p><b>Title:</b> The Effect of Spironolactone on Morbidity and Mortality in Patients with Severe Heart Failure</p> <p><b>Purpose:</b> Assess the efficacy of spironolactone on morbidity and mortality in patients with severe HF.</p> <p><b>Methods:</b> 1663 patients with severe HF and LVEF &lt;35% who were being treated with ACEI, loop diuretic and digoxin, were randomized to spironolactone 25 mg daily or placebo. The primary endpoint was all-cause mortality.</p> <p><b>Results:</b> There was a mortality rate of 46% in the placebo group, compared to 35% in the spironolactone group (RR 0.70; 95% CI 0.60 to 0.82; P&lt;0.001). The frequency of hospitalization for worsening HF was 35% less in the intervention group (RR 0.65; 95% CI 0.54 to 0.77, P&lt;0.001).</p> <p><b>Conclusions:</b> In severe CHF (class III/IV) and LVEF &lt;35%, spironolactone reduced all-cause mortality, sudden death, and death due to progression of HF.</p>
SCD-HeFT	NEJM 2005;352:225-37	<p><b>Title:</b> Amiodarone or an Implantable Cardioverter–Defibrillator for Congestive Heart Failure</p> <p><b>Purpose:</b> Study prognosis differences in CHF patients treated with amiodarone or ICD.</p> <p><b>Methods:</b> 2521 patients with CHF and LVEF &lt;35% were randomized to conventional therapy plus placebo, conventional therapy plus amiodarone, or conventional therapy plus shock-only single-lead ICD. The primary endpoint was death from any cause.</p> <p><b>Results:</b> Mortality rates were 29% in placebo patients, 28% in the amiodarone group, and 22% in the ICD group (hazard ratio 1.06; 97.5% CI 0.86 to 1.30; P=0.53). ICD was associated with a decreased risk of death of 23% compared to placebo (hazard ratio 0.77; 97.5% CI 0.62 to 0.96; P=0.007). Results did not vary based on ischemic or nonischemic causes of CHF.</p> <p><b>Conclusions:</b> In mild-to-moderate CHF, shock-only ICD significantly reduces risk of death; amiodarone had no benefit compared with placebo in treating patients with mild-to-moderate CHF.</p>
TRACE	NEJM 1995;333:1670-76	<p><b>Title:</b> A Clinical Trial of the Angiotensin-Converting–Enzyme Inhibitor Trandolapril in Patients with Left Ventricular Dysfunction after Myocardial Infarction</p> <p><b>Purpose:</b> Determine whether the mortality benefit of ACEI post-MI extends to all patients, or only selected patients.</p> <p><b>Methods:</b> On d 3-7 post-MI, 1749 patients were randomized to receive oral trandolapril or placebo. The primary endpoint was all-cause mortality.</p> <p><b>Results:</b> The mortality rate was 34.7% in the trandolapril group, compared with 42.3% in the placebo group (P=0.001; RR 0.78; 95% CI 0.67 to 0.91). Trandolapril reduced rates of sudden death (RR 0.75; 95% CI 0.59 to 0.98; P=0.03) and CV death (RR 0.75; 0.62 to 0.89; P=0.001).</p> <p><b>Conclusions:</b> In patients with LV dysfunction post-MI, long-term trandolapril reduced the risk of death or progression to severe CHF and reduced risk of sudden death.</p>

Trial Name	Reference	Clinical Trial Details
<b>ARRHYTHMIA</b>		
AFFIRM	NEJM 2002;347:1825-33	<p><b>Title:</b> A Comparison of Rate Control and Rhythm Control in Patients with Atrial Fibrillation</p> <p><b>Purpose:</b> Compare rate and rhythm control in patients with AFib and high risk of stroke or death.</p> <p><b>Methods:</b> 4060 patients with AFib were randomized to rhythm-control therapy with antiarrhythmic drugs, or rate-control therapy.</p> <p><b>Results:</b> The mortality rate was 23.8% in rhythm-controlled patients and 21.3% in rate-controlled patients (hazard ratio 1.15; 95% CI 0.99 to 1.34; P=0.08). More patients were hospitalized in the rhythm-control group, with higher rates of adverse drug events.</p> <p><b>Conclusions:</b> No significant difference in mortality rates between rate or rhythm control of AFib.</p>
ARISTOTLE	NEJM 2011;365:981-92	<p><b>Title:</b> Apixaban vs. Warfarin in Patients with Atrial Fibrillation</p> <p><b>Purpose:</b> Assess the efficacy of apixaban for stroke prevention in patients with AF, in comparison with warfarin.</p> <p><b>Methods:</b> 18201 patients with AFib and one additional RF for stroke were randomized to apixaban 5 mg twice daily or warfarin. The primary outcome was stroke or systemic embolism.</p> <p><b>Results:</b> The rate of primary outcome was 1.27% per year in the apixaban group and 1.60% per year in the warfarin group (hazard ratio 0.79; 95% CI 0.66 to 0.95; P&lt;0.001). The rate of major bleeding was 2.13% per year with apixaban and 3.09% per year with warfarin (hazard ratio 0.69; 95% CI 0.69 to 0.80; P&lt;0.001). The rate of hemorrhagic stroke was 0.24% per year in the apixaban group and 0.47% per year in the warfarin group.</p> <p><b>Conclusions:</b> AFib patients treated with apixaban had a lower incidence of stroke, major bleeding and mortality compared to warfarin.</p>
AUGUSTUS	NEJM 2019;380:1509-24	<p><b>Title:</b> Antithrombotic Therapy after Acute Coronary Syndrome or PCI in Atrial Fibrillation</p> <p><b>Purpose:</b> Elucidate benefits of antithrombotic regimens for patients with AFib and either ACS or previous PCI.</p> <p><b>Methods:</b> Patients with AFib and a prior ACS or PCI were randomized to apixaban or a vitamin K antagonist, and to ASA or placebo for 6 mo. The primary outcome was major or clinically relevant non-major bleeding.</p> <p><b>Results:</b> The primary outcome occurred in 10.5% of apixaban patients and 14.7% of vitamin K antagonist-patients (hazard ratio 0.69; 95% CI 1.59 to 2.25; P&lt;0.001). Patients in the apixaban group had a lower incidence of death or hospitalization compared to the vitamin K antagonist group (23.5% vs. 27.4%; hazard ratio 0.83; 95% CI 0.74 to 0.93; P=0.002).</p> <p><b>Conclusions:</b> In patients with AFib and recent ACS or PCI, apixaban reduced bleeding compared to regimens that included a vitamin K antagonist, ASA, or both.</p>
COACT	JAMA Cardiol. 2020;5:1358-65	<p><b>Title:</b> Coronary Angiography after Cardiac Arrest without ST Segment Elevation: One-Year Outcomes of the COACT Randomized Clinical Trial</p> <p><b>Purpose:</b> Compare 1-yr clinical outcomes of immediate angiography and PCI versus delayed angiography in resuscitated cardiac arrest patients without STEMI.</p> <p><b>Methods:</b> 552 patients who had undergone cardiac arrest in the absence of STEMI were randomized to immediate coronary angiography, or angiography after recovery of neurological function. PCI was carried out as indicated by angiography, in keeping with the time allotments between groups. The primary endpoints were survival, MI, revascularization, hospitalization for HF, and the composite of death and MI, at 1 yr follow-up time.</p> <p><b>Results:</b> Survival at 1-yr follow-up were 61.4% and 64.0% in the immediate angiography and delayed angiography groups, respectively (OR 0.90; 95% CI 0.63 to 1.28; P=0.51). Similar to 90-d outcomes, this represents a statistically insignificant difference. MI rates were 0.8% and 0.4% in the immediate and delayed groups, respectively (OR 1.96; 95% CI 0.18 to 21.8). The composite outcome of death, revascularization, or MI occurred at a rate of 42.9% and 40.6% in the immediate and delayed groups, respectively (OR 1.10; 95% CI 0.77 to 1.56).</p> <p><b>Conclusions:</b> Similar to the previous 90-d follow-up, immediate angiography did not significantly improve 1-yr clinical outcomes compared to delayed angiography in resuscitated cardiac arrest patients without evidence of STEMI.</p>
ENGAGE AF-TIMI48	NEJM 2013;369:2093-104	<p><b>Title:</b> Edoxaban vs. Warfarin in Patients with Atrial Fibrillation</p> <p><b>Purpose:</b> Compare the long-term efficacy and safety of edoxaban and warfarin in AFib patients.</p> <p><b>Methods:</b> 21105 patients with moderate-high risk AFib were randomized to two once-daily regimens of edoxaban or warfarin. The primary endpoint was stroke or systemic embolism.</p> <p><b>Results:</b> The primary endpoint rate was 1.50% with warfarin and 1.18% in the edoxaban group (hazard ratio 0.79; 97.5% CI 0.63 to 0.99; P&lt;0.001). The annualized rate of major bleeding was 3.43% with warfarin and 2.75% with high-dose edoxaban (hazard ratio 0.80; 95% CI 0.71 to 0.91; P&lt;0.001).</p> <p><b>Conclusions:</b> AFib patients treated with edoxaban had similar rates of stroke and lower rates of major bleeding compared to warfarin.</p>
ETOH-AFib	NEJM 2020;382:20-28	<p><b>Title:</b> Alcohol Abstinence in Drinkers with Atrial Fibrillation</p> <p><b>Purpose:</b> Study the effects of alcohol abstinence on secondary prevention of atrial fibrillation.</p> <p><b>Methods:</b> Adults who consumed &gt;10 standardized drinks/wk with AFib were randomized to abstinence or continuation of current practices. The two primary endpoints were freedom from AFib recurrence and total AFib burden.</p> <p><b>Results:</b> After a 2-wk blanking period, AFib recurred in 53% of patients in the abstinence group and 73% of patients in the control group (hazard ratio 0.55; 95% CI 0.36 to 0.84; P=0.005). The AFib burden after 6 mo was lower in the abstinence group than the control group.</p> <p><b>Conclusions:</b> Abstinence from alcohol reduced arrhythmia recurrences in regular drinkers with AFib.</p>
RE-LY	NEJM 2009;361:1139-51	<p><b>Title:</b> Dabigatran vs. Warfarin in Patients with Atrial Fibrillation</p> <p><b>Purpose:</b> Compare the reduction of stroke risk in AFib patients with warfarin versus dabigatran.</p> <p><b>Methods:</b> 18113 patients with AFib and stroke risk were randomized to fixed doses of dabigatran (110 mg or 150 mg twice daily) or warfarin. The primary outcome was systemic embolism.</p> <p><b>Results:</b> Rates of primary outcomes were 1.69% per year with warfarin, compared with 1.53% per year with 110 mg dabigatran (RR 0.91; 95% CI 0.74 to 1.11; P&lt;0.001) and 1.11% per year with 150 mg dabigatran (RR 0.66; 95% CI 0.53 to 0.82; P&lt;0.001). The rate of major bleeding was 3.36% in the warfarin group, compared to 2.71% in the dabigatran 110 mg group and 3.11% in the dabigatran 150 mg group.</p> <p><b>Conclusions:</b> AFib patients treated with dabigatran had a lower incidence of stroke compared to warfarin, with similar rates of major bleeding.</p>
ROCKET-AFib	NEJM 2011;365:883-91	<p><b>Title:</b> Rivaroxaban vs. Warfarin in Nonvalvular Atrial Fibrillation</p> <p><b>Purpose:</b> Compare rivaroxaban with warfarin in reducing stroke risk in AFib patients.</p> <p><b>Methods:</b> 14264 patients with nonvalvular AFib were randomized to rivaroxaban 20 mg daily or dose-adjusted warfarin. The primary endpoint was stroke or systemic embolism.</p> <p><b>Results:</b> The primary endpoint occurred in 1.7% of patients in the rivaroxaban group and 2.2% of patients on warfarin (hazard ratio 0.79; 95% CI 0.66 to 0.96; P&lt;0.001). Major and non-major bleeding occurred in 14.9% of patients in the rivaroxaban group and 14.5% of warfarin patients (hazard ratio 1.03; 95% CI 0.96 to 1.11; P=0.44).</p> <p><b>Conclusions:</b> In patients with AFib, rivaroxaban is non-inferior to warfarin for stroke prevention without an excess of major bleeding.</p>

Trial Name	Reference	Clinical Trial Details
<b>HYPERTENSION</b>		
HYVET	NEJM 2008;358:1887-98	<b>Title:</b> Treatment of Hypertension in Patients 80 Years of Age or Older <b>Purpose:</b> Assess antihypertensive therapy for stroke risk reduction, in patients >80 yr with hypertension. <b>Methods:</b> 3845 patients with sBP >160 mmHg and >80 yr were randomized to indapamide SR 2.5 mg or placebo. Perindopril 2 mg or 4 mg was added if needed to achieve target BP 150/80 mmHg. The primary endpoint was fatal or non-fatal stroke. <b>Results:</b> Active treatment was associated with a 30% reduction in fatal or non-fatal stroke (95% CI -1 to 51; P=0.06), a 39% reduction in death from stroke (95% CI 1 to 62; P=0.05) and a 21% reduction in all-cause mortality (95% CI 4 to 35; P=0.02). <b>Conclusions:</b> In hypertensive patients >80 yr, treatment with indapamide, with or without perindopril, showed a trend towards reduced relative risk of fatal or non-fatal stroke.
SPRINT	NEJM 2015;373:2103-16	<b>Title:</b> A Randomized Trial of Intensive vs. Standard Blood-Pressure Control <b>Purpose:</b> Determine appropriate targets for sBP to reduce CV morbidity and mortality among patients without DM. <b>Methods:</b> 9361 patients with an sBP 130 mmHg or greater and increased CV risk, without diabetes, were randomized to sBP target <120 mmHg or <140 mmHg. The primary outcome was a composite of MI, other ACS, stroke, HF, or CV death. <b>Results:</b> There was a significant reduction in the rates of primary outcome in the intensive group compared to the conservative group (1.65% vs. 2.19%; hazard ratio 0.75; 95% CI 0.64 to 0.89; P<0.001). All-cause mortality was significantly lowered in the intensive group (hazard ratio 0.73; 95% CI 0.60 to 0.90; P=0.003). <b>Conclusions:</b> In patients with high risk of CV events excluding DM, strict sBP control (<120 mmHg) is associated with fewer CV events and lower all-cause mortality.
VALUE	Lancet 2004;363:2022-31	<b>Title:</b> Outcomes in Hypertensive Patients at High Cardiovascular Risk Treated with Regimens Based on Valsartan or Amlodipine: The Value Randomised Trial <b>Purpose:</b> Determine whether valsartan would reduce cardiac morbidity more than amlodipine in hypertensive patients with high CV risk. <b>Methods:</b> 15245 patients with hypertension and high CV risk were randomized to valsartan or amlodipine. The primary endpoint was a composite of cardiac morbidity and mortality. <b>Results:</b> The primary composite endpoints occurred in 10.6% of patients in the valsartan group and 10.4% of patients in the amlodipine group (hazard ratio 1.04; 95% CI 0.94 to 1.15; P=0.49). <b>Conclusions:</b> The valsartan group had a higher incidence of MI than the amlodipine group.

## Acronyms

ACE	angiotensin converting enzyme	cGMP	cyclic guanosine monophosphate	INR	international normalized ratio	P-gp	P-glycoprotein
ACh	acetylcholine			MME	milligram morphine equivalents	PK	pharmacokinetics
ADE	adverse drug event	Cl	clearance rate	NDC	National Drug Code	SLC	solute carrier
ADR	adverse drug reaction	COMT	catechol-O-methyltransferase	NE	norepinephrine (NPN)	SSRI	selective serotonin reuptake inhibitor
ARB	angiotensin receptor blocker	CYP	cytochrome P450 enzyme	NPO	nothing by mouth		
AUC	area under the concentration-time curve	DIN	drug identification number	NS	nervous system	TBW	total body water
		FDA	Food and Drug Administration	Po/w	partition coefficient of a drug	TDM	therapeutic drug monitoring
BBB	blood-brain barrier	GFR	glomerular filtration rate	PD	pharmacodynamics	TI	therapeutic index
		HH	Henderson-Hasselbalch	PDE	phosphodiesterase	Vd	volume of distribution

## General Principles

### Drug Nomenclature

- **DIN or NDC:** Drug Identification Number assigned to each drug approved by Health Canada; National Drug Code assigned by FDA (US), equivalent to the DIN in Canada
- **DIN-HM:** identification number assigned to registered homeopathic products in Canada
- **NPN: Natural Product Number;** refers to natural health products (excluding homeopathic medicines) regulated by the Natural and Non-Prescription Health Products Directorate within Health Canada
- **chemical name:** describes chemical structure; consistent in all countries via International Union of Pure and Applied Chemistry (e.g. N-(4-hydroxyphenyl)acetamide = acetaminophen)
- **non-proprietary (generic) name:** approved name (requires approval from nomenclature committee), official name (listed in pharmacopeia), often referred to as the generic name; may contain an ending similar to drugs in its class (e.g. atorvastatin, pravastatin, simvastatin)
- **proprietary (trade) name:** the brand name or registered trademark (e.g. Lipitor®)

### Phases of Clinical Drug Testing

- pre-clinical: assessments of the drug before it is given to humans (e.g. laboratory studies in cells or animals) to examine PK and PD properties and potential toxicities
- phase I: first administration to a small number of healthy volunteers, following preclinical studies; to explore PK and safety
- phase II: first administration to patients, small sample sizes; primarily to determine safety and efficacy, dose range and PK
- phase III: comparative studies (new drug vs. placebo or standard of care) to establish safety and efficacy in a larger group of patients; generally involves double-blinded RCTs
- phase IV: post-marketing surveillance, wider distribution; to determine effectiveness (in contrast to efficacy), monitor long-term drug effects, and detect previously unappreciated ADRs

### Drug Administration

- choice of route of administration depends on available formulations, local and systemic effects, desired time to onset and/or duration of action, adherence, and other patient characteristics

See Landmark Clinical Pharmacology Trials table for more information on results from the BNT162b2 trial, one of the first phase III global trials utilizing BNT162b2 mRNA vaccine in preventing COVID-19 in persons 16 yr and older.

**Table 1. Routes of Drug Administration**

Route	Advantage	Potential Disadvantages
Oral (PO)	Convenient, easy to administer Large surface area for absorption Inexpensive relative to parenteral administration	Incomplete absorption Hepatic and intestinal first-pass effect Adverse GI effects Higher likelihood of drug-drug/drug-food-interactions May be affected by dietary factors Requires an intact GI system Affected by GI motility
Buccal/Sublingual (SL)	Rapid onset of action No hepatic first-pass effect	Must be lipid-soluble, non-irritating
Rectal (PR)	Small hepatic first-pass effect Use when NPO, vomiting, or unconscious	Inconvenient, irritation at site of application Erratic absorption Appropriate for limited number of drugs
Intravenous (IV)	No hepatic first-pass effect Provides rapid onset of action Easy to titrate dose	Little ability to undo inappropriate drug administration Risk of infection, bleeding, vascular injury, and extravasation More expensive Requires sterile conditions and trained professionals
Intramuscular (IM)	Depot storage if oil-based = slow release of drug Aqueous solution = rapid onset of action (e.g. epinephrine for serious allergic reactions)	Pain/hematoma at site of injection
Subcutaneous (SC)	Constant, even absorption Alternative to IV Easier administration (can be self-administered)	Pain at site of injection Smaller volumes than IM Possible tissue damage from multiple injections
Intrathecal	Direct into CSF Bypass BBB and blood-CSF barrier	Risk of infection and CSF leak Invasive procedure
Inhalation	Immediate action in lungs Rapid delivery to blood No hepatic first-pass effect and generally less presystemic clearance	Must be gas, vapour, or aerosol
Topical (skin, mucous membranes, eyes)	Easy to administer Localized (limited systemic absorption)	Effects are generally limited to site of application
Transdermal	Drug absorption through intact skin No hepatic first-pass effect	Irritation at site of application Delayed onset of action
Others (Intraperitoneal, Intra-articular)	Local effect	Risk of infection and hemorrhage

See Landmark Clinical Pharmacology Trials table for more information on results from the ATLAS trial, which is the first trial utilizing long-acting cabotegravir and rilpivirine intramuscular injections for maintenance of HIV-1 suppression vs. standard daily oral antiretroviral therapy. The trial is expected to improve long-term HIV-1 suppression medication adherence.

## Pharmacokinetics

- “what the body does to the drug” – i.e. the fate of a drug in the body following administration
- **definition:** the time-course of drug absorption, distribution, metabolism, and elimination from the body (ADME) following drug administration

## Absorption

- **definition:** movement of the drug from the site of administration into bloodstream

### Mechanisms of Drug Absorption

- most drug absorption involves passive diffusion
- other mechanisms include active transport, facilitated diffusion, and pinocytosis/phagocytosis

### Factors Affecting the Rate and Extent of Drug Absorption

- **lipophilicity** ( $P_{o/w}$ )
- local blood flow at the site of administration (e.g. sublingual vessels facilitate rapid absorption of sublingually-administered medications)
- **molecular size** (e.g. drugs with smaller molecular weights are absorbed faster; drugs with large molecular weights (i.e. >1000 Da) are not as easily absorbed by passive diffusion)
- **pH and drug ionization**
  - drugs are usually weak acids (e.g. ASA) or weak bases (e.g. ketoconazole) and thus exist in ionized and non-ionized forms in the body
  - non-ionized (uncharged) forms cross cell membranes more readily by passive diffusion than ionized (charged) forms
  - the ratio of ionized to non-ionized forms is determined by body compartment pH and drug pKa (as per the Henderson-Hasselbalch equation)
- **total surface area for absorption** (e.g. small intestinal villi are the primary site of absorption for most orally-administered drugs)
- **drug transporters**

**Bioavailability (F)**

- **definition:** proportion of dose that reaches systemic circulation in an unchanged state and is available to access the site of action
- lower F usually reflects limited drug absorption or significant first-pass effect
- IV dose has 100% bioavailability ( $F=1$ )

**First-Pass Effect**

- **definition:** metabolism (i.e. biotransformation) of the drug prior to reaching systemic circulation, resulting in reduced F
- can occur with PO administration of a drug: GI tract (absorption with possible metabolism) → portal vein to liver (possible first-pass metabolism) → systemic circulation
- with rectal administration, 50% of drug absorbed in the colon goes through the portal system

**Drug Transporters**

- there are many drug transporters that can affect the uptake or efflux of drugs from cells and organelles, and affect drug absorption, distribution, and elimination
- P-glycoprotein (P-gp) is a transport protein of clinical relevance as it is found in a wide variety of body tissues (including the small intestinal epithelium, proximal tubule, bile canaliculi, and BBB) where it acts as a multidrug efflux pump and provides a "natural defence mechanism" against drugs and xenobiotics
- P-gp limits the absorption and enhances the elimination of its many P-gp substrates (e.g. digoxin, etoposide, paclitaxel, tacrolimus, cyclosporine, apixaban)
- some drugs (e.g. most macrolide antibiotics) inhibit P-gp, leading to increased serum concentrations of P-gp substrate drugs; P-gp inducers (e.g. rifampin, St. John's wort) increase efflux activity leading to decreased serum concentrations
- some tumours overexpress P-gp leading to multidrug resistance to chemotherapeutic agents
- other members of the ATP Binding Cassette (ABC) superfamily and the Solute Carrier (SLC) superfamily of drug transporters also affect drug absorption; members of the SLC superfamily generally function as uptake drug transporters

**Distribution**

- **definition:** movement of drugs between different body compartments and to their sites of action
- major body fluid compartments include plasma, interstitial fluid, intracellular fluid, and transcellular fluid (e.g. CSF, peritoneal, pleural)
- tissue compartments include fat, muscle, and brain

**Factors Affecting the Rate and Extent of Drug Distribution**

- physical and chemical properties of the drug (e.g.  $P_{a/w}$ , pKa, and size)
- pH of fluid
- binding to plasma proteins
- binding within compartments (i.e. depots)
- regional blood flow
- drug transporters

**Plasma Protein Binding**

- some drug molecules in the blood exist in an equilibrium of two forms:
  1. bound to plasma protein: acidic drugs bind to albumin, basic drugs bind to  $\alpha$ 1-acid glycoprotein
  2. free (unbound): can leave the circulation to distribute into tissues and exert an effect, subject to metabolism and elimination
- bound fraction is determined by drug concentration, binding affinity, and plasma protein concentration (number of binding sites)
- reduced number of binding sites (e.g. hypoalbuminemia) or saturation of binding sites (e.g. competition/displacement) may result in increased concentration of free drug, which is often cleared with no harmful effects, although toxicity is possible

**Volume of Distribution**

- $V_d$ : the apparent volume of fluid into which a drug distributes
- a calculated value ( $V_d$ ) = amount of drug in body (i.e. dose administered) ÷ initial plasma drug concentration
- a theoretical value that does not correspond to an actual physiologic volume;  $V_d$  can greatly exceed TBW
  - Total Body Water (TBW) represents the maximal anatomical fluid volume thought to be accessible to a drug (~40 L for average adult)
- small  $V_d$  (<0.04 L/kg) generally corresponds to a drug that distributes in plasma and/or binds plasma proteins to a high degree
- large  $V_d$  corresponds to a drug that distributes into tissues (fat, muscle, etc.); since most of the drug is not located in blood, the measured drug concentration in blood is low; thus, when dividing the dose by the blood/plasma drug concentration, it "appears" to distribute in a large volume

- $V_d$  of drugs that are highly bound to plasma proteins can be altered by liver and kidney disease due to changes in plasma protein binding
- $V_d$  of drugs changes with age
- $V_d$  of drugs may change in the geriatric population based on the drug  $P_o/w$ ; in geriatric populations, there is a reduction in total body water and total muscle mass, but an increase in total body fat resulting in an increase in the  $V_d$  of hydrophobic drugs

### Depot

- a body compartment in which drug molecules tend to be stored and released slowly over a long period of time
- fat is a depot for very lipid soluble drugs (e.g. diazepam, THC)
- some oil-based medications are injected IM for slow release (e.g. depot medroxyprogesterone acetate dosed q3 mo; depot risperidone dosed q2 wk)

### Barriers (Relative)

- anatomical body structures that limit or prevent diffusion of drug molecules, such as the placenta or BBB (a barrier composed of tight junctions between capillary endothelial cells and astrocytes)
- physiological barriers such as drug transporters (e.g. P-gp), often serve as a natural defence mechanism against drugs and xenobiotics
- need to consider dosing route and/or drug interactions for drug penetration across these barriers
- barriers are important in determining sites of action and side effect profiles of drugs (e.g. risk of CNS depression if drug crosses BBB, risk of harm to a fetus if drug crosses placenta)

## Elimination

- **definition:** removal of a drug from the body

### Routes of Drug Elimination

- kidney (main organ of elimination)
  - renal drug clearance = (glomerular filtration + tubular secretion) - (tubular reabsorption)
  - renal function (assessed using serum creatinine) decreases with age (7.5 mL/min per decade) and is affected by many disease states (e.g. diabetes)
  - processes affecting renal elimination:
    1. glomerular filtration
      - a passive process, thus only the free drug fraction can be eliminated
      - drug filtration rate depends on GFR, degree of protein binding of drug, and size of drug
    2. tubular secretion
      - a saturable transport process allowing both protein-bound and free drug fractions to be excreted
      - distinct transport mechanisms for weak acids (e.g. penicillin, salicylic acid, probenecid, chlorothiazide) and weak bases (e.g. quinine, metformin, quaternary ammonium compounds such as choline)
      - drugs may block the secretion of other drugs if one or more share or inhibit the same drug transporter (e.g. probenecid can inhibit the excretion of penicillin via organic anion transporters)
    3. tubular reabsorption: some drugs can be actively or passively reabsorbed back into the systemic circulation, reducing their excretion
- stool: some drugs and metabolites are actively secreted into the bile or directly into the GI tract
  - enterohepatic recirculation occurs when drugs are reabsorbed from the intestine and returned to the liver to cycle between the intestine and liver, which can prolong the drug's duration in the body (e.g. some glucuronic acid conjugates that are excreted in bile may be hydrolyzed in the intestines by bacteria back to their original form and can be systemically reabsorbed)
- lungs: elimination of anesthetic gases and vapours by exhalation
- other routes: sweat, saliva, and breast milk are generally less significant routes, but saliva concentrations of some drugs parallel their plasma concentrations (e.g. rifampin) and drug excretion into breast milk is a concern for some drugs

## Metabolism (Biotransformation)

- **definition:** chemical transformation of a drug in vivo
- sites of biotransformation include the liver (main), GI tract, lung, plasma, kidney, and most other tissues
- as a result of the process of biotransformation:
  - a prodrug (i.e. inactive drug) may be activated (e.g. tamoxifen to endoxifen; codeine to morphine)
  - a drug may be changed to another active metabolite (e.g. diazepam to oxazepam and others)
  - a drug may be changed to a toxic metabolite (e.g. acetaminophen to NAPQI)
  - a drug may be inactivated, as with most drugs (e.g. acetaminophen to acetaminophen glucuronide)

## Drug Metabolizing Pathways

- phase I reactions
  - oxidation, reduction, or hydrolysis reactions that introduce or unmask polar groups on a parent compound to slightly increase water solubility (e.g. hydroxylation, demethylation)
  - the change in  $P_{0/w}$  is typically minimal compared to phase II, and often phase I places a polar "handle" on a hydrophobic drug to permit conjugation in phase II
  - often mediated by cytochrome P450 (CYP) enzymes found in the endoplasmic reticulum (primarily in hepatocytes, but in lots of other tissues)
  - products of the reaction can be excreted or undergo further phase II reactions
- phase II (conjugation) reactions
  - conjugation with large endogenous substrates that are often polar (e.g. glucuronic acid, glutathione, sulphate, acetyl groups, methyl groups, or amino acids)
  - often substantially increases water solubility and renal elimination
  - can result in biologically active metabolites (e.g. morphine glucuronide)
  - can occur independently of phase I reactions (e.g. morphine to morphine glucuronides)

Examples of CYP Substrates, Inhibitors, and Inducers  
[drug-interactions.medicare.uo.edu/MainTable.aspx](http://drug-interactions.medicare.uo.edu/MainTable.aspx)

## Factors Affecting Drug Biotransformation

- **genetic polymorphisms** of metabolizing enzymes
  - for some enzymes, individual genotypes may alter the rate of drug metabolism (e.g. poor, intermediate, extensive, or ultra-rapid metabolizers, with extensive being considered the "normal" or average condition)
  - may lead to toxicity (e.g. if poor metabolizer) or ineffectiveness (e.g. if ultra-rapid metabolizer) of a drug at a normal dose
  - tamoxifen, tramadol, and codeine are prodrugs activated by CYP2D6 (nonfunctional alleles reduce effectiveness, whereas hypermorphic alleles impart "ultra-rapid metabolizer" phenotype)
  - warfarin is metabolized by CYP2C9 (nonfunctional alleles lead to higher drug concentrations, greater effect and lower dose requirements)
- **enzyme inhibition** may result from other chemical exposures including drugs and foods
  - CYP inhibition leads to an increased concentration and bioavailability of the substrate drug (e.g. erythromycin (CYP3A4 inhibitor) can predispose patients to simvastatin toxicity (metabolized by CYP3A4))
  - grapefruit juice is a potent inhibitor of intestinal CYP3A4, resulting in numerous drug interactions (e.g. saquinavir AUC increased 3-fold, simvastatin AUC increased 17-fold)
- **enzyme induction** may be due to the same or other medications
  - for example, certain medications enhance gene transcription to increase the activity of metabolizing enzymes
  - a drug may induce its own metabolism (e.g. carbamazepine) or that of other drugs (e.g. phenobarbital can induce the metabolism of oral contraceptive pills) by inducing the CYP system
- **liver dysfunction** (e.g. hepatitis, alcoholic liver, biliary cirrhosis, or hepatocellular carcinoma) may decrease drug metabolism but it is not always clinically significant due to the liver's reserve capacity
- **renal disease** often results in decreased drug clearance
- **extremes of age** (neonates or elderly) have reduced biotransformation capacity, but toddlers often have increased capacity, and doses should be adjusted accordingly
- **nutrition** may be involved, as insufficient protein and fatty acid intake decreases biotransformation, and vitamin/mineral deficiencies may also impact metabolizing enzymes
- **alcohol** has varying effects; while acute alcohol ingestion inhibits CYP2E1, chronic consumption can induce CYP2E1, increasing the risk of hepatocellular damage from acetaminophen by increasing the production of the toxic metabolite (NAPQI)
- **smoking** can induce CYP1A2, thus increasing the metabolism of some drugs (e.g. theophylline, clozapine)

## Pharmacokinetic Considerations

- **definition:** the term "pharmacokinetics" is used to describe given aspects of drug disposition (i.e. the fate of drugs in the body) and encompasses absorption, distribution, metabolism, and elimination (ADME)
- absorption, distribution, and elimination can be graphically represented (e.g. a graph of concentration vs. time)

### Time Course of Drug Action

- many kinetic parameters are measured after IV dosing because it avoids incomplete absorption, and distribution for most drugs is rapid
- when drug doses or concentrations are plotted vs. time, the dose or concentration plotted on the x-axis is often converted to a logarithmic scale (commonly log<sub>10</sub>) to allow for easier mathematical calculations
- the shape of the elimination phase of a concentration (or dose) or log-concentration (or log-dose) vs. time curve indicates whether the drug undergoes a first-order rate of elimination (visualized as a straight line on a log-dose or log concentration vs. time curve) or a zero-order rate of elimination (curvilinear on a log-dose or log-concentration vs. time curve)
- drugs such as warfarin can exhibit hysteresis (for a single drug concentration, there may be two different response levels)

**Half-Life**

- definition: time taken for the serum drug concentration to decrease by 50%; usually refers to as the elimination half-life
- drugs with first-order kinetics (i.e. most drugs) require approximately four to five half-lives to reach steady-state with repeated dosing, or for complete drug elimination once dosing is stopped

**Steady-State Drug Concentration**

- drug concentration remains constant when the amount of drug entering the system is equivalent to the amount eliminated from the system
- determination of drug concentrations in therapeutic drug monitoring is of greatest utility when steady-state concentration has been reached
- special dosing situations
  - use a loading dose for drugs with a long half-life and/or when there is a clinical need to rapidly achieve therapeutic levels (e.g. amiodarone, digoxin, phenytoin, some antibiotic settings)
  - use continuous infusion for drugs with a very short half-life and when there is a need for a long-term effect and multiple or frequently repeated doses are too inconvenient (e.g. nitroprusside, unfractionated heparin, naloxone)

**Clearance Rate**

- quantitative measurement of the volume of body fluid from which a substance is removed per unit time
- $Cl = \text{rate of elimination of drug} \div \text{plasma drug concentration}$
- may be determined for a particular organ (e.g. liver or kidney), but if not specified, represents the total body clearance rate determined from the sum of individual clearance rates or by determining  $k_e \times V_d$ , where  $k_e$  is the elimination rate constant equal to  $\ln 2/\text{half-life}$

**Elimination Kinetics**

- first-order kinetics (most common type)
  - constant proportion of drug eliminated per unit time
  - some drugs can follow first-order kinetics until elimination is saturated (usually at large doses) at which point the  $Cl$  is less than would be predicted for a given concentration
  - shows linear relationship when plotted on a graph of concentration (log) vs. time (linear)
  - the concentration axis is converted to a log scale to allow for easier mathematical calculations
- non-linear or zero-order kinetics (less common, applies to a few drugs in the therapeutic range (e.g. alcohol, phenytoin, Aspirin\*) and is more commonly associated with overdose)
  - constant amount of drug eliminated per unit time, regardless of concentration; the concept of half-life does not apply
  - saturation of various ADME processes creates non-linear kinetics, with first-order exhibited at lower concentrations and zero-order exhibited at higher concentrations after saturation
  - the complexity of dosing drugs with non-linear kinetics has resulted in the creation of drug-specific nomograms to aid clinicians in dosing, with these drugs often being the target of TDM (e.g. phenytoin, theophylline)

**Loading and Maintenance Doses**

- loading doses are used when an immediate effect is needed, with parenteral administration being the most common way of giving a large dose to "fill up" the volume of distribution
- maintenance doses can be given after a loading dose, but are most commonly initiated without a loading dose
  - steady-state levels are achieved after approximately five half-lives
  - can be given as either a continuous infusion (rare) or more commonly as intermittent oral doses

## Pharmacodynamics

- study of "what the drug does to the body"
- definition: study of the effects of the drug on the body

**Dose-Response Relationship**

- graded dose-response relationship: relates dose to intensity of effect

**Efficacy**

- the maximum biological response produced by a drug
- measured by  $E_{max}$  (the maximal response that a drug can elicit or under optimal circumstances)

**Potency**

- measured by  $EC_{50}$  (the concentration of a drug needed to produce 50% of  $E_{max}$ );  $ED_{50}$  if dose is used
- a drug that reaches its  $EC_{50}$  at a lower dose is more potent (e.g. in Figure 1, drug A is more potent than drug B)

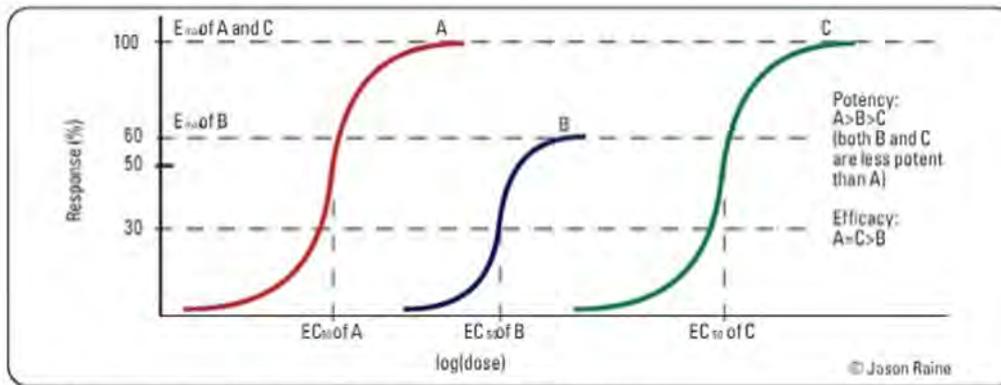

Figure 1. Log(dose)-response curve illustrating efficacy and potency

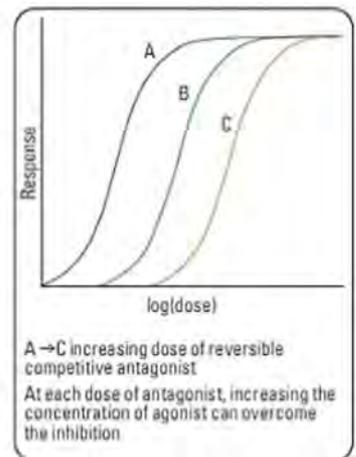

Figure 2. The log(dose)-response curve for reversible competitive antagonism

## Effects of Drugs on Receptors

### Agonists

- drugs that mimic the effects of the endogenous ligand and evoke a response when bound to the receptor
  - affinity:** the ability and strength of the agonist to bind to the receptor (e.g. the  $\beta_2$ -agonist salbutamol has greater affinity for  $\beta_2$ -receptors than  $\beta_1$ -receptors, thus it binds preferentially to  $\beta_2$ -receptors)
  - efficacy:** the ability to replicate endogenous response via the receptor interaction (e.g. binding of salbutamol to  $\beta_2$ -receptors results in smooth muscle relaxation)
    - drug efficacy is often determined under ideal conditions whereas drug effectiveness is a better measure of how the drug works in real-world situations
- full agonists: can elicit a maximal effect at a receptor (e.g. methadone and morphine on the  $\mu$  opioid receptor system)
- partial agonists: can only elicit a partial effect, irrespective of the concentration at the receptor; also known as a ceiling effect (i.e. reduced efficacy compared to full agonists) (e.g. buprenorphine on the  $\mu$  opioid receptor system)

### Antagonists

- drugs that bind to receptors without activating them; they reduce the action of an agonist drug or of an endogenous ligand
- chemical antagonism:** direct chemical interaction between agonist and antagonist prevents agonist-receptor binding (e.g. chelating agents for the removal of heavy metals, such as charcoal)
- physiological/functional antagonism:** drugs that produce opposite physiological effects (e.g. insulin decreases blood glucose levels through its action at insulin receptors vs. glucagon raises blood glucose levels through its action at glucagon receptors)
- pharmacological antagonism:** antagonist binds to the same site as the agonist or an alternative effector site and reduces the ability of the agonist to bind
- competitive antagonism:** antagonist binds directly to the active site on a given receptor, without activating it (i.e. zero efficacy) and blocks or displaces the agonist from the active site
  - reversible competitive antagonists:** bind non-covalently to the receptor, thus increasing concentrations of agonist may overcome the antagonist (e.g. naloxone is a competitive antagonist to morphine or heroin)
  - irreversible competitive antagonists:** form a covalent bond with the receptor and cannot be displaced, thus irreversibly blocking other substrates from binding (e.g. phenoxybenzamine forms a covalent bond with adrenergic receptors preventing adrenaline and NE from binding)
- non-competitive antagonism:** antagonist (negative allosteric modulator) binds to an alternate site on the receptor which is distinct from the active site, producing allosteric effects that alter the ability of the agonist to bind

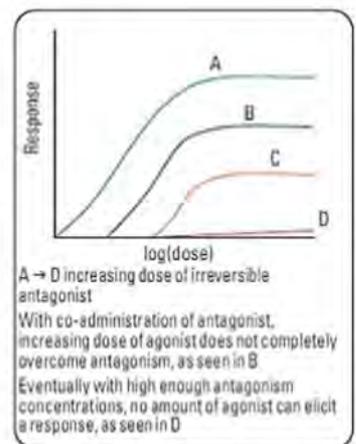

Figure 3. The log(dose)-response curve for irreversible antagonism

See Landmark Clinical Pharmacology Trials table for more information on results from the EPIC trial, which evaluates the effect of chimeric monoclonal antibody Fab fragment (c7E3 Fab) directed against the platelet glycoprotein IIb/IIIa receptor, to treat ischemic complications of coronary angioplasty and atherectomy.

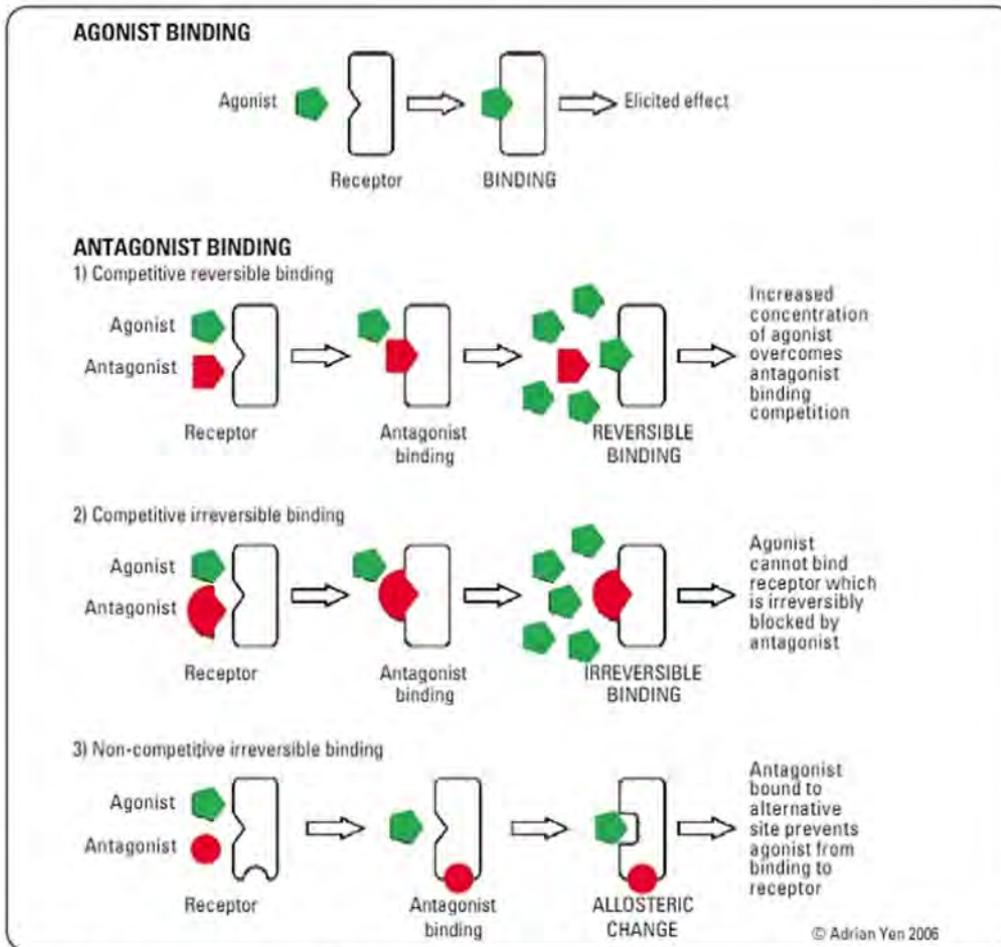

Figure 4. Mechanism of agonists and antagonists

## Effectiveness and Safety

### Effectiveness

- ED<sub>50</sub> (effective dose): the dose of a drug needed to cause a therapeutic effect in 50% of a test population of subjects

### Safety

- LD<sub>50</sub> (lethal dose): the dose of a drug needed to cause death in 50% of a test population of subjects
- TD<sub>50</sub> (toxic dose): the dose of a drug needed to cause a harmful effect in 50% of a test population of subjects

## Therapeutic Indices

### Therapeutic Index: TD<sub>50</sub>/ED<sub>50</sub> (LD<sub>50</sub>/ED<sub>50</sub> in animals)

- a measure of relative drug safety often used when comparing drugs to examine the likelihood of a therapeutic dose to cause serious toxicity or death
- the larger the TI, the safer the drug
- common drugs with a narrow therapeutic window or low TI that sometimes require TDM include digoxin, theophylline, warfarin, lithium, and cyclosporine
- factors that can change the TI include presence of interacting drugs, changes in drug ADME, and patient characteristics (e.g. age, pregnancy, and organ impairment)

### Certain Safety Factor: TD<sub>1</sub>/ED<sub>99</sub>

- a comparison of the dose that is effective in at least 99% of the population and toxic in less than 1% of the population
- regulatory agencies often like to see a certain safety factor or margin of safety above 100

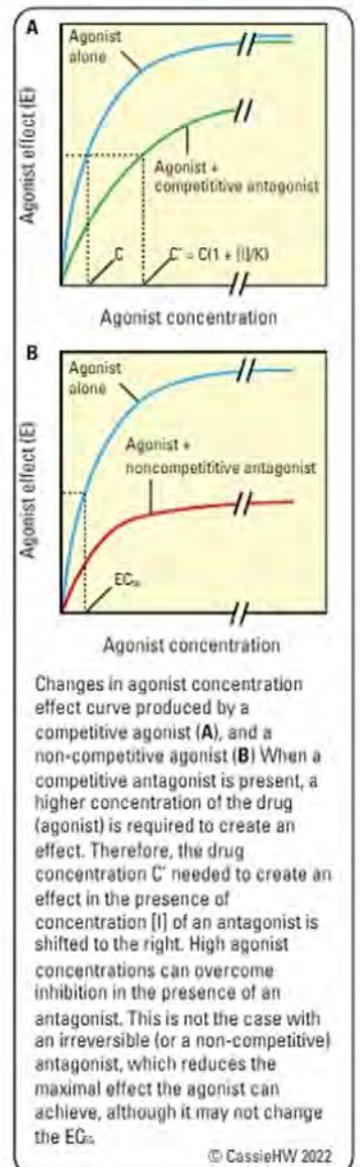

Figure 5. Agonist concentration

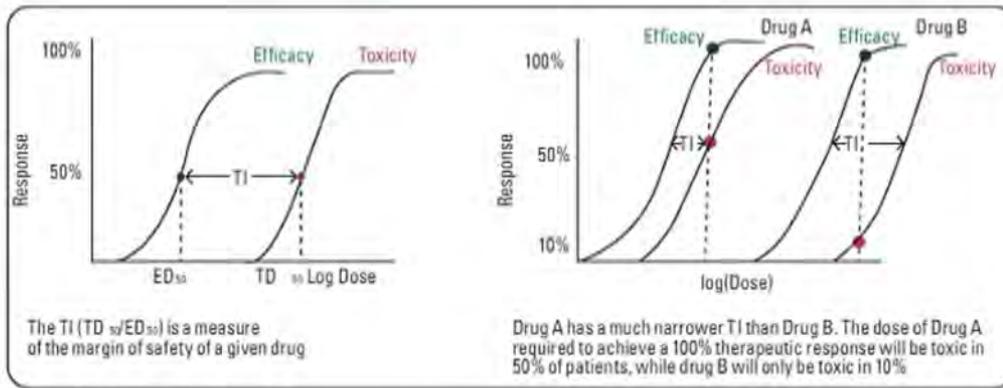

Figure 6. ED<sub>50</sub>, TD<sub>50</sub>, and the TI

## Therapeutic Drug Monitoring

- **definition:** using serum drug concentration data to optimize drug therapy (e.g. dose adjustment, monitor compliance). Serum drug samples are usually taken when the drug has reached steady-state (i.e. after approximately 5 half-lives)
- TDM is often used for drugs that have low TIs, unpredictable dose-response relationships, significant consequences associated with therapeutic failure or toxicity, and/or wide interpatient PK variability
- nomograms are often used for low TI drugs, particularly in the setting of patients with complex clinical factors such as renal insufficiency, hepatic failure, dialysis, and hypoalbuminemia
- examples of drugs that sometimes require TDM include:
  - vancomycin
  - aminoglycosides (gentamicin, tobramycin)
  - digoxin
  - phenytoin and other anticonvulsants
  - warfarin
  - lithium

## Adverse Drug Reactions

- **definition:** ADEs are events that occur while a patient is on a drug at either appropriate or inappropriate dosage. A causal relationship is not required
- **definition:** ADRs are reactions to drugs that occur when a drug is used for the appropriate indication at normal therapeutic doses

Table 2. Characteristics of Type A-F Adverse Drug Reactions

Classification	Definition	Characteristics
<b>A (Augmented)</b>	Dose-related	Predictable extension of drug's pharmacologic effect (e.g. $\beta$ -blockers causing bradycardia) >80% of all ADRs
<b>B (Bizarre)</b>	Not dose-related	Reactions unrelated to the known pharmacological actions of the drug, generally with a genetic basis E.g. drug hypersensitivity syndromes, immunologic reactions (e.g. penicillin hypersensitivity), and idiosyncratic reactions (e.g. malignant hyperthermia)
<b>C (Chronic)</b>	Dose- and time-related	Related to cumulative doses Effects are well-known and can be anticipated (e.g. atypical femoral fracture from bisphosphonates, retinal toxicity from hydroxychloroquine)
<b>D (Delayed)</b>	Time-related	Occurs some time after use of drug (e.g. cardiovascular toxicity following doxorubicin therapy) May also be dose-related
<b>E (End of use)</b>	Withdrawal	Occurs after cessation of drug use (e.g. opioid withdrawal resulting from opioid dependence)
<b>F (Failure)</b>	Unexpected failure of therapy	The expected effect is not produced. This is often due to pharmacogenetic variants (e.g. failure to bioactivate a prodrug such as clopidogrel)

### Tips to Reduce Drug-Related Adverse Events in the Elderly

- Be mindful of longstanding medications that have never been adjusted for patient age or renal or hepatic function
- Consider whether medications initiated during hospital admission are needed long-term (and whether the discharge dose is appropriate for maintenance)
- Avoid polypharmacy by decreasing the dose of or discontinuing medications that are causing side effects or are no longer indicated
- Verify adherence to medications before automatically increasing the dose of subtherapeutic treatment
- When prescribing medications, preferentially use those with a high TI
- Review the patient's problem list and reconcile current medications to avoid duplication or inappropriate dosing/frequency

### Antibiotic Allergies - What is the Risk of Cross-Reactivity?

- In clinical practice, cross-reactivity between drugs presents a problem for both patients and physicians
- In the case of penicillin allergy, cross-reactivity to cephalosporins is less than 2%. However, in patients who have a history of true anaphylactic reaction, cross-reactivity is closer to 40% depending on the side chain
- Cross-reactivity between penicillins and carbapenems is <1%
- The term "sulfa allergy" is often misused and has no formal definition. Current evidence suggests cross-reactivity between sulfonamide antibiotics (e.g. sulfamethoxazole-trimethoprim) and non-antibiotic sulfonamides, including loop diuretics (e.g. furosemide), thiazide diuretics (e.g. hydrochlorothiazide), protease inhibitors containing an arylamine group (e.g. darunavir), carbonic anhydrase inhibitors (e.g. acetazolamide), and sulfonyleureas (e.g. glipizide)

## Approach to Suspected Adverse Drug Reactions

- history and physical exam: signs and symptoms of reaction (e.g. rash, fever, hepatitis, anaphylaxis), timing, risk factors, detailed medication history including all drugs and timing, de-challenge (response when drug is removed), and re-challenge (response when drug is given again, if applicable)
  - medication history should include prescription, non-prescription and over-the-counter, natural health products/samples, supplements, creams, ear/eye drops, inhalers, and nasal sprays
  - dosage, frequency, route of administration, and duration of use should be recorded for each
- differentiate between drug therapy vs. disease pathophysiology
- treatment: stop the drug, supportive care, and symptomatic relief. Specific interventions (e.g. steroids, immunosuppressants) used for some ADRs
- resources: check recent literature, Health Canada, and FDA; contact the pharmaceutical company; call Poison Control (1-800-268-9017) if overdose or poisoning suspected; check with MotherToBaby (<https://mothertobaby.org/>) in cases involving pregnant or breastfeeding women
- report all suspected ADRs that are: 1) unexpected, 2) serious, or 3) reactions to recently marketed drugs (on the market <5 yr) regardless of nature or severity
  - Canadian Adverse Drug Reaction Monitoring Program available for online reporting
    - <https://www.canada.ca/en/health-canada/services/drugs-health-products/medeffect-canada/adverse-reaction-reporting/drug/health-care-providers.html>

## Variability in Drug Response

- recommended patient dosing is based on clinical research and represents mean values for a select population, but each person may be unique in their dosing requirements due to age, genetics, disease states, drug interactions, diet, environmental factors, etc.
- possible causes of individual variability in drug response include problems with:
  - intake: medication adherence
  - absorption: vomiting, diarrhea, or steatorrhea; first-pass effect increased due to enzyme induction or decreased due to enzyme inhibition or liver disease
  - drug interactions (e.g. calcium carbonate complexes with iron, thyroxine, and fluoroquinolones in the GI lumen, impairing absorption)
  - distribution: very high or low percentage body fat, intact or disrupted BBB, patient is elderly or a neonate, or has liver dysfunction
  - biotransformation and elimination: certain genetic polymorphisms or enzyme deficiencies related to drug metabolism (e.g. acetylcholinesterase deficiency, CYP polymorphism), kidney or liver dysfunction
  - PD: genetic variability in drug response (e.g. immune-mediated reactions), diseases that affect drug PD, drug tolerance or cross-tolerance

## Drug Interactions

- concomitant medications (including natural health products, e.g. St. John's wort) or foods (e.g. grapefruit juice): one drug alters the effect of one or more other drugs by changing PK and/or PD
- PK interactions involve changes in drug concentration when a new drug is added
  - absorption: alterations in gastrointestinal pH, gastric mucosa and/or emptying, intestinal motility, and/or transporter function
  - distribution: alterations in blood flow, plasma protein binding, anatomical and/or functional barriers (e.g. drug transporters)
  - metabolism: alterations in drug metabolism
  - elimination: alterations in renal or hepatic elimination
- PD interactions are due to two drugs that exert similar effects (additive or synergistic) or opposing effects (antagonistic)

### Examples of Clinically Relevant Drug Interactions

Interaction	Potential Effect	Mechanism of Interaction
Warfarin plus ciprofloxacin, clarithromycin, erythromycin, metronidazole, or trimethoprim-sulfamethoxazole	Increased effect of warfarin	Multiple proposed PK and PD mechanisms (including antibiotic interference with enteric flora-mediated Vitamin K2 production and alterations in drug metabolism)
Warfarin plus acetaminophen	Note that this is not with typical use, but with more chronic and higher dose use	Acetaminophen (NAPQ) further increases INR
Oral contraceptive pills plus rifampin	Decreased effectiveness of oral contraception	PK (rifampin induces CYP3A4, which increases hormone metabolism)
Sildenafil plus nitrates	Hypotension	PD (both PDE5 inhibitors and nitrates potentiate cGMP production)
SSRI plus St. John's wort	Serotonin syndrome	PD (concomitant use of serotonergic medications)
SSRI plus selegiline or non-selective MAOI	Serotonin syndrome	PD (all decrease metabolism of serotonin, so excess serotonin in synaptic cleft)
Some HMG-CoA reductase inhibitors plus niacin, gemfibrozil, erythromycin or itraconazole	Possible rhabdomyolysis	PK (various mechanisms based on drugs listed; CYP3A or OATP1B1, e.g. clarithromycin inhibits)
Sulfamethoxazole-trimethoprim and ACEIs/ARBs, or spironolactone	Increased risk of hyperkalemia	PD (reduced renal potassium excretion in the presence of trimethoprim resulting from decreased sodium reabsorption as a result of inhibition of sodium channels in the distal tubule)

# Autonomic Pharmacology

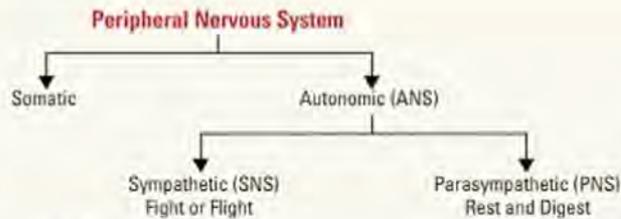

Figure 7. Subdivisions of the peripheral nervous system

- most organs are innervated by both sympathetic and parasympathetic nerves, which have opposing effects (see [Neurology, N8](#))
- ACh and NE are the main neurotransmitters of the autonomic NS
- ACh binds to many cholinergic receptor subtypes, which include nicotinic and muscarinic receptors
- NE binds to adrenergic receptors, which principally include  $\beta_1$ ,  $\beta_2$ ,  $\alpha_1$ , and  $\alpha_2$
- ACh action is terminated by metabolism in the synaptic cleft by acetylcholinesterase and in the plasma by pseudocholinesterase
- acetylcholinesterase inhibitors (pyridostigmine, donepezil, galantamine, and rivastigmine) can be used to increase ACh levels in conditions such as myasthenia gravis or Alzheimer's disease
- NE action is terminated by reuptake at the presynaptic membrane, diffusion from the synaptic cleft, and degradation by MAO and COMT

## Parasympathetic Nervous System

- blood vessels, sweat glands, the spleen capsule, and adrenal medulla do NOT have parasympathetic innervation
- parasympathetic pre-ganglionic fibres originate in the lower brainstem from cranial nerves III, VII, IX, and X, and in the sacral spinal cord at levels S2-S4. For this reason, it is sometimes referred to as the "craniosacral" nervous system. They connect with post-ganglionic fibres via nicotinic receptors in ganglionic cells located near or within the target organ (e.g. ciliary ganglion)
- post-ganglionic fibres connect with effector tissues via:
  - M1 muscarinic receptors located in the CNS
  - M2 muscarinic receptors located in smooth muscle, cardiac muscle, and glandular epithelium

## Sympathetic Nervous System

- sympathetic preganglionic fibres originate in the spinal cord at spinal levels T1-L2/L3
- preganglionic fibres connect with postganglionic fibres via nicotinic receptors located in one of two groups of ganglia:
  1. paravertebral ganglia (i.e. the sympathetic trunk) that lie in a chain close to the vertebral column
  2. prevertebral ganglia (i.e. celiac and mesenteric ganglia) that lie within the abdomen
- post-ganglionic fibres connect with effector tissues via:
  - $\beta_1$  receptors in cardiac tissue
  - $\beta_2$  receptors in smooth muscle of bronchi and GI tract
  - $\alpha_1$  receptors in vascular smooth muscle
  - $\alpha_2$  receptors in vascular smooth muscle
  - M3 muscarinic receptors located in sweat glands

Table 3. Direct Effects of Autonomic Innervation on the Cardiorespiratory System

Organ	Sympathetic NS		Parasympathetic NS	
	Receptor	Action	Receptor	Action
<b>Heart</b>				
1. Sinoatrial	$\beta_1$	Increased HR	M	Decreased conduction
2. Atrioventricular node	$\beta_1$	Increased conduction	M	Decreased conduction
3. Atria	$\beta_1$	Increased contractility	M	Decreased conduction
4. Ventricles	$\beta_1$	Increased contractility	M	Decreased HR
<b>Blood Vessels</b>				
1. Skin, splanchnic	$\alpha_1, \beta_2$	Constriction	M	Dilatation
2. Skeletal muscle	$\alpha$	Constriction	M	Dilatation
3. Coronary	$\beta_2$ (large muscles)	Dilatation	M	Dilatation
	$\alpha_1, \beta_2$	Constriction	M	Dilatation
	$\beta_2$	Dilatation	M	Dilatation
<b>Lungs</b>				
1. Bronchiolar smooth muscle	$\beta_2$	Relaxation	M	Constriction
2. Bronchiolar glands	$\alpha_1, \beta_2$	Increased secretion	M	Stimulation

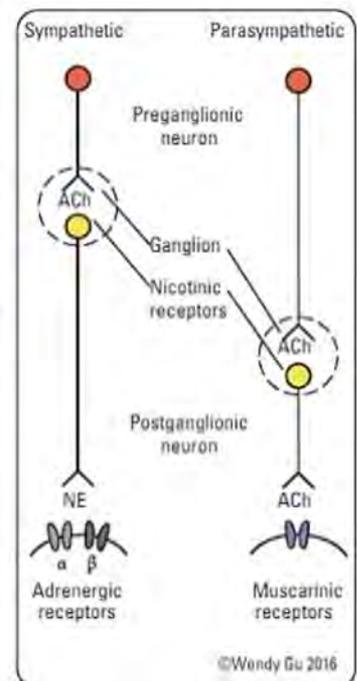

Figure 8. Autonomic nervous system efferent tracts

## Opioid Therapy and Chronic Non-Cancer Pain

### General Management Principles

- when first considering therapy for patients with chronic non-cancer pain, optimize non-opioid pharmacotherapy and non-pharmacologic therapy rather than starting a trial of opioids (strong recommendation)
- general approaches to opioid use include avoiding high doses, and when possible, a slow, collaborative approach when tapering
- for patients with chronic non-cancer pain beginning opioid therapy, restrict the prescribed dose to <90 mg MME, and ideally <50 MME, especially at starting dose
  - for patients with chronic non-cancer pain who are currently using 90 mg MME or more, encourage a slow, collaborative taper of opioids to the lowest effective dose, potentially discontinuing
- for patients with chronic non-cancer pain who are using opioids and experiencing serious challenges in tapering, a formal multidisciplinary program is suggested
- please refer to national opioid guidelines for a comprehensive approach to opioid use (link: <http://nationalpaincentre.mcmaster.ca/guidelines.html>)

## Common Drug Endings

Table 4. Common Drug Endings

Ending	Category	Example
-afil	PDE-5 inhibitor	sildenafil
-ane	Inhaled general anesthetic	halothane
-azepam	Benzodiazepine	lorazepam
-azole*	Antifungal	ketoconazole
-caine	Local anesthetic	lidocaine
-mab	Monoclonal antibody	adalimumab
-nib	Small molecular inhibitor	imatinib
-olol	$\beta$ -blocker	propranolol
-grazole	Proton pump inhibitor	omeprazole
-pril	ACE inhibitor	captopril
-sartan	ARB	candesartan
-statin	HMG-CoA inhibitor	atorvastatin
-terol	$\beta_2$ agonist	albuterol
-tidine	H <sub>2</sub> antagonist	cimetidine
-tropin	Pituitary hormone	somatotropin
-vir	Antiviral	acyclovir
-zosin	$\alpha_1$ antagonist	prazosin

Note: This table provides the most common drug endings for which there are only a few exceptions (e.g. methimazole, an antithyroid; stanozolol is an anabolic steroid) and is not exhaustive

\*Unless ending is -prazole

### Does Opioid Tapering in Chronic Pain Patients Result in Improved Pain or Same Pain vs. Increased Pain at Taper Completion?

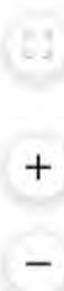

Pain Med 2019;20:2179-2197

**Purpose:** Support or refute the hypothesis that opioid tapering in chronic pain patients (CPPs) improves pain or maintains the same pain level by taper completion but does not increase pain levels.

**Methods:** Structured systematic review searching relevant subject headings. 20 studies met inclusion/exclusion criteria and were of type III/IV level evidence. Characteristics were abstracted for numerical analysis.

**Results:** Total of 2109 CPPs tapered in all studies combined. 8% of the studies showed that by taper completion, pain had improved. In 15% of the studies, pain remained the same.

**Conclusions:** There is consistent type 3 and 4 evidence that opioid tapering in CPPs reduces or maintains the same pain levels. Studies were marginal in quality and further controlled studies needed.

## Landmark Pharmacology Trials

Trial Name	Reference	Clinical Trial Details
<b>MONOCLONAL ANTIBODIES or DRUG EFFECTS ON RECEPTORS</b>		
EPIC	NEJM 1994; 330:956-961	<p><b>Title:</b> Use of a Monoclonal Antibody (mab) Directed against the Platelet Glycoprotein IIb/IIIa Receptor in High-Risk Coronary Angioplasty</p> <p><b>Purpose:</b> To evaluate the effect of chimeric mab Fab fragment (c7E3 Fab) directed against the platelet glycoprotein IIb/IIIa receptor, in patients undergoing angioplasty at high risk for ischemic complications.</p> <p><b>Methods:</b> RCT involving 2099 high-risk patients scheduled to undergo coronary angioplasty or directional atherectomy. Patients received 1 of 3 combinations of c7E3 Fab (bolus and an infusion of placebo, a bolus of c7E3 Fab and an infusion of placebo, or a bolus and an infusion of c7E3 Fab) or placebo. Primary endpoints included death, nonfatal MI, intra-aortic balloon pump insertion for refractory ischemia or unplanned surgical revascularization, repeat percutaneous procedure or implantation of a coronary stent.</p> <p><b>Results:</b> c7E3 Fab bolus and infusion resulted in a 35% reduction in rate of the primary end point vs. placebo. 10% reduction was observed with the c7E3 Fab bolus alone. Bleeding episodes and transfusions were more frequent in c7E3 Fab bolus and infusion group vs. other two groups.</p> <p><b>Conclusions:</b> Ischemic complications of coronary angioplasty and atherectomy were reduced with a mab directed against platelet IIb/IIIa glycoprotein receptor.</p>
<b>mRNA VACCINES</b>		
BNT162b2 trial	NEJM 2020; 383:2603-2615	<p><b>Title:</b> Safety and Efficacy of the BNT162b2 mRNA Covid-19 Vaccine</p> <p><b>Purpose:</b> To report safety and efficacy findings from the phase 2/3 of a global trial of BNT162b2 in preventing Covid-19 in persons 16 yr and older.</p> <p><b>Methods:</b> Eligible participants were randomly assigned in a 1:1 ratio to receive two doses, 21 d apart, of either placebo or the BNT162b2 vaccine candidate (30 µg per dose).</p> <p><b>Results:</b> Among those eligible 43448 received injections. A total of 21720 patients received BNT162b2 and the rest received placebo. BNT162b2 was 95% effective in preventing Covid-19 (95% credible interval, 90.3 to 97.6). Safety profile of BNT162b2 characterized by short-term, mild-to-moderate pain at the injection site, fatigue, and headache. Incidence of serious adverse events was low and similar in both groups.</p> <p><b>Conclusions:</b> BNT162b2 conferred 95% protection against Covid-19 in persons &gt;16 yr. Safety over a median of 2 mo was comparable to other viral vaccines.</p>
<b>INTRAMUSCULAR INJECTIONS or DRUG ADMINISTRATION</b>		
ATLAS	NEJM 2020; 382:1112-1123	<p><b>Title:</b> Long-Acting Cabotegravir and Rilpivirine for Maintenance of HIV-1 Suppression</p> <p><b>Purpose:</b> To establish whether switching to long-acting cabotegravir plus rilpivirine is noninferior to current oral therapy among adults with virologically suppressed HIV-1.</p> <p><b>Methods:</b> Patients with plasma HIV-1 RNA levels &lt;50 copies/ml for 6 mo were randomly assigned to either continue standard therapy (placebo) or receive monthly long-acting cabotegravir and rilpivirine.</p> <p><b>Results:</b> Treatment was initiated in 308 participants/group. HIV-1 RNA levels &gt;50 copies/ml were found in 5 participants in intervention vs. 3 in placebo (0.6% points; 95% CI: -1.2-2.5). HIV-1 RNA levels &lt;50 copies/ml were found in 92.5% of participants in intervention vs. 95.5% in placebo (-3.0% points; 95% CI: -6.7-0.7). Adverse events included injection-site pain (75%). Participants who received intervention reported greater satisfaction and preferred long-acting therapy over previous oral therapy.</p> <p><b>Conclusions:</b> Monthly injections of long-acting cabotegravir and rilpivirine were noninferior to standard therapy for maintaining HIV-1 suppression. Adverse events were common but medication withdrawal infrequent.</p>

## Introduction to Skin

### Normal Processes of Skin and Subcutaneous Tissue

#### Embryonic Development of the Skin

**Figure 1. Fetal maturation of the skin**

(A) 4 wk gestation: fetal skin has two distinct layers - the basal cell layer and outer layer (i.e. periderm). (B) 9 wk gestation: keratinization begins. (C) 14 wk gestation: stratification of epidermal layer; primordial hair follicle forms from the basal cell bud. (D) 16 wk gestation: local proliferation of mesenchymal cells associated with the epidermal buds as hair follicles develop and elongate. (E) 18 wk gestation: sebaceous gland develops; hair follicle elongates. (F) 23 wk gestation: continuous elongation of the hair follicle; primordial eccrine gland forms from the basal cell bud. (G) 30 wk gestation: continuous elongation and foiling coiling of the eccrine glands.

Modified from Facial Plastic Surgery Clinics of North America, 21(1), King A, Balaji S, Keswari SG. Biology and Function of Fetal and Paediatric Skin, 1-6, Copyright (2020), with permission from Elsevier

#### • embryonic development and fetal maturation (see Figure 1)

#### • neonatal changes

- full-term infants have skin with all five layers, similar to adults
- epidermal cells mature from columnar stratum basale to squamous keratinocytes of the stratum corneum
  - maturation occurs more rapidly in facial skin than trunk or limb skin
- neonatal skin is coarser and develops into a more smooth texture homogeneously during the first 30 d of life
- infants have smaller corneocytes and thinner stratum corneum until 2 yr old
- from infancy to puberty, dermal thickness increases
- repair, regeneration, and changes associated with stages of life
  - regeneration relies on tissue-specific stem cells and restricted progenitor cells

**Layers of the Epidermis**  
 "Californians Like Going Sun Bathing"  
 OR  
 "Canadians Like Good Sushi Boxes"

- regenerative abilities decline with age as both cell types undergo:
  - a loss of self-renewing capacities
  - altered proliferative activity
  - functional decline
- with age, the skin becomes thinner and less able to withstand external stress because:
  - the epidermis attenuates with effacement of the rete ridges
  - keratinocytes lose proliferative abilities
  - the dermis loses volume
  - hyaluronic acid diminishes in the extracellular matrix of the dermis
- these changes lead to loss of skin and hair integrity, leading to conditions such as senile purpura and male pattern baldness (i.e. androgenic alopecia, see D44)
  - senile purpura (i.e. solar or actinic purpura): typically arise spontaneously; characterized by non-blanchable red-to-purple patches that resolve over 1-3 wk, leaving residual brown-yellow discoloration secondary to hemosiderin deposition
- the decline in regenerative ability can also be seen as postmenopausal hair changes (see D45)

## Skin Anatomy

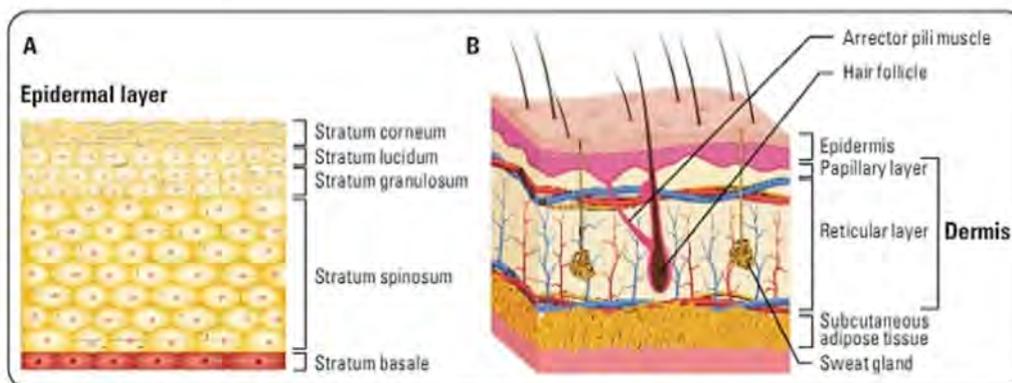

Figure 2. Histologic layers of the skin. A. epidermal layers of the skin. B. all layers of the skin

### Skin

- divided anatomically into epidermis, dermis, and subcutaneous tissue
- epidermis**
  - avascular: receives its nutrition from the dermal capillaries
  - derived from keratinocytes with the youngest presenting at the stratum basale
  - cells progress from stratum basale to stratum corneum in about 4 wk
    - stratum basale (i.e. germinativum): mitotic figures that give rise to keratinocytes
    - stratum spinosum (prickle cells): junctions in this layer (tonofilaments) give the epidermis its strength
    - stratum granulosum: flat cells containing basophilic granules
    - stratum lucidum: transparent layers of packed dead cells
    - stratum corneum: flat scales of the water-resistant protein keratin
  - cells of the epidermis:
    - keratinocytes: located in all layers of the epidermis except the stratum corneum; connected to each other by desmosomes
    - melanocytes: located in the stratum basale; keratinocyte:melanocyte ratio in the basal layer is 10:1; melanocyte number is equal among races; produce melanosomes containing melanin, which are transferred to keratinocytes
    - Langerhans cells: dendritic cells which are important for immune surveillance
    - Merkel cells: located in the stratum basale; involved in touch sensation
- dermis**
  - comprised of connective tissue divided into two regions
    - papillary: contains numerous capillaries that supply nutrients to the dermis and epidermis
    - reticular: provides a strong structure for skin; consists of collagen bundles woven together along with elastic fibres, fibroblasts, and macrophages
  - cells of dermis
    - fibroblasts: produce collagen, elastin, and ground substance
    - mast cells: release histamines which mediate type I hypersensitivity
  - other components of dermis include: blood vessels, nerves, pilosebaceous units, and sweat glands
- subcutaneous tissue (i.e. hypodermis)**
  - consists primarily of adipose cells, larger calibre vessels, nerves, and fascia

### Epidermal Appendages

- epidermal in origin, can extend into the dermis; includes hair, nails, and cutaneous glands
- pilosebaceous unit = hair + hair follicle + sebaceous gland + arrector pili muscle

### Cutaneous Glands

- **sebaceous gland:** part of pilosebaceous unit; produces sebum which is secreted into the hair follicle via the sebaceous duct, where it covers the skin surface (protective function)
  - sebum has some antifungal properties
  - these glands cover entire skin surface and are absent only in non-hair bearing areas (e.g. palms, soles, lips)
- **apocrine sweat gland:** apocrine duct empties into hair follicle above sebaceous gland
  - not part of pilosebaceous unit
  - found concentrated in axillae and perineum
  - likely a vestigial structure, functions in other species to produce scent (e.g. pheromones)
- **eccrine sweat gland:** not part of pilosebaceous unit
  - found over entire skin surface except lips, nail beds, and glans penis
  - important in temperature regulation via secretion of sweat to cool skin surface

## Skin Function

- **protection**
  - due to continuous recycling and avascularity of epidermis, as well as normal skin flora
  - barrier to UV radiation (melanin), mechanical/chemical insults (sensory/mechanoreceptors), pathogens (immune cells), and dehydration (lipid rich barrier)
- **thermal regulation**
  - insulation to maintain body temperature in cool environments via peripheral vasoconstriction, hair, and subcutaneous adipose tissue
  - dissipation of heat in warm environments via increased activity of sweat glands and increased blood flow within dermal vascular networks
- **sensation**
  - touch, pain, and temperature sensation
- **metabolic function**
  - vitamin D synthesis
  - energy storage (mainly in the form of triglycerides)

## Morphology

### Primary Lesions

#### Definition

- a de-novo initial lesion that has not been altered by trauma or manipulation, and has not regressed

Table 1. Types of Primary Morphological Lesions

Profile	<1 cm Diameter	≥1 cm Diameter
Flat Lesion	Macule (e.g. freckle)	Patch (e.g. vitiligo)
Raised Superficial Lesion	Papule (e.g. wart)	Plaque (e.g. psoriasis)
Deep Palpable (Dermal or Subcutaneous) Lesion	Nodule (e.g. dermatofibroma)	Tumour (e.g. lipoma)
Elevated Fluid-Filled Lesion	Vesicle (e.g. HSV)	Bulla (e.g. bullous pemphigoid)

#### Describe a Lesion with SCALDA

Size and Surface area  
 Colour (e.g. hyperpigmented, hypopigmented, erythematous)  
 Arrangement (e.g. solitary, linear, reticulated, grouped, herpetiform)  
 Lesion morphology  
 Distribution (e.g. dermatomal, intertriginous, symmetrical/asymmetrical, follicular)  
 Always check hair, nails, mucous membranes, and intertriginous areas

### Secondary Lesions

#### Definition

- develop during the evolutionary process of skin disease, created by manipulation, or due to complication of primary lesion (e.g. rubbing, scratching, infection)

#### Types of Secondary Morphological Lesions

- **crust:** dried fluid (serum, blood, or purulent exudate) originating from a lesion (e.g. impetigo)
- **scale:** excess keratin (e.g. seborrheic dermatitis)
- **lichenification:** thickening of the skin and accentuation of normal skin markings (e.g. chronic AD)
- **fissure:** a linear slit-like cleavage of the skin
- **excoriation:** a scratch mark
- **erosion:** a disruption of the skin involving the epidermis alone; heals without scarring
- **ulcer:** a disruption of the skin that extends into the dermis or deeper; may heal with scarring
- **xerosis:** pathologic dryness of skin (xeroderma), conjunctiva (xerophthalmia), or mucous membranes (xerostomia)
- **atrophy:** histological decrease in size or number of cells or tissues, resulting in thinning or depression of the skin

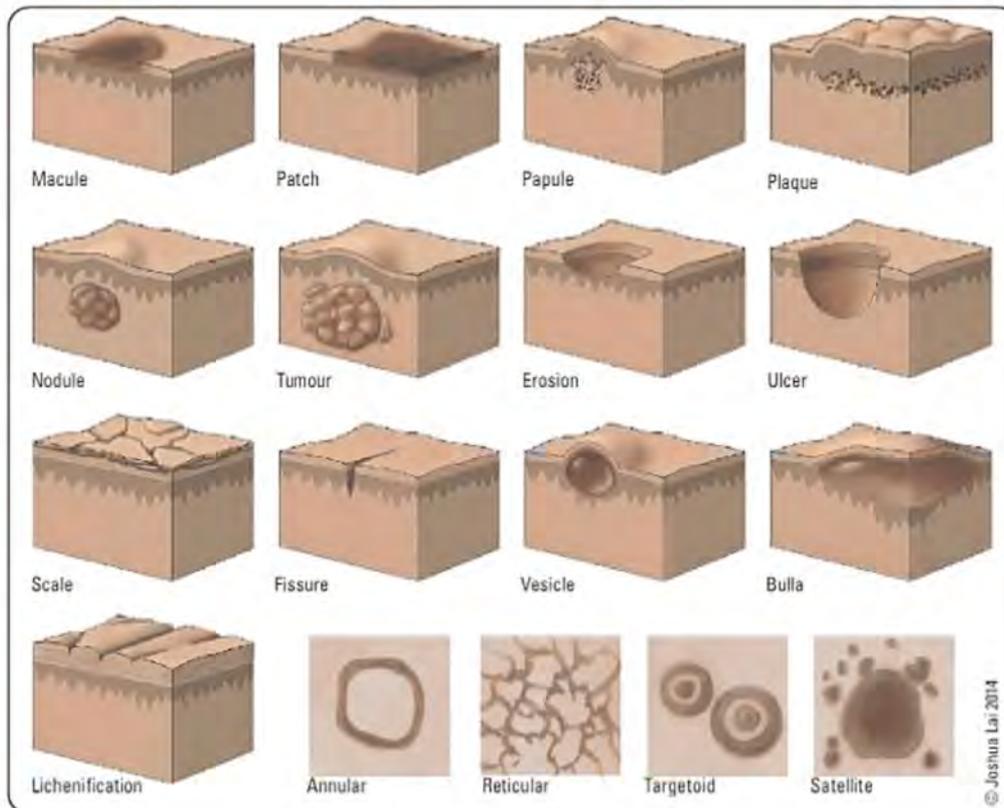

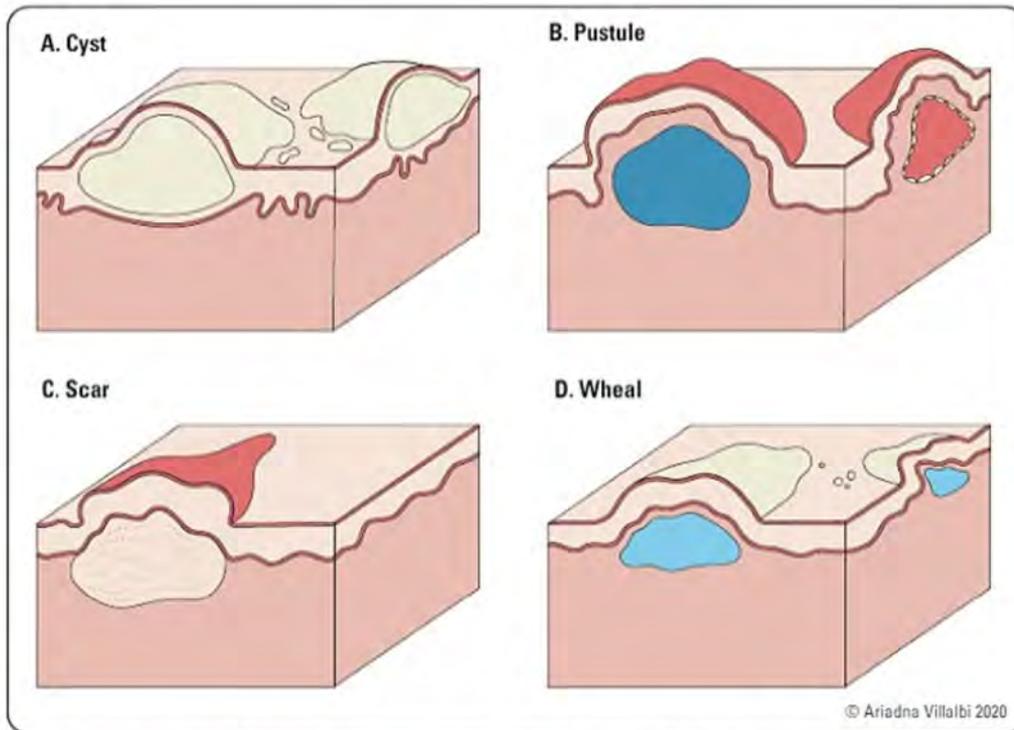

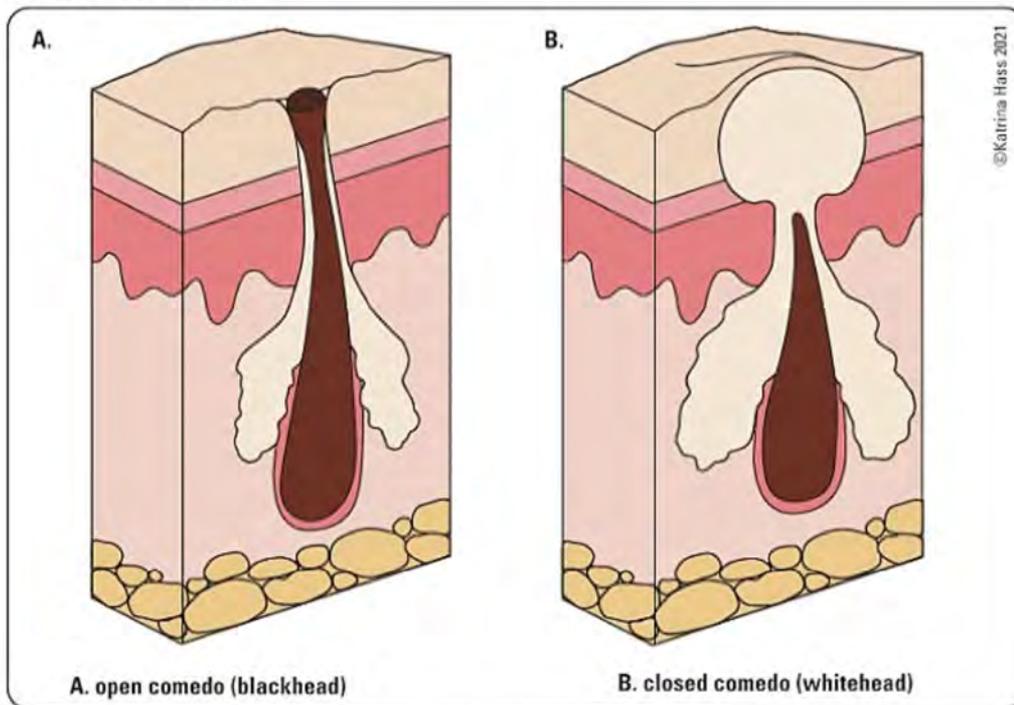

Figure 3. Examples of primary and secondary lesions

#### Other Morphological Terms

- **cyst**: an internally epithelial-lined structure containing semi-solid material or fluid
- **pustule**: an elevated lesion containing a collection of neutrophils (infectious or inflammatory in nature)
- **scar**: replacement fibrosis of dermis and subcutaneous tissue (hypertrophic or atrophic)
- **wheel**: a special form of papule or plaque that is transient (<24 h) and blanchable, often with a halo and central clearing, formed by edema in the dermis (e.g. urticaria)
- **comedone**: a special collection of sebum and keratin
  - open comedone (blackhead)
  - closed comedone (whitehead)
- **petechiae**: pinpoint extravasation of blood into dermis resulting in hemorrhagic lesions; non-blanchable, <3 mm in size
- **purpura**: larger than petechiae, 3 mm-1 cm in size
- **ecchymosis (i.e. bruise)**: larger than purpura, >1 cm in size
- **telangiectasia**: dilated superficial blood vessels; blanchable, reticulated, and of small calibre, can be associated with benign or malignant entities

**Figure 4. Examples of other morphological terms: cyst, pustule, scar, and wheal**  
Wolff K, Johnson R, Saavedra A, Fitzpatrick's Colour Atlas and Synopsis of Clinical Dermatology, Seventh Edition, copyright © 2020. Modified by Permission of McGraw-Hill Education

**Figure 5. Examples of other morphological terms: open and closed comedone**

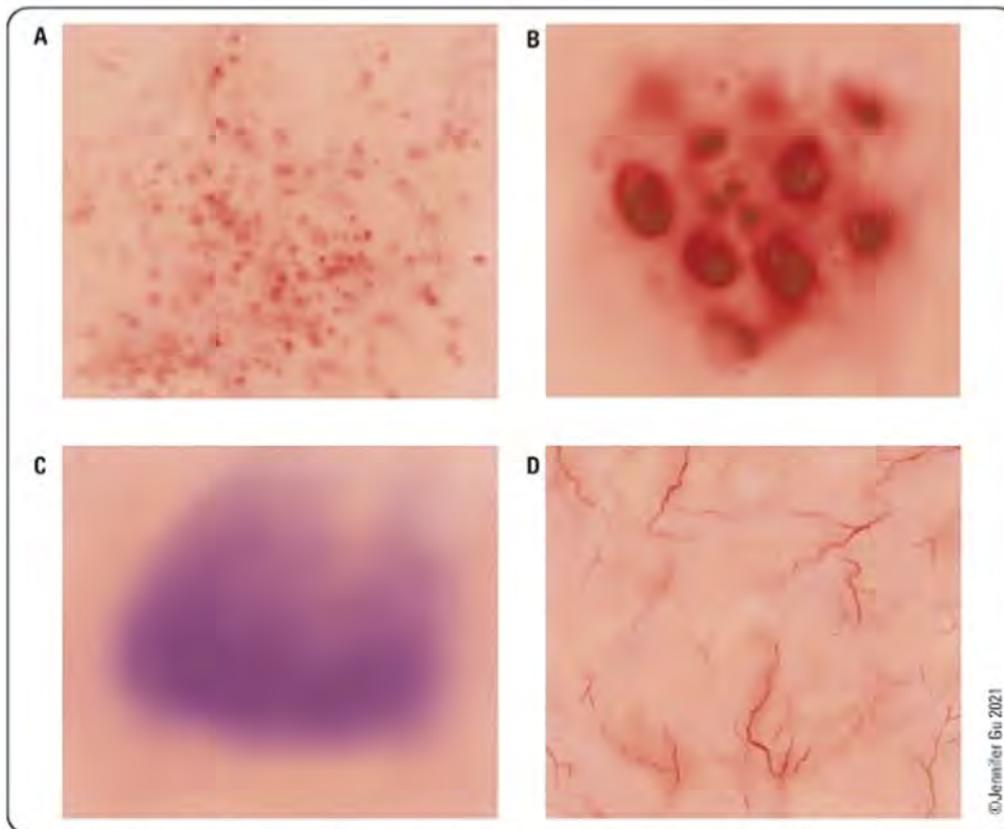

Figure 6. Examples of other morphological terms: A: petechiae, B: purpura, C: ecchymosis, and D: telangiectasia

## Patterns and Distribution

Table 2. Patterns and Distribution of Morphological Lesions

Pattern or Distribution	Definition	Example
Acral	Relating to the hands and feet	Perniosis, secondary syphilis
Annular	Ring-shaped	Granuloma annulare
Follicular	Involving hair follicles	Folliculitis
Guttate	Lesions following a "drop-like" pattern	Guttate psoriasis
Koebner Phenomenon (i.e. isomorphic response)	Appearance of lesions at a site of skin injury	Lichen planus, psoriasis, vitiligo
Morbilliform	Literally means "measles-like," an eruption composed of macules and papules with truncal predominance	Morbilliform drug eruption
Reticular	Lesions following a "net-like" pattern	Livedo reticularis
Satellite	Small lesions scattered around the periphery of a larger lesion	Candida diaper dermatitis
Serpiginous	Lesions following a "snake-like" pattern	Cutaneous larva migrans
Target/Targetoid	Concentric ring lesions, like a bullseye	EM

Other descriptive terms: discrete, clustered, linear, confluent, dermatitic, indurated (i.e. hard or firm)

## Differential Diagnoses for Common Presentations

Table 3. Differential Diagnoses for Common Presentations

Lesion	Infectious	Inflammatory	Drug/Toxin	Miscellaneous
Brown Macule		Post-inflammatory hyperpigmentation	UV radiation, actinic/solar lentigo, freckle (i.e. ephelis)	Congenital: café-au-lait macule, congenital nevus, epidermal/junctional nevus Neoplasia: lentigo maligna, MM, pigmented BCC Other: melasma/chloasma (i.e. "mask of pregnancy")
Discrete Red Papule	Folliculitis Furuncle Scabies	Acne vulgaris Rosacea Psoriasis Urticaria	Bites/stings	Autoimmune: lichen planus Vascular: hemangioma, pyogenic granuloma Other: dermatofibroma, miliaria rubra

Table 3. Differential Diagnoses for Common Presentations

Lesion	Infectious	Inflammatory	Drug/Toxin	Miscellaneous
<b>Red Scales</b>	Pityriasis rosea Secondary syphilis Tinea	Dermatitis (atopic, contact, nummular, seborrheic) Discoid lupus Psoriasis	Gold	Autoimmune: lichen planus Neoplastic: mycosis fungoides
<b>Vesicle</b>	Cat scratch disease Impetigo Viral: HSV, HZV, VZV, Coxsackie virus Scabies	Acute contact dermatitis Dyshidrotic eczema		Other: dermatitis herpetiformis, porphyria cutanea tarda
<b>Bulla</b>	Bullous impetigo	Acute dermatitis EM, SLE, SJS/TEN	Fixed drug eruption SJS/TEN	Autoimmune: bullous pemphigoid, pemphigus vulgaris Other: dermatitis herpetiformis, porphyria cutanea tarda
<b>Pustule</b>	Candida Dermatophyte Impetigo Sepsis Varicella	Acne vulgaris Rosacea Dyshidrotic dermatitis Pustular folliculitis Pustular psoriasis Hidradenitis suppurativa	AGEP (usually secondary to drug reaction)	
<b>Oral Ulcer</b>	Aspergillosis CMV Coxsackie virus Cryptococcosis HSV/HZV HIV, TB, Syphilis	Allergic stomatitis EM Lichen planus Seronegative arthropathies, SLE Recurrent aphthous stomatitis Behçet's disease	Chemotherapy Radiation therapy SJS/TEN	Autoimmune: pemphigus vulgaris Congenital: XXY Hematologic: sickle cell disease Neoplasia: BCC, SCC
<b>Skin Ulcer</b>	Plague Syphilis TB Tularemia	RA, SLE, vasculitis UC, pyoderma gangrenosum		Autoimmune: necrobiosis lipoidica diabetorum (e.g. DM) Congenital: XXY Hematologic: sickle cell disease Neoplasia: SCC Vascular: arterial, neurotrophic, pressure, venous, aphthous, leukoplakia, traumatic

## Common Skin Lesions

### Cysts

Table 4. Cysts

	Clinical Features	Pathophysiology	Epidemiology	Clinical Course	Management
<b>Epidermal Cyst</b>	Round, yellow/flesh-coloured, slow growing, mobile, firm, fluctuant, nodule, or tumour	Epithelial cells displaced into dermis, epidermal lining becomes filled with keratin and lipid-rich debris May be post-traumatic, rarely syndromic	Most common cutaneous cyst in youth-middle age	Central punctum may rupture (foul, cheesy odour, creamy colour) and produce inflammatory reaction Can increase in size and number over time	No treatment Elective excision
<b>Pilar Cyst (i.e. Trichilemmal)</b>	Multiple, hard, variable-sized nodules under the scalp; lacks central punctum	Thick-walled cyst lined with stratified squamous epithelium and filled with dense keratin Idiopathic Post-trauma	2nd most common cutaneous cyst F>M, hereditary	Rupture causes pain and inflammation	No treatment Elective excision
<b>Dermoid Cyst</b>	Firm nodule most commonly found at lateral third of eyebrow or midline under nose	Rare, congenital hamartomas, which arise from inclusion of epidermis along embryonal cleft closure lines, creating a thick-walled cyst filled with dense keratin	Rare	If nasal midline, risk of extension into CNS	No treatment Elective excision
<b>Ganglion Cyst</b>	Usually solitary, rubbery, translucent; a clear gelatinous viscous fluid may be extruded	Cystic lesion that originates from joint or tendon sheath, called a digital mucous cyst when found on fingertip Associated with osteoarthritis	Older age	Stable	No treatment Incision and expression of contents Elective excision
<b>Milium</b>	1-2 mm superficial, white to yellow subepidermal papules occurring on eyelids, cheeks, and forehead	Small epidermoid cyst, primarily arising from pluripotential cells in epidermal or adnexal epithelium Can be secondary to blistering, ulceration, trauma, topical corticosteroid atrophy, or cosmetic procedures	Any age 40-50% of infants	In newborns, spontaneously resolves in first 4 wk of life	No treatment Incision and expression of contents Electrodesiccation Topical retinoid therapy

### Fibrous Lesions

#### DERMATOFIBROMA

##### Clinical Features

- firm dermal papule or nodule, skin-coloured to red-brown
- majority are asymptomatic but may be pruritic and/or tender
- sites: legs > arms > trunk
- dimple sign (i.e. Fitzpatrick's sign): lateral compression causes dimpling of the lesion

**Pathophysiology**

- benign tumour due to fibroblast proliferation in the dermis

**Etiology**

- unknown; may be associated with history of minor trauma (e.g. shaving or insect bites)
- eruptive dermatofibroma can be associated with SLE

**Epidemiology**

- adults, F>M

**Differential Diagnosis**

- dermatofibrosarcoma protuberans, MM, Kaposi's sarcoma, blue nevus

**Investigations**

- biopsy if diagnosis is uncertain

**Management**

- no treatment required
- excision if bothersome

**SKIN TAGS****Clinical Features**

- small (1-10 mm), soft, skin-coloured or darker pedunculated papule, often polypoid
- sites: eyelids, neck, axillae, inframammary, and groin

**Pathophysiology**

- benign outgrowth of skin

**Epidemiology**

- middle-aged and elderly, F>M, obese, can increase in size and number during pregnancy

**Differential Diagnosis**

- pedunculated seborrheic keratosis, compound or dermal melanocytic nevus, neurofibroma, fibroepithelioma of Pinkus (rare variant of BCC), nevus lipomatosis superficialis

**Management**

- snip excision, electrodesiccation, cryosurgery

**Hyperkeratotic Lesions****SEBORRHEIC KERATOSIS****Clinical Features**

- i.e. 'wisdom spots,' 'age spots,' or 'barnacles of life'
- well-demarcated waxy papule/plaque with classic "stuck on" appearance
- occasionally pruritic
- over time lesions appear more warty, greasy, and pigmented
- sites: face, trunk, upper extremities (may occur at any site except palms or soles)

**Pathophysiology**

- very common benign epithelial tumour due to proliferation of keratinocytes and melanocytes

**Epidemiology**

- unusual <30 yr old
- M>F
- autosomal dominant inheritance
- Leser-Trelat sign: sudden appearance of seborrheic keratosis that can be associated with malignancy, commonly gastric adenocarcinomas

**Differential Diagnosis**

- MM (lentigo maligna, nodular melanoma), melanocytic nevi, pigmented BCC, solar lentigo, spreading pigmented AK

**Investigations**

- biopsy only if diagnosis uncertain

**Management**

- none required, for cosmetic purposes only
- cryotherapy, electrodesiccation, shave excision

**ACTINIC KERATOSES (SOLAR KERATOSES)**

- see *Pre-Malignant Skin Conditions, D39*

**KERATOACANTHOMA**

- see

**CORNS (HELOMATA)****Clinical Features**

- firm papule with a central, translucent, cone-shaped, hard keratin core
- painful with direct pressure
- sites: most commonly on dorsolateral fifth toe and dorsal aspects of other toes

**Pathophysiology**

- localized hyperkeratosis induced by pressure on hands and feet

**Epidemiology**

- F>M, can be caused by chronic microtrauma

**Differential Diagnosis**

- calluses, plantar warts

**Management**

- relieve pressure with padding or alternate footwear, orthotics
- paring, topical salicylic acid

**Corns vs. Warts vs. Calluses**

- Corns have a whitish yellow central translucent keratinous core; painful with direct pressure; interruption of dermatoglyphics
- Warts bleed with paring and have a black speckled central appearance due to thrombosed capillaries; plantar warts destroy dermatoglyphics (epidermal ridges)
- Calluses have layers of yellowish keratin revealed with paring; there are no thrombosed capillaries or interruption of epidermal ridges

**Keloids vs. Hypertrophic Scars**

- **Keloids:** extend beyond margins of original injury with claw-like extensions
- **Hypertrophic scars:** confined to original margins of injury

**DDx of Hyperpigmented Macules**

- Purpura (e.g. solar, ASA, anticoagulants, steroids, hemosiderin stain)
- Post-inflammatory
- Melasma
- Melanoma
- Fixed drug eruption

**Keloids****Clinical Features**

- firm, shiny, skin-coloured or red-bluish papules/nodules that most often arise from cutaneous injury (e.g. piercing, surgical scar, acne), but may appear spontaneously
- extends beyond the margins of the original injury, and may continue to expand in size for yr with claw-like extensions
- can be pruritic and painful
- sites: earlobes, shoulders, sternum, scapular area, angle of mandible

**Pathophysiology**

- excessive deposition of randomly organized collagen fibres following trauma to skin

**Epidemiology**

- most common in Black patients, followed by those of Asian descent (predilection for darker skin)
- M=F, most commonly between ages 10-30

**Management**

- intralesional corticosteroid injections
- silicone gel sheets

**Pigmented Lesions****CONGENITAL NEVOMELANOCYTIC NEVI (CNN)****Clinical Features**

- i.e. congenital hairy nevi
- sharply demarcated pigmented papule or plaque with regular borders ± coarse hairs
- classified by size: small (<1.5 cm), medium (M1: 1.5-10 cm, M2: >10-20 cm), large (L1: >20-30 cm, L2: >30-40 cm), giant (G1: >40-60 cm, G2: >60 cm)
- may be surrounded by smaller satellite nevi

**Pathophysiology**

- nevomelanocytes in epidermis (clusters) and dermis (strands)

**Epidemiology**

- present at birth or develops in early infancy to childhood
- malignant transformation is rare (1-5%) and more correlated with size of the lesion
- neurocutaneous melanosis can occur in giant CNN (melanocytes in the CNS)

**Management**

- take a baseline photo and observe lesion for change in shape, colour, or size out of proportion with growth
- surgical excision if suspicious, due to increased risk of melanoma
- MRI if suspicious for neurological involvement

**Other Nevi**

- Halo nevus: often appears as a typical nevus surrounded by a ring of depigmentation; common in children; uncommonly associated with vitiligo; no treatment required unless irregular colour or borders
- Blue nevus: round to oval macule/papule with homogenous blue to blue-black colour; often appears in childhood and late adolescence; no treatment required unless atypical features are noted

**Other Nevi**

- **Halo nevus:** often appears as a typical nevus surrounded by a ring of depigmentation; common in children; uncommonly associated with vitiligo; no treatment required unless irregular colour or borders
- **Blue nevus:** round to oval macule/papule with homogenous blue to blue-black colour; often appears in childhood and late adolescence; no treatment required unless atypical features are noted

**OTHER CONGENITAL PIGMENTED LESIONS**

**Table 5. Comparison of Other Congenital Pigmented Lesions**

	Clinical Feature	Pathophysiology	Epidemiology	Differential Diagnosis	Clinical Course and Management
<b>Café-au-lait Macule</b>	Flat light-brown lesions with smooth or jagged borders	Areas of increased melanogenesis	Six or more is suggestive of neurofibromatosis type I Also associated with McCune-Albright syndrome	Flat congenital melanocytic nevus, speckled lentiginous nevus	Enlarge in proportion to the child No effective treatment
<b>Speckled Lentiginous Nevus (i.e. nevus spilus)</b>	Brown pigmented macular background (café-au-lait macule-like) with dark macular or papular speckles	Increased melanocyte concentration	Risk of melanoma similar to that of a CNN of the same size	Café-au-lait macule, agminated lentiginos, Becker's nevus	Usually the light macular background is present at birth and speckles develop over time Management is similar to that of CNNs
<b>Dermal Melanocytosis (historically known as Mongolian Spot)</b>	Congenital grey-blue solitary or grouped macules commonly on lumbosacral area	Ectopic melanocytes in dermis	99% occurs in Asian and Indigenous infants	Ecchymosis	Usually fades in early childhood but may persist into adulthood
<b>Xeroderma Pigmentosum</b>	Extreme sensitivity to UV light, redness and blistering, xerosis, and changes in skin colour Typically affects the eyes and sun-exposed areas; may affect nervous system	Involves mutations in genes responsible for DNA repair (e.g. nucleotide excision repair genes)	More common in Japan, North Africa, and Middle East	Freckles, Rothmund-Thomson syndrome, and porphyria disease	Prevention by avoiding sun exposure (damage is irreversible) Reduce incidence of cancer using anticancer drugs (e.g. isotretinoin, fluorouracil) in adults only

**ACQUIRED NEVOMELANOCYTIC NEVI (NMN)**

**Clinical Features**

- common mole: well circumscribed, round, uniformly pigmented macules/papules <1.5 cm
- average number of moles per person: 18-40
- three stages of evolution: junctional NMN, compound NMN, and dermal NMN

**Table 6. Evolution of Acquired Nevomelanocytic Nevi**

Type	Age of Onset	Clinical Feature	Histology
<b>Junctional</b>	Childhood Majority progress to compound nevus	Flat, regularly bordered, uniformly tan-dark brown, sharply demarcated macule	Melanocytes at dermal-epidermal junction above basement membrane
<b>Compound</b>	Any age	Domed, regularly bordered, smooth, round, tan-dark brown papule Face, trunk, extremities, scalp NOT found on palms or soles	Melanocytes at dermal-epidermal junction; migration into dermis
<b>Dermal</b>	Adults	Soft, dome-shaped, skin-coloured to tan/brown papules or nodules Sites: face, neck	Melanocytes exclusively in dermis

**Management**

- new or changing pigmented lesions should be evaluated for atypical features which could indicate a melanoma
- excisional biopsy should be considered if the lesion demonstrates rapid change, asymmetry, varied colours, irregular borders, and persistent pain or bleeding

**OTHER ACQUIRED PIGMENTED LESIONS**

**Table 7. Comparison of Other Acquired Pigmented Lesions**

	Clinical Feature	Pathophysiology	Epidemiology	Differential Diagnosis	Clinical Course and Management
<b>Atypical Nevus (Dysplastic Nevus)</b>	Variiegated macule/papule with irregular distinct melanocytes in the basal layer	Hyperplasia and proliferation of melanocytes extending beyond dermal compartment of the nevus Often with region of adjacent nests	Five atypical nevi increase risk for melanoma Numerous dysplastic nevi may be part of familial atypical mole and melanoma syndrome Risk factor: family history	Melanoma	Follow with baseline photographs for changes Excisional biopsy if lesion changing or highly atypical Close surveillance with whole body skin examination
<b>Ephelides (i.e. Freckles)</b>	Small (<5 mm) well-demarcated light brown macules Sites: sun-exposed skin	Increased melanin within basal layer keratinocytes secondary to sun exposure	Skin phototypes I-II most commonly	Junctional nevi Juvenile lentigines	Multiply and darken with sun exposure, fade in winter No treatment required Sunscreen and sun avoidance may prevent the appearance of new freckles
<b>Solar Lentigo (i.e. Liver Spot)</b>	Well-demarcated brown/black macules Sites: sun-exposed skin	Benign melanocytic proliferation in dermal-epidermal junction due to chronic sun exposure	Most common in white individuals >40 yr Skin phototypes I-III most commonly	Lentigo maligna, seborrheic keratosis, pigmented AK	Laser therapy, shave excisions, cryotherapy
<b>Becker's Nevus</b>	Hairy, light brown macule/patch with a papular verrucous surface Sites: trunk and shoulders Onset in teen yr	Pigmented hamartoma with increased melanin in basal cells	M>F Often becomes noticeable at puberty	Hairy congenital melanocytic nevus	Hair growth follows onset of pigmentation Cosmetic management (usually too large to remove)
<b>Melasma</b>	Symmetrical hyperpigmentation on sun-exposed areas of face (forehead, upper lip, cheeks, chin)	Increase in number and activity of melanocytes Associated with estrogen and progesterone	F>M Common in pregnancy and women taking OCP or HRT Can occur with mild endocrine disturbances, antiepileptic medications, and other photosensitizing drugs Risk factors: sun exposure, dark skin tone	Post-inflammatory hyperpigmentation	Often fades over several mo after stopping hormone treatment or delivering baby Treatment: hydroquinone, azelaic acid, retinoic acid, topical steroid, combination creams, destructive modalities (chemical peels, laser treatment), camouflage make-up, sunscreen, sun avoidance

**Vascular Lesions**

**Table 8. Vascular Tumours Compared to Vascular Malformations**

	Vascular Tumours	Vascular Malformations
<b>Definition</b>	Endothelial hyperplasia	Congenital malformation with normal endothelial turnover
<b>Presence at Birth</b>	Usually postnatal	100% at birth (not always obvious)
<b>M:F</b>	1:3-5	1:1
<b>Natural History</b>	Phases Proliferating Involuting Involved	Proportionate growth (can expand)

Pyogenic granuloma is a misnomer: it is neither pyogenic nor granulomatous

**Venous Lake:** benign blue or violaceous papular lesion occurring on the face, lips, and ears due to dilation of a venule. Distinguished from malignant pigmented lesions through diascopy, as compression blanches the lesion

A spider angioma will blanch when the tip of a paperclip is applied to the centre of the lesion

**HEMANGIOMAS**

**Clinical Features**

- red or blue subcutaneous mass that is soft/compressible, blanches with pressure; feels like a "bag of worms" when palpated

**Pathophysiology**

- benign vascular tumour
- includes: cavernous hemangioma, capillary/infantile hemangioma, spider hemangioma

**Table 9. Vascular Tumours**

	Clinical Feature	Pathophysiology	Epidemiology	Clinical Course	Management
<b>Hemangioma of Infancy</b>	Hot, firm, red to blue plaques of tumours	Benign vascular proliferation of endothelial lining	Appears shortly after birth; rarely congenital	Appears shortly after birth, increases in size over mo., then regresses 50% of lesions resolve spontaneously by 5 yr	10% require treatment due to functional impairment (visual compromise, airway obstruction, high output cardiac failure) or cosmesis Consider treatment if not gone by school age; topical timolol, propranolol; systemic corticosteroids; laser treatment; surgery Provide early specialist referral or treatment in infants with high-risk hemangiomas
<b>Spider Angioma (i.e. Campbell Telangiectasia)</b>	Central red arteriole with slender branches, blanchable	Can be associated with hyperestrogenic state (e.g. in liver disease, pregnancy, OCP) but more often is not	Any age	Increase in number over time	Reassurance Electrodesiccation or laser surgery if patient wishes
<b>Cherry Angioma (i.e. Campbell De Morgan Spot)</b>	Bright red to deep maroon, dome-shaped vascular papules, 1-5 mm Site: trunk Less friable compared to pyogenic granulomas	Benign vascular neoplasm	>30 yr old	Lesions do not fade in time Lesions bleed infrequently	Usually no treatment needed Laser or electrocautery for small lesions Excision of large lesions if necessary
<b>Pyogenic Granuloma</b>	Bright red, dome-shaped sessile or pedunculated friable nodule Sites: fingers, lips, mouth, trunk, toes DDx: glomus tumour, nodular MM, SCC, nodular BCC	Rapidly developing hemangioma Proliferation of capillaries with erosion of epidermis and neutrophilia	<30 yr old	Lesion grows rapidly over wk-mo., then stabilizes Lesion may persist indefinitely if untreated	Surgical excision with histologic examination Electrocautery; laser; cryotherapy

**VASCULAR MALFORMATIONS**

**Table 10. Vascular Malformations**

Type	Clinical Feature	Pathophysiology	Management
<b>Nevus Flammeus (i.e. Port-wine Stain)</b>	Red to blue macule present at birth that follows a dermatomal distribution, rarely crosses midline Most common site: nape of neck Never spontaneously regresses but grows in proportion to the child	Congenital vascular malformation of dermal capillaries; rarely associated with Sturge-Weber syndrome (V1, V2 distribution)	Laser or make-up
<b>Nevus Simplex (i.e. Salmon Patch)</b>	Pink-red irregular patches Midline macule on glabella known as "Angel Kiss;" in the nuchal region known as "Stork Bites" Present in 1/3 of newborns Majority regress spontaneously	Congenital dilation of dermal capillaries	No treatment required

**Lipoma**

**Clinical Features**

- single or multiple non-tender subcutaneous tumours that are soft and mobile
- occurs most frequently on the trunk and extremities, but can be anywhere on the body

**Pathophysiology**

- adipocytes enclosed in a fibrous capsule

**Epidemiology**

- often solitary or few in number, if multiple can be associated with rare syndromes

**Differential Diagnosis**

- angioliipoma, liposarcoma

**Investigations**

- biopsy only if atypical features (painful, rapid growth, firm)

**Management**

- reassurance
- excision or liposuction only if desired for cosmetic purposes

**Xanthoma**

**Clinical Features**

- localized lipid deposits that manifest as papules, plaques, or nodules in the skin
- several variants: eruptive xanthoma (1-5 mm erythematous-to-yellow papules); tuberous xanthoma (≤3 cm yellow-to-orange or erythematous papules or nodules); tendinous xanthoma (smooth, firm, mobile, skin-coloured nodules); plane xanthoma (soft, yellow, thin plaques)

### Pathophysiology

- xanthoma associated with hyperlipidemia: formed from macrophages due to excessive uptake and oxidation of low density lipoprotein particles
- xanthoma not associated with hyperlipidemia (e.g. plane xanthoma): develop associated with monoclonal gammopathy, multiple myeloma, and other hematologic diseases; immune complexes form between antibodies and lipoproteins leading to lipid accumulation in macrophages
- xanthoma not associated with hyperlipidemia (e.g. verruciform xanthoma): may be response to immune reaction to local trauma or inflammation

### Epidemiology

- often present in adulthood (except xanthoma associated with hypercholesterolemia, in which xanthoma develops before 10 yr old)
- occur in both males and females, no sex predilection

### Differential Diagnosis

- xanthelasma: sebaceous hyperplasia, juvenile xanthogranuloma, syringoma, nodular BCC
- plane xanthoma: necrobiotic xanthogranuloma
- eruptive xanthoma: generalized granuloma annulare, xanthoma disseminatum
- tendinous xanthoma and tuberous xanthoma: other nodular eruptions over joints and tendons (e.g. rheumatoid nodules, gouty tophi, subcutaneous granuloma annulare, erythema elevatum diutinum)
- verrucous xanthoma: condylomata, oral papillomas, verrucous carcinoma, SCC

### Investigations

- biopsy (shave, punch, or excisional)
- fasting lipid panel (except for xanthomas not associated with hyperlipidemia, e.g. verruciform xanthomas)

### Management

- typically asymptomatic and therefore do not require treatment unless for cosmetic reasons
- options include surgical excision, cryotherapy, trichloroacetic acid 70% chemical peels, or Er:YAG or Nd:YAG lasers
- pharmacologic treatment of dyslipidemia usually indicated

## Acneiform Eruptions

### Acne Vulgaris/Common Acne

#### Clinical Features

- a common inflammatory pilosebaceous disease categorized with respect according to severity
  - Type I: comedonal, sparse, no scarring
  - Type II: comedonal, papular, moderate ± little scarring
  - Type III: comedonal, papular, and pustular, with scarring
  - Type IV: nodulocystic acne, risk of severe scarring
- sites of predilection: face, neck, upper chest, and back

#### Pathophysiology

- hyperkeratinization at the follicular ostia (opening) blocks the secretion of sebum leading to the formation of microcomedones
- androgens promote excess sebum production
- *Cutibacterium acnes* (*C. acnes*) metabolizes sebum to free fatty acids and produces pro-inflammatory mediators

#### Epidemiology

- age of onset typically in puberty (10-17 yr in females, 14-19 yr in males)
- in prepubertal children consider underlying hormonal abnormality (e.g. late onset congenital adrenal hyperplasia)
- incidence decreases in adulthood
- genetic predisposition: majority of individuals with cystic acne have parent(s) with history of severe acne

#### Differential Diagnosis

- folliculitis, keratosis pilaris (upper arms, face, thighs), perioral dermatitis, rosacea

#### Treatment of Acne Scars

- Tretinoin creams
- Glycolic acid
- Chemical peels for superficial scars
- Injectable fillers (collagen, hyaluronic acid) for pitted scars
- Fraxel laser
- CO<sub>2</sub> laser resurfacing

#### Topical Benzoyl Peroxide for Acne

Cochrane DB Syst Rev 2020;CD011154

**Purpose:** Systemically review the use of topical benzoyl peroxide for treating acne.

**Methods:** RCTs comparing the use of topical benzoyl peroxide, for the treatment of clinically diagnosed acne to either placebo, or other topical medication were eligible for inclusion. The primary outcome measures that were assessed were 'participant global self-assessment of acne improvement' and 'withdrawal due to adverse events in the whole course of the trial'. The secondary outcome measure that was assessed was 'Percentage of participants experiencing any adverse event in the whole course of the trial.'

**Results:** A total of 120 studies including 29592 people were included in this review. For 'participant global self-assessment of acne improvement' benzoyl peroxide was more effective than placebo or no treatment (risk ratio (RR) 1.27, 95% confidence interval (CI) 1.12-1.45; 3 RCTs; 2234 participants; treatment for 10-12 wk; low-certainty evidence). Little to no difference existed between benzoyl peroxide and adapalene (RR 0.99, 95% CI 0.90-1.10; 5 RCTs; 1472 participants; treatment for 11-12 wk) and clindamycin (RR 0.95, 95% CI 0.68-1.34; 1 RCT; 240 participants; treatment for 10 weeks). Withdrawal due to adverse effects was higher with benzoyl peroxide than with no treatment or placebo and the most common cited adverse effects included erythema, pruritus, and skin burning. Low quality evidence suggests little to no difference in withdrawal due to adverse events between benzoyl peroxide and adapalene, clindamycin, erythromycin, or salicylic acid. Very low quality evidence exists comparing the incidence of any adverse events between benzoyl peroxide and other treatments, however most reported adverse events were mild.

Table 11. Management of Acne

Compound/Drug Class	Product Names	Notes
<b>MILD ACNE: OTC</b>		
<b>Topical Therapies</b>		
<b>Benzoyl peroxide (BPO)</b>	Solugel <sup>®</sup> , Benzac <sup>®</sup> , Desquam <sup>®</sup> , Fostex <sup>®</sup> , CeraVe Acne Foaming Cleanser <sup>®</sup>	Helps prevent <i>Propionibacterium acnes</i> ( <i>P. acnes</i> ) resistance, is a bactericidal agent (targets <i>P. acnes</i> ), and is comedolytic
<b>Salicylic acid</b>	Akurza <sup>®</sup> cream, DermaZone <sup>®</sup>	Used when patients cannot tolerate a topical retinoid due to skin irritation
<b>MILD ACNE: Prescription</b>		
<b>Topical Therapies</b>		
<b>Antimicrobials</b>	clindamycin (Dalacin T <sup>®</sup> ), erythromycin	High rate of resistance when used as monotherapy
<b>Retinoids</b>	vitamin A acid (tretinoin, Stieva-A <sup>®</sup> , Retin A Micro <sup>®</sup> ), adapalene (Differin <sup>®</sup> ), ARAZLO <sup>®</sup> (tazarotene) Lotion 0.045%, AKLIEF <sup>®</sup> (trifarotene) Cream	Backbone of topical acne therapy All regimens should include a retinoid unless patient cannot tolerate
<b>Combination products</b>	clindamycin and BPO (Clindoxyl <sup>®</sup> ) clindamycin and BPO (Benzaclicin <sup>®</sup> ) TactuPump <sup>®</sup> (adapalene and BPO) clindamycin and tretinoin (Biacna <sup>®</sup> ) erythromycin and BPO (Benzamycin <sup>®</sup> )	Allows for greater adherence and efficacy Combines different mechanisms of action to increase efficacy and maximize tolerability
<b>MODERATE ACNE</b>		
<b>Tetracycline/Minocycline/Doxycycline</b>	Sumycin <sup>®</sup> /Minocin <sup>®</sup> /Vibramycin <sup>®</sup>	Use caution with regard to drug interactions: do not use with isotretinoin Sun sensitivity Antibiotics require 3 mo of use before assessing efficacy
<b>Cyproterone acetate-ethinyl estradiol</b>	Diane-35 <sup>®</sup>	After 35 yr of age, estrogen/progesterone should only be considered in exceptional circumstances, carefully weighing the risk/benefit ratio with physician guidance
<b>Spirolactone</b>	Aldactone <sup>®</sup>	May cause hyperkalemia if concurrent renal dx Black box warning for breast cancer
<b>SEVERE ACNE</b>		
<b>Isotretinoin</b>	Accutane <sup>®</sup> , Clarus <sup>®</sup> , Epuris <sup>®</sup>	See Table 29, D53 for full side effect profile Most adverse effects are temporary and will resolve when the drug is discontinued Baseline lipid profile (risk of hypertriglyceridemia), LFTs and $\beta$ -hCG before treatment May transiently exacerbate acne before patient sees improvement Refractory cases may require multiple courses of isotretinoin

## Perioral Dermatitis

### Clinical Features

- discrete erythematous papulopustular eruptions that often become confluent, forming inflammatory plaques on perioral, perinasal, and/or periorbital skin
- commonly symmetrical, rim of sparing around vermilion border of lips

### Epidemiology

- 15-40 yr old, occasionally in younger children
- predominantly females

### Differential Diagnosis

- contact dermatitis, rosacea, acne vulgaris

### Management

- avoid all topical steroids, avoid ointment/oil-based products, stop all cosmetic products
- topical: metronidazole 0.75% gel or 0.75-1% cream to affected area BID
- systemic: tetracycline family antibiotic (utilized for its anti-inflammatory properties)
- occasional use of a topical calcineurin inhibitor cream (i.e. pimecrolimus)

## Rosacea

### Clinical Features

- dome-shaped inflammatory papules  $\pm$  pustules
- flushing, non-transient erythema, and telangiectasia
- distribution: typically on central face including forehead, nose, cheeks, and chin; rarely on scalp, neck, and upper body
- characterized by remissions and exacerbations
- exacerbating factors: heat, cold, wind, sun, stress, drinking hot liquids, alcohol, spices
- all forms of rosacea can progress from mild to moderate to severe
- rarely in longstanding rosacea, signs of thickening, induration, and lymphedema in the skin can develop

### Acne Myths Debunked

- Eating greasy food and chocolate does not cause or worsen acne
- Blackheads (comedones) are black because of oxidized fatty acids, not dirt
- Acne is not caused by poor hygiene; on the contrary, excessive washing of face can be an aggravator

Antibiotics are used in inflammatory skin conditions since they also have anti-inflammatory properties (e.g. macrolides in acne). Topical antibiotics may also be used to treat secondary bacterial superinfections (e.g. impetigo)

### Acne Exacerbating Factors

- Systemic medications: lithium, phenytoin, steroids, halogens, androgens, iodides, bromides, danazol
- Topical agents: steroids, tars, ointments, oily cosmetics
- Mechanical pressure or occlusion, such as leaning face on hands
- Emotional stress

A combination of topical retinoids and topical erythromycin or clindamycin is more effective than either agent used alone

### Intralesional Injections

Intralesional corticosteroid injections are effective in the treatment of individual acne nodules

### Isotretinoin and Pregnancy

- Use of isotretinoin during pregnancy is associated with spontaneous abortion and major birth defects such as facial dysmorphism and cognitive impairment
- Pregnancy should be ruled out before starting isotretinoin
- Patients should use two forms of contraception while on isotretinoin

### Important Controversies Associated with Isotretinoin Therapy for Acne

Am J Clin Dermatol 2013;14:71-76

#### Main Points:

- The evidence on whether isotretinoin causes depression and suicide is inconsistent; however, numerous controlled studies have shown an improvement in anxiety and depression scores in those taking isotretinoin.
- There is no association between IBD and isotretinoin use. Only one study showed a significantly increased risk of UC. When considering using isotretinoin in a patient with IBD or with a strong family history, consider involving a gastroenterologist.

Activate Windows

Go to Settings to activate Windows.

- phyma: a distinct swelling caused by lymphedema and hypertrophy of subcutaneous tissue, particularly affecting the nose (rhinophyma)
- ocular manifestations: blepharconjunctivitis, keratitis, iritis

**Pathophysiology**

- unknown

**Epidemiology**

- although found in all skin types, highest prevalence in fair-skinned people
- 30-50 yr old; F>M

**Differential Diagnosis**

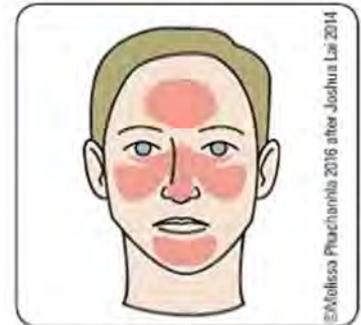

- acne vulgaris, seborrheic dermatitis, perioral dermatitis, contact dermatitis

**Management**

- trigger avoidance and daily sunscreen use for long-term management
- avoid topical corticosteroids
- telangiectasia: treated by physical ablation; electrical hyfrecators, vascular lasers, and intense pulsed light therapies
- phymas: treated by physical ablation or removal; paring, electrosurgery, cryotherapy, laser therapy (CO<sub>2</sub>, argon, Nd:YAG)

**Table 12. Specific Rosacea Treatments**

First Line	Second Line	Third Line
Oral tetracyclines	Topical clindamycin	Oral retinoids
Topical metronidazole	Topical erythromycin 2% solution	
Oral erythromycin (250-500 mg PO BID)	Oral metronidazole	
Topical azelaic acid		
Topical ivermectin		

**Figure 7. Rosacea distribution**

Rosacea can be differentiated from acne by the absence of comedones, a predilection for the central face, and symptoms of flushing

**Guidelines for the Diagnosis of Rosacea**

J Drugs Dermatol 2012;11(6):725-730

- Presence of one or more of the following primary features:
  - Flushing (transient erythema)
  - Nontransient erythema
  - Papules and pustules
  - Telangiectasia

May include one or more of the following secondary features:

- Burning or stinging
- Dry appearance
- Edema
- Phymatous changes
- Ocular manifestations
- Peripheral location

**Emollients and Moisturisers for Eczema**

Cochrane DB Syst Rev 2017;CD012119

**Purpose:** To review the effects of moisturizers for eczema.

**Methods:** This review included RCTs published prior to December 2015 on the effects of moisturizer on eczema.

**Results:** 77 studies with a total of 6603 participants were included in this review. Moisturizers showed beneficial effects on eczema symptoms and severity. Key benefits included prolonging time to flares, reducing the number of flares, and reducing the amount of corticosteroids needed. When active treatment was combined with moisturizer, greater benefits were seen. Evidence does not exist to support the use of one moisturizer over another.

**Triggers for Atopic Dermatitis**

- Irritants (detergents, solvents, clothing, water hardness)
- Contact allergens
- Environmental aeroallergens (e.g. dust mites)
- Inappropriate bathing habits (e.g. long hot showers)
- Sweating
- Microbes (e.g. *S. aureus*)
- Stress

# Dermatitis (Eczema)

**Definition**

- inflammation of the skin

**Clinical Features**

- poorly demarcated erythematous patches or plaques
- symptoms include pruritus and pain
- acute dermatitis: papules, vesicles
- subacute dermatitis: scaling, crusting, excoriations
- chronic dermatitis: lichenification, xerosis, fissuring

## Asteatotic Dermatitis

**Clinical Features**

- diffuse, mild pruritic dermatitis secondary to dry skin
- very common in elderly, especially in the winter (i.e. "winter itch") but starts in the fall
- shins predominate, looks like a "dried river bed"

**Management**

- skin rehydration with moisturizing routine ± corticosteroid creams

## Atopic Dermatitis

**Clinical Features**

- subacute and chronic eczematous reaction associated with prolonged severe pruritus
- distribution depends on age
- inflammation, lichenification, and excoriations are secondary to relentless scratching
- atopic palms: hyperlinearity of the palms (associated with ichthyosis vulgaris)
- associated with: keratosis pilaris (hyperkeratosis of hair follicles, "chicken skin"), xerosis, occupational hand dryness
- associated with severe or poorly controlled psychosocial distress and psychiatric comorbidities

**Epidemiology**

- frequently affects infants, children, and young adults
- 10-20% of children in developed countries <5 yr old are affected
- associated with personal or family history of atopy (asthma, hay fever), anaphylaxis, eosinophilia
- polygenic inheritance: one parent >60% chance for child; two parents >80% chance for child
- long-term condition with 1/3 of patients continuing to show signs of AD into adulthood

**Pathophysiology**

- a T-cell driven inflammatory process with epidermal barrier dysfunction

**Investigations**

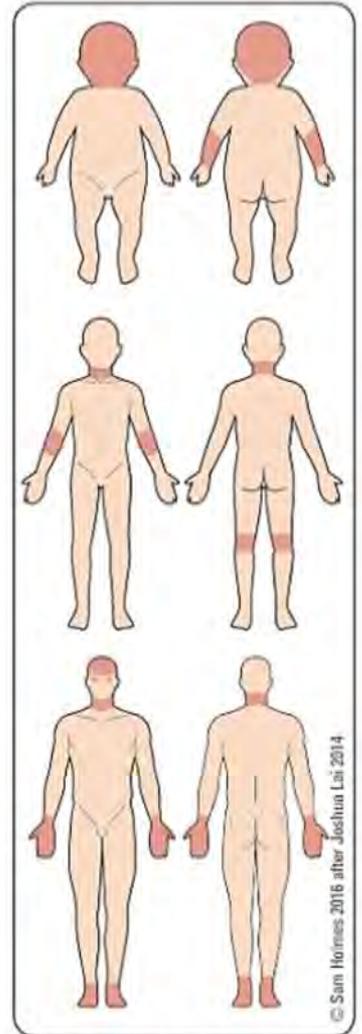

- clinical diagnosis
- consider: skin biopsy, serum IgE levels, patch testing if allergic contact dermatitis is suspected

**Management**

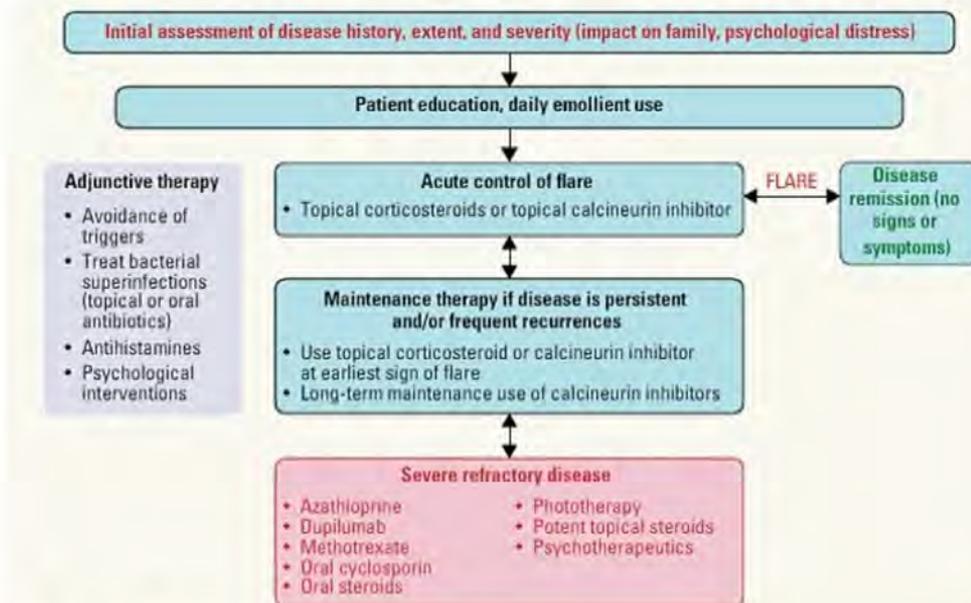

- goal: reduce signs and symptoms, prevent or reduce recurrences/flares
- better outcomes (e.g. less flare-ups, modified course of disease) if diagnosis made early
- avoid triggers of AD (e.g. wool, scented products, heat, etc.)
- be vigilant for depressive symptoms and the possible need for psychiatric referral, especially among those with severe disease
- non-pharmacologic therapy
  - moisturizers
    - apply liberally and reapply at least twice a day with goal of minimizing xerosis
    - include in treatment of mild to severe disease as well as in maintenance therapy
    - bathe in plain warm water for a short period of time once daily followed by lightly, but not completely, drying the skin with a towel; immediately apply topical agents or moisturizers after this
  - use fragrance-free hypoallergenic non-soap cleansers
- pharmacologic therapy
  - topical corticosteroids
    - effective in reducing acute and chronic symptoms as well as prevention of flares
    - choice of steroid potency depends on age, body site, short vs. long-term use
    - apply one adult fingertip unit (0.5 g) to an area the size of two adult palms BID for acute flares
    - local side effects: skin atrophy, purpura, telangiectasia, striae, hypertrichosis, and acneiform eruption are all very rarely seen
  - topical calcineurin inhibitors
    - tacrolimus 0.03%, 0.1% (Protopic®) and pimecrolimus 1% (Elidel®)
    - can be used as acute treatments and as steroid-sparing agents in the long-term
    - advantages over long-term corticosteroid use: no skin atrophy; safe for sensitive areas such as the face and neck
    - apply BID for acute flares, and 2-3x/wk to recurrent sites to prevent relapses
    - local side effects: stinging, burning, cost
    - U.S. black box warning of malignancy risk: rare cases of skin cancer and lymphoma reported; no causal relationship established, warning is discounted by both the Canadian Dermatology Association and the American Academy of Dermatology
  - biologics
    - dupilumab (anti-IL 4/13)
    - upadacitinib (JAK Inhibitor)
  - topical PDE-4 inhibitor
    - crisaborole (Eucrisa)

**Complications**

- infections
  - treatment of infections:
    - topical mupirocin, ozenoxacin, or fusidic acid (Canada only, not available in US)
    - oral antibiotics (e.g. cloxacillin, cephalexin) for widespread *S. aureus* infections

**Figure 8. AD distribution**  
The typical distribution of AD in infants <6 mo (top), children >18 mo (middle), and adults ≥18 yr (bottom)

**Figure 9. Atopic dermatitis treatment algorithm**  
Adapted from: Ellis C, et al. ICCAD II Faculty. International Consensus Conference on Atopic Dermatitis II (ICCAD II): clinical update and current treatment strategies. Br J Dermatol 2003;148(Suppl 63):3-10

## Contact Dermatitis

### Clinical Features

- cutaneous inflammation caused by an external agent(s)

Table 13. Contact Dermatitis

	Irritant Contact Dermatitis	Allergic Contact Dermatitis
<b>Mechanism of Reaction</b>	Toxic injury to skin; non-immune mechanism	Cell-mediated delayed (Type IV) hypersensitivity reaction (see <i>Rheumatology</i> , RH2)
<b>Type of Reaction</b>	Erythema, dryness, fine scale, burning Acute: quick reaction, sharp margins (e.g. from acid/alkali exposure) Cumulative insult: slow to appear, poorly defined margins (e.g. from soap), more common	Erythema with a papulovesicular eruption, swelling, pruritus
<b>Frequency</b>	Majority; will occur in anyone given sufficient concentration of irritants	Minority; patient acquires susceptibility to allergen that persists indefinitely
<b>Distribution</b>	Hands are the most common site	Areas exposed to allergen
<b>Examples</b>	Soaps, weak alkali, detergents, organic solvents, alcohol, oils	Many allergens are irritants, so may coincide with irritant dermatitis Nickel Tattoos
<b>Management</b>	Avoidance of irritants Wet compresses with Burow's solution (drying agent) Barrier moisturizers Topical/oral steroids	Patch testing to determine specific allergen Avoid allergen and its cross-reactants Wet compresses soaked in Burow's solution Topical steroids BID PRN Systemic steroids PRN if extensive

## Dyshidrotic Dermatitis

### Clinical Features

- "tapioca pudding" papulovesicular or bullous dermatitis of hands and feet that coalesce into plaques, followed by painful fissuring
- acute stage often very pruritic
- secondary infections common
- lesions heal with desquamation and may lead to chronic lichenification
- sites: palms and soles ± dorsal surfaces of hands and feet

### Pathophysiology

- unknown
- NOT caused by hyperhidrosis (excessive sweating)
- emotional stress may precipitate flares

### Management

- topical: high potency corticosteroid with plastic cling wrap occlusion to increase penetration
- systemic
  - prednisone in severe cases
  - alitretinoïn (Toctino®) for all types of chronic hand dermatitis, including dyshidrotic dermatitis
  - antibiotics for secondary *S. aureus* infection

## Nummular Dermatitis

### Clinical Features

- nummular (coin-shaped), pruritic, dry, scaly, erythematous plaques
- often associated with atopic and dyshidrotic dermatitis
- secondary infection common

### Pathophysiology

- little is known, but it is often accompanied by xerosis, which results from a dysfunction of the epidermal lipid barrier; this in turn can allow permeation of environmental agents, which can induce an allergic or irritant response

### Management

- moisturization
- mid- to high-potency corticosteroid ointment BID

## Seborrheic Dermatitis

### Clinical Features

- greasy, erythematous, yellow, scaling, papules and plaques in areas rich in sebaceous glands, can look moist and superficially eroded in flexural regions
- infants: "cradle cap"
- children: may be generalized with flexural and scalp involvement
- adults: diffuse involvement of scalp margin with yellow to white flakes, pruritus, and underlying erythema
- sites: scalp, nasolabial folds, eyebrows, eyelashes, beard, glabella, post-auricular, over sternum, trunk, body folds, genitalia

### Pathophysiology

- possible etiologic association with *Malassezia* spp. (yeast)

### Epidemiology

- common in infants, adolescents, and males
- increased incidence and severity in immunocompromised patients and Parkinson's disease
- in adults can cause dandruff (pityriasis sicca)

### Management

- face: keratolytic creams ketoconazole (Nizoral<sup>®</sup>) cream daily or BID and/or mild steroid cream daily or BID
- scalp: Derma-Smoother FS<sup>®</sup> lotion (peanut oil, mineral oil, fluocinolone acetonide 0.01%) to remove dense scales, ketoconazole 2% shampoo (Nizoral<sup>®</sup>), ciclopirox (Stieprox<sup>®</sup>) shampoo, selenium sulfide (e.g. Selsun<sup>®</sup>) or zinc pyrithione (e.g. Head and Shoulders<sup>®</sup>) shampoo, steroid lotion (e.g. betamethasone valerate 0.1% lotion BID)

## Stasis Dermatitis

### Clinical Features

- erythematous, scaly, pruritic plaques on lower legs, particularly the medial ankle
- brown hemosiderin deposition, woody fibrosis, atrophy blanche, and lipodermatosclerosis in late stages
- usually bilateral, accompanied by swelling, oozing, crusting, may have accompanying varicosities

### Pathophysiology

- chronic venous insufficiency leads to venous stasis
- surrounding soft tissue inflammation and fibrosis results

### Investigations

- Doppler if suspicious for DVT, other vascular studies (e.g. venous duplex, ankle-brachial index)
- swab for bacterial culture if there is crusting

### Management

- compression stockings
- rest and elevate legs (above the level of the heart)
- moisturizer daily after shower to treat xerosis
- mid-high potency topical corticosteroids to control inflammation

### Complications

- ulceration (common at medial malleolus), secondary bacterial infections

## Lichen Simplex Chronicus

### Clinical Features

- well-defined plaque(s) of lichenified skin with increased pruritic skin markings ± excoriations
- common sites: neck, scalp, extremities, urogenital area
- often seen in patients with atopy, anxiety disorders, nonspecific emotional stress, among other conditions

### Pathophysiology

- skin hyperexcitable to itch, resulting in continued rubbing/scratching of skin
- eventually lichenification occurs

### Investigations

- histopathology/biopsy confirms diagnosis if clinical diagnosis uncertain
- if patient has generalized pruritus, rule out systemic cause: CBC with differential count, transaminases, bilirubin, ferritin, renal and thyroid function tests, TSH, glucose, SPEP
- CXR if lymphoma suspected

### Management

- antipruritics (e.g. antihistamines, topical or intralesional glucocorticoids)

# Papulosquamous Diseases

## Lichen Planus

### Clinical Features

- acute or chronic inflammation of skin or mucous membranes
- morphology: pruritic, well-demarcated, violaceous, polygonal, flat-topped papules and plaques
- common sites: wrists, nails, scalp, mucous membranes in 60% (mouth, vulva, glans)
- distribution: symmetrical and bilateral
- Wickham's striae: reticulate white-grey lines over surface; pathognomonic but may not be present
- mucous membrane lesions: lacy, whitish reticular network, milky-white plaques/papules; increased risk of SCC in erosions and ulcers
- nails: longitudinal ridging; pterygium formation, complete dystrophy
- scalp: known as lichen planopilaris, scarring alopecia with perifollicular hyperkeratosis and erythema
- usually resolves spontaneously but may last for wk, mo, or yr
- rarely associated with hepatitis C
- Koebner phenomenon

### Pathophysiology

- immune-mediated, antigen unknown
- lymphocyte activation leads to keratinocyte apoptosis

### Epidemiology

- 1%, 30-60 yr, F>M

### Investigations

- consider a skin biopsy
- hepatitis C serology if patient has risk factors

### Management

- topical or intralesional corticosteroids
- short courses of oral prednisone (rarely)
- phototherapy, oral retinoids, or systemic immunosuppressants (e.g. azathioprine, methotrexate, cyclosporine) for extensive or recalcitrant cases

## Pityriasis Rosea

### Clinical Features

- acute, self-limiting eruption characterized by red, oval plaques/patches with central scale that does not extend to edge of lesion
- long axis of lesions follows skin tension lines (i.e. Langer lines) parallel to ribs producing "Christmas tree" pattern on back
- varied degree of pruritus
- most start with a "herald" patch which precedes other lesions by 1-2 wk
- common sites: trunk, proximal aspects of arms and legs

### Pathophysiology

- suspected HHV-7 or HHV-6 reactivation

### Investigations

- none required

### Management

- none required; clears spontaneously in 6-12 wk
- symptomatic: topical corticosteroids if pruritic, cool compresses, emollients

## Psoriasis

### Classification

1. plaque psoriasis
2. guttate psoriasis
3. erythrodermic psoriasis
4. pustular psoriasis
5. inverse psoriasis

### Pathophysiology

- not fully understood, genetic and immunologic factors
- shortened keratinocyte cell cycle correlates with Th1- and Th17-mediated inflammatory response

### The 6 Ps of Lichen Planus

- Purple
- Pruritic
- Polygonal
- Peripheral
- Papules
- Penis (i.e. mucosa)

### Skin Treatments for Chronic Plaque Psoriasis

Cochrane DB Syst Rev 2013;CD005028

**Purpose:** To review the effectiveness, tolerability, and safety of topical treatments for chronic plaque psoriasis.

**Methods:** This review identified RCTs comparing active topical treatments to either placebo or vitamin D analogues (used alone or in combination) in people with chronic plaque psoriasis.

**Results:** 170 studies including a total of 34808 participants were included in this review.

**Conclusion:** Both topical corticosteroids and vitamin D analogues were effective in treating chronic plaque psoriasis of the body. Corticosteroids showed benefits over vitamin D analogues in treating chronic plaque psoriasis of the scalp. Treatments combining vitamin D analogues and topical corticosteroids were more effective than using either vitamin D analogues or corticosteroids alone. Vitamin D analogues did result in more local adverse events than topical corticosteroids, the most common event being skin irritation or burning. People were more likely to discontinue using vitamin D analogues than topical corticosteroids.

**Calcipotriol is a Vitamin D Derivative**  
Dovobet® = calcipotriene combined with betamethasone dipropionate and is considered to be one of the most potent topical psoriatic therapies

**Epidemiology**

- 1.5-2%, M=F
- all ages: peaks of onset: 20-39 yr and 50-60 yr
- polygenic inheritance: 8% with one affected parent, 41% with both parents affected
- risk factors: smoking, obesity, alcohol, drugs, infections, physical trauma (Koebner phenomenon)

**Differential Diagnosis**

- mycosis fungoides (cutaneous T-cell lymphoma), seborrheic dermatitis, tinea, nummular dermatitis, lichen planus

**Investigations**

- none required; biopsy if atypical presentation

**PLAQUE PSORIASIS**

**Clinical Features**

- chronic and recurrent disease characterized by well-circumscribed erythematous papules/plaques with silvery-white scales
- often worse in winter (lack of sun)
- Auspitz sign: bleeds from minute points when scale is removed
- common sites: scalp, extensor surfaces of elbows and knees, trunk (especially buttocks), nails, pressure areas

**Management**

- depends on severity of disease, as defined by BSA affected or less commonly PASI
- mild (<3% BSA)
  - first line treatment includes topical steroids ± topical vitamin D analogue combination
  - topical retinoid ± topical steroid combination, anthralin, and tar are also effective but tend to be less tolerated than first line therapies
  - emollients
  - phototherapy or systemic treatment may be necessary if the lesions are scattered or in difficult-to-treat areas (e.g. palms, soles, scalp, and genitals)
- moderate (3-10% BSA) to severe (>10% BSA)
  - goal of treatment is to attain symptom control that is adequate from patient's perspective
  - phototherapy if accessible
  - systemic or biological therapy based on patient's treatment history and comorbidities
  - topical steroid ± topical vitamin D3 analogue as adjunct therapy

**Table 14. Topical Treatment of Psoriasis**

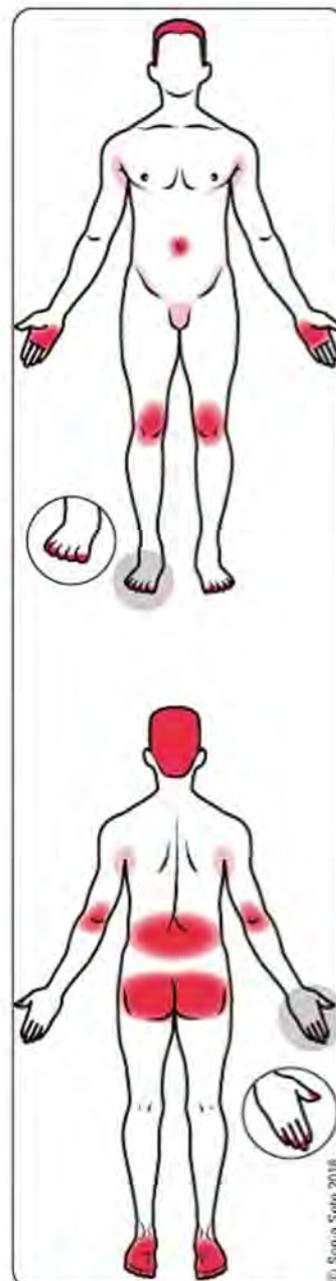

Treatment	Mechanism	Comments
Emollients	Reduce fissure formation	
Salicylic acid 1-12%	Remove scales	
Tar (LCO; liquor carbonis detergens)	Inhibits DNA synthesis, increases cell turnover	Messy, poor long-term compliance
Topical corticosteroids	Reduce scaling, redness and thickness	Use appropriate potency steroid in different areas for degree of psoriasis
Vitamin D analogues: calcipotriene/calcipotriol (Dovonex®, Silkis®)	Reduces keratinocyte hyperproliferation	
Betamethasone + calcipotriene (Dovobet®)	Combined corticosteroid and vitamin D analogue. See above mechanisms	Not to be used on face or folds
Tazarotene (Tazorac®) (gel/cream)	Retinoid derivative, reduce scaling	Irritating

**Table 15. Systemic Treatment of Psoriasis**

Treatment	Considerations	Adverse Effects
Acitretin	More effective when used in combination with phototherapy	Alopecia, cheilitis, teratogenicity, hepatotoxicity, photosensitivity, epistaxis, xerosis, hypertriglyceridemia
Cyclosporine	Used for intermittent control rather than continuously Avoid using for >1 yr	Renal toxicity, hypertension, hypertriglyceridemia, immunosuppression, lymphoma
Methotrexate	Has been used for over 50 yr	Bone marrow toxicity, hepatic cirrhosis, teratogenicity
Apremilast (Otezla®)	Extremely safe	GI upset, headache, loose stool, weight loss
PUVA	Highly effective in achieving remission Avoid >200 sessions in lifetime	Pruritus, burning, skin cancer
Broadband UVB and NB-UVB (311-312 nm)	UVB is much less carcinogenic than PUVA. NB-UVB has not been shown to increase the risk of skin cancer	Rare burning

See Landmark Dermatology Trials table for more information on the BE WVID trial comparing the efficacy and safety of a 52 wk treatment with bimekizumab vs. placebo vs. ustekinumab in patients with moderate to severe plaque psoriasis.

**Figure 10. Psoriasis distribution**

**Mechanism of Biologics**  
 "-mab" = monoclonal antibody  
 "-cept" = receptor

Table 16. Biologics Approved in Canada

Treatment	Route	Dosing Schedule	Effectiveness	Action
Etanercept (Enbrel®)*	SC	50 mg twice per wk for 3 mo, then 50 mg every wk	+++	Anti-TNF
Adalimumab (Humira®)*	SC	80 mg x 1, then 40 mg at wk 1 and every 2 wk thereafter	++++	Anti-TNF
Infliximab (Remicade®)*	IV	5 mg/kg at wk 0, 2, 6, and every 8 wk thereafter	++++	Anti-TNF
Ustekinumab (Stelara®)*	SC	45 mg or 90 mg at wk 0, 4, and every 12 wk thereafter	++++	Anti-IL 12/23
Secukinumab (Cosentyx®)*	SC	300 mg at wk 0, 1, 2, 3, 4, and every month thereafter	++++	Anti-IL 17A
Ixekizumab (Taltz®)*	SC	160 mg at wk 0, then 80 mg at wk 2, 4, 6, 8, 10, 12, then 80 mg every 4 wk thereafter	++++	Anti-IL 17A
Guselkumab (Tremfya®)	SC	100 mg at wk 0, 4, and every 8 wk thereafter	++++	Anti-IL 23
Brodalumab (Siliq®)	SC	210 mg at wk 0, 1, 2 and every 2 wk thereafter	++++	mAb IL-17R (brodalumab is a monoclonal antibody that targets the IL-17 receptor)
Certolizumab pegol (Cimzia®)*	SC	400 mg every 2 wk	++++	Anti-TNF
Risankizumab (Skyrizi®)	SC	150 mg at wk 0, 4, and every 12 wk thereafter	++++	Anti-IL 23
Tildrakizumab (ILUMYA®)	SC	100 mg at wk 0, 4, and every 12 wk thereafter	++++	Anti-IL 23
Bimekizumab (BIMZELX®)	SC	320 mg at wk 0, 4, 8, 12, 16, and every 8 wk thereafter	++++	Anti-IL 17A/IL 17F

\*Can also be used to treat psoriatic arthritis

### GUTTATE PSORIASIS ("RAIN DROP-LIKE")

#### Clinical Features

- discrete, scattered salmon-pink small scaling papules
- sites: diffuse, usually on trunk and legs, sparing palms and soles
- often antecedent streptococcal pharyngitis

#### Management

- UVB phototherapy, sunlight, lubricants, topical steroids
- penicillin V, erythromycin, or azithromycin if GAS on throat culture

### ERYTHRODERMIC PSORIASIS

#### Clinical Features

- generalized erythema (>90% of BSA) with fine desquamative scale on surface
- associated signs and symptoms: arthralgia, pruritus, dehydration, electrolyte imbalance
- aggravating factors: lithium,  $\beta$ -blockers, NSAIDs, antimalarials, phototoxic reaction, infection

#### Management

- potentially life-threatening, requires immediate medical care
- IV fluids, monitor fluids and electrolytes, may require hospitalization
- treat underlying aggravating condition
- cyclosporine, acitretin, methotrexate, UV, biologics

### PUSTULAR PSORIASIS

#### Clinical Features

- sudden onset of erythematous macules and papules which evolve rapidly into pustules, can be painful
- may be generalized or localized
- patient usually has a history of psoriasis; may occur with sudden withdrawal from steroid therapy

#### Management

- methotrexate, cyclosporine, acitretin, UV, biologics

### INVERSE PSORIASIS

#### Clinical Features

- erythematous plaques on flexural surfaces such as axillae, inframammary folds, gluteal fold, inguinal folds
- lesions may be macerated

#### Management

- low potency topical corticosteroids
- topical vitamin D analogues (e.g. calcipotriene, calcitriol)
- topical calcineurin inhibitors (e.g. tacrolimus, pimecrolimus)
- phototherapy

**PSORIATIC ARTHRITIS**

- 20-30% of patients with psoriasis also suffer from psoriatic arthritis
- psoriatic patients with nail or scalp involvement are at a higher risk for developing psoriatic arthritis
- see [Rheumatology](#), RH25

## Vesiculobullous Diseases

### Bullous Pemphigoid

**Clinical Features**

- chronic autoimmune bullous eruption characterized by pruritic, tense, subepidermal bullae on an erythematous or normal skin base
- can present as urticarial plaques without bullae
- common sites: flexor aspect of forearms, axillae, medial thighs, groin, abdomen, mouth in 33%

**Pathophysiology**

- IgG produced against dermal-epidermal basement membrane proteins (hemidesmosomes) leading to subepidermal bullae

**Epidemiology**

- mean age of onset: 60-80 yr, F=M

**Investigations**

- immunofluorescence shows linear deposition of IgG and C3 along the basement membrane
- anti-basement membrane antibody (IgG) (pemphigoid antibody detectable in serum)

**Prognosis**

- heals without scarring, usually chronic
- rarely fatal

**Management**

- prednisone 0.5-1 mg/kg/d until clear, then taper ± steroid-sparing agents (e.g. azathioprine, cyclosporine, mycophenolate mofetil)
- topical potent steroids (clobetasol) may be as effective as systemic steroids in limited disease
- tetracycline ± nicotinamide is effective for some cases
- immunosuppressants such as azathioprine, mycophenolate mofetil, cyclosporine
- For refractory cases: IVIg, rituximab, dupilumab, or omalizumab

### Pemphigus Vulgaris

**Clinical Features**

- autoimmune blistering disease characterized by flaccid, non-pruritic intraepidermal bullae/vesicles on an erythematous or normal skin base
- may present with erosions and secondary bacterial infection
- sites: mouth (90%), scalp, face, chest, axillae, groin, umbilicus
- Nikolsky's sign: epidermal detachment with shear stress
- Asboe-Hansen sign: pressure applied to bulla causes it to extend laterally

**Pathophysiology**

- IgG against epidermal desmoglein-1 and -3 lead to loss of intercellular adhesion in the epidermis

**Epidemiology**

- 40-60 yr, M=F, higher prevalence in Jewish, Mediterranean, Asian populations
- paraneoplastic pemphigus may be associated with thymoma, myasthenia gravis, malignancy, and use of D-penicillamine

**Investigations**

- immunofluorescence: shows intraepidermal IgG and C3 deposition
- circulating serum anti-desmoglein IgG antibodies

**Prognosis**

- lesions heal with hyperpigmentation but do not scar
- may be fatal unless treated with immunosuppressive agents

**Management**

- prednisone 1-2 mg/kg until no new blisters, then 1-1.5 mg/kg until clear, then taper ± steroid-sparing agents (e.g. azathioprine, cyclophosphamide, cyclosporine, IVIg, mycophenolate mofetil, rituximab)

**Pemphigus Vulgaris vs. Bullous Pemphigoid**

Vulgaris = Superficial, intraepidermal, flaccid lesions  
Pemphigoid = Deeper, tense lesions at the dermal-epidermal junction

**Pemphigus Foliaceus**

An autoimmune intraepidermal blistering disease that is more superficial than pemphigus vulgaris due to antibodies against desmoglein-1, a transmembrane adhesion molecule. Appears as crusted patches, erosions and/or flaccid bullae that usually start on the trunk. Localized disease can be managed with topical steroids. Active widespread disease is treated like pemphigus vulgaris

## Dermatitis Herpetiformis

### Clinical Features

- grouped papules/vesicles/urticarial wheals on an erythematous base, associated with intense pruritus, burning, stinging, excoriations
- lesions grouped, bilaterally symmetrical
- common sites: extensor surfaces of elbows/knees, sacrum, buttocks, scalp

### Pathophysiology

- transglutaminase IgA deposits in the skin alone or in immune complexes leading to eosinophil and neutrophil infiltration
- almost all carry human leukocyte antigen (HLA) DQ2 or DQ8, other haplotypes include B8, DR3, and DQWZ
- 90% have gluten-sensitive enteropathy, 20% have intestinal symptoms of celiac disease
- 30% have thyroid disease; increased risk of intestinal lymphoma in untreated comorbid celiac disease; Fe/folate deficiency is common

### Epidemiology

- 20-60 yr, M:F=2:1

### Investigations

- biopsy
- immunofluorescence shows IgA deposits in perilesional skin

### Management

- dapsone (sulfapyridine if contraindicated or poorly tolerated)
- gluten-free diet for life: this can reduce risk of lymphoma

## Porphyria Cutanea Tarda

### Clinical Features

- skin fragility followed by formation of tense vesicles/bullae and erosions on photo-exposed skin
- gradual healing to scars, milia
- periorbital violaceous discolouration, diffuse hypermelanosis, facial hypertrichosis
- common sites: light-exposed areas subjected to trauma, dorsum of hands and feet, nose, and upper trunk

### Pathophysiology

- uroporphyrinogen decarboxylase deficiency leads to excess heme precursors
- can be associated with hemochromatosis, alcohol abuse, DM, drugs (estrogen therapy, NSAIDs), HIV, hepatitis C, increased iron indices

### Epidemiology

- 30-40 yr, M>F

### Investigations

- urine and HCl 5% shows orange-red fluorescence under Wood's lamp (UV rays)
- 24 h urine has elevated uroporphyrins
- stool contains elevated coproporphyrins
- immunofluorescence shows IgE at dermal-epidermal junctions

### Management

- discontinue aggravating substances (alcohol, estrogen therapy)
- phlebotomy to decrease body iron load
- low dose hydroxychloroquine

## Drug Eruptions

### Exanthematous

#### EXANTHEMATOUS DRUG REACTION

### Clinical Features

- morphology: erythematous macules and papules ± scale
- spread: symmetrical, trunk to extremities
- time course: 7-14 d after drug initiation, fades 7-14 d after withdrawal

#### Diagnosis of a Drug Reaction

Classification by Naranjo et al. has 4 criteria:

- Temporal relationship between drug exposure and reaction
- Recognized response to suspected drug
- Improvement after drug withdrawal
- Recurrence of reaction on re-challenge with the drug

Definite drug reaction requires all 4 criteria to be met

Probable drug reaction requires #1-3 to be met

Possible drug reaction requires only #1

**Epidemiology**

- most common cutaneous drug reaction; increased in presence of infections
- common causative agents: penicillin, sulfonamides, phenytoin

**Management**

- weigh risks and benefits of drug discontinuation
- antihistamines, emollients, topical steroids

**Drug Hypersensitivity Syndrome Triad**

- Fever
- Exanthematous eruption
- Internal organ involvement

**DRUG-INDUCED HYPERSENSITIVITY SYNDROME (DIHS)/DRUG REACTION WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS (DRESS)****Clinical Features**

- morphology: morbilliform rash involving face, trunk, arms; can have facial edema
- systemic features: fever, malaise, cervical lymphadenopathy, internal organ involvement (e.g. hepatitis, arthralgia, nephritis, pneumonitis, lymphadenopathy, hematologic abnormalities, thyroid abnormalities)
- spread: starts with face or periorbitally and spreads caudally; no mucosal involvement
- time course: onset 1-6 wk after first exposure to drug; persists wk after withdrawal of drug

**Epidemiology**

- rare: incidence varies considerably depending on drug
- common causative agents: anticonvulsants (e.g. phenytoin, phenobarbital, carbamazepine, lamotrigine), sulfonamides, and allopurinol
- 10% mortality if severe, undiagnosed, and untreated

**Management**

- discontinue offending drug  $\pm$  prednisone 0.5 mg/kg/d, consider cyclosporine in severe cases
- may progress to generalized exfoliative dermatitis/erythroderma if drug is not discontinued

**Urticarial****DRUG-INDUCED URTICARIA AND ANGIOEDEMA****Clinical Features**

- morphology: wheals lasting  $>24$  h unlike non-drug induced urticaria, angioedema (face and mucous membranes)
- systemic features: may be associated with systemic anaphylaxis (bronchospasm, laryngeal edema, shock)
- time course: h-d after exposure depending on the mechanism

**Epidemiology**

- second most common cutaneous drug reaction
- common causative agents: penicillins, ACEI, analgesics/anti-inflammatories, radiographic contrast media

**Management**

- discontinue offending drug, treatment with antihistamines, oral corticosteroids, epinephrine if anaphylactic

**SERUM SICKNESS-LIKE REACTION****Clinical Features**

- morphology: symmetrical cutaneous eruption (usually urticarial)
- systemic features: malaise, low grade fever, arthralgia, lymphadenopathy
- time course: appears 1-3 wk after drug initiation, resolves 2-3 wk after withdrawal

**Epidemiology**

- more prevalent in children (0.02-0.2%)
- common causative agents: cefaclor in children; bupropion in adults

**Management**

- discontinue offending drug  $\pm$  topical/oral corticosteroids

## Pustular

### ACUTE GENERALIZED EXANTHEMATOUS PUSTULOSIS (AGEP)

#### Clinical Features

- morphology: extensive erythematous, edematous, and sterile pustules
- systemic features: high fever, leukocytosis with neutrophilia
- spread: starts in face and intertriginous areas, spreads to trunk and extremities
- time course: appears 1 wk after drug initiation, resolves 2 wk after withdrawal

#### Epidemiology

- rare: 1-5/million
- common causative agents: aminopenicillins, cephalosporins, clindamycin, calcium channel blockers

#### Management

- discontinue offending drug and systemic corticosteroids

## Bullous

### STEVENS-JOHNSON SYNDROME (SJS)/TOXIC EPIDERMAL NECROLYSIS (TEN)

#### Clinical Features

- morphology: prodromal rash (morbilliform/targetoid lesions ± purpura, or diffuse erythema), confluence of flaccid blisters, positive Nikolsky sign (epidermal detachment with shear stress), full thickness epidermal loss; dusky tender skin, bullae, desquamation/skin sloughing, atypical targets
- classification:
  - BSA with epidermal detachment: <10% in SJS, 10-30% in SJS/TEN overlap, and >30% in TEN
- spread: face and extremities; may generalize; scalp, palms, soles relatively spared; erosion of mucous membranes (lips, oral mucosa, conjunctiva, GU mucosa)
- systemic features: fever (higher in TEN), cytopenias, renal tubular necrosis/AKI, tracheal erosion, infection, contractures, corneal scarring, phimosis, vaginal synechiae
- time course: appears 1-3 wk after drug initiation; progression <4 d; epidermal regrowth in 3 wk
- can have constitutional symptoms: malaise, fever, hypotension, tachycardia

#### Epidemiology

- SJS: 1.2-6/million; TEN: 0.4-1.2/million
- risk factors: SLE, HIV/AIDS, HLA-B1502 (reaction most prevalent in East Asians, associated with carbamazepine), HLA-B5801 (reaction most prevalent in Asian and White populations, associated with allopurinol)
- common causative agents: drugs (allopurinol, anti-epileptics, sulfonamides, NSAIDs, cephalosporins) responsible in 50% of SJS and 80% of TEN; viral or mycoplasma infections
- prognosis: 5% mortality in SJS, 30% in TEN due to fluid loss and infection

#### Differential Diagnosis

- scarlet fever, phototoxic eruption, GVHD, SSSS, exfoliative dermatitis, AGEP, paraneoplastic pemphigus

#### Management

- discontinue offending drug
- admit to intermediate/intensive care/burn unit
- supportive care: IV fluids, electrolyte replacement, nutritional support, pain control, wound care, sterile handling, monitor for and treat infection
- IV Ig, cyclosporine, or etanercept

## Other

### FIXED DRUG ERUPTION

#### Clinical Features

- morphology: sharply demarcated erythematous oval patches on the skin or mucous membranes
- spread: commonly face, mucosa, genitalia, acral; recurs in same location upon subsequent exposure to the drug (fixed location)

#### Epidemiology

- common causative agents: antimicrobials (tetracycline, sulfonamides), anti-inflammatories, psychoactive agents (barbiturates), phenolphthalein

#### Management

- discontinue offending drug ± prednisone 1 mg/kg/d x 2 wk for generalized lesions
- potent topical corticosteroids for non-eroded lesions or antimicrobial ointment for eroded lesions

#### SCORTEN Score for TEN Prognosis

One point for each of: age ≥40, malignancy, initial BSA detached ≥10%, tachycardia ≥120 bpm, serum urea >10 mmol/L, serum glucose >14 mmol/L, serum bicarbonate <20 mmol/L

Used to determine appropriate clinical setting: score 0-1 can be treated in non-specialized wards; score ≥2 should be transferred to intensive care or burn unit

Score at admission is predictive of survival: 94% for 0-1, 87% for 2, 53% for 3, 25% for 4, and 17% for ≥5

#### Systemic Immunomodulating Therapies for Stevens-Johnson Syndrome and Toxic Epidermal Necrolysis: A Systematic Review and Meta-analysis

JAMA Dermatol 2017;153:514-522

**Purpose:** To examine possible immunomodulating treatments for SJS/TEN and estimate mortality effect compared to supportive care.

**Methods:** Systematic review of randomized and nonrandomized studies on systemic immunomodulating therapies or supportive care for SJS/TEN.

**Results:** Ninety-six studies with 3248 patients were included in the final analysis. Glucocorticoids were associated with a survival benefit for patients (aggregate -OR 0.5, 95% CI 0.3-1.0). Though findings were limited to a small number of patients overall, cyclosporine was associated with significant benefit (OR 0.1; 95% CI 0.0-0.4). No beneficial effects were observed with other therapies, including IV Ig.

**Conclusion:** Though based on limited evidence, glucocorticoids and cyclosporine were most promising as SJS/TEN immunosuppressive therapies.

## PHOTOSENSITIVITY REACTION

### Clinical Features

- phototoxic reaction: "exaggerated sunburn" (erythema, edema, vesicles, bullae) confined to sun-exposed areas
- photoallergic reaction: pruritic eczematous eruption with papules, vesicles, scaling, and crusting that may spread to areas not exposed to light

### Pathophysiology

- phototoxic reaction: direct tissue injury
- photoallergic reaction: type IV delayed hypersensitivity

### Epidemiology

- common causative agents: chlorpromazine, doxycycline, thiazide diuretics, procainamide

### Management

- sun protection ± topical/oral corticosteroids

## Heritable Disorders

### Ichthyosis Vulgaris

#### Clinical Features

- xerosis with fine scaling as well as large adherent scales ("fish-scales")
- affects arms, legs, palms, soles, back, forehead, and cheeks; spares flexural creases
- improves in summer, with humidity, and as the child grows into adulthood

#### Pathophysiology

- genetic deficiency in filaggrin protein leads to abnormal retention of keratinocytes (hyperkeratosis)
- scaling without inflammation

#### Epidemiology

- 1:300 incidence
- autosomal dominant inheritance
- associated with AD and keratosis pilaris

#### Investigations

- electron microscopy: keratohyalin granules

#### Management

- immersion in bath and oils followed by an emollient cream, humectant cream, or creams/oil containing urea or  $\alpha$ - or  $\beta$ -hydroxy acids
- intermittent systemic retinoids for severe cases

### Epidermolysis Bullosa

#### Clinical Features

- blisters and erosions on skin and mucous membranes following minor trauma
- extracutaneous manifestation may occur in severe disease and include intraoral blistering and erosions, nail abnormalities, esophageal strictures, and genitourinary abnormalities

#### Pathophysiology

- group of rare inherited diseases caused by mutations in genes coding for structural proteins involved in basement membrane of skin

#### Differential Diagnosis

- friction blisters, epidermolysis bullosa acquisita

#### Investigations

- skin biopsy for immunofluorescence mapping

#### Management

- symptomatic management
- avoid inducing friction on skin
- place padding on furniture
- wear loose clothing and appropriate footwear
- maintain cool ambient room temperature

## Neurofibromatosis (Type I; von Recklinghausen's Disease)

### Clinical Features

- diagnostic criteria includes 2 or more of the following, if parent not diagnosed with NF1:
  - 1.6 or more café-au-lait patches >1.5 cm in an adult or 6 or more café-au-lait macules >0.5 cm in prepubertal individuals
  2. axillary or inguinal freckling
  3. 2 or more iris hamartomas (Lisch nodules)
  4. optic glioma
  5. 2 or more neurofibromas of any type or one plexiform neurofibroma
  6. distinctive bony lesion (sphenoid wing dysplasia or thinning of long bone cortex)
  7. heterozygous pathogenic NF1 variant with a variant allele fraction of 50% in normal tissue
- a child of a parent who meets the diagnostic criteria above needs 1 or more to be diagnosed with NF1
- associated with pheochromocytoma, astrocytoma, bilateral acoustic neuromas, bone cysts, scoliosis, precocious puberty, developmental delay, and renal artery stenosis
- skin lesions less prominent in neurofibromatosis Type II (see [Paediatrics, P89](#))

### Pathophysiology

- autosomal dominant disorder with excessive and abnormal proliferation of neural crest elements (Schwann cells, melanocytes), high incidence of spontaneous mutation
- linked to absence of neurofibromin (a tumour suppressor gene)

### Epidemiology

- incidence 1 in 3000

### Investigations

- Wood's lamp to detect café-au-lait macules in patients with pale skin

### Management

- refer to orthopaedics, ophthalmology, plastics, and psychiatry
- follow-up annually for brain tumours (e.g. astrocytoma)
- excise suspicious or painful lesions
- see [Paediatrics, P89](#)

## Oculocutaneous Albinism

### Clinical Features

- hypopigmentation of skin and hair, including eyebrows and eyelashes, compared to family members and persons of same ethnicity
- ocular involvement: decreased retinal pigmentation, impaired vision, photophobia, nystagmus, strabismus

### Pathophysiology

- group of genetic disorders of melanin biosynthesis
- autosomal recessive

### Epidemiology

- 1 in 20000
- varies across ethnic groups

### Investigations

- often clinical diagnosis, may consider molecular testing

### Management

- sun protection
- close surveillance for skin cancers with whole body skin examinations

## Vitiligo

### Clinical Features

- primary pigmentary disorder characterized by depigmentation
- acquired destruction of melanocytes characterized by sharply demarcated white patches
- associated with streaks of depigmented hair, chorioretinitis
- sites: extensor surfaces and periorificial areas (mouth, eyes, anus, genitalia)
- Koebner phenomenon, may be precipitated by trauma

### Pathophysiology

- acquired autoimmune destruction of melanocytes

### Interventions for Vitiligo

Cochrane DB Syst Rev 2015;2:CD003263

**Purpose:** To assess the effects of existing interventions used in the management of vitiligo.  
**Method:** Systematic review of RCTs assessing the effects of vitiligo treatments (topical treatments, light therapies, oral treatments, surgical methods). Primary outcomes were quality of life and >75% re-pigmentation.

**Results:** Ninety-six RCTs with 4512 participants were deemed eligible, of which only 25 reported on the primary outcomes and were finally included. Re-pigmentation was better with combination therapy (calcipotriol plus PUVA, than PUVA alone, hydrocortisone-17-butyrate plus excimer laser vs. excimer laser alone; oral minipulse of prednisolone (OMP) plus narrowband UVB (NB-UVB) vs. OMP alone; azathioprine with PUVA vs. PUVA alone; 8-methoxypsoralen (8-MOP) plus sunlight vs. psoralen). A non-significant increase in proportion of participants with >75% re-pigmentation was noted in favour of NB-UVB compared to PUVA. Compared to PUVA, the NB-UVB group reported lower incidences of nausea and erythema, but not itching.

**Conclusions:** Some studies support existing therapies for vitiligo management, but follow-up is needed to assess permanence of re-pigmentation and higher quality RCTs need to be conducted.

**Epidemiology**

- 1 in 100 incidence
- 30 in 100 with positive family history

**Investigations**

- rule out associated autoimmune diseases: thyroid disease, pernicious anemia, Addison's disease, T1DM
- Wood's lamp to detect lesions: illuminates UV light onto skin to detect amelanosis (porcelain white discoloration)

**Management**

- sun avoidance and protection
- topical calcineurin inhibitor (e.g. tacrolimus, pimecrolimus) or topical corticosteroids
- PUVA or NB-UVB
- camouflage
- "bleaching" normal pigmented areas (i.e. monobenzyl ether of hydroquinone 20%) if widespread loss of pigmentation

## Infections

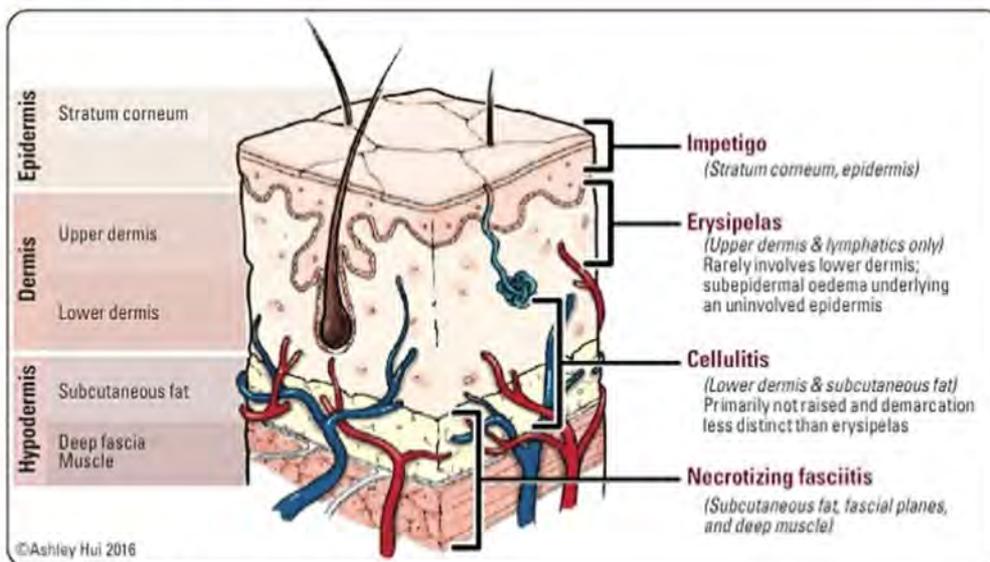

Figure 11. Layers of skin affected by bacterial infections

## Bacterial Infections: Epidermis

**IMPETIGO****Clinical Features**

- acute purulent infection which appears vesicular; progresses to golden yellow "honey-crusted" lesions surrounded by erythema
- can present with bullae
- common sites: face, arms, legs, and buttocks

**Etiology**

- GAS, *S. aureus*, or both

**Epidemiology**

- preschool and young adults living in crowded conditions, poor hygiene, neglected minor trauma

**Differential Diagnosis**

- infected eczema, HSV, VZV

**Investigations**

- usually clinical diagnosis
- Gram stain and culture of lesion fluid or biopsy

**Management**

- remove crusts, use saline compresses, and topical antiseptic soaks BID
- topical antibiotics (e.g. mupirocin 2% or fusidic acid 2% (Canada only) TID; continue for 7-10 d after resolution, or ozenaxacin 1% cream BID for 5 d)
- systemic antibiotics (e.g. cloxacillin or cephalexin for 7-10 d)

**Staphylococcal Scalded Skin Syndrome**

- see [Emergency Medicine](#), ER43

**Bacterial Infections: Dermis**

**Table 17. Comparison of Erysipelas and Cellulitis**

	Clinical Features	Etiology	Complications	Differential Diagnosis	Investigations	Management
<b>Erysipelas</b>	Involves upper dermis Confluent, erythematous, sharp raised edge, warm plaque, well demarcated Very painful ("St. Anthony's fire") Sites: face and legs Systemic symptoms: fever, chills, headache, weakness (if present, sign of more serious infection)	GAS	Scarlet fever, streptococcal gangrene, fat necrosis, coagulopathy Spreads via lymphatics	DVT (less red, less hot, smoother), superficial phlebitis, contact dermatitis, photosensitivity reaction, stasis dermatitis, panniculitis, vasculitis	Clinical diagnosis; rarely do skin/blood culture If suspect necrotizing fasciitis: do immediate biopsy and frozen section, histopathology	1st line: penicillin, cephalexin, cloxacillin or cefazolin 2nd line: clindamycin If allergic to penicillin, use erythromycin
<b>Cellulitis</b>	Involves lower dermis/subcutaneous fat Unilateral erythematous flat lesion, often with vesicles, poorly demarcated, not uniformly raised Tender Sites: commonly on legs Systemic symptoms (uncommon): fever, leukocytosis, lymphadenopathy	GAS, <i>S. aureus</i> (large sized wounds), <i>Haemophilus influenzae</i> (peri-orbital), <i>Pasteurella multocida</i> (dog/cat bite)	Uncommon	Same as erysipelas	Same as erysipelas	1st line: cloxacillin or cefazolin/cephalexin clindamycin Hospitalized and MRSA positive: vancomycin Children: cefuroxime If DM (foot infections): TMP/SMX and metronidazole

**COMMON HAIR FOLLICLE INFECTIONS**

**Table 18. Comparison of Superficial Folliculitis, Furuncles, and Carbuncles**

	Clinical Features	Etiology	Management
<b>Superficial Folliculitis</b>	Superficial infection of the hair follicle (versus pseudofolliculitis: inflammation of follicle due to friction, irritation, or occlusion) Acute lesion consists of a dome-shaped pustule at the mouth of hair follicle Pustule ruptures to form a small crust Sites: primarily scalp, shoulders, anterior chest, upper back, other hair-bearing areas	Normal non-pathogenic bacteria ( <i>Staphylococcus</i> – most common; <i>Pseudomonas</i> – hot tub) <i>Pityrosporum</i>	Antiseptic (Hibiclens®) Topical antibacterial (fusidic acid, mupirocin, erythromycin, or clindamycin) Oral cloxacillin or cephalexin for 7-10 d
<b>Furuncles (Boils)</b>	Red, hot, tender, inflammatory nodules with central yellowish point, which forms over summit and ruptures Involves subcutaneous tissue that arises from a hair follicle Sites: hair-bearing skin (thigh, neck, face, axillae, perineum, buttocks)	<i>S. aureus</i>	Incise and drain large furuncles to relieve pressure and pain If afebrile: hot wet packs, topical antibiotic If febrile/cellulitis: culture blood and aspirate pustules (Gram stain and CBS) Cloxacillin or cephalexin for 1-2 wk (especially for lesions near external auditory canal/nose, with surrounding cellulitis, and not responsive to topical therapy)
<b>Carbuncles</b>	Deep-seated abscess formed by multiple coalescing furuncles Usually in areas of thicker skin Occasionally ulcerates Lesions drain through multiple openings to the surface Systemic symptoms may be associated	<i>S. aureus</i>	Same as for furuncles

**SKIN ABSCESS**

**Clinical Features**

- painful, fluctuant, erythematous nodule, with or without surrounding cellulitis
- spontaneous drainage or purulent material may be discharged, regional adenopathy may be observed
- may progress to furuncle (deep infection of hair follicle) or carbuncle (collection of furuncles)
- sites: back of the neck, face, axillae, buttocks

**Pathophysiology**

- one or more pathogens; *S. aureus* with GAS and gram-negative bacilli with anaerobes is common in the perioral, perirectal, or vulvovaginal areas
- collection of pus within the dermis or subcutaneous tissue

**Investigations**

- clinical diagnosis; laboratory testing with uncomplicated infection in absence of comorbidities or complications is not required

**Management**

- if drainable abscess, incise and drain
- culture of debrided materials and antibiotics for the following circumstances:
  - severe local infection, systemic signs of infection, history of multiple/recurrent abscesses, presence of underlying comorbidities, immunosuppression, failure of initial antibiotic therapy, extremes of age (i.e. very young or very old), special exposures (e.g. animal bites), prophylaxis against infective endocarditis
- culture of debrided materials is not required in healthy patients who do not receive antibiotics

**Bacterial Infections: Epidermis and Dermis****CUTANEOUS ANTHRAX****Clinical Features**

- painless, pruritic, red-brown papule with surrounding edema and erythema
- lesions blister and then ulcerate, developing a black eschar
- often associated with systemic symptoms: lymphadenopathy, fever, myalgia, nausea, vomiting

**Pathophysiology**

- caused by *Bacillus anthracis*

**Investigations**

- Gram stain and culture
- polymerase chain reaction (PCR)
- full-thickness punch biopsy

**Management**

- oral antibiotic: ciprofloxacin, levofloxacin, or doxycycline

**LEPROSY**

- see [Infectious Diseases](#), ID21

**PILONIDAL CYST**

- see [General and Thoracic Surgery](#), GS49

**Dermatophytoses****Clinical Features**

- infection of skin, hair, and nails caused by dermatophytes (fungi that live within the epidermal keratin or hair follicle and do not penetrate into deeper structures)

**Pathophysiology**

- digestion of keratin by dermatophytes resulting in scaly skin, broken hairs, crumbling nails/onycholysis

**Etiology**

- *Trichophyton*, *Microsporum*, *Epidermophyton* species (*Pityrosporum* is a superficial yeast and not a dermatophyte)

**Investigations**

- skin scrapings, hair, and/or nail clippings analyzed with potassium hydroxide (KOH) prep to look for hyphae and mycelia

**Management**

- topicals as first line agents for tinea corporis/cruris and tinea pedis (interdigital type): clotrimazole, ketoconazole, terbinafine, or ciclopirox olamine cream applied BID
- oral therapy is indicated for onychomycosis and tinea capitis: terbinafine (Lamisil® – CYP2D6 inhibitor, liver toxicity) or itraconazole (Sporanox® – CYP3A4 inhibitor, liver toxicity)

**A Placebo-Controlled Trial of Antibiotics for Smaller Skin Abscesses**

NEJM 2017;376:2545-2555

**Purpose:** To determine the appropriate management of uncomplicated skin abscesses.**Study:** Multi-centre, prospective, double-blind trial involving outpatient adults and children with abscesses 5 cm or smaller, stratified by presence of surgically drainable abscess, abscess size, number of sites of skin infection, and presence of non-purulent cellulitis. Following incision and drainage, participants were randomly assigned to 10 d courses of clindamycin, TMP-SMX or placebo. Primary outcome was clinical cure 7 to 10 d after treatment end. Intention-to-treat analyses were conducted.**Results:** Seven hundred and eighty-six participants were enrolled (505 adults, 281 children). 10 d after therapy, the cure rate was similar between clindamycin and TMP-SMX (83.1% vs. 81.7%;  $P=0.73$ ), and was higher than that of the placebo group (68.9%;  $P=0.001$  for both comparisons). Among those who were cured, new infections at 1 mo follow-up were less common in the clindamycin group than the TMP-SMX or placebo groups (6.8% vs. 11.1%;  $P=0.03$  vs. 12.4%;  $P=0.06$ ). Adverse events were more frequent with clindamycin than either of the other groups (21.9% vs. 11.1% vs. 12.5%), though all resolved without sequelae.**Conclusions:** Clindamycin or TMP-SMX in conjunction with incision and drainage for simple abscesses improves short-term outcomes compared to incision and drainage alone, though side effects must be considered.

Table 19. Different Manifestations of Dermatophyte Infection

	Clinical Features	Differential Diagnosis	Investigations	Management
<b>Tinea Capitis</b>	Round, scaly patches of alopecia, possibly with broken off hairs; pruritic Sites: scalp, eyelashes, and eyebrows; involving hair shafts and follicles Kerion (boggy, elevated, purulent inflamed nodule/plaque) may form secondary to infection by bacteria and result in scarring May have occipital lymphadenopathy Affects children (mainly Black), immunocompromised adults Very contagious and may be transmitted from barber, hats, theatre seats, pets	Alopecia areata, psoriasis, seborrheic dermatitis, trichotillomania	Wood's light examination of hair; green fluorescence only for <i>Microsporum</i> infection Culture of scales/hair shaft Microscopic examination of KOH preparation of scales or hair shafts	Terbinafine (Lamisil®) x 4 wk N.B.: oral agents are required to penetrate the hair root where dermatophyte resides Adjunctive antifungal shampoos or lotions may be helpful, and may prevent spread (e.g. selenium sulfide 2.5%, ketoconazole, ciclopirox)
<b>Tinea Corporis (Ringworm)</b>	Pruritic, scaly, round/oval plaque with active erythematous margin, ± central clearing Sites: trunk, limbs, face	Granuloma annulare, pityriasis rosea, psoriasis, seborrheic dermatitis	Microscopic examinations of KOH prep of scales show hyphae Culture of scales	Topicals: clotrimazole 1%, ketoconazole 2%, miconazole 2%, terbinafine, or ciclopirox olamine cream BID for 2-4 wk Oral: terbinafine (Lamisil®), or itraconazole (Sporanox®), or fluconazole, or ketoconazole if extensive
<b>Tinea Cruris ("Jock Itch")</b>	Scaly patch/plaque with a well-defined, curved border and central clearing Pruritic, erythematous, dry/macerated Sites: starts medial thigh, spreads centrifugally to perineum, gluteal cleft, buttocks	Candidiasis (involvement of scrotum and satellite lesions), contact dermatitis, erythrasma		
<b>Tinea Pedis (Athlete's Foot)</b>	Pruritic scaling and/or maceration of the web spaces, and powdery scaling of soles Acute infection: interdigital (especially 4th web space) red/white scales, vesicles, bullae, often with maceration Secondary bacterial infection may occur Chronic: non-pruritic, pink, scaling keratosis on soles, and sides of feet May present as flare-up of chronic tinea pedis Predisposing factors: heat, humidity, occlusive footwear	AD, contact dermatitis, dyshidrotic dermatitis, erythrasma, intertrigo, inverse psoriasis		
<b>Tinea Manuum</b>	Primary fungal infection of the hand is rare; usually associated with tinea pedis Acute: blisters at edge of red areas on hands Chronic: single dry scaly patch	AD, contact dermatitis, granuloma annulare, psoriasis		
<b>Tinea Unguium (Onychomycosis)</b>	Crumbling, distally dystrophic nails; yellowish, opaque with subungual hyperkeratotic debris Toenail infections usually precede fingernail infections <i>T. rubrum</i> (90% of all toenail infections)	Psoriasis, lichen planus, contact dermatitis, traumatic onychodystrophy, bacterial infection	Microscopic examinations of KOH prep of scales from subungual scraping shows hyphae Culture of subungual scraping or nail clippings on Sabouraud's agar Periodic acid-Schiff (PAS) stain of nail clipping by pathology	Terbinafine (Lamisil®) (6 wk for fingernails, 12 wk for toenails) Itraconazole (Sporanox®) 7 d on, 3 wk off (2 pulses for fingernails, 3 pulses for toenails) Topical: ciclopirox (Penlac®); nail lacquer (often ineffective), Eflinaconazole (Jublia®) (48 wk)
<b>Tinea Barbae</b>	Superficial inflamed annular lesions; pustules and crusting around hairs Inflammatory kerion may occur and result in scarring hair loss Predominantly affects men who work with animals Site: beard area	Folliculitis, malignant lymphoma, sporotrichosis	Same as for tinea corporis	Terbinafine (Lamisil®) or Itraconazole (Sporanox®) x 4 wk

**DIAPER RASH**

- see Paediatrics, P15, P44

**Parasitic Infections****CUTANEOUS LARVA MIGRANS****Clinical Features**

- erythematous pruritic papules at site of initial infection
- larvae migrate under skin causing serpiginous eruption of red pruritic lines
- sites: often feet, legs, buttocks; anywhere skin comes into contact with contaminated sand or soil

**Pathophysiology**

- parasitic infection caused by hookworm larvae, most commonly from dog or cat feces

**Epidemiology**

- most common in tropical or subtropical regions

**Management**

- self-limiting, often resolves without treatment within a few weeks
- consider treatment with anthelmintics, antihistamines

**CUTANEOUS LEISHMANIASIS****Clinical Features**

- begins as a solitary pink painless papule, enlarges to nodule or plaque-like lesion with central ulceration
- incubation time typically 2 wk to 6 mo

**Pathophysiology**

- transmitted by sandflies infected with *Leishmania*

**Investigations**

- histology, culture, and PCR

**Management**

- most cases resolve spontaneously
- may consider treatment with oral antifungals (e.g. fluconazole, ketoconazole) or parenteral treatment in severe or complicated cases

**SCABIES****Clinical Features**

- characterized by superficial burrows, intense pruritus (especially nocturnal), and secondary infection
- primary lesion: superficial linear burrows; inflammatory papules and nodules in the axilla and groin
- secondary lesion: small urticarial crusted papules, eczematous plaques, excoriations
- common sites: axillae, groin, buttocks, hands/feet (especially web spaces); sparing of head and neck (except in infants)

**Pathophysiology**

- scabies mite remains alive 2-3 d on clothing/sheets
- incubation of 1 mo, then pruritus begins
- re-infection followed by hypersensitivity in 24 h

**Etiology**

- Sarcoptes scabiei* (a mite)
- risk factors: sexual promiscuity, crowding, poverty, nosocomial, immunocompromised

**Differential Diagnosis**

- asteatotic eczema, dermatitis herpetiformis, lichen simplex chronicus (neurodermatitis)

**Investigations**

- microscopic examination of root and content of burrow and mineral oil mount for mite, eggs, feces
- skin biopsy may sometimes show scabies mite

**Management**

- bathe, then apply permethrin 5% cream (i.e. Nix<sup>®</sup>) from neck down to soles of feet (must be left on for 8-14 h and requires second treatment 7 d after first treatment)
- Ivermectin
- change underwear and linens; wash twice with detergent in hot water cycle then machine dry
- treat family and close contacts
- pruritus may persist for 2-3 wk after effective treatment due to prolonged hypersensitivity reaction
- mid-potency topical steroids and antihistamines for symptom management after treatment with permethrin

**LICE (PEDICULOSIS)****Clinical Features**

- intensely pruritic, red excoriations, morbilliform rash, caused by louse (a parasite)
- scalp lice: nits (i.e. louse eggs) on hairs; red, excoriated skin with secondary bacterial infection, lymphadenopathy
- pubic lice: nits on hairs; excoriations
- body lice: nits and lice in seams of clothing; excoriations and secondary infection mainly on shoulders, belt-line, and buttocks

**Etiology**

- Phthirus pubis* (pubic), *Pediculus humanus capitis* (scalp), *Pediculus humanus humanus* (body): attaches to body hair and feeds on the nearby body site
- can transmit infectious agents (e.g. *Bartonella quintana*, *Rickettsia prowazekii*)

**Differential Diagnosis**

- bacterial infection of scalp, seborrheic dermatitis

**Diagnosis**

- lice visible on inspection of affected area or clothing seams

**Management**

- permethrin 1%: Nix<sup>®</sup> cream rinse (ovicidal), RC & Cor<sup>®</sup> shampoo, or Kwellada-P<sup>®</sup> shampoo
- comb hair with fine-toothed comb using dilute vinegar solution to remove nits
- repeat in 7 d after first treatment
- shave hair if feasible, change clothing and linens; wash with detergent in hot water cycle then machine dry
- children are medically cleared to return to school after first treatment

**BED BUGS (HEMIPTERA)****Clinical Features**

- burning wheals, turning to firm papules, often in groups of three – “breakfast, lunch, and dinner” – in areas with easy access (face, neck, arms, legs, hands)

**Etiology**

- caused by *Cimex lectularius*, a small insect that feeds mainly at night (hides in crevices in walls and furniture during the day)

**Differential Diagnosis**

- dermatitis herpetiformis, drug eruptions, ecthyma, other insect bites, scabies

**Investigations**

- none required, but lesional biopsy can confirm insect bite reaction

**Management**

- professional fumigation
- topical steroids and oral H1-antagonists for symptomatic relief
- definitive treatment is removal of clutter in home and application of insecticides to walls and furniture

**Viral Infections****HERPANGINA****Clinical Features**

- small vesicles form in mouth after exposure to virus
- lesions evolve into painful shallow oral ulcers, 1-5 mm in size, yellowish with an erythematous base
- often associated with sore throat, dysphagia, and headache

**Pathophysiology**

- caused by Coxsackie A viruses, highly contagious

**Epidemiology**

- most common in children and young adults

**Investigations**

- typically clinical diagnosis

**Management**

- self-limited
- symptomatic treatment, acetaminophen for fever and pain

**HERPES SIMPLEX VIRUS****Clinical Features**

- herpetiform (i.e. grouped) vesicles on an erythematous base on skin or mucous membranes
- transmitted via contact with erupted vesicles or via asymptomatic viral shedding
- primary
  - children and young adults
  - usually asymptomatic; may have high fever, regional lymphadenopathy, malaise
  - followed by antibody formation and latency of virus in dorsal nerve root ganglion
- secondary
  - recurrent form seen in adults; much more common than primary
  - prodrome: tingling, pruritus, pain
  - triggers for recurrence: fever, excess sun exposure, physical trauma, menstruation, emotional stress, URTI
- complications: dendritic corneal ulcer, EM, herpes simplex encephalitis (infants at risk), HSV infection on AD causing Kaposi's varicelliform eruption (eczema herpeticum)

- two biologically and immunologically different subtypes: HSV-1 and HSV-2
  - HSV-1
    - typically "cold sores" (grouped vesicles at the mucocutaneous junction which quickly burst)
    - recurrent on face, lips, and hard palate, but NOT on soft, non-keratinized mucous membranes (unlike aphthous ulcers)
  - HSV-2
    - usually sexually transmitted; incubation 2-20 d
    - gingivostomatitis: entire buccal mucosa involved with erythema and edema of gingiva
    - vulvovaginitis: edematous, erythematous, extremely tender, profuse vaginal discharge
    - urethritis: watery discharge in males
    - recurrent on vulva, vagina, penis for 5-7 d
    - differential diagnosis of genital ulcers: candidal balanitis, chancroid, syphilitic chancres

Both HSV-1 and HSV-2 can occur on face or genitalia

### Investigations

- Tzanck smear with Giemsa stain shows multinucleated giant epithelial cells
- viral culture, electron microscopy, PCR, and direct fluorescence antibody test of specimen taken from the base of a relatively new lesion
- serologic testing for antibody for current or past infection if necessary

### Management

- HSV-1
  - treat during prodrome to prevent vesicle formation
  - topical antiviral (Zovirax<sup>®</sup>/Xerese<sup>®</sup>) cream, apply 5-6 times daily for 4-7 d for facial/genital lesions
  - oral antivirals (e.g. acyclovir, famciclovir, valacyclovir) are far more effective and have an easier dosing schedule than topicals
- HSV-2
  - rupture vesicle with sterile needle if you wish to culture it
  - wet dressing with aluminum subacetate solution, Burow's compression, or betadine solution
  - 1st episode: acyclovir 200 mg PO 5x times daily x 10 d
    - maintenance: acyclovir 400 mg PO BID
  - famciclovir and valacyclovir may be substituted and have better enteric absorption and less frequent dosing
  - in case of herpes genitalis, look for and treat any other STIs
  - for active lesions in pregnancy (see [Obstetrics, OB31](#))

#### Erythema Multiforme

**Etiology:** most often HSV or *Mycoplasma pneumoniae*, rarely drugs  
**Morphology:** macules/papules with central vesicles; classic bull's-eye pattern of concentric light and dark rings (typical target lesions)  
**Management:** symptomatic treatment (oral antihistamines, oral antacids); corticosteroids in severely ill (controversial); prophylactic oral acyclovir for 6-12 mo for HSV-associated EM with frequent recurrences

## HERPES ZOSTER VIRUS (SHINGLES)

### Clinical Features

- unilateral dermatomal eruption occurring 3-5 d after pain and paresthesia of that dermatome
- vesicles, bullae, and pustules on an erythematous, edematous base
- lesions may become eroded/ulcerated and last days to weeks
- pain can be pre-herpetic, synchronous with rash, or post-herpetic
- severe post-herpetic neuralgia often occurs in elderly
- Ramsay Hunt syndrome (see [Otolaryngology, OT23](#))
- Hutchinson's sign: shingles on the tip of the nose signifies ocular involvement
  - shingles in this area involves the nasociliary branch of the ophthalmic branch of the trigeminal nerve (V1)
- distribution: thoracic (50%), trigeminal (10-20%), cervical (10-20%); disseminated in HIV

HZV typically involves a single dermatome; and lesions rarely cross the midline

### Etiology

- caused by reactivation of VZV
- risk factors: immunosuppression, old age, occasionally associated with hematologic malignancy

### Differential Diagnosis

- before thoracic skin lesions occur, must consider other causes of chest pain
- contact dermatitis, localized bacterial infection, zosteriform HSV (more pathogenic for the eyes than VZV)

### Investigations

- none required, but can do Tzanck test, direct fluorescence antibody test, or viral culture to rule out HSV

### Prevention

- routine vaccination in >50 yr with Shingrix<sup>®</sup> (recombinant zoster vaccine) preferred to in >60 yr Zostavax<sup>®</sup> (live zoster vaccine)

### Management

- compress with normal saline, Burow's or betadine solution
- oral antivirals: famciclovir, valacyclovir, or acyclovir for 7 d; must initiate within 72 h to be of benefit
- analgesia: NSAIDs, acetaminophen for mild-moderate pain; opioids if severe
- post-herpetic neuralgia: tricyclic antidepressants, anticonvulsants (gabapentin, pregabalin)

## MOLLUSCUM CONTAGIOSUM

### Clinical Features

- discrete dome-shaped and umbilicated pearly, white papules caused by DNA Pox virus (Molluscum contagiosum virus)
- common sites: eyelids, beard (likely spread by shaving), neck, axillae, trunk, perineum, buttocks

### Etiology

- virus is spread via direct contact, auto-inoculation, sexual contact
- common in children and sexually active young adults (giant molluscum and severe cases can be seen in the setting of HIV)
- virus is self-limited and can take 1-2 yr to resolve

### Investigations

- none required, however can biopsy to confirm diagnosis

### Management

- topical cantharidin
- cryotherapy
- curettage
- topical retinoids
- Aldara® (imiquimod): immune modulator that produces a cytokine inflammation

## WARTS (HUMAN PAPILLOMAVIRUS INFECTIONS)

Table 20. Different Manifestations of HPV Infection

	Definition and Clinical Features	Differential Diagnosis	Distribution	HPV Type
<b>Verruca Vulgaris</b> (Common Warts)	Hyperkeratotic, elevated, discrete epithelial growths with papillated surface caused by HPV Paring of surface reveals punctate, red-brown specks (thrombosed capillaries)	Molluscum contagiosum, seborrheic keratosis	Located at trauma sites: fingers, hands, knees of children and teens	At least 80 types are known
<b>Verruca Plantaris</b> (Plantar Warts)	Hyperkeratotic, shiny, sharply marginated growths	May need to scrape ("pare") lesions to differentiate wart from callus and corn	Located at pressure sites: metatarsal heads, heels, toes	Commonly HPV 1, 2, 4, 10
<b>Verruca Palmaris</b> (Palmar Warts)	Paring of surface reveals red-brown specks (capillaries), interruption of epidermal ridges			
<b>Verruca Planae</b> (Flat Warts)	Multiple discrete, skin coloured, flat topped papules grouped or in linear configuration Common in children	Syringoma, seborrheic keratosis, molluscum contagiosum, lichen planus	Sites: face, dorsa of hands, shins, knees	Commonly HPV 3, 10
<b>Condyloma Acuminata</b> (Genital Warts)	Skin-coloured pinhead papules to soft cauliflower-like masses in clusters Can be asymptomatic, lasting months to years Highly contagious, transmitted sexually and non-sexually (e.g. Koebner phenomenon via scratching, shaving), and can spread without clinically apparent lesions Investigations: acetowhitening (subclinical lesions seen with acetic acid 5% x5 min and hand lens) Complications: fairy-ring warts (satellite warts at periphery of treated area of original warts)	Condyloma lata (secondary syphilitic lesion, dark field strongly +ve), molluscum contagiosum	Sites: genitalia and perianal areas	Commonly HPV 6 and 11 HPV 16, 18, 31, 33 cause cervical dysplasia, SCC, and invasive cancer

### Treatment for Warts

- first line therapies
  - salicylic acid preparations (patches, solutions, creams, ointments), cryotherapy
- second line therapies
  - topical imiquimod, topical 5-fluorouracil, topical tretinoin, podophyllotoxin
- third line therapies
  - curettage, cautery, surgery for non plantar warts, CO<sub>2</sub> laser, oral cimetidine (particularly children), intralesional bleomycin (plantar warts), trichloroacetic acid, diphencyprone

### CHICKEN POX (VARICELLA)

- see [Paediatrics, P63](#)

### ERYTHEMA INFECTIONOSUM (FIFTH DISEASE)

- see [Paediatrics, P62](#)

### HAND-FOOT-AND-MOUTH DISEASE

- see [Paediatrics, P62](#)

### MEASLES

- see [Paediatrics, P62](#)

### PARVOVIRUS

- see [Paediatrics, P62](#)

**ROSEOLA**

- see [Paediatrics, P62](#)

**RUBELLA**

- see [Paediatrics, P63](#)

**VERRUCAE VULGARISMS**

- see [Table 20, D36](#)

**Yeast Infections****CANDIDIASIS****Etiology**

- many species of *Candida* (70-80% of infections are from *Candida albicans*)
- opportunistic infection in those with predisposing factors (e.g. trauma, malnutrition, immunodeficiency)

**Candidal Paronychia**

- clinical features: painful red swelling of periungual skin
- management: topical agents not as effective; oral antifungals recommended

**Candidal Intertrigo**

- clinical features
  - macerated/eroded erythematous patches that may be covered with papules and pustules, located in intertriginous areas often under breast, groin, or interdigitally
  - peripheral "satellite" pustules
  - starts as non-infectious maceration from heat, moisture, and friction
- predisposing factors: obesity, DM, systemic antibiotics, immunosuppression, malignancy
- management: keep area dry, terbinafine, ciclopirox olamine, ketoconazole/clotrimazole cream BID until rash clears

Oral terbinafine (Lamisil<sup>®</sup>) is not effective because it is not secreted by sweat glands

**PITYRIASIS (TINEA) VERSICOLOR****Clinical Features**

- asymptomatic superficial fungal infection with brown/white scaling macules
- affected skin darker than surrounding skin in winter, lighter in summer (does not tan)
- common sites: upper chest and back

**Pathophysiology**

- microbe produces azelaic acid → inflammatory reaction inhibiting melanin synthesis yielding variable pigmentation
- affinity for sebaceous glands; requires fatty acids to survive

**Etiology**

- *Pityrosporum ovale* (*Malassezia furfur*)
- also associated with folliculitis and seborrheic dermatitis
- predisposing factors: summer, tropical climates, excessive sweating, Cushing's syndrome, prolonged corticosteroid use

**Investigations**

- clinical diagnosis but can perform microscopic examination, KOH prep of scales for hyphae and spores

**Management**

- ketoconazole 2% shampoo or cream daily for 3 d
- selenium sulfide 2.5% lotion applied for 10 min for 7 d
- ciclopirox olamine BID
- systemic fluconazole or itraconazole for 7 d if extensive

## Sexually Transmitted Infections

### SYPHILIS

#### Clinical Features

- characterized initially by a painless ulcer (chancre)
- following inoculation, systemic infection with secondary and tertiary stages

#### Etiology

- *Treponema pallidum*
- transmitted sexually, congenitally, or rarely by transfusion

Table 21. Stages of Syphilis

	Clinical Features	Investigations	Management
<b>Primary Syphilis</b>	Single red, indurated, painless chancre, that develops into painless ulcer with raised border and scanty serous exudate Chancre develops at site of inoculation after 3 wk of incubation and heals in 4-6 wk; chancre may also develop on lips or anus Regional non-tender lymphadenopathy appears ~1 wk after onset of chancre DDx: chancroid (painful), HSV (multiple lesions)	CANNOT be based on clinical features alone VDRL negative – repeat weekly for 1 mo FTA-ABS test has greater sensitivity and may detect disease earlier in course Dark field examination – spirochete in chancre fluid or lymph node	Penicillin G, 2.4 million units IM, single dose
<b>Secondary Syphilis</b>	Presents 2-6 mo after primary infection (patient may not recall presence of primary chancre) Associated with generalized lymphadenopathy, splenomegaly, headache, chills, fever, arthralgias, myalgias, malaise, photophobia Lesions heal in 1-5 wk and may recur for 1 yr 3 types of lesions: 1. Macules and papules: flat top, scaling, non-pruritic, sharply defined, circular/annular rash (DDx: pityriasis rosea, tinea corporis, drug eruptions, lichen planus) 2. Condyloma lata: wart-like moist papules around genital/perianal region 3. Mucous patches: macerated patches mainly found in oral mucosa	VDRL positive FTA-ABS +ve; –ve after 1 yr following appearance of chancre Dark field +ve in all secondary	Same as for primary syphilis
<b>Tertiary Syphilis</b>	Extremely rare 3-7 yr after secondary Main skin lesion: 'Gumma' – a granulomatous non-tender nodule	As in primary syphilis, VDRL can be falsely negative	Penicillin G, 2.4 million units IM weekly x 3 wk

#### Natural History of Untreated Syphilis

- Inoculation
- Primary syphilis (10-90 d after infection)
- Secondary syphilis (simultaneous to primary syphilis or up to 6 mo after healing of primary lesion)
- Latent syphilis
- Tertiary syphilis (2-20 yr)

#### Latent Syphilis

70% of untreated patients will remain in this stage for the rest of their lives and are immune to new primary infection

### GONOCOCCEMIA

#### Clinical Features

- disseminated gonococcal infection
- hemorrhagic, tender, pustules on a purpuric/petechial background
- common sites: distal aspects of extremities
- associated with fever, arthritis, urethritis, proctitis, pharyngitis, and tenosynovitis
- neonatal conjunctivitis if infected via birth canal

#### Etiology

- *Neisseria gonorrhoeae*

#### Investigations

- requires high index of clinical suspicion because tests are often negative
- bacterial culture of blood, joint fluid, and skin lesions
- joint fluid cell count and Gram stain

#### Management

- notify public health authorities
- screen for other STIs
- cefixime 400 mg PO (drug of choice) or ceftriaxone 1 g IM

### Herpes Simplex Virus

- see *Viral Infections, D34*

### Human Papillomavirus

- see *Viral Infections, D36*

## Pre-Malignant Skin Conditions

### Actinic Keratoses (Solar Keratoses)

#### Clinical Features

- ill-defined, scaly, erythematous papules or plaques associated with sun-damaged skin (solar heliosis)
- initial lesion is a rough erythematous papule with white to yellow scale
- often easier to appreciate on palpation rather than inspection, as the lesion has a gritty, sandpaper-like texture
- sites: areas of sun exposure (face, helices of the ears primarily in men, hairless scalp, neck, upper trunk, dorsal aspects of the hands and forearms)

#### Pathophysiology

- UV radiation damage to keratinocytes from repeated sun exposure (especially UVB)
- risk of transformation of AK to SCC (<1/1000 per yr), but higher likelihood if AK is persistent
- UV-induced p53 gene mutation
- risk factors: increased age, light skin/eyes/hair, immunosuppression, genetic syndromes such as albinism or xeroderma pigmentosum
- risk factors for malignancy: immunosuppression, history of skin cancer, persistence of AK

#### Epidemiology

- common with increasing age, outdoor occupation, M>F
- skin phototypes I-III, rare in deeper skin tones as melanin is protective

#### Differential Diagnosis

- SCC *in situ*, superficial BCC, seborrheic keratosis

#### Investigations

- biopsy refractory or suspicious lesions (infiltrative, tender, bleeding spontaneously)

#### Management

- destructive: shave excision and curettage with electrodesiccation, or cryotherapy
- topical pharmacotherapy (mechanism: destruction of rapidly growing cells or immune system modulation)
  - topical 5-fluorouracil cream (for 2-4 wk), imiquimod 5% (2x/wk for 16 wk), imiquimod 3.75% (daily for 2 wk, and then daily again for 2 wk more)
- photodynamic therapy
- chemical peels (e.g. TCA, phenol)
- excision
- laser resurfacing

#### Types of AK

- Erythematous: typical AK lesion
- Hypertrophic: thicker, rough papule/plaque
- Cutaneous horn: firm hyperkeratotic outgrowth
- Actinic cheilitis: confluent AKs on the lip
- Pigmented: flat, tan-brown, scaly plaque
- Spreading pigmented
- Proliferative
- Conjunctival: pinguecula, pterygium

### Leukoplakia

#### Clinical Features

- a morphologic term describing homogeneous or speckled white plaques with sharply demarcated borders
- sites: oropharynx, most often floor of the mouth, soft palate, and ventral/lateral surfaces of the tongue

#### Pathophysiology

- precancerous or pre-malignant condition
- oral variant is strongly associated with tobacco use and alcohol consumption

#### Epidemiology

- 1-5% prevalence in adult population >30 yr old; peak at age >50
- M>F, fair-skinned
- most common oral mucosal pre-malignant lesion

#### Differential Diagnosis

- DLE, invasive SCC, candidiasis, lichen planus, oral hairy leukoplakia, white sponge nevus

#### Investigations

- biopsy due to risk of malignancy

#### Management

- low-risk sites on buccal/labial mucosal or hard palate: eliminate carcinogenic habits, smoking cessation, follow-up
- moderate/dysplastic lesions: excision, cryotherapy
- primary aim of treatment is to decrease the risk of oral SCC

# Malignant Skin Tumours

## Nonmelanoma Skin Cancers

### BASAL CELL CARCINOMA

#### Subtypes

- nodular BCC (most common)
  - skin-coloured papule/nodule with rolled, translucent ("pearly") telangiectatic border, and depressed/eroded/ulcerated centre
- pigmented BCC
  - areas of pigment in translucent lesion with surface telangiectasia
  - may mimic MM
- superficial BCC
  - thin, tan to red-brown plaque, often with scaly, pearly border, and fine telangiectasia at margin
  - least aggressive subtype
- morpheaform BCC
  - flesh/yellowish-coloured, shiny papule/plaque with indistinct borders, indurated

#### Pathophysiology

- malignant proliferation of basal keratinocytes of the epidermis
  - low grade cutaneous malignancy, locally aggressive (primarily tangential growth), rarely metastatic
  - usually due to UVB light exposure, therefore >80% on sun exposed sites
  - typical latency period of 20-50 yr between time of UV damage and onset of BCC
  - also associated with previous scars, radiation, trauma, arsenic exposure, or genetic predisposition (Gorlin Syndrome)

#### Epidemiology

- most common malignancy in humans
- 75% of all malignant skin tumours in >40 yr old, increased prevalence in the elderly
- risk factors: M>F, skin phototypes I and II, chronic cumulative sun exposure, ionizing radiation, immunosuppression, arsenic exposure

#### Differential Diagnosis

- benign: sebaceous hyperplasia, intradermal melanocytic nevus, dermatofibroma
- malignant: nodular MM, SCC, merkel cell carcinoma (MCC)

#### Management

- see Table 22, *Management of Nonmelanoma Skin Cancers*
- follow-up for new primary disease or recurrence
- 95% cure rate if lesion <2 cm in diameter or if treated early

#### Workup/Investigations of Basal Cell Carcinoma and Other Nonmelanoma Skin Cancers

- **History:** duration, growth rate, family/personal Hx of skin cancer, prior therapy to the lesion
- **Physical:** location, size, whether circumscribed, tethering to deep structures, full skin exam, lymph node exam
- **Biopsy:** if shallow lesion, can do shave biopsy; otherwise punch or excisional biopsy may be more appropriate

#### Surgical Margins

- **Smaller lesions:** electrodesiccation and curettage with 2-3 mm margin of normal skin
- **Deep infiltrative lesions:** surgical excision with 3-5 mm margins beyond visible and palpable tumour border, which may require skin graft or flap; or Mohs surgery, which conserves tissue and does not require margin control

Table 22. Management of Nonmelanoma Skin Cancers

Treatment Category	Treatment Options	Indications	Disadvantages
Topical	Imiquimod 5% cream (Aldara <sup>®</sup> )	Superficial BCCs, Bowen's Disease	Side effects: erythema, edema, ulceration and scaling
	Cryotherapy	Superficial BCCs, Bowen's Disease Advantages: minimal equipment, simple to perform, cost-effective, no restriction of activity after surgery	Margin around cancer may not be free, potential for scarring, minimally painful, no skin tissue for diagnosis
	5-fluorouracil (Efudex <sup>®</sup> )	Superficial BCCs, Bowen's Disease	Side effects: pain, burning, swelling
Procedural	Photodynamic therapy	Superficial BCCs Advantages: low cost, tolerable side effect profile	Side effects: pain
	Radiation therapy	Advanced cases of BCC, SCC Advantages: if lesions are located in cosmetically sensitive area	Side effects: alopecia, pigmentary changes, fibrosis, atrophy, buccal mucositis, gingivitis, telangiectasias
Surgical	Shave excision and electrodesiccation and curettage	Most types of BCCs, Bowen's Disease Advantages: minimal equipment needed, simple to perform, cost-effective, no restriction of activity after surgery	Not used for morpheaform BCC, margin around cancer may not be free, slow healing, possible scarring
	Mohs surgery	BCC and SCC lesions on the face or in areas that are difficult to reconstruct Advantages: highest cure rate, good cosmetic results, healthy skin tissue is preserved	Expensive, highly technical, resource intensive, activity restriction after surgery if skin graft/flap needed
	Traditional surgical excision	SCC Advantages: margin around cancer more likely to be free than shave excision, tissue is available for diagnosis, cosmetic satisfaction	Activity restriction after surgery if skin graft/flap needed, healthy tissue around cancer must be removed
Medical Therapy	Vismodegib	Metastatic BCC, Gorlin Syndrome (multiple BCCs)	Side effects: muscle spasms, hair loss, abnormal taste, weight loss, nausea, amenorrhea

## BOWEN'S DISEASE (SQUAMOUS CELL CARCINOMA IN SITU)

### Clinical Features

- sharply demarcated erythematous patch/thin plaque with scale and/or crusting
- often 1-3 cm in diameter and found on the skin and mucous membranes
- evolves to SCC in 10-20% of cutaneous lesions and >20% of mucosal lesions

### Management

- see *Table 22, Management of Nonmelanoma Skin Cancers, D40*

## SQUAMOUS CELL CARCINOMA

### Clinical Features

- hyperkeratotic indurated, pink/red/skin-coloured papule/plaque/nodule with surface scale/crust ± ulceration
- more rapid enlargement than BCC
- exophytic (grows outward), may present as a cutaneous horn
- common sites: face, ears, scalp, forearms, dorsum of hands

### Pathophysiology

- malignant neoplasm of keratinocytes (primarily vertical growth)
- predisposing factors include: cumulative UV radiation, PUVA, ionizing radiation therapy/exposure, chemical carcinogens (such as arsenic, tar, and nitrogen mustards), HPV 16 or 18, immunosuppression
- may occur in previous scar (SCC more commonly than BCC)

### Epidemiology

- second most common type of cutaneous neoplasm in less pigmented skin types
- most common cutaneous neoplasm in patients with Type 6 skin, typically in non-photoexposed sites
- primarily on sun-exposed skin in the elderly, M>F, skin phototypes I and II, chronic sun exposure
- SCC is the most common cutaneous malignancy in immunocompromised patients such as in organ transplant recipients, with increased mortality as compared to non-immunocompromised population

### Differential Diagnosis

- benign: wart, psoriasis, irritated seborrheic keratosis
- pre-malignant: AK, Bowenoid papulosis
- malignant: keratoacanthoma, Bowen's disease, BCC, amelanotic melanoma

### Management

- see *Table 22, Management of Nonmelanoma Skin Cancers, D40*
- lifelong follow-up (more aggressive treatment than BCC)

### Prognosis

- good prognostic factors: early treatment, negative margins, and small size of lesion
- rate of metastasis from primary SCC is 2-5%
- higher risk of metastasis if diameter >2 cm, depth >2 mm, recurrent, involvement of bone/muscle/nerve, location on scalp/ears/nose/lips, immunosuppressed, caused by arsenic ingestion, or tumour arose from scar/chronic ulcer/burn/genital tract/sinus tract

## KERATOACANTHOMA

### Clinical Features

- rapidly growing, firm, dome-shaped, erythematous or skin-coloured volcano-like nodule with central keratin-filled crater
- may spontaneously regress
- sites: sun-exposed skin

### Pathophysiology

- epithelial neoplasm with atypical keratinocytes in epidermis
- low grade variant of SCC

### Etiology

- HPV, UV radiation, chemical carcinogens (tar, mineral oil)

### Epidemiology

- most common in >50 yr old, rare in <20 yr old

### Differential Diagnosis

- treat as SCC until proven otherwise
- nodular BCC, MCC, hypertrophic solar keratosis, verruca vulgaris

#### Interventions for AK

Cochrane DB Syst Rev 2012;2:C004415

**Purpose:** To assess the efficacy of treatments for AK.

**Methods:** Systematic review of RCTs.

**Results:** A total of 83 RCTs (10036 patients) were included evaluating 24 treatments. Cryotherapy, diclofenac, 5-fluorouracil, imiquimod, ingenol mebutate, photodynamic therapy, resurfacing and trichloroacetic acid peel were all effective at treating AK and generally comparable with one another. Skin irritation was more common with diclofenac and 5-fluorouracil. Photodynamic therapy and imiquimod treatment resulted in better cosmetic appearance.

**Conclusion:** For individual lesions, photodynamic therapy is more effective than cryotherapy. For field-directed treatments, 5-fluorouracil, diclofenac, imiquimod and ingenol mebutate had comparable efficacy.

**Management**

- surgical excision or saucerization (shave biopsy) followed by electrodesiccation of the base, treated similarly to SCC
- intralesional methotrexate or 5-fluorouracil injection

**Malignant Melanoma****Clinical Features**

- malignant characteristics of a mole: "ABCDE" mnemonic
- sites: skin, mucous membranes, eyes, CNS
- ~2/3 arise *de novo* without an associated nevus
- abnormal dermoscopic features

**Clinical Subtypes of Malignant Melanoma Listed from most to least common subtype**

- **superficial spreading melanoma** (60-70% of all melanomas)
  - atypical melanocytes initially spread laterally in epidermis then invade the dermis
  - irregular, indurated, enlarging plaques with red/white/blue discoloration, focal papules or nodules
  - ulcerate and bleed with growth
  - subtype most likely associated with pre-existing nevus
- **nodular melanoma** (15-30% of all melanomas)
  - atypical melanocytes that initially grow vertically with little lateral spread
  - uniformly ulcerated, blue-black, and sharply delineated plaque or nodule
  - rapidly fatal
  - may be pink or have no colour at all, this is called an amelanotic melanoma
  - EFG = elevated, firm, growing
- **lentigo maligna**
  - MM *in situ* (normal and malignant melanocytes confined to the epidermis)
    - 2-6 cm, tan/brown/black uniformly flat macule or patch with irregular borders
    - lesion grows radially and produces complex colours
    - often seen in the elderly
    - 10% evolve to lentigo maligna melanoma
  - **lentigo maligna melanoma** (5-15% of all melanomas)
    - older individuals, ~7th decade
    - malignant melanocytes invading into the dermis
    - associated with pre-existing solar lentigo, not pre-existing nevi
    - flat, brown, stain-like, gradually enlarging with loss of skin surface markings
    - with time, colour changes from uniform brown to dark brown with black and blue
    - found on all skin surfaces, especially those often exposed to sun, such as the face and hands
- **acral lentiginous melanoma** (5-10% of all melanomas)
  - ill-defined dark brown, blue-black macule
  - palmar, plantar, subungual skin
  - melanomas on mucous membranes have poor prognosis
  - most common subtype found in patients with type 6 skin
- **amelanotic melanoma** (2-8% of all melanomas)
  - little to no pigment
  - pink or red macules, papules, or nodules, some may present with light-brown pigmentation
  - delay in diagnosis may contribute to its poor prognosis
  - MM in young children is more commonly an amelanotic variant

**Pathophysiology**

- malignant neoplasm of pigment-forming cells (melanocytes and nevus cells)

**Epidemiology**

- 1 in 75 (Canada), 1 in 50 (US)
- risk factors: increasing age, fair skin, red hair, positive personal/family history, familial dysplastic nevus syndrome, large congenital nevi (>20 cm), any dysplastic nevi, >50 common nevi, immunosuppression, sun exposure with sunburns, tanning beds
- most common sites: back (M), calves (F)
- worse prognosis if: male, on scalp, hands, feet, late lesion, no pre-existing nevus present

**Differential Diagnosis**

- benign: nevi, solar lentigo, seborrheic keratosis, dermatofibroma, spitz nevus
- malignant: pigmented BCC, dermatofibrosarcoma protuberans

**Management**

- excisional biopsy preferable (margin determined by Breslow depth), otherwise incisional biopsy, sentinel lymph node dissection controversial
- remove full depth of dermis and extend beyond edges of lesion only after histologic diagnosis
- beware of lesions that regress – tumour is usually deeper than anticipated
- high dose IFN for stage II (regional), chemotherapy (cis-platinum, BCG) and high dose IFN for stage III (distant) disease
- newer chemotherapeutic regimens, immunotherapy, and vaccines in metastatic melanoma
- radiotherapy may be used as adjunctive treatment

**Does this Patient have a Mole or Melanoma?****ABCDE checklist**

- Asymmetry
- Border (irregular and/or indistinct)
- Colour (varied)
- Diameter (increasing or >6 mm)
- Enlargement, elevation, evolution (i.e. change in colour, size, or shape)
- Sensitivity 92% (CI 82-96%)
- Specificity 100% (CI 54-100%)
- JAMA 1998;279:696-701

**Risk Factors for Melanoma****no SPF is a SIN**

- Sun exposure
- Pigment traits (blue eyes, fair/red hair, pale complexion)
- Freckling
- Skin reaction to sunlight (increased incidence of sunburn)
- Immunosuppressive states (e.g. renal transplantation)
- Nevi (dysplastic nevi; increased number of benign melanocytic nevi)

**Node Dissection for Lesions**

- >1 mm thick OR <1 mm and ulcerated OR >1 mitoses/mm<sup>2</sup> (Stage IB or higher melanoma patients should be offered a sentinel lymph node biopsy)
- Assess sentinel node at time of wide excision

See Landmark Dermatology Trials table for more information on the trial by Hadi et al, 2010, which details improved survival with Ipilimumab in patients with metastatic melanoma.

See Landmark Dermatology Trials table for more information on the BRIM-3 trial comparing the efficacy of BRAF kinase inhibitor vemurafenib (PLX4032) to dacarbazine in patients with metastatic melanoma.

**Table 23. American Joint Committee on Cancer Staging System Based on Breslow's Thickness of Invasion**

Tumour Depth	Stage	Approximate 5 Yr Survival
T1 <1.0 mm	Stage I T1a – T1a	5-yr survival 90%
T2 1.01-2.0 mm	Stage II T2b – T4b	5-yr survival 70%
T3 2.01-4.0 mm	Stage III any nodes	5-yr survival 45%
T4 >4.0 mm	Stage IV any mets	5-yr survival 10%

a = no ulceration; b = ulceration

## Other Cutaneous Cancers

### CUTANEOUS T-CELL LYMPHOMA

#### Clinical Features

- Mycosis fungoides (limited superficial type)
  - characterized by slightly atrophic scaling, erythematous patches/plaques/nodules/tumours, which may be pruritic and poikilodermic (atrophy, telangiectasia, hyperpigmentation, hypopigmentation)
  - common sites include: trunk, buttocks, proximal limbs
  - mildly symptomatic, usually excellent prognosis for early disease
  - hypopigmented subtype most commonly seen in children with deeper skin tones
- Sézary syndrome (widespread systemic type)
  - rare variant characterized by erythroderma, lymphadenopathy, WBC >20 x 10<sup>9</sup>/L with Sézary cells
  - can be considered to have evolved from mycosis fungoides (not initially meeting diagnostic criteria), but more commonly arises de novo
  - associated with intense pruritus, alopecia, palmoplantar hyperkeratosis, and systemic symptoms (fatigue, fever)
  - high mortality

#### Pathophysiology

- clonal proliferation of skin-homing CD4 T-cells

#### Epidemiology

- seen in >50 yr, M:F ratio is 2:1

#### Differential Diagnosis

- tinea corporis, nummular dermatitis, psoriasis, DLE, Bowen's disease, adult T-Cell leukemia-lymphoma (ATL)

#### Investigations

- skin biopsy (histology, "lymphocyte antigen cell" markers, TcR gene arrangement)
- blood smear looking for Sézary cells or flow cytometry (e.g. CD4:CD8 >10 is characteristic but not diagnostic of Sézary)
- imaging (for systemic involvement)

#### Management

- Mycosis fungoides
  - depends on stage of disease
  - early stage: topical steroids, topical chemotherapy, topical retinoids, topical imiquimod, local radiation, and/or PUVA, NB-UVB (311-313 nm)
  - advanced stage: biologics, low-dose methotrexate, systemic retinoids, PUVA
- Sézary syndrome
  - oral retinoids and IFN
  - extra-corporeal photopheresis
  - may need radiotherapy for total skin electron beam radiation
  - may maintain on UV therapy
  - other chemotherapy agents

### KAPOSI SARCOMA

#### Definition

- an angioproliferative neoplasm that requires infection with human herpesvirus 8 (HHV-8)
- 4 types based on the clinical circumstance at which it develops
  - classical: develops in middle or old age in individuals of Mediterranean descent
  - endemic: seen in sub-Saharan indigenous Africans
  - iatrogenic: associated with immunosuppressive drug therapy and renal allograft recipients
  - AIDS associated

**Clinical Features**

- purplish, reddish blue, or dark brown/black macules, plaques, and nodules on the skin
- skin nodules can range in size from very small to several centimeters in diameter, and lesions may ulcerate and bleed
- lesions typically present on the distal extremities
- also affects the gastrointestinal tract and lymphatics leading to secondary lymphoedema

**Epidemiology**

- incidence is 0.02% to 0.06% of all malignant tumours, M>F

**Differential Diagnosis**

- well-differentiated angiosarcoma, benign lymphangiomas, hypertrophic lichen planus

**Investigations**

- biopsy
- PCR - can identify HHV-8 DNA sequences

**Treatment**

- surgery, cryotherapy, laser surgery, photodynamic therapy, topical retinoids, immunomodulators for superficial macules and plaques
- radiation therapy, systemic chemotherapy

## Diseases of Hair Density

### Hair Growth

- hair grows in a cyclic pattern that is defined in 3 stages (most scalp hairs are in anagen phase)
  1. growth stage = anagen phase
  2. transitional stage = catagen stage
  3. resting stage = telogen phase
- total duration of the growth stage reflects the type and location of hair: eyebrow, eyelash, and axillary hairs have a short growth stage in relation to the resting stage
- growth of the hair follicles is also based on the hormonal response to testosterone and dihydrotestosterone (DHT); this response is genetically controlled

### Non-Scarring (Non-Cicatricial) Alopecia

#### ANDROGENETIC ALOPECIA

**Clinical Features**

- male- or female-pattern alopecia
- males: fronto-temporal areas progressing to vertex, entire scalp may be bald
- females: widening of central part, "Christmas tree" pattern

**Pathophysiology**

- action of DHT on hair follicles

**Epidemiology**

- males: early 20s-30s
- females: 40s-50s

**Management**

- camouflage techniques (i.e. wigs, hair extensions, powders, concealing lotions or sprays)
- topical minoxidil (Rogaine®) solution or foam to reduce rate of loss/partial restoration
- females: spironolactone (anti-androgenic effects), cyproterone acetate (Diane-35®)
- males: finasteride (Propecia®) (5- $\alpha$ -reductase inhibitor) 1 mg/d
- oral minoxidil
- procedural (hair transplant, platelet-rich plasma)

#### TELOGEN EFFLUVIUM

**Clinical Features**

- uniform decrease in hair density secondary to hairs leaving the growth (anagen) stage and entering the resting (telogen) stage of the cycle

**Pathophysiology**

- variety of precipitating factors (i.e. post-partum, psychological stress, major illness)
- hair loss typically occurs 2-4 mo after exposure to precipitant
- regrowth occurs within a few mo but may not be complete

**Hair Regrowth Potential**

Ability to regrow hair depends on location of inflammatory infiltrates on hair follicle as stem cells are located at the upper part (bulge region) of the hair follicle

- **Scarring alopecia:** inflammatory infiltrates found in upper part of hair follicles, destroying stem cells
- **Non-scarring alopecia:** Hair follicle is not permanently damaged, and therefore spontaneous or treatment-induced regrowth is possible

**DDx of Non-Scarring (Non-Cicatricial) Alopecia****Autoimmune**

- Alopecia areata

**Endocrine**

- Hypothyroidism
- Androgens

**Micronutrient deficiencies**

- Iron
- Zinc

**Toxins**

- Heavy metals
- Anticoagulants
- Chemotherapy
- Vitamin A

**Trauma to the hair follicle**

- Trichotillomania
- Tight ponytail or braiding styles

**Other**

- Syphilis
- Severe illness
- Childbirth

**Precipitants of Telogen Effluvium**

"SEND" hair follicles out of anagen and into telogen

**S**tress and **S**calp disease (surgery)

**E**ndocrine (hypothyroidism, post-partum)

**N**utritional (iron and protein deficiency)

**D**rugs (acitretin, heparin, lithium, IFN,  $\beta$ -blockers, valproic acid, SSRIs)

## ANAGEN EFFLUVIUM

### Clinical Features

- hair loss due to insult of hair follicle impairing its mitotic activity (growth stage)

### Pathophysiology

- precipitated by chemotherapeutic agents (most common), other medications (bismuth, levodopa, colchicine, cyclosporine), exposure to chemicals (thallium, boron, arsenic)
- dose-dependent effect
- hair loss 7-14 d after single pulse of chemotherapy; most clinically apparent after 1-2 mo
- reversible effect; follicles resume normal mitotic activity few wk after agent stopped

## ALOPECIA AREATA

### Clinical Features

- autoimmune disorder characterized by patches of complete hair loss often localized to scalp, but can affect eyebrows, beard, eyelashes, etc.
- may be associated with dystrophic nail changes – fine stippling, pitting
- "exclamation mark" pattern (hairs fractured and have tapered shafts, i.e. looks like "!")
- may be associated with autoimmune conditions: pernicious anemia, vitiligo, thyroid disease, Addison's disease
- spontaneous regrowth may occur within mo of first attack (worse prognosis if young at age of onset and extensive loss)
- frequent recurrence often precipitated by emotional distress
- alopecia totalis: complete loss of hair on scalp
- alopecia universalis: complete loss of scalp hair, eyelashes, eyebrows, and body hair

### Management

- excellent prognosis for localized disease
- topical corticosteroids and intralesional triamcinolone acetonide (corticosteroids) can be used for isolated patches
- topical immunotherapy (diphencyprone, anthralin)
- systemic immunosuppressants for refractory or extensive disease
- immunomodulatory (diphencyprone, anthralin)
- newer treatments: janus kinase inhibitors

### OTHER

- trichotillomania: impulse-control disorder characterized by compulsive hair pulling with irregular patches of hair loss, and with remaining hairs broken at varying lengths
- traumatic (e.g. tight braiding styles, wearing tight ponytails, tight tying of hair coverings)

## Scarring (Cicatricial) Alopecia

### Clinical Features

- irreversible loss of hair follicles with fibrosis

### Etiology

- physical: radiation, burns
- infections: fungal, bacterial, TB, leprosy, viral (HSV)
- primary inflammatory – subdivided into lymphocytic, neutrophilic, and mixed
  - lymphocytic:
    - lichen planus (lichen planopilaris) – white scale around hair follicles, up to 50% have lichen planus at other body sites
    - DLE (note that SLE can cause an alopecia unrelated to DLE lesions which are non-scarring)
    - central centrifugal cicatricial alopecia (CCCA): seen in up to 40% of Black women, starting at central scalp; one of the most commonly diagnosed scarring alopecias, may be associated with hair care practices
    - keratosis follicularis spinulosa decalvans (autosomal dominant, X-linked)
  - neutrophilic:
    - folliculitis decalvans – discharge of pus and blood, tufting of hair follicles
    - dissecting cellulitis of the scalp – follicular papules, pustules, nodules, and abscesses develop on the scalp
  - mixed
    - acne keloidalis nuchae – dome-shaped papules, pustules, and plaques on the occipital scalp
- morphea: "coup de sabre" with involvement of centre of scalp

### Investigations

- biopsy from active border

### Management

- infections: treat underlying infection
- inflammatory: topical/intralesional steroids, anti-inflammatory antibiotics, antimalarials, immunosuppressants (e.g. cyclosporine)

#### Hair Loss

##### TOP HAT

Telogen effluvium, Tinea capitis  
 Out of iron, zinc  
 Physical: trichotillomania, tight ponytail or braiding styles  
 Hormonal: hypothyroidism, androgenic  
 Autoimmune: SLE, alopecia areata  
 Toxins: heavy metals, anticoagulants, chemotherapy, vitamin A, SSRIs

**Non-scarring alopecia:** intact hair follicles on exam → biopsy not required (but may be helpful)

**Scarring alopecia:** absent hair follicles on exam → biopsy required

#### Alopecia Areata Subtypes

Alopecia totalis: loss of all scalp hair and eyebrows

Alopecia universalis: loss of all body hair

### Postmenopausal Hair Changes

- estrogen regulates the growth and cycling of hair follicles
- hormonal changes (e.g. reduced estrogen) during menopause leads to decreased hair diameter, growth rate, and percentage of hairs in the anagen phase; moreover, chronological age affects hair density
- these compounded effects of the two factors above (hormone changes and aging) may lead to a perception of decreased scalp hairs in middle-aged women

## Nails and Disorders of the Nail Apparatus

Table 24. Nail Changes in Systemic and Dermatological Conditions

Nail Abnormality	Definition/Etiology	Associated Disease
<b>NAIL PLATE CHANGES</b>		
Clubbing	Proximal nail plate has greater than 180° angle to nail fold, watch-glass nails, bulbous digits	Cyanotic heart disease, bacterial endocarditis, pulmonary disorders, GI disorders, etc.
Koilonychia	Spoon shaped nails	Iron deficiency, malnutrition, DM
Onycholysis	Separation of nail plate from nail bed	Psoriasis, dermatophytes, thyroid disease, repetitive trauma
Onychogryphosis	Hypertrophy of the nail plate producing a curved, claw-like deformity	Poor circulation, chronic inflammation, tinea
Onychohemia	Subungual hematoma	Trauma to nail bed
Onychomycosis	Fungal infection of nail (e.g. dermatophyte, yeast, mould)	HIV, DM, peripheral arterial disease
Onychomadesis	Nail plate detachment from proximal nail fold due to severe trauma that produces a complete arrest of nail matrix activity	Manicures, eczema, chronic paronychia, severe or febrile illness, erythroderma
<b>SURFACE CHANGES</b>		
V-Shaped Nicking	Distal margin has v-shaped loss of the nail plate	Darier's disease (keratosis follicularis)
Pterygium Inversum Unguis	Distal nail plate does not separate from underlying nail bed	Scleroderma
Pitting	Punctate depressions that migrate distally with growth	Psoriasis (random pattern), alopecia areata (geometric, grid-shaped arrangement), eczema
Transverse Ridging	Transverse depressions, often more in central portion of nail plate	Serious acute illness slows nail growth (when present in all nails = Beau's lines), eczema, chronic paronychia, trauma
Transverse White Lines	Bands of white discoloration	Poisons, hypoalbuminemia (Muehrcke's lines)
Onychorrhexis	Brittle nails leading to longitudinal ridging	Lichen planus, psoriasis, normal aging, fungal infection
<b>COLOUR CHANGES</b>		
Yellow		Tinea, jaundice, tetracycline, pityriasis rubra pilaris, yellow nail syndrome, psoriasis, tobacco use
Green		<i>Pseudomonas</i>
Black		Melanoma, hematoma
Brown		Nicotine use, psoriasis, poisons, longitudinal melanonychia (more common in Fitzpatrick V and VI)
Splinter Hemorrhages	Extravasation of blood from longitudinal vessels of nail bed, blood attaches to overlying nail plate and moves distally as it grows	Trauma, bacterial endocarditis, blood dyscrasias, psoriasis
Oil Spots	Brown-yellow discoloration	Psoriasis
Leukonychia	White nails	Hypoalbuminemia, chronic renal failure
Terry's Nails	White proximal nail, darker distal nail with ground glass appearance, no lunula	Liver cirrhosis
<b>NAIL FOLD CHANGES</b>		
Herpetic Whitlow	HSV infection of distal phalanx	HSV infection
Paronychia	Local inflammation of the nail fold around the nail bed	Acute: painful infection Chronic: constant wetting (e.g. dishwashing, thumbsucking)
Nail Fold Telangiectasias	Cuticular hemorrhages, roughness, capillary changes	Scleroderma, SLE, dermatomyositis
<b>LOSS OF NAILS</b>		
Temporary Loss	Occurs without scarring	Trauma (especially toenails or fingernails after large subungual hematoma), Beau's lines after severe illness
Permanent Loss	Occurs with scarring	Lichen planus (pterygium), genetic abnormalities (rare)

## Adnexal Disorders

### HIDRADENITIS SUPPURATIVA

#### Definition

- a chronic inflammatory skin condition that is a result of poor occlusion of the pilosebaceous units within intertriginous zones

#### Clinical Features

- primary lesions are inflammatory nodules
- presence of sinus formation, clusters of open comedones (double tombstone comedones), and hypertrophic scarring of intertriginous areas
- sites: occurs primarily in the intertriginous areas of the axillae (most common site), inguinal area, inner thighs, perianal and perineal areas, mammary and inframammary regions, buttocks, pubic region, scrotum, vulva, trunk, and occasionally the scalp and retroauricular areas
- additionally significant hyperpigmentation and keloid formation can be seen in more pigmented skin types

#### Pathophysiology

- follicular occlusion, follicular rupture, and an immune response

#### Epidemiology

- affects 1-4% of the population, F>M
- onset of symptoms occur between puberty and age 40, typically in 2nd or 3rd decade
- increased incidence in people of African descent
- associated with smoking and excess weight

#### Differential Diagnosis

- folliculitis, furuncles, carbuncles, acne vulgaris, Crohn's disease, granuloma inguinale, pyoderma gangrenosum

#### Investigations

- clinical diagnosis

#### Treatment

- behavioural: patient self-management including avoidance of skin trauma, smoking cessation, and weight management
- pain management with NSAIDs
- mild disease: local therapy with topical clindamycin, intralesional corticosteroid injections, topical resorcinol
- moderate to severe disease: antibiotic therapy (oral tetracyclines, clindamycin and rifampin combination, dapsone), oral retinoids, hormonal therapy, surgery (punch debridement), laser and light-based therapies (CO<sub>2</sub> laser and Nd:YAG)
- refractory moderate to severe disease: TNF- $\alpha$  inhibitors such as adalimumab and infliximab, systemic glucocorticoids, and cyclosporine

### PRIMARY HYPERHIDROSIS

#### Definition

- secretion of sweat in amounts greater than physiologically needed for thermoregulation

#### Clinical Features

- focal, visible, excessive sweating of at least 6 mo without apparent cause
- symptoms typically develop during childhood or adolescence and persist throughout life
- symptoms occur only during waking hours (diurnal)
- focal symptoms typically localized to the palms, soles, and axillae, and less commonly the scalp and face

#### Pathophysiology

- abnormal or exaggerated central response of the eccrine sweat glands to normal emotional stress

#### Epidemiology

- affects 1-5% of the population
- most patients have a family history of hyperhidrosis

#### Differential Diagnosis

- excessive heat, medications (e.g. antidepressants, antipyretics, cholinergic agonists, hormonal agents), menopause, and spinal cord injuries (autonomic dysreflexia, orthostatic hypotension, posttraumatic syringomyelia)

**Investigations**

- clinical diagnosis, iodine starch test

**Treatment**

- antiperspirants, botulinum toxin, microwave thermolysis, topical glycopyrronium bromide, suction curettage, systemic agents (oral glycopyrrolate, oral oxybutynin), iontophoresis, or endoscopic thoracic sympathectomy

## Oral Diseases

**LEUKOPLAKIA**

- see *Leukoplakia, D39*

**RECURRENT APHTHOUS STOMATITIS****Clinical Features**

- also known as “canker sores”
- painful, shallow, typically less than 5 mm in diameter, round to oval shaped, covered by a creamy-white pseudomembrane with an erythematous halo
- sites: labial and buccal mucosa, floor of the mouth, ventral surface of the tongue, soft palate, and oropharyngeal mucosa

**Pathophysiology**

- dysfunction in the immune system resulting in immunologically mediated damage to epithelial cells
- triggered by trauma, infectious agents, genetic factors, HIV infection, and hormonal fluctuations
- early lesions can show a neutrophilic vessel-based submucosal infiltrate

**Epidemiology**

- women more commonly affected than men
- peak prevalence in ages 20-30

**Differential Diagnosis**

- Behçet syndrome, SLE, gluten-sensitive enteropathy, HSV

**Investigations**

- diagnosis is made clinically

**Treatment**

- oral hygiene: soft toothbrush, waxed tape-style dental floss, soft-tipped gum stimulator for plaque removal, and nonalcoholic mouthwash
- reduce traumatic factors inside the mouth such as biting cheeks or lips, and sharp/rough dental restorations
- pain control: lidocaine viscous 2%, diphenhydramine liquid (12.5 mg/5 mL), dyclonine lozenges
- severe refractory cases: colchicine

# Skin Manifestations of Systemic Disease

Table 25. Skin Manifestations of Internal Conditions

Disease	Related Dermatoses
<b>AUTOIMMUNE DISORDERS</b>	
Behçet's Disease	Painful aphthous ulcers in oral cavity + genital mucous membranes, erythema nodosum, acneiform papules
Buerger's Disease	Superficial migratory thrombophlebitis, pallor, cyanosis, gangrene, ulcerations, digital resorptions
Dermatomyositis	Periorbital and extensor violaceous erythema, heliotrope with edema, Gottron's papules (violaceous flat-topped papules with atrophy), periungual erythema, telangiectasia, calcinosis cutis
Polyarteritis Nodosa	Subcutaneous nodules, stellate purpura, erythema, gangrene, splinter hemorrhages, livedo reticularis, ulceration
Reactive Arthritis	Keratoderma blennorrhagica (on feet), balanitis circinata (on male penis)
Rheumatic Fever	Petechiae, urticaria, erythema nodosum, rheumatoid nodules, evanescent rash
Scleroderma	Raynaud's, non-pitting edema, waxy/shiny/tense atrophic skin (morphea), ulcers, cutaneous calcification, periungual telangiectasia, acrosclerosis, salt-and-pepper pigmentation
SLE	Malar erythema, discoid rash (erythematous papules or plaques with keratotic scale, follicular plugging, atrophic scarring on face, hands, and arms), hemorrhagic bullae, palpable purpura, urticarial purpura, patchy/diffuse alopecia, mucosal ulcers, photosensitivity
Crohn's Disease/UC	Pyoderma gangrenosum, erythema nodosum, Sweet's syndrome
<b>ENDOCRINE DISORDERS</b>	
Addison's Disease	Generalized hyperpigmentation or limited to skin folds, buccal mucosa, and scars
Cushing's Syndrome	Moon facies, purple striae, acne, hyperpigmentation, hirsutism, atrophic skin with telangiectasia
DM	Infections (e.g. boils, carbuncles, candidiasis, <i>S. aureus</i> , dermatophytoses, tinea pedis and cruris, infectious eczematoid dermatitis), pruritus, eruptive xanthomas, necrobiosis lipoidica diabetorum, granuloma annulare, diabetic foot, diabetic bullae, acanthosis nigricans, calciphylaxis
Hyperthyroidism	Moist, warm skin, seborrhea, acne, nail atrophy, hyperpigmentation, toxic alopecia, pretibial myxedema, acropachy, onycholysis
Hypothyroidism	Cool, dry, scaly, thickened, hyperpigmented skin; toxic alopecia with dry, coarse hair, brittle nails, myxedema, loss of lateral 1/3 eyebrows
<b>HIV-RELATED</b>	
Infections	Viral (e.g. HSV, HZV, HPV, CMV, Molluscum contagiosum, oral hairy leukoplakia), bacterial (impetigo, acneiform folliculitis, dental caries, cellulitis, bacillary epithelioid angiomatosis, syphilis), fungal (candidiasis, histoplasmosis, cryptococcus, blastomycosis)
Inflammatory Dermatoses	Seborrhea, psoriasis, pityriasis rosea, vasculitis
Malignancies	Kaposi's sarcoma, lymphoma, BCC, SCC, MM
<b>MALIGNANCY</b>	
Adenocarcinoma Gastrointestinal Cervix/anus/rectum	Peutz-Jeghers: pigmented macules on lips/oral mucosa Paget's disease: eroding scaling plaques of perineum
Carcinoma Breast GI Thyroid Breast/lung/ovary	Paget's disease: eczematous and crusting lesions of the skin of the nipple and usually areola of the breast Palmoplantar keratoderma: thickened skin of palms/soles Sipple's syndrome: multiple mucosal neuromas Dermatomyositis: heliotrope erythema of eyelids and violaceous plaques over knuckles
Lymphoma/Leukemia Hodgkin's Acute leukemia	Ataxia telangiectasia: telangiectasia on pinna, bulbar conjunctiva Ichthyosis: generalized scaling especially on extremities, Sweet's syndrome Bloom's syndrome: butterfly erythema on face, associated with short stature
Multiple Myeloma	Amyloidosis: large, smooth tongue with facial petechiae and waxy papules on eyelids, nasolabial folds, and lips
<b>OTHERS</b>	
Liver Disease	Pruritus, hyperpigmentation, spider nevi, palmar erythema, white nails (Terry's nails), porphyria cutanea tarda, xanthomas, hair loss, jaundice
Renal Disease	Pruritus, pigmentation, half and half nails, perforating dermatosis, calciphylaxis
Pruritic Urticarial Papules and Plaques of Pregnancy	Erythematous papules or urticarial plaques in distribution of striae distensae: buttocks, thighs, upper inner arms, and lower back
Cryoglobulinemia	Palpable purpura in cold-exposed areas, Raynaud's, cold urticaria, acral hemorrhagic necrosis, bleeding disorders, associated with hepatitis C infection

## Raynaud's Phenomenon DDx

**COLD HAND**  
Cryoglobulins/Cryofibrinogens  
Obstruction/Occupational  
Lupus erythematosus, other connective tissue disease  
DM/Drugs  
Hematologic problems (polycythemia, leukemia, etc.)  
Arterial problems (atherosclerosis)  
Neurologic problems (vascular tone)  
Disease of unknown origin (idiopathic)

## Acanthosis Nigricans

An asymptomatic dark thickened velvety hyperpigmentation of flexural skin most commonly around the neck. Associated with DM, obesity, and other endocrine disorders, and malignancy. It is a cutaneous marker of tissue insulin resistance.

## Paediatric Exanthems

- see Paediatrics, P62

## Miscellaneous Lesions

### Angioedema and Urticaria

#### Angioedema

- deeper swelling of the skin involving subcutaneous tissues; often involves the eyes, lips, and tongue
- may or may not accompany urticaria
- hereditary or acquired forms
- hereditary angioedema (does not occur with urticaria)
  - onset in childhood; 80% have positive family history
  - recurrent attacks; 25% die from laryngeal edema
  - triggers: minor trauma, emotional upset, temperature changes
- types of acquired angioedema
  - acute allergic angioedema (allergens include food, drugs, contrast media, insect venom, latex)
  - non-allergic drug reaction (drugs include ACEI)
  - acquired C1 inhibitor deficiency
- treatment
  - prophylaxis with danazol or stanozolol for hereditary angioedema
  - epinephrine pen to temporize until patient reaches hospital in acute attack

#### Urticaria

- also known as "hives"
- transient, red, pruritic well-demarcated wheals
- each individual lesion lasts less than 24 h
- second most common type of drug reaction
- results from release of histamine from mast cells in dermis
- can also result after physical contact with allergen

Table 26. Classification of Urticaria

Type	Etiology
<b>Acute Urticaria</b> >2/3 of cases Attacks last <6 wk Individual lesions last <24 h	Drugs: especially ASA, NSAIDs Foods: nuts, shellfish, eggs, fruit Idiopathic Infection Drugs (antibiotics, hormones, local anesthetics) Foods Parasitic infections Insect stings (bees, wasps, hornets) Physical contact (animal saliva, plant resins, latex, metals, lotions, soap) Direct mast cell release Opiates, muscle relaxants, radio-contrast agents Complement-mediated Serum sickness, transfusion reactions Infections, viral/bacterial (>80% of urticaria in paediatric patients)
<b>Chronic Urticaria</b> <1/3 of cases Attacks last >6 wk Individual lesion lasts <24 h	Idiopathic (90% of chronic urticaria patients) IgE-dependent: trigger associated Aeroallergens Urticarial vasculitis Arachidonic acid metabolism ASA, NSAIDs Physical Dermatographism (friction, rubbing skin), cold (ice cube, cold water), cholinergic (hot shower, exercise), solar, pressure (shoulder strap, buttocks), aquagenic (exposure to water), adrenergic (stress), heat Other Mastocytosis, urticaria pigmentosa Parasitic infections Systemic diseases: SLE, endocrinopathy, neoplasm Stress
<b>Urticarial Vasculitis</b> Individual lesions last >24 h Often painful, less likely pruritic, wheals with bruise type lesions Biopsy indicated	Idiopathic Infections Hepatitis Autoimmune diseases SLE Drug hypersensitivity Cimetidine and diltiazem

#### DDx for Urticaria

##### MAD HIVES

Malignancy  
 Allergic  
 Drugs and foods  
 Hereditary  
 Infection  
 Vasculitis  
 Emotions  
 Stings

#### Approach to Urticaria

- Thorough Hx and physical exam
- **Acute:** no immediate investigations needed; consider referral for allergy testing
- **Chronic:** further investigations required: CBC and differential, urinalysis, ESR, TSH, LFTs to help identify underlying cause
- **Vasculitic:** biopsy of lesion and referral to dermatology

#### Wheal

- Typically erythematous flat-topped, palpable lesions varying in size with circumscribed dermal edema
- Individual lesion lasts <24 h
- Associated with mast cell release of histamine
- May be pruritic

#### Mastocytosis (Urticaria Pigmentosa)

Rare disease due to excessive infiltration of the skin by mast cells. It manifests as many reddish-brown elevated plaques and macules. Friction to a lesion produces a wheal surrounded by intense erythema (Darier's sign), due to mast cell degranulation; this occurs within minutes of rubbing

## Erythema Nodosum

### Clinical Features

- acute or chronic inflammation of subcutaneous fat (panniculitis)
- round, red, tender, poorly demarcated nodules
- sites: asymmetrically arranged on extensor lower legs (typically shins), knees, arms
- associated with arthralgia, fever, malaise

### Etiology

- 40% are idiopathic
- drugs: sulfonamides, OCPs (also pregnancy), analgesics, all-trans retinoic acid
- infections: GAS, TB, histoplasmosis, *Yersinia*
- inflammation: sarcoidosis, Crohn's > UC
- malignancy: acute leukemia, Hodgkin's lymphoma

### Epidemiology

- 15-30 yr old, F:M=3:1
- lesions last for days and spontaneously resolve in 6 wk

### Investigations

- CXR (to rule out chest infection and sarcoidosis)
- throat culture, ASO titre, PPD skin test

### Management

- symptomatic: bed rest, compressive bandages, wet dressings
- NSAIDs, intralesional steroids, oral potassium iodide
- treat underlying cause

### DDx of Erythema Nodosum

#### NODOSUMM

NO cause (idiopathic) in 40%  
 Drugs (sulfonamides, OCP, etc.)  
 Other infections (Group A Strep)  
 Sarcoidosis  
 UC and Crohn's  
 Malignancy (leukemia, Hodgkin lymphoma)  
 Many infections

## Pruritus

### Clinical Features

- a sensation provoking a desire to scratch, with or without skin lesions
- lesions may arise from the underlying disease, or from excoriation causing crusts, lichenified plaques, or wheals

### Etiology

- dermatologic – generalized
  - asteatotic dermatitis ("winter itch" due to dry skin)
  - pruritus of senescent skin (may not have dry skin, any time of year)
  - infestations: scabies, lice
  - immunoglobulins disease (bullous pemphigoid)
  - drug eruptions: ASA, antidepressants, opiates
  - psychogenic states
- dermatologic – local
  - atopic and contact dermatitis, lichen planus, urticaria, insect bites, dermatitis herpetiformis
  - infection: varicella, candidiasis
  - lichen simplex chronicus
  - prurigo nodularis
- systemic disease – usually generalized
  - hepatic: obstructive biliary disease, cholestatic liver disease of pregnancy
  - renal: chronic renal failure, uremia secondary to hemodialysis
  - hematologic: Hodgkin's lymphoma, multiple myeloma, leukemia, polycythemia vera, hemochromatosis, iron deficiency anemia, cutaneous T-cell lymphoma
  - neoplastic: lung, breast, gastric (internal solid tumours), non-Hodgkin's lymphoma
  - endocrine: carcinoid, DM, hypothyroid/thyrototoxicosis
  - infectious: HIV, trichinosis, echinococcosis, hepatitis C
  - psychiatric: depression, psychosis
  - neurologic: post-herpetic neuralgia, multiple sclerosis

### DDx of Pruritus

#### SCRATCHED

Scabies  
 Cholestasis  
 Renal  
 Autoimmune  
 Tumours  
 Crazies (psychiatric)  
 Hematology (polycythemia, lymphoma)  
 Endocrine (thyroid, parathyroid, iron)  
 Drugs, Dry skin

Consider biopsy of any non-healing wound to rule out cancer

### Investigations

- blood work: CBC, ESR, Cr/BUN, LFT, TSH, fasting blood sugar, stool culture, and serology for parasites
- biopsy

### Management

- treat underlying cause
- cool water compresses to relieve pruritus
- bath oil and emollient ointment (especially if xerosis is present)
- topical corticosteroid and antipruritics (e.g. menthol, camphor, phenol, mirtazapine, capsaicin)
- systemic antihistamines: H1 blockers are most effective, most useful for urticaria

- phototherapy with UVB or PUVA
- doxepin, amitriptyline
- immunosuppressive agents if severe: steroids and steroid-sparing

## Wounds and Ulcers

- see [Plastic Surgery](#), PL8, PL17

## Sunscreens and Preventative Therapy

### Sunburn (Solar Erythema)

- erythema 2-6 h post UV exposure often associated with edema, pain and blistering with subsequent desquamation of the dermis, and hyperpigmentation
- chronic UVA and UVB exposure leads to photoaging, immunosuppression, photocarcinogenesis
- prevention: avoid peak UVR (10 am-4 pm), wear appropriate clothing, wide-brimmed hat, sunglasses, and broad-spectrum sunscreen
- clothing with UV protection expressed as UV protection factor (UPF) is analogous to SPF of sunscreen

### Sunscreens

- under ideal conditions an SPF of 10 means that a person who normally burns in 20 min will burn in 200 min following the application of the sunscreen
- topical chemical: absorbs UV light
  - requires application at least 15-30 min prior to exposure, should be reapplied every 2 h (more often if sweating, swimming)
  - UVB absorbers: PABA, salicylates, cinnamates, benzylidene camphor derivatives
  - UVA absorbers: benzophenones, anthranilates, dibenzoylmethanes, benzylidene camphor derivatives
- topical physical: reflects and scatters UV light
  - titanium dioxide, zinc oxide, kaolin, talc, ferric chloride, and melanin
  - all are effective against the UVA and UVB spectrum
  - less risk of sensitization than chemical sunscreens and waterproof, but may cause folliculitis or miliaria
- some sunscreen ingredients may cause contact or photocontact allergic reactions, but are uncommon

### Management

- sunburn: if significant blistering present, consider treatment in hospital; otherwise, symptomatic treatment (cool wet compresses, oral anti-inflammatory, topical corticosteroids)
- antioxidants, both oral and topical are being studied for their abilities to protect the skin; topical agents are limited by their ability to penetrate the skin

## Topical Steroids

Table 27. Potency Ranking of Topical Steroids

Relative Potency	Relative Strength	Generic Names	Trade Names	Usage
Weak	x1	hydrocortisone – 2.5% (1% available OTC)	Emo Cort <sup>®</sup>	Intertriginous areas, children, face, thin skin
Moderate	x3	hydrocortisone 17-valerate – 0.2% desonide mometasone furoate	Westcort <sup>®</sup> Tridesilon <sup>®</sup> Elocom <sup>®</sup>	Arm, leg, trunk
Potent	x6	betamethasone – 0.1% 17-valerate – 0.1% amcinonide	Betnovate <sup>®</sup> Celestoderm – V <sup>®</sup> Cyclocort <sup>®</sup>	Body
Very Potent	x9	betamethasone dipropionate – 0.05% fluocinonide – 0.05% halcinonide	Diprosone <sup>®</sup> Lidex, Topsyn gel <sup>±</sup> Lyderm <sup>®</sup> Halog <sup>®</sup>	Palms and soles
Extremely Potent	x12	clobetasol propionate – 0.05% (most potent) betamethasone dipropionate ointment halobetasol propionate – 0.05%	Dermovate <sup>®</sup> Diprolene <sup>®</sup> Ultravate <sup>®</sup>	Palms and soles

### Skin Phototypes (Fitzpatrick)

Phototype	Colour of Skin	Skin's Response to Sun Exposure (without SPF protection)
I	White	Always burns, never tans
II	White	Always burns, little tan
III	White	Slight burn, slow tan
IV	Pale brown	Slight burn, faster tan
V	Brown	Rarely burns, dark tan
VI	Dark brown or black	Never burns, dark tan

SPF = burn time with cream/burn time without cream

### UV Radiation

#### UVA (320-400 nm): Aging

- Penetrates skin more effectively than UVB or UVC
- Responsible for tanning, burning, wrinkling, photoallergy, and premature skin aging
- Penetrates clouds, glass and is reflected off water, snow, and cement

#### UVB (290-320 nm): Burning

- Absorbed by the outer dermis
- Is mainly responsible for burning and premature skin aging
- Primarily responsible for BCC, SCC
- Does not penetrate glass and is substantially absorbed by ozone

#### UVC (200-290 nm)

- Is filtered by ozone layer

### Body Site:

#### Relative Percutaneous Absorption

Forearm	1.0
Plantar foot	0.14
Palm	0.83
Back	1.7
Scalp	3.7
Forehead	6.0
Cheeks	13.0
Scrotum	42.0

Calculation of strength of steroid compared to hydrocortisone on forearm: relative strength of steroid x relative percutaneous absorption

### Side Effects of Topical Steroids

- **Local:** atrophy, perioral dermatitis, steroid acne, rosacea, contact dermatitis, tachyphylaxis (tolerance), telangiectasia, striae, hypertrichosis, hypopigmentation
- **Systemic:** suppression of HPA axis, mood changes, nervousness, insomnia, hyperglycemia, fluid/sodium retention, increased appetite, weight gain, muscular weakness

Activate Windows

Go to Settings to activate Windows.

## Dermatologic Therapies

Table 28. Common Topical Therapies

Drug Name	Dosing Schedule	Indications	Comments
<b>Calcipotriol (Dovonex<sup>®</sup>)</b>	0.005% cream, ointment, scalp solution, apply BID For maintenance therapy, apply once daily	Psoriasis	Burning, itching, skin irritation, worsening of psoriasis Avoid face, mucous membranes, eyes; wash hands after application Maximum weekly dosage of cream by age: 2-5 yr – 25 g/wk 6-10 yr – 50 g/wk 11-14 yr – 75 g/wk >14 yr – 100 g/wk Inactivated by light (do not apply before phototherapy)
<b>Imiquimod (Aldara<sup>®</sup>)</b>	5% cream applied 3x/wk Apply at bedtime, leave on 6-10 h, then wash off with mild soap and water Max duration 16 wk	Genital warts Cutaneous warts AK Superficial BCC	Avoid natural/artificial UV exposure Local skin and application site reactions Erythema, ulceration, edema, flu-like symptoms Works best for warts on mucosal surfaces May induce inflammation and erosion
<b>Permethrin (Kwellada<sup>®</sup> P Lotion and Nix<sup>®</sup> Dermal Cream)</b>	1% or 5% cream, applied once overnight to all skin areas from neck down, repeated one wk later	Scabies (Kwellada-P Lotion, Nix <sup>®</sup> Dermal Cream) Pediculosis (Kwellada-P Crème Rinse <sup>®</sup> , Nix Crème Rinse <sup>®</sup> )	Do not use in children <2 yr Hypersensitivity to drug, or known sensitivity to chrysanthemums Local reactions only (resolve rapidly); including burning, pruritus Low toxicity, excellent results Consider second application after 7 d
<b>Pimecrolimus (Elidel<sup>®</sup>)</b>	1% cream BID Use for as long as lesions persist and discontinue upon resolution of symptoms	AD (mild to moderate)	Burning Lacks adverse effects of steroids May be used on all skin surfaces including head, neck, and intertriginous areas Expensive
<b>Tacrolimus Topical (Protopic<sup>®</sup>)</b>	0.03% (children) or 0.1% (adults) ointment BID Continue for duration of disease plus 1 wk after clearing	AD (mild to moderate)	Burning Lacks adverse effects of steroids May be used on all skin surfaces including head, neck, and intertriginous areas Expensive

### Topical Vehicles

- **Ointment** (water in oil): hydrate, greasy
- **Cream** (oil in water): hydrate, variable
- **Lotion** (powder in water): drying, cosmesis
- **Solutions** (water, alcohol, propylene glycol)
- **Gel** (solution that melts on contact with skin, alcohol): drying
- **Foam** is a newer vehicle and several agents are now available in foam vehicles. Examples include Olux-E<sup>™</sup> (clobetasol), Verdeso<sup>™</sup> (desonide), Luxiq<sup>™</sup> (betamethasone), and Enstilar<sup>™</sup> (betamethasone propionate and calcipotriol)
- **Sprays:** Lamisil<sup>™</sup> (terbinafine) spray, Clobex<sup>™</sup> spray (clobetasol)
- **Lacquers:** Penlac<sup>®</sup> (ciclopirox), Jublia<sup>®</sup> (efinaconazole)

### Deciding on the Amount of Steroid to Use

- 1 palm = 1% BSA
- 1 fingertip unit (FTU) = Amount of topical medication (from 5 mm nozzle) placed on pad of index finger from distal tip to DIP = 500 mg = 2% BSA
- Therefore give 30 g for every 2 palms of area to cover (if applying steroid BID, 1 mo supply)

Table 29. Common Oral Therapies

Drug Name	Dosing Schedule	Indications	Comments
<b>Acitretin (Soriatane<sup>®</sup>)</b>	25-50 mg PO once daily; maximum 75 mg/d	Severe psoriasis Other disorders of hyperkeratinization (ichthyosis, Darier's disease)	<b>Monitoring</b> Cr at baseline; LFTs at baseline, then q1-2 wk until stable, then as clinically indicated; fasting lipid panel at baseline, then q1-2 wk until stable, then if long-term treatment or high-risk patient, continue periodically; urine or serum pregnancy test x 2 at baseline, qmo during treatment, then q3 mo for >3 yr after discontinuation; glucose if diabetes; radiography periodically if long-term treatment <b>Contraindications</b> Women of childbearing potential unless strict contraceptive requirements are met <b>Drug interactions</b> Other systemic retinoids, methotrexate, tetracyclines, certain contraceptives May be combined with PUVA phototherapy (known as re-PUVA)
<b>Antivirals</b>	famciclovir (Famvir <sup>®</sup> ) 250 mg PO TID x 7-10 d (for 1st episode of genital herpes) 125 mg PO BID x 3 d (for recurrent genital herpes)  valacyclovir (Valtrex <sup>®</sup> ) 1000 mg PO BID x 3 d (for 1st episode of genital herpes) 500 mg PO BID x 5 d (for recurrent genital herpes)	Chickenpox HZV Genital herpes Acute and prophylactic to reduce transmission in infected patients Herpes labialis	<b>Side effects</b> Headache, nausea, diarrhea, abdominal pain Reduce dose if impaired renal function <b>Drug interactions</b> Cladribine, varicella vaccine, zoster vaccine  <b>Side effects</b> Dizziness, depression, abdominal pain Reduce dose if impaired renal function <b>Drug interactions</b> cladribine, foscarnet, varicella vaccine, zoster vaccine
<b>Cyclosporine (Neoral<sup>®</sup>)</b>	2.5-4 mg/kg/d PO divided BID Max 4 mg/kg/d After 4 wk may increase by 0.5 mg/kg/d q2 wk Concomitant dose of magnesium may protect the kidneys	Psoriasis May also be effective in: Lichen planus EM Recalcitrant urticaria Recalcitrant AD	<b>Monitoring</b> BUN/Cr x2 at baseline, then q2 wk x 3 mo, then if stable, qmo; BP x 2, CBC, K <sup>+</sup> , Mg <sup>2+</sup> , lipid panel, uric acid at baseline, then q2 wk x 3 mo, then qmo if stable, or more frequently if adjust dose; LFTs <b>Contraindications</b> Abnormal renal function, uncontrolled hypertension, malignancy (except NMSC), uncontrolled infection, immunodeficiency (excluding autoimmune disease), hypersensitivity to drug Long-term effects preclude use of cyclosporine for >2 yr; discontinue earlier if possible May consider rotating therapy with other drugs to minimize adverse effects of each drug
<b>Dapsone</b>	50-100-150 mg PO once daily tapering to 25-50 mg PO once daily to as low as 50 mg 2x/wk	Dermatitis herpetiformis, neutrophilic dermatoses	<b>Monitoring</b> GGPD before treatment starts; CBC qwk x 4, qmo x 6, then q6 mo thereafter; LFTs at baseline, then periodically <b>Side effects</b> Neuropathy Hemolysis (Vitamin C and E supplementation can help prevent this) <b>Drug interactions</b> Substrate of CYP2C8/9 (minor), 2C19 (minor), 2E1 (minor), 3A4 (major) Often a dramatic response within hours

Table 29. Common Oral Therapies

Drug Name	Dosing Schedule	Indications	Comments
Doxycycline	100 mg PO BID	Acne vulgaris Rosacea Bullous pemphigoid	<u>Contraindications</u> Pregnancy, hepatic impairment, drug hypersensitivity Taking acitretin, isotretinoin, or penicillin antibiotic Oral typhoid vaccine
Isotretinoin (Accutane®, Clarus®, Epuris®)	0.5-1 mg/kg/d given once daily to achieve a total dose of 120 mg/kg (20-24 wk)	Severe nodular and/or inflammatory acne Acne conglobata Recalcitrant acne Widespread comedonal acne	<u>Monitoring</u> Fasting lipid panel at baseline, then q1-2 wk until lipid response to isotretinoin is established or if risk factors more frequently; LFTs at baseline, then q1-2 wk until stable; pregnancy test x 2 at baseline; glucose frequently if risk factors <u>Contraindications</u> Teratogenic – in sexually active females, 2 forms of reliable contraception necessary Generally regarded as unsafe in lactation <u>Side effects</u> Decreased night vision, decreased tolerance to contact lenses, dry mucous membranes May transiently exacerbate acne, dry skin Depression, myalgia <u>Drug interactions</u> Caution if used at the same time as tetracycline family antibiotics – both may cause pseudotumour cerebri Discontinue vitamin A supplements Drug may be discontinued at 16-20 wk when nodule count has dropped by >70%; a second course may be initiated after 2 mo prn Refractory cases may require >3 courses
Itraconazole (Sporanox®)	100-400 mg PO once daily, depending on infection Tinea corporis/cruris/versicolor: 200 mg PO once daily x 7 d Tinea pedis: 200 mg PO BID x 3 d Toenails: 200 mg PO BID x 3 d once per mo, repeated 3x Fingernail involvement only: 200 mg BID PO x 3 d once per mo	Onychomycosis Tinea corporis, cruris, pedis, versicolor, capitis	<u>Contraindications</u> CHF <u>Side effects</u> Serious hepatotoxicity <u>Drug Interactions</u> Inhibits CYP3A4 Increases concentration of some drugs metabolized by this enzyme (i.e. statins, diabetic drugs) Give capsules with food, capsules must be swallowed whole
Ivermectin (Mectizan®, Stromectol®)	200-250 µg/kg PO weekly x 2 Take once as directed; repeat one wk later	Onchocerciasis (USA only) Not licensed for use in Canada Also effective for: scabies	No significant serious side effects Efficacious
Methotrexate	10-25 mg qwk, PO, IM, or IV Max: 30 mg/wk To minimize side effects, administer with folic acid supplementation: 1-5 mg once daily	Psoriasis AD Lymphomatoid papulosis May also be effective in: cutaneous sarcoidosis	<u>Monitoring</u> Pregnancy test at baseline; CBC at baseline, then q6 mo or more frequently if initial treatment, dose change, elevated serum level risk, or chemotherapy use; BUN/Cr, LFTs at baseline, then q4-8 wk or more frequently if initial Tx, dose change, elevated serum level risk, or chemotherapy use; serum albumin at baseline if psoriasis, then continue periodically; CXR at baseline; liver biopsy at baseline if psoriasis or if RA with history of alcoholism, persistently abnormal baseline LFTs, or chronic HBV or HCV infection, then if psoriasis repeat after total cumulative dose 1.5 g and each additional 1-1.5 g; serum drug levels if renal impairment, or high dose chemotherapy use <u>Contraindications</u> Pregnancy, lactation, alcohol abuse, liver dysfunction, immunodeficiency syndrome, blood dyscrasias, hypersensitivity to drug Restricted to severe, recalcitrant or disabling psoriasis not adequately responsive to other forms of therapy May be combined with cyclosporine to allow lower doses of both drugs
OCPs (TriCyclen®, Diane 35®, Alesse®)	1 pill PO once daily	Hormonal acne (chin, jawline) Acne associated with polycystic ovarian syndrome or other endocrine abnormalities	All combined OCPs are helpful in acne but those listed on the left have undergone RCTs <u>Contraindications</u> Smoking, HTN, migraines with aura, pregnancy Routine gynaecological health maintenance should be up to date
Spironolactone	50-100 mg PO once daily alone or with OCPs	Hormonal acne (chin, jawline) Acne with endocrine abnormality	<u>Contraindications</u> Pregnancy <u>Side effects</u> Menstrual irregularities at higher doses if not on OCPs Breast tenderness, mild diuresis common Risk of hyperkalemia – counsel patients to reduce intake of potassium rich foods such as bananas
Terbinafine (Lamisil®)	250 mg PO once daily x 2 wk Fingernails x 6 wk Toenails x 12 wk Confirm diagnosis prior to treatment	Onychomycosis Tinea corporis, cruris, pedis, capitis	<u>Contraindications</u> Pregnancy, chronic or active liver disease <u>Drug interactions</u> Potent inhibitor of CYP2D6; use with caution when also taking β-blockers, certain anti-arrhythmic agents, MAOI type B, and/or antipsychotics Drug concentrates rapidly in skin, hair, and nails at levels associated with fungicidal activity
Tetracycline	250-500 mg PO BID to TID Taken 1 h before or 2 h after a meal	Acne vulgaris Rosacea Bullous pemphigoid	<u>Contraindications</u> Severe renal or hepatic dysfunction

## Traumatic and Mechanical Disorders

### PERNIOSIS

#### Definition

- abnormal inflammatory response to cold, damp, non-freezing conditions

#### Epidemiology

- common in the United Kingdom and northwestern Europe; common for those whose homes lack central heating
- women, the elderly, and children are most affected

#### Clinical Features

- single or multiple erythematous to blue-violet macules, nodules, or papules
- blistering or ulceration seen in severe cases
- lesions present on the distal toes and fingers, and less often on the heels, ears, and nose
- symptoms of burning, itching, or pain, lasting 1-3 wk

#### Pathophysiology

- unknown but may be associated with cryoglobulins or cold agglutinins

#### Differential Diagnosis

- chilblain lupus erythematosus, lupus pernio

#### Treatment

- warming clothing, avoidance of cold, damp conditions, keeping feet dry, smoking cessation
- nifedipine, nicotinamide, phenoxybenzamine, sympathectomy, and erythemogenic UVB phototherapy

## Landmark Dermatology Trials

Trial Name	Reference	Clinical Trial Details
<b>MELANOMA</b>		
Hodi et al. 2010	NEJM 2016; 375:311-322	<p><b>Title:</b> Improved Survival with Ipilimumab in Patients with Metastatic Melanoma</p> <p><b>Purpose:</b> To compare ipilimumab administered with or without a glycoprotein 100 (gp100) peptide vaccine to gp100 alone in patients with previously treated metastatic melanoma.</p> <p><b>Methods:</b> 676 HLA-A*0201-positive patients with unresectable stage III or IV melanoma, were randomized in a 3:1:1 ratio to receive ipilimumab+gp100 (n=403), ipilimumab alone (n=137), or gp100 alone (n=136).</p> <p><b>Results:</b> Median survival was 10 mo among patients receiving ipilimumab plus gp100, as compared with 6.4 mo among patients receiving gp100 alone and 10.1 mo median survival with ipilimumab alone. No significant difference in survival between ipilimumab groups was noted. Grade 3 or 4 immune-related adverse events occurred in 10-15% of patients treated with ipilimumab and 3% treated with gp100 alone.</p> <p><b>Conclusions:</b> Ipilimumab, with or without a gp100 peptide vaccine, as compared with gp100 alone, improved overall survival in patients with previously treated metastatic melanoma.</p>
BRIM-3	NEJM 2011; 364:2507-2516	<p><b>Title:</b> Improved Survival with Vemurafenib in Melanoma with BRAF V600E Mutation</p> <p><b>Purpose:</b> To compare the efficacy of BRAF kinase inhibitor vemurafenib (PLX4032) vs. dacarbazine in patients with metastatic melanoma.</p> <p><b>Methods:</b> Phase 3 RCT comparing vemurafenib with dacarbazine in 675 patients with untreated, metastatic melanoma with BRAF V600E mutation. Patients were randomized to receive vemurafenib (960 mg orally twice daily) or dacarbazine (1000 mg/m<sup>2</sup> of body-surface area intravenously every 3 weeks). Co-primary endpoints: overall and progression-free survival.</p> <p><b>Results:</b> At 6 mo, overall survival was 84% in the vemurafenib group and 64% in the dacarbazine group. Vemurafenib was associated with a relative reduction of death risk by 63% and a reduction of 74% in the risk of either death or disease progression vs. dacarbazine. Response rates were reported to be 48% for vemurafenib and 5% for dacarbazine. Common adverse events associated with vemurafenib: arthralgia, rash, fatigue, alopecia, keratoacanthoma, photosensitivity, nausea, and diarrhea.</p> <p><b>Conclusions:</b> Vemurafenib improved rates of overall and progression-free survival in patients with previously untreated melanoma with the BRAF V600E mutation.</p>
<b>PSORIASIS</b>		
BE VIVID	Lancet 2021; 397: 475-486	<p><b>Title:</b> Bimekizumab versus Ustekinumab for the Treatment of Moderate to Severe Plaque Psoriasis (BE VIVID): Efficacy and Safety from a 52 wk, Multicentre, Double-blind, Active Comparator and Placebo Controlled Phase 3 Trial</p> <p><b>Purpose:</b> To compare the efficacy and safety of a 52 wk treatment with bimekizumab vs. placebo vs. ustekinumab in patients with moderate to severe plaque psoriasis.</p> <p><b>Methods:</b> Multicentre RCT involving adults 18 yr of age or older with moderate to severe plaque psoriasis (Psoriasis Area and Severity Index [PASI] score <math>\geq 12</math>, <math>\geq 10\%</math> body surface area affected by psoriasis, and Investigator's Global Assessment [IGA] score <math>\geq 3</math> on a five point scale). Patients were randomly assigned (4:2:1) to bimekizumab 320 mg every 4 wk, ustekinumab 45 mg or 90 mg at wk 0 and 4, then every 12 wk, or placebo every 4 wk. At 16 wk, patients in the placebo group were switched to bimekizumab.</p> <p><b>Results:</b> The study enrolled 567 patients. At wk 16, 85% of patients in bimekizumab group had PASI90 vs. 50% in ustekinumab group and 5% in placebo group. Approximately 84% patients in bimekizumab group had an IGA response vs. 53% in ustekinumab group and 5% in placebo groups. Major cardiac adverse events occurred in 5 patients with pre-existing CV risk factors in the bimekizumab group whereas none occurred in the ustekinumab group. Additionally, oral candidiasis rates were higher than placebo and ustekinumab, and one case of IBD was recorded.</p> <p><b>Conclusion:</b> Bimekizumab was more efficacious than ustekinumab and placebo in the treatment of moderate to severe plaque psoriasis. Additional studies may be needed to assess safety.</p>
ADVANCE	J Am Acad Dermatol 2022;86(1):77	<p><b>Title:</b> Efficacy and Safety of Apremilast (Phosphodiesterase Inhibitor) in Patients with Mild-to-moderate Plaque Psoriasis</p> <p><b>Purpose:</b> To evaluate the effectiveness of apremilast in treating mild-to-moderate plaque psoriasis.</p> <p><b>Methods:</b> A phase 3, double-blind, placebo-controlled study was conducted in 595 adults with mild-to-moderate psoriasis. Patients were randomized to either 30 mg twice daily oral apremilast or placebo (oral tablets of no pharmacological significance) for the first 16 wk. The outcome of interest was the achievement of a static Physician Global Assessment score of 0 (clear) or 1 (almost clear).</p> <p><b>Results:</b> A significantly larger proportion of the apremilast group met the desired static Physician Global Assessment response rate when compared with the placebo group (21.6% vs. 4.1%).</p> <p><b>Conclusions:</b> Apremilast proved effective as a treatment for mild-to-moderate plaque psoriasis.</p>
<b>ATOPIC DERMATITIS</b>		
ECZTRA	Br J Dermatol 2021;184(3):450	<p><b>Title:</b> Tralokinumab (Monoclonal Antibody) Plus Topical Corticosteroids (TCS) for the Treatment of Moderate-to-severe Atopic Dermatitis</p> <p><b>Purpose:</b> To evaluate the safety and effectiveness of tralokinumab in treating moderate to severe atopic dermatitis</p> <p><b>Methods:</b> A double-blind placebo study was conducted using 380 patients, 253 of which were randomized to the treatment group (subcutaneous tralokinumab 300 mg every 2 wk with TCS as needed over 16 wk) and the remainder to the placebo group (placebo every 2 wk with TCS as needed over 16 wk). The outcome of interest was a 75% improvement in the Eczema Area and Severity Index (EASI).</p> <p><b>Results:</b> After 16 wk of treatment there was a significantly larger proportion of patients treated with tralokinumab (56%) that achieved the EASI benchmark when compared to the placebo group (35.7%).</p> <p><b>Conclusions:</b> Tralokinumab in combination with the current standard of care was proven to be effective and well tolerated in treatment for atopic dermatitis.</p>

## Acronyms

AAA	abdominal aortic aneurysm	D10W	dextrose 10% in water	INR	international normalized ratio	rt-PA	recombinant tissue plasminogen activator
ABG	arterial blood gas	D50W	dextrose 50% in water	IVC	inferior vena cava	SAH	subarachnoid hemorrhage
ACEI	angiotensin-converting enzyme inhibitor	D25W	dextrose 25% in water	LBBB	left bundle branch block	SBP	spontaneous bacterial peritonitis
ACLS	Advanced Cardiac Life Support	DGI	disseminated gonococcal infection	LOC	level of consciousness	SCI	spinal cord injury
ACS	acute coronary syndrome	DIC	disseminated intravascular coagulation	LP	lumbar puncture	SJS	Stevens-Johnson syndrome
AED	automatic external defibrillator	DKA	diabetic ketoacidosis	LSD	lysergic acid diethylamide	SNS	sympathetic nervous system
AFib	atrial fibrillation	DRE	digital rectal exam	LVH	left ventricular hypertrophy	SOB	shortness of breath
AG	anion gap	DT	delirium tremens	MAP	mean arterial pressure	SSRI	selective serotonin reuptake inhibitor
ARDS	acute respiratory distress syndrome	DVT	deep vein thrombosis	MDI	metered dose inhaler	SSSS	staphylococcal scalded skin syndrome
AVN	avascular necrosis	ED	emergency department	MDMA	methylenedioxy-methamphetamine	STEMI	ST elevation myocardial infarction
AVPU	alert, voice, pain, unresponsive	EM	erythema multiforme	MMSE	mini-mental state examination	TBI	traumatic brain injury
AXR	abdominal x-ray	ESR	erythrocyte sedimentation rate	MVC	motor vehicle collision	TCA	tricyclic antidepressant
Bi-PAP	bilevel positive airway pressure	ETT	endotracheal tube	NS	normal saline	Tdap	tetanus, diphtheria, acellular pertussis
BSA	body surface area	FAST	focused assessment with sonography for trauma	NSTEMI	non-ST elevation myocardial infarction	TEN	toxic epidermal necrolysis
BUN	blood urea nitrogen	FEV1	forced expiratory volume in 1 second	PID	pelvic inflammatory disease	TIA	transient ischaemic attack
CAS	Children's Aid Society Clinical Institute Withdrawal Assessment for Alcohol	FFP	fresh frozen plasma	PNS	parasympathetic nervous system	TSS	toxic shock syndrome
CIWA	Clinical Institute Withdrawal Assessment for Alcohol	GERD	gastroesophageal reflux disease	POG	plasma osmolar gap	VBG	venous blood gas
CNS	central nervous system	GCS	glasgow coma scale	PRBC	packed red blood cells	VFib	ventricular fibrillation
CPAP	continuous positive airway pressure	HEENT	head eyes ears nose throat	PT	prothrombin time	VTach	ventricular tachycardia
CPP	cerebral perfusion pressure	HI	head injury	PTT	partial thromboplastin time	VTE	venous thromboembolism
CRP	c-reactive protein	H&N	head and neck	RAPD	relative afferent pupillary defect		
CVA	costovertebral angle	IBD	inflammatory bowel disease	RBBB	right bundle branch block		
CVS	cardiovascular system	IBS	irritable bowel syndrome	ROM	range of motion		
D5W	dextrose 5% in water	ICS	intercostal space	RPS	rapid primary survey		
				RSI	rapid sequence induction		

## Patient Assessment/Management

### 1. Rapid Primary Survey

- Airway maintenance with C-spine control
- Breathing and ventilation
- Circulation (pulses, hemorrhage control)
- Disability (neurological status)
- Exposure (complete) and Environment (temperature control)
  - continually reassessed during secondary survey
  - changes in hemodynamic and/or neurological status necessitates a return to the primary survey beginning with airway assessment
- **IMPORTANT:** always watch for signs of shock while doing primary survey
- addressing the "ABCs" is the hallmark of the emergency department
  - in the setting of cardiac arrest, the approach changes to the "CABs": chest compressions, airway, and breathing
  - CAB can also be applied in massive trauma situations in the setting of massive blood loss to treat hypovolemic shock

#### A. AIRWAY

- first priority is to secure airway
- assume a cervical injury in every trauma patient and immobilize with collar
- assess ability to breathe and speak
- listen for evidence of airway obstruction (e.g. stridor)
- can change rapidly, therefore reassess frequently
- assess for facial fractures/edema/burns (impending airway collapse)

#### Airway Management

- anatomic optimization to allow for oxygenation and ventilation

#### 1. Basic Airway Management

- protect the C-spine
- chin lift (if C-spine injury not suspected) or jaw thrust to open the airway
- sweep and suction to clear mouth of foreign material

#### 2. Temporizing Measures

- nasopharyngeal airway (if gag reflex present, i.e. conscious)
- oropharyngeal airway (if gag reflex absent, i.e. unconscious)
- "rescue" airway devices (e.g. laryngeal mask airway, Combitube®)
- especially for children <8 yo, transtracheal jet ventilation through cricothyroid membrane (rarely used and best to consider opting for a definitive airway)

#### Approach to the Critically Ill Patient

1. Rapid Primary Survey (RPS)
2. Resuscitation (often concurrent with RPS)
3. Detailed Secondary Survey
4. Definitive Care

#### Signs of Airway Obstruction

- Agitation, confusion, "universal choking sign"
- Respiratory distress
- Failure to speak, dysphonia, stridor
- Cyanosis

### 3. Definitive Airway Management

- ETT intubation (with in-line stabilization of C-spine if applicable)
  - orotracheal ± RSI preferred
  - nasotracheal may be better tolerated in conscious patient
- surgical airway (if unable to intubate using oral/nasal route and unable to ventilate)
- cricothyroidotomy

### Contraindications to Intubation

- see Table 2, [Anesthesia](#), A8
- supraglottic/glottic pathology that would preclude successful intubation
- provider safety: e.g. SARS-CoV-2 (COVID-19) precludes intubation, CPR, and other aerosol generating procedures in the absence of full PPE

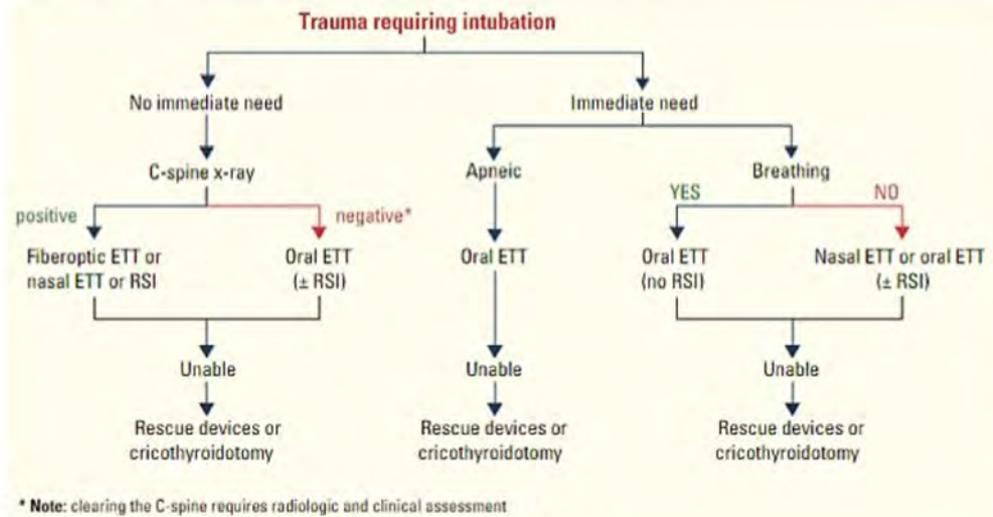

Figure 1. Approach to endotracheal intubation in an injured patient

## B. BREATHING

### Breathing Assessment

- quantitative measures of respiratory function: rate, oximetry, ABG, A-a gradient
- **Look**
  - mental status (anxiety, agitation, decreased LOC), chest movement (bilateral vs. asymmetrical), respiratory rate/effort, nasal flaring, increased work of breathing
- **Listen**
  - auscultate for signs of obstruction (e.g. stridor), breath sounds, symmetry of air entry, air escaping, adventitious sounds (e.g. wheezes, crackles)
- **Feel**
  - tracheal shift, chest wall for crepitus (e.g. subcutaneous emphysema, rib fracture), flail segments, sucking chest wounds

### Management of Breathing

- treat likely underlying cause (e.g. bronchodilators, epinephrine, diuresis)
- optimize oxygenation: nasal prongs → simple face mask → venturi mask → non-rebreather mask → high-flow nasal cannula → CPAP/BiPAP (in order of increasing FiO<sub>2</sub>)
- bag-valve mask and CPAP to supplement inadequate ventilation

## C. CIRCULATION

### Definition of Shock

- inadequate organ and tissue perfusion with oxygenated blood (brain, kidney, extremities)

Table 1. Major Types of Shock

Hypovolemic	Cardiogenic	Distributive	Obstructive
Hemorrhage (external and internal)	Myocardial ischaemia	Septic (see <i>Sepsis</i> , ER38)	Cardiac tamponade (see <i>Chest Trauma</i> , ER11)
Severe burns	Dysrhythmias	Anaphylactic (see <i>Anaphylaxis and Allergic Reactions</i> , ER29)	Tension pneumothorax (see <i>Chest Trauma</i> , ER11)
High output fistulas	CHF	Neurogenic (spinal cord injury)	PE (see <i>Venous Thromboembolism</i> , ER32)
Dehydration (diarrhea, DKA)	Cardiomyopathies		Aortic stenosis
	Cardiac valve problems		Constrictive pericarditis

### Clinical Evaluation

- early: tachypnea, tachycardia, narrow pulse pressure, reduced capillary refill, cool extremities (except neurogenic and septic shock), and reduced central venous pressure
- late: hypotension, altered mental status, reduced urine output

### Medications that can be Delivered via ETT

- NAVEL**
- Naloxone (Narcan<sup>®</sup>)
  - Atropine
  - Ventolin<sup>®</sup> (salbutamol)
  - Epinephrine
  - Lidocaine

### Indications for Intubation (4 P's)

- Patent airway
- Protects against aspiration (e.g. decreasing GCS <8)
- Positive pressure ventilation
- Pulmonary toilet (suction)

### Rescue Techniques in Intubation

- Bougie (used like a guidewire)
- Glidescope<sup>®</sup>
- Lighted stylet (uses light through skin to determine if ETT in correct place)
- Fiberoptic intubation (uses fiberoptic cable for indirect visualization)

### Video Laryngoscopes

- Stylets**
- Bonfil
  - Rigid and flexible laryngoscope (RIFL)
  - SensaScope

### Guide Channels

- AirTraq
- Pentax AWS
- Res-Q-Scope II
- Traditional (non-guided)
- Glidescope

Noisy breathing is obstructed breathing until proven otherwise

### O<sub>2</sub> Delivery Methods

	FiO <sub>2</sub>	Amount Given
Nasal Prongs	25-40%	1-6 L/min
Face Mask	40-60%	5-10 L/min
Non-rebreather	80-90%	15 L/min
High-flow Nasal Cannula	up to 100%	15-60L/min
CPAP/BiPAP	up to 100%	

Shock in a trauma patient is hemorrhagic until proven otherwise

**Table 2. Estimation of Degree of Hemorrhagic Shock**

Class	I	II	III	IV
Blood Loss	<750 cc	750-1500 cc	1500-2000 cc	>2000 cc
% of Blood Volume	<15%	15-30%	30-40%	>40%
Pulse	<100	>100	>120	>140
Blood Pressure	Normal	Normal	Decreased	Decreased
Respiratory Rate	20	30	35	>45
Capillary Refill	Normal	Decreased	Decreased	Decreased
Urinary Output	30 cc/h	20 cc/h	10 cc/h	None
Fluid Replacement	Crystalloid	Crystalloid	Crystalloid + blood	Crystalloid + blood

**Management of Hemorrhagic Shock**

- clear airway and assess breathing either first or simultaneously
- apply direct pressure on external wounds while elevating extremities. Do not remove impaled objects in the emergency room setting as they may tamponade bleeds
- start two large bore (14-16 G) IVs in the brachial/cephalic vein of each arm
- permissive hypotension with pRBC transfusion, ideally crossmatched. If crossmatched blood is unavailable in a timely manner, consider O- for women of childbearing age and O+ for men. Use FFP, platelets or tranexamic acid in early bleeding. If available, activate 'massive transfusion protocol'
- consider common sites of internal bleeding (abdomen, chest, pelvis, long bones, GI tract) where surgical intervention may be necessary

**D. DISABILITY**

- assess LOC using GCS
- pupils
  - assess equality, size, symmetry, reactivity to light
- unequal or sluggish suggests local eye problem or lateralizing CNS lesion
- non-reactive pupils + decreased LOC: structural cause (especially if asymmetric)
- lateralizing motor deficits

**Glasgow Coma Scale**

- GCS is for use in trauma patients with decreased LOC; good indicator of severity of injury and neurosurgical prognosis
- most useful if repeated; change in GCS with time is more relevant than the absolute number
- less meaningful for metabolic coma
- patient with deteriorating GCS needs immediate attention
- prognosis based on best post-resuscitation GCS
- reported as a 3-part score: Eyes + Verbal + Motor = Total
- if patient intubated, GCS score reported out of 10 + T (T = tubed, i.e. no verbal component)

**Table 3. Glasgow Coma Scale**

Eyes Open		Best Verbal Response		Best Motor Response	
Spontaneously	4	Answers questions appropriately	5	Obeys commands	6
To voice	3	Confused, disoriented	4	Localizes to pain	5
To pain	2	Inappropriate words	3	Withdraws from pain	4
No response	1	Incomprehensible sounds	2	Decorticate (flexion)	3
		No verbal response	1	Decerebrate (extension)	2
				No response	1

13-15 = mild injury, 9-12 = moderate injury, ≤8 = severe injury See Table 36, ER57 for Modified GCS for infants and children

**E. EXPOSURE/ENVIRONMENT**

- expose patient completely and assess entire body for injury; log roll to examine back
- DRE for trauma patients
- keep patient warm with a blanket ± radiant heaters; avoid hypothermia
- warm IV fluids/blood
- keep providers safe (contamination, combative patient)

**2. Resuscitation**

- done concurrently with primary survey
- attend to ABCs
- manage life-threatening problems as they are identified
- vital signs q5-15 min
- ECG, BP, and O<sub>2</sub> monitors
- Foley catheter and NG tube if indicated
- tests and investigations: CBC, electrolytes, BUN, Cr, glucose, amylase, INR/PTT, β-hCG, toxicology screen, cross and type

**Causes of Shock**

**SHOCKED**

- Septic, spinal/neurogenic Hemorrhagic
- Obstructive (e.g. tension pneumothorax, cardiac tamponade, PE)
- Cardiogenic (e.g. blunt myocardial injury, dysrhythmia, MI)
- anaphylactic
- Endocrine (e.g. Addison's, myxedema, coma)
- Drugs

**Common Sites of Bleeding**

- External (e.g. scalp)
- Chest
- Abdomen (peritoneum, retroperitoneum)
- Pelvis
- Long bones
- GI

**Fluid Resuscitation**

- Give bolus until HR decreases, urine output increases, and patient stabilizes
- Maintenance: 4:2:1 rule
  - 0-10 kg: 4 cc/kg/h
  - 10-20 kg: 2 cc/kg/h
  - Remaining weight: 1 cc/kg/h
  - Replace ongoing losses and deficits (assume 10% of body weight)
- Shortcut for calculating maintenance fluids for any patient ≥20kg: Fluid rate (in cc/hr) = 40 + patient's weight in kg

**Unilateral, Dilated, Non-Responsive Pupil**

- Focal mass lesion
- Epidural hematoma
- Subdural hematoma

**Contraindications to Foley Insertion**

- Blood at urethral meatus
- Scrotal hematoma
- High-riding prostate on DRE

**NG Tube Contraindications**

- Significant mid-face trauma
- Basal skull fracture

**Table 4. 2010 AHA CPR Guidelines with 2020 Updates**

Step/Action	Adult: >8 yr	Child: 1-8 yr	Infant: <1 yr
<b>Airway</b>	Head tilt-chin lift; jaw thrust without head extension if concern for spinal injury		
<b>Breaths</b>	2 breaths at 1 s/breath – stop once see chest rise		
<b>Severe Foreign-Body Airway Obstruction</b>	Abdominal thrust (if conscious)		Back blows and chest compressions
<b>Compressions</b>			
Compression landmarks	In the centre of the chest, lower half of the sternum		Just below nipple line
Compression method: push hard and fast, and allow for complete recoil	2 hands: heel of 1 hand with heel of second hand on top	2 hands: heel of 1 hand with second on top, or 1 hand: heel of 1 hand only	2 fingers, or thumbs
Compression depth	2-2.4 inches	About 1/2 to 1 1/2 the depth of the chest	
Compression rate	100-120/min with complete chest wall recoil between compressions		
Compression-ventilation ratio	30 compressions to 2 ventilations		
Compression-only CPR	Hands-only CPR is preferred if the bystander is not trained or does not feel confident in their ability to provide conventional CPR or if the bystander is trained but chooses to use compressions only		
<b>Defibrillation</b>	Immediate defibrillation if a shockable rhythm (ventricular fibrillation or ventricular tachycardia) is identified. Compressions (5 cycles/2 min) and use AED if unwitnessed arrest. Manual defibrillators are preferred for children and infants but can use adult dose AED if a manual defibrillator is not available.		

See [Anesthesia, A32 for ACLS Guidelines](#)

### 3. Secondary Survey

- done after primary survey once patient is hemodynamically and neurologically stabilized
- identifies major injuries or areas of concern
- full physical exam and CT (C-spine, chest, abdomen, and pelvis – required in blunt trauma, consider T-spine and L-spine if indicated)

#### HISTORY

- “SAMPLE”: Signs and symptoms, Allergies, Medications, Past medical history, Last meal, Events related to injury

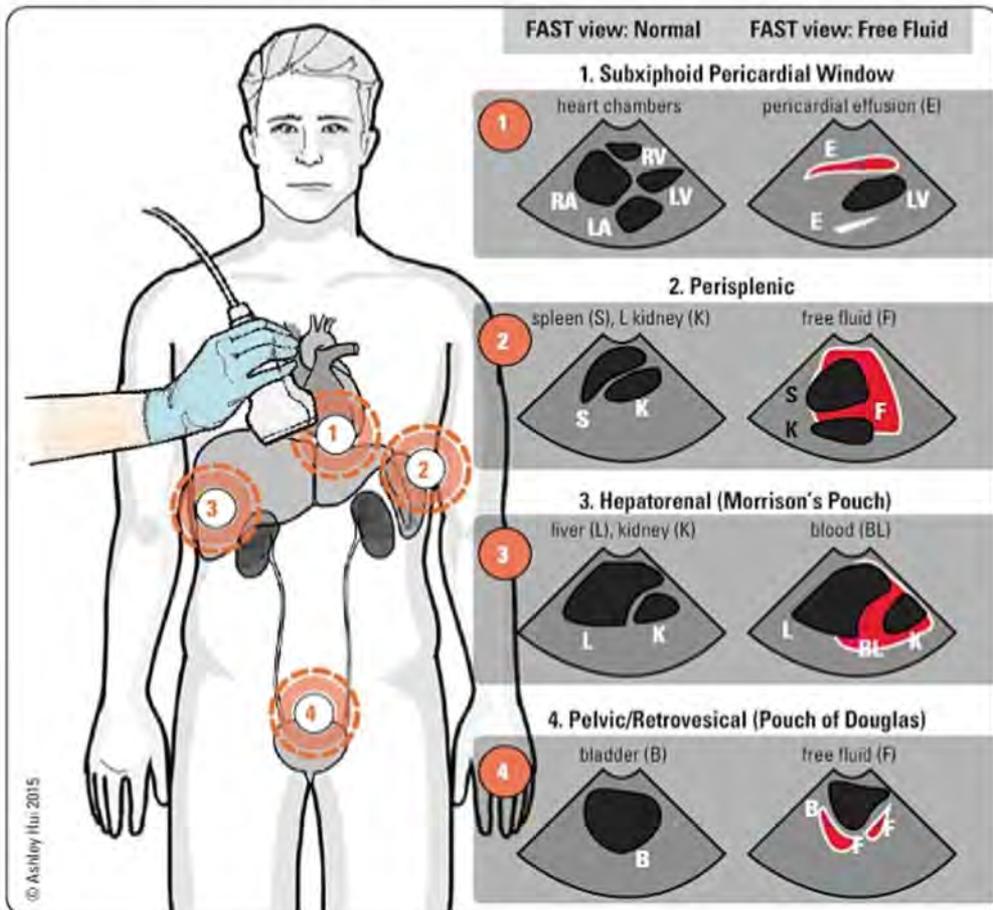

Figure 2. Four areas of a FAST

**PHYSICAL EXAM** (see *Traumatology, ER7*)**Head and Neck**

- palpation of facial bones, scalp

**Chest**

- inspect for midline trachea and flail chest
- auscultate lung fields
- palpate for subcutaneous emphysema

**Abdomen**

- assess for peritonitis, abdominal distention, and evidence of intra-abdominal bleeding
- DRE for GI bleed, high-riding prostate, and anal tone

**Musculoskeletal**

- examine all extremities for swelling, deformity, contusions, tenderness, ROM
- check for pulses (using Doppler probe) and sensation in all injured limbs
- log roll and palpate thoracic and lumbar spines
- palpate iliac crests and pubic symphysis and assess pelvic stability (lateral, AP, vertical)

**Neurological**

- GCS
- full cranial nerve exam
- alterations of rate and rhythm of breathing are signs of structural or metabolic abnormalities with progressive deterioration in breathing indicating a failing CNS
- assess spinal cord integrity
- conscious patient: assess distal sensation and motor function
- unconscious patient: response to painful or noxious stimulus applied to extremities

**INITIAL IMAGING**

- non-contrast CT head/face/C-spine (rule out fractures and bleeds)
- CXR
- FAST (see *Figure 2, ER5*) or CT abdomen/pelvis (if stable)
- pelvis x-ray

**Ethical Considerations****Consent to Treatment: Adults**

- see [Ethical, Legal, and Organizational Medicine, ELOM11](#)
- Emergency Rule: consent is not needed when a patient is at imminent risk from a serious injury AND obtaining consent is either: a) not possible, OR b) would increase risk to the patient
  - assumes that most people would want to be saved in an emergency
- any capable and informed patient can refuse treatment or part of treatment, even if it is life-saving
- be aware of who the legal substitute decision maker (SDM) is and contact them early
- exceptions to the Emergency Rule – treatment cannot be initiated if:
  - a competent patient has previously refused the same or similar treatment and there is no evidence to suggest the patient's wishes have changed (e.g. after an SDM has been contacted to clarify patient's wishes)
  - an advanced directive is available (e.g. do not resuscitate order)
  - NOTE: refusal of help in a suicide situation is NOT an exception; care must be given
- if in doubt, initiate treatment
- care can be withdrawn if necessary at a later time or if wishes are clarified by family

**Consent to Treatment: Children**

- treat immediately if patient is at imminent risk
- parents/guardians have the right to make treatment decisions, up to the age of 16 (beyond age 16, the patient can be considered an emancipated minor)
- if parents refuse treatment that is considered life-saving or will potentially alter the child's quality of life, CAS must be contacted – consent of CAS is needed to treat

**Other Issues of Consent**

- consent is required for HIV testing and/or administration of blood products
- however, if delay in substitute consent for blood transfusions puts patient at risk, transfusions can be given

**Duty to Report**

- law may vary depending on province and/or state
- e.g. gunshot wounds, suspected child abuse, various communicable diseases, medical unsuitability to drive, risk of substantial harm to others

**Signs of Increased ICP**

- Deteriorating LOC (hallmark)
- Deteriorating respiratory pattern
- Cushing reflex (high BP, low HR, irregular respirations)
- Lateralizing CNS signs (e.g. cranial nerve palsies, hemiparesis)
- Seizures
- Papilledema (occurs late)
- N/V and headache

Non-contrast head CT is the best imaging modality for intracranial injury

**Jehovah's Witnesses**

- Capable adults have the right to refuse medical treatment
- May refuse whole blood, pRBCs, platelets, and plasma even if considered life-saving
- Should be questioned directly about the use of albumin, immunoglobulins, hemophilic preparations
- Do not allow autologous transfusion unless there is uninterrupted extra corporeal circulation
- Usually ask for the highest possible quality of care without the use of the above interventions (e.g. crystalloids for volume expansion, attempts at bloodless surgery)
- Patient will generally sign hospital forms releasing medical staff from liability
- Most legal cases involve children of Jehovah's Witnesses; if life-saving treatment is refused, contact CAS

## Traumatology

- epidemiology
  - 4.9 million deaths are caused by injuries worldwide (data from 2016)
  - in Canada, traumatic injuries contributed more than 269000 hospitalizations and 17000 deaths (data from 2018)
  - leading cause of death in patients <45 yr
  - 4th highest cause of death in North America
  - causes more deaths in children/adolescents than all diseases combined
- trimodal distribution of death
  - minutes: death usually at the scene from lethal injuries
  - early: death within 4-6 h – “golden hour” (decreased mortality with trauma care)
  - days-weeks: death from multiple organ dysfunction, sepsis, VTE, etc.
- injuries fall into two categories
  - blunt (most common): MVC, pedestrian-automobile impact, motorcycle collision, fall, assault, sports
  - penetrating (increasing in incidence): gunshot wound, stabbing, impalement

## Considerations for Traumatic Injury

- important to know the mechanism of injury to anticipate traumatic injuries
- always look for an underlying cause (alcohol, medications, illicit substances, seizure, suicide attempt, medical problem)
- always inquire about HI, loss of consciousness, amnesia, vomiting, headache, and seizure activity

Table 5. Mechanisms and Considerations of Traumatic Injuries

Mechanism of Injury	Special Considerations	Associated Injuries
<b>MVC</b>	Vehicle(s) involved: weight, size, speed, damage Location of patient in vehicle Use and type of seatbelt Ejection of patient from vehicle Entrapment of patient under vehicle Airbag deployment Helmet use in motorcycle collision	Head-on collision: head/facial, thoracic (aortic), lower extremity Lateral/T-bone collision: head, C-spine, thoracic, abdominal, pelvic, and lower extremity Rear-end collision: hyper-extension of C-spine (whiplash injury) Rollover: all of the above may be associated injuries
<b>Pedestrian-Automobile Impact</b>	High morbidity and mortality Vehicle speed is an important factor Site of impact on car	Adults tend to be struck in lower legs (lower extremity injuries), impacted against car (truncal injuries), and thrown to ground (HI)
<b>Falls</b>	1 storey = 12 ft = 3.6 m Distance of fall: 50% mortality at 4 storeys and 95% mortality at 7 storeys Landing position (vertical vs. horizontal)	Vertical: lower extremity, pelvic, and spine fractures; HI Horizontal: facial, upper extremity, and rib fractures; abdominal, thoracic, and HI

## Head Trauma

- see [Neurosurgery, NS35](#)

### Specific Injuries

- fractures
  - Dx: non-contrast head CT and physical exam
- A. skull fractures
  - vault fractures
    - linear, non-depressed
      - most common
      - typically occur over temporal bone, in area of middle meningeal artery (commonest cause of epidural hematoma)
    - depressed
      - open (associated overlying scalp laceration and torn dura, skull fracture disrupting paranasal sinuses or middle ear) vs. closed
  - basal skull fractures
    - typically occur through floor of anterior cranial fossa (longitudinal more common than transverse)
    - can be a radiological or clinical diagnosis
    - associated with Battle's sign, racoon eyes, hemotympanum, and/or CSF otorrhea/rhinorrhea
- B. facial fractures (see [Plastic Surgery, PL31](#))
  - neuronal injury
  - beware of open fracture or sinus fractures (risk of infection)
  - severe facial fractures may pose risk to airway from profuse bleeding

Always completely expose and count the number of wounds

**Cardiac Box:** sternal notch, nipples, and xiphoid process; penetrating injuries inside this area should increase suspicion of cardiac injury

**High-Risk Injuries**

- MVC at high speed, resulting in ejection from vehicle
- Motorcycle collisions
- Vehicle vs. pedestrian crashes
- Fall from height >12 ft (3.6 m)

**Vehicle vs. Pedestrian Crash**

- In adults look for triad of injuries
- Waddell's triad
- Tibia-fibula or femur fracture
- Truncal injury
- Craniofacial injury

**Signs of Basal Skull Fracture**

- Battle's sign (bruised mastoid process)
- Hemotympanum
- Raccoon eyes (periorbital bruising)
- CSF rhinorrhea/otorrhea

- **scalp laceration**
  - can be a source of significant bleeding
  - achieve haemostasis, inspect and palpate for skull bone defects ± CT head (rule out skull fracture)
- **neuronal injury**
  - A. diffuse
    - mild TBI = concussion (GCS 13-15, patients are awake, may be confused but able to communicate and follow commands)
      - ♦ transient alteration in mental status that may involve loss of consciousness
      - ♦ hallmarks of concussion: confusion and amnesia, which may occur immediately after the trauma or minutes later
      - ♦ loss of consciousness (if present) must be less than 30 min and post-traumatic amnesia must be less than 24 h
    - diffuse axonal injury
      - ♦ mild: coma 6-24 h, possibly lasting deficit
      - ♦ moderate: coma >24 h, little or no signs of brainstem dysfunction
      - ♦ severe: coma >24 h, frequent signs of brainstem dysfunction
  - B. focal injuries
    - contusions
    - intracranial hemorrhage (epidural, subdural, intracerebral)

## ASSESSMENT OF BRAIN INJURY

### History

- prehospital status
- mechanism of injury

### Physical Exam

- assume C-spine injury until ruled out
- vital signs
  - shock (not likely due to isolated brain injury, except in infants)
  - Cushing's response to increasing ICP (bradycardia, HTN, irregular respirations)
- severity of injury determined by
  1. LOC
    - ♦ GCS ≤8 intubate, any change in score of 3 or more = serious injury
    - ♦ GCS of mild TBI = 13-15, moderate = 9-12, severe = 3-8
  2. pupils: size, anisocoria >1 mm (in patient with altered LOC), response to light
  3. lateralizing signs (motor/sensory)
    - ♦ may become subtler with increasing severity of injury
    - ♦ reassess frequently

### Investigations

- labs: CBC, electrolytes, INR/PTT, glucose, toxicology screen
- CT head (non-contrast) to exclude intracranial hemorrhage/hematoma
- C-spine imaging

### Management

- goal in ED: reduce secondary injury by avoiding hypoxia, ischaemia, decreased CPP, seizure
- general
  - ABCs
  - ensure oxygen delivery to brain through intubation and prevent hypercarbia
  - maintain BP (sBP >90)
  - treat other injuries
- early neurosurgical consultation for acute and subsequent patient management after imaging
- seizure treatment/prophylaxis
  - benzodiazepines, phenytoin, phenobarbital
- treat suspected raised ICP:
  - intubate (neuroprotective RSI where possible)
  - calm (sedate) if risk for high airway pressures or agitation
  - paralyze if agitated
  - hyperventilate (100% O<sub>2</sub>) to a pCO<sub>2</sub> of 30-35 mmHg
  - elevate head of bed to 20°
  - adequate BP to ensure good cerebral perfusion
  - give mannitol 1g/kg infused rapidly (contraindicated in shock/renal failure) or 3 mL/kg of hypertonic (3%) saline

### Disposition

- neurosurgical ICU admission for severe HI
- in a hemodynamically unstable patient with other injuries, prioritize most life-threatening injuries and maintain cerebral perfusion
- for minor HI not requiring admission, provide 24 h HI protocol (regular assessment of the patient for signs of loss of consciousness, confusion or amnesia) to competent caregiver, follow up with concussion and/or sports clinic as even seemingly minor HI may cause lasting deficits

#### Warning Signs of Severe Head Injury

- GCS <8
- Deteriorating GCS
- Unequal pupils
- Lateralizing signs

**N.B.** Altered LOC is a hallmark of brain injury

#### Canadian CT Head Rule Lancet 2001;357:1391-1396

**CT Head is only required for patients with minor HI with any one of the following**

##### High-Risk (for neurological intervention)

- GCS score <15 at 2 h after injury
- Suspected open or depressed skull fracture
- Any sign of basal skull fracture (hemotympanum, "raccoon" eyes, CSF otorrhea/rhinorrhea, Battle's sign)
- Vomiting ≥2 episodes
- Age ≥65 yr

##### Medium-Risk (for brain injury on CT)

- Amnesia before impact >30 min (i.e. cannot recall events just before impact)
- Dangerous mechanism (pedestrian struck by MVC, occupant ejected from motor vehicle, fall from height ≥3 ft or five stairs)

**Minor HI** is defined as witnessed loss of consciousness, definite amnesia, or witnessed disorientation in a patient with a GCS score of 13-15.  
**NB:** Canadian CT Head Rule does not apply for non-trauma cases, for GCS <13, ages <16, for patients on Coumadin™ and/or having a bleeding disorder, or having an obvious open skull fracture.

## Mild Traumatic Brain Injury

### Epidemiology

- TBI results in 1.7 million deaths, hospitalizations, and ED visits each year (US)
- 75% are estimated to be mild TBI; remainder are moderate or severe (see [Neurosurgery, NS37](#))
- highest rates in children 0-4 yr, adolescents 15-19 yr, and elderly >65 yr

### Clinical Features

- somatic: headache, sleep disturbance, N/V, blurred vision
- cognitive dysfunction: attentional impairment, reduced processing speed, drowsiness, amnesia
- emotion and behaviour: impulsivity, irritability, depression
- severe concussion: may precipitate seizure, bradycardia, hypotension, sluggish pupils

### Etiology

- falls, MVC, struck by an object, assault, sports

### Investigations

- neurological exam
- concussion recognition tool (see [parachute.ca](#))
- imaging – CT as per Canadian CT Head Rules, or MRI if worsening symptoms despite normal CT

### Treatment

- close observation and follow-up; for patients at risk of intracranial complications, give appropriate discharge instructions to patient and family; watch for changes to clinical features of more severe TBI (see above), and if change, return to ED
- hospitalization with normal CT (GCS <15, seizures, bleeding diathesis), or with abnormal CT
- pharmacological management of pain, depression, headache
- follow Return to Play/Return to Learn guidelines

### Prognosis

- most recover with minimal treatment
  - athletes with previous concussion are at increased risk of cumulative brain injury
- repeat TBI can lead to life-threatening cerebral edema or permanent impairment

## Spine and Spinal Cord Trauma

- assume cord injury with significant falls (>12 ft), deceleration injuries, blunt trauma to head, neck, or back
- spinal immobilization (cervical collar, spine board during patient transport only) must be maintained until spinal injury has been ruled out
- vertebral injuries may be present without spinal cord injury; normal neurologic exam does not exclude spinal injury
- cord may be injured despite normal C-spine x-ray (spinal cord injury without radiologic abnormality)
- injuries can include: complete/incomplete transection, cord edema, spinal shock

### History

- mechanism of injury, previous deficits, SAMPLE
- neck pain, paralysis/weakness, paresthesia

### Physical Exam

- ABCs
- abdominal: ecchymosis, tenderness
- neurological: complete exam, including mental status
- spine: maintain neutral position, palpate C-spine; log roll, then palpate T-spine and L-spine, assess rectal tone
  - when palpating, assess for tenderness, muscle spasm, bony deformities, step-off, and spinous process malalignment
- extremities: check capillary refill, suspect thoracolumbar injury with calcaneal fractures

### Investigations

- bloodwork: CBC, electrolytes, Cr, glucose, coagulation profile, cross and type, toxicology screen
- imaging
  - CT of the spine; if not available, protect spines and transfer for definitive imaging
  - indications
    - C-spine injury
    - unconscious patients (with appropriate mechanism of injury)
    - neurological symptoms or findings
    - deformities that are palpable when patient is log rolled
    - back pain

Extent of retrograde amnesia correlates with severity of injury

For minor paediatric HI (up to 16 yo with GCS ≥13 and injury within the last 24 h), use Canadian Assessment of Tomography for Childhood Head Injury (CATCH) rule to determine need for CT. CT head required if any of the following findings are exhibited

- GCS <15 at two hours after injury
- Suspected open or depressed skull fracture
- History of worsening headache
- Irritability on examination
- Signs of basal skull fracture
- Hematoma on scalp
- Dangerous mechanism of injury (MVC, fall from ≥3 ft or 5 stairs, fall from bicycle with no helmet)

Every Patient with One or More of the Following Signs or Symptoms should be Placed in a C-Spine Collar

- Midline tenderness
- Neurological symptoms or signs
- Significant distracting injuries
- HI
- Intoxication
- Dangerous mechanism
- History of altered LOC

Of the investigations, CT is the best modality to assess C-Spine injuries. If unavailable and significant trauma is suspected, protect C-Spine and transfer for definitive imaging. If minor trauma of C-Spine, may consider x-ray imaging

Cauda Equina Syndrome can occur with any spinal cord injury below T10 vertebrae. Look for incontinence, anterior thigh pain, quadriceps weakness, abnormal sacral sensation, decreased rectal tone, and variable reflexes

- bilateral calcaneal fractures (due to fall from height)
  - concurrent burst fractures of the lumbar or thoracic spine in 10% (T11-L2)
- MRI (for soft tissue injuries) if appropriate

**Can Clear C-Spine if:**

- oriented to person, place, time, and event
- no evidence of intoxication
- no posterior midline cervical tenderness
- no focal neurological deficits
- no painful distracting injuries (e.g. long bone fracture)

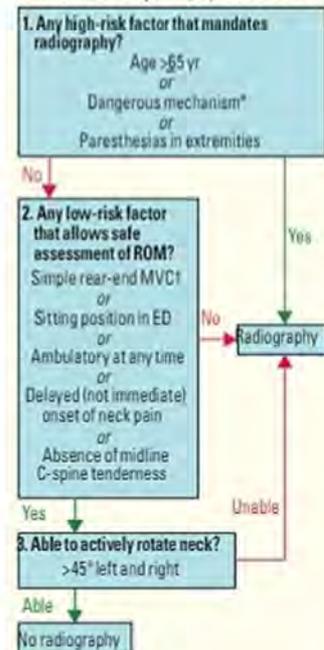

**Management of Cord Injury**

- immobilize
- evaluate ABCs
- treat neurogenic shock (maintain sBP >100 mmHg)
- insert NG (for decompression of paralytic ileus) and Foley catheter (only if no concerns about urethral injury)
- complete imaging of spine and consult spine service
- continually reassess high cord injuries as edema can travel up cord
- if cervical cord lesion, watch for respiratory insufficiency
  - low cervical transection (C5-T1) produces abdominal breathing (phrenic innervation of diaphragm still intact but loss of innervation of intercostals and other accessory muscles of breathing)
  - high cervical cord injury (above C4) may require intubation and ventilation
- if patient is in shock, treat with: warm blanket, Trendelenburg position (occasionally), volume infusion, consider vasopressors

**Approach to C-Spine Imaging**

- CT of the spine is the screening modality of choice
- C-Spine CT can detect 97-100% of injuries
- compared to radiography, CT scans allows for more rapid clearance of the C-Spine
- MRI of C-Spine is the preferred technique for soft tissue injuries (spinal cord lesions, intervertebral discs, and spinal ligaments)
- CT of C-Spine is the preferred modality. If only C-Spine x-rays are available, radiography can be assessed as follows

**The Canadian C-Spine Rule**  
 JAMA 2001;286:1841-48  
**For Alert (GCS Score = 15) and Stable Trauma Patients where C-Spine Injury is a Concern**

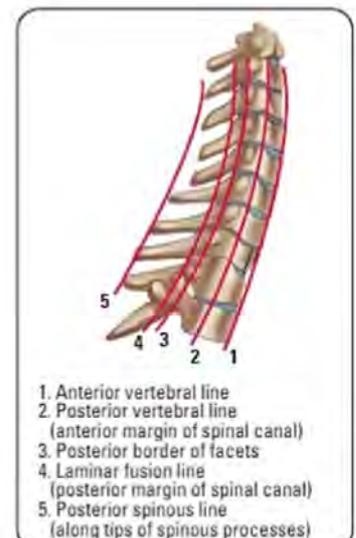

\*Dangerous Mechanism:  
 • Fall from >1 meter/5 stairs  
 • Axial load to head (e.g. diving)  
 • MVC high speed (>100 km/h), rollover, ejection  
 • Motorized recreational vehicles  
 • Bicycle collision

†Simple rear-end MVC excludes:  
 • Pushed into oncoming traffic  
 • Hit by bus/large truck  
 • Rollover  
 • Hit by high-speed vehicle

**Table 6. Interpretation of Lateral View: The ABCS**

<b>A Adequacy and Alignment</b>	Follow the anterior and posterior contour lines Translation of the vertebra >3.5 mm and angulation of >11 degrees is considered significant for spinal instability Next, follow the spinolaminar line; the diameter between the posterior cortex and the spinolaminar line should be >18 mm Fanning of spinous processes suggests posterior ligamentous disruption Widening of facet joints Check atlanto-occipital joint Line extending inferiorly from clivus should transect odontoid Atlanto-axial articulation, widening of predental space (normal: <3 mm in adults, <5 mm in children) indicates injury of C1 or C2 In children, there is a phenomenon called pseudosubluxation where there is a normal "translation" of C2 on C3 (less often C3 on C4) The translation may be seen in the flexed or neutral position and is not associated with soft tissue swelling (see below) The line of Swischuk is helpful in differentiating pathological cervical spine displacement from pseudosubluxation The line is drawn from the anterior aspect of the posterior arch from C1-C3 The anterior aspect of the posterior arch of C2 should not be more than 2 mm from this line (>2mm is indicative of true subluxation)
<b>B Bones</b>	Follow the bony contours of the vertebrae to look for any breaks in the cortex Height, width, and shape of each vertebral body Pedicles, facets, and laminae should appear as one - doubling suggests rotation
<b>C Cartilage</b>	Look at the disk spaces to ensure that they are of equal length throughout The anterior and posterior aspect of the individual discs should be equal Intervertebral disc spaces - wedging anteriorly or posteriorly suggests vertebral compression Measure the pre-dental space (distance from dens to C1 body); it should be <3 mm The distance between the lowest part of the occiput base and the dens should be <2 mm The facet joints should be stacked on top of each other at a 45-degree angle
<b>S Soft Tissues</b>	The retropharyngeal space lies anteriorly to the C-Spine; it widens around C4 due to the esophagus The retropharyngeal space normally measures less than 7mm at C2 and 21mm at C7; may be wide in children <2 yr on expiration (alternatively, less than the height of the vertebra at C2 and less than the width of the vertebra at C7) Assess retrotracheal spaces (normal: <22 mm at C6-T1, <14 mm in children <5 yr)

- Plain films of C-Spine are not reliable in patients with significant trauma and should be used with caution

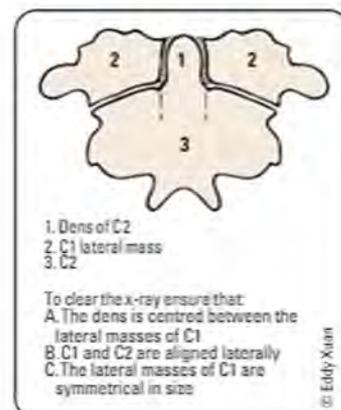

**Figure 3. Lines of contour on a lateral C-spine x-ray**

Prevertebral soft tissue swelling is only 49% sensitive for injury

**Sequelae of C-Spine Fractures**

- see *Neurosurgery*, NS39
- acute phase of SCI
  - spinal shock: absence of all voluntary and reflex activity below level of injury
    - decreased reflexes, no sensation, flaccid paralysis below level of injury, lasting days to months
  - neurogenic shock: loss of vasomotor tone, SNS tone
    - watch for: hypotension (lacking SNS), bradycardia (unopposed PNS), poikilothermia (lacking SNS so no shunting of blood from extremities to core)
    - occurs within 30 min of SCI at level T6 or above, lasting up to 6 wk
    - provide airway support, fluids, atropine (for bradycardia), vasopressors for BP support
- chronic phase of SCI
  - autonomic dysreflexia: in patients with an SCI at level T6 or above
    - signs and symptoms: pounding headache, nasal congestion, feeling of apprehension or anxiety, visual changes, dangerously increased sBP and dBP
    - common triggers
      - GU causes: bladder distention, urinary tract infection, and kidney stones
      - GI causes: fecal impaction or bowel distension
  - treatment: monitoring and controlling BP, prior to addressing causative issue

**Figure 4. C-spine x-ray; odontoid view**

**Chest Trauma**

- two types: those found and managed in 1<sup>o</sup> survey and those found and managed in 2<sup>o</sup> survey

**Table 7. Life-Threatening Chest Injuries Found in Primary Survey**

	Physical Exam	Investigations	Management
<b>Airway Obstruction</b>	Anxiety, stridor, hoarseness, altered mental status Apnea, cyanosis	Do not wait for ABG to intubate	Definitive airway management Intubate early Remove foreign body with magill forceps prior to the intubation Be prepared for a potential surgical airway
<b>Tension Pneumothorax</b> Clinical diagnosis One-way valve causing accumulation of air in pleural space	Respiratory distress, tachycardia, hypoxia, distended neck veins, cyanosis, asymmetry of chest wall motion Tracheal deviation away from pneumothorax Percussion hyperresonance Unilateral absence of breath sounds	Non-radiographic diagnosis	Needle thoracostomy – large bore needle, 2nd ICS mid clavicular line or finger thoracostomy. Definitive management is a chest tube
<b>Open Pneumothorax</b> Air entering chest from wound rather than trachea	Gunshot or other wound (hole >2/3 tracheal diameter) ± exit wound Unequal breath sounds	ABG: decreased pO <sub>2</sub>	Air-tight dressing sealed on 3 sides Chest tube Surgery
<b>Massive Hemothorax</b> >1500 cc blood loss in chest cavity	Pallor, flat neck veins, shock Unilateral dullness Absent breath sounds Hypotension	Usually only able to do supine CXR – entire lung appears radiopaque as blood spreads out over posterior thoracic cavity	Restore blood volume Chest tube Thoracotomy if: >1500 cc total blood loss ≥200 cc/h continued drainage
<b>Flail Chest</b> Free-floating segment of chest wall due to >2 rib fractures, each at 2 sites Underlying lung contusion (cause of morbidity and mortality)	Paradoxical movement of flail segment Palpable crepitus of ribs Decreased air entry on affected side	VBG: decreased pO <sub>2</sub> , increased pCO <sub>2</sub> CT: rib fractures, lung contusion	O <sub>2</sub> fluid therapy + pain control Judicious fluid therapy in absence of systemic hypotension Positive pressure ventilation ± intubation and ventilation if persistently hypoxic or unable to ventilate
<b>Cardiac Tamponade</b> Clinical diagnosis Pericardial fluid accumulation impairing ventricular function	Penetrating wound (usually) Beck's triad: hypotension, distended neck veins, muffled heart sounds Tachycardia, tachypnea Kussmaul's sign (increased JVP with inspiration)	Echocardiogram FAST	IV fluids Open thoracotomy

**Supine Oblique Views**

- Rarely used
- Better visualization of posterior element fractures (lamina, pedicle, facet joint)
- Good to assess patency of neural foramina
- Can be used to visualize the C7-T1 junction

20% of C-spine fractures are accompanied by other spinal fractures, so ensure thoracic and lumbar spine CT is normal before proceeding to OR

Trauma to the chest accounts for 50% of trauma deaths

80% of all chest injuries can be managed non-surgically with simple measures such as intubation, chest tubes, and pain control

**3-way Seal for Open Pneumothorax (i.e. sucking chest wound)**

Allows air to escape during the expiratory phase (so that you do not get a tension pneumothorax) but seals itself to allow adequate breaths during the inspiratory phase

**Pulsus Paradoxus:** a drop in BP of >10 mmHg with inspiration. Recall that BP normally drops with inspiration, but what's "paradoxical" about this is that it drops more than it should

**Table 8. Potentially Life-Threatening Chest Injuries Found in Secondary Survey**

	Physical Exam	Investigations	Management
<b>Pulmonary Contusion</b>	Blunt trauma to chest Interstitial edema impairs compliance and gas exchange	CT: areas of opacification of lung within 6h of trauma	Maintain adequate ventilation Monitor with ABG, pulse oximeter, and ECG Chest physiotherapy Positive pressure ventilation if severe
<b>Ruptured Diaphragm</b>	Blunt trauma to chest or abdomen (e.g. high lap belt in MVC)	CXR: abnormality of diaphragm/lower lung fields/NG tube placement CT scan and endoscopy: sometimes helpful for diagnosis	Laparotomy for diaphragm repair and associated intra-abdominal injuries
<b>Esophageal Injury</b>	Usually penetrating trauma (pain out of proportion to degree of injury)	CXR: mediastinal air (not always) Esophagram (Gastrografin <sup>®</sup> ) Flexible esophagoscopy	Early repair (within 24 h) improves outcome)
<b>Aortic Tear</b> 90% tear at subclavian (near ligamentum arteriosum), most die at scene Salvageable if diagnosis made rapidly	Sudden high speed deceleration (e.g. MVC, fall, airplane crash), complaints of chest pain, dyspnea, hoarseness (frequently absent) Decreased femoral pulses, differential arm BP (arch tear)	CXR, CT scan, transesophageal echocardiogram, aortography (gold standard)	Thoracotomy (may treat other severe injuries first)
<b>Blunt Myocardial Injury (rare)</b>	Blunt trauma to chest (usually in setting of multi-system trauma and therefore difficult to diagnose) Physical exam: overlying injury (e.g. fractures, chest wall contusion)	ECG: dysrhythmias, ST changes Cardiac blood work (e.g. troponin) 2-D Echo: Can assess for tamponade, wall motion, valve function, or thrombi. Patients with a normal ECG, normal troponin, and normal hemodynamics rarely get dysrhythmias	O <sub>2</sub> Antidysrhythmic agents Analgesia

**Other Potentially Life-Threatening Injuries Related to the Chest****Penetrating Neck Trauma**

- includes all penetrating trauma to the three zones of the neck
- management: injuries deep to platysma require further evaluation by angiography, contrast CT, or surgery
- do not explore penetrating neck wounds except in the OR

**Airway Injuries**

- always maintain a high index of suspicion
- larynx
  - history: strangulation, direct blow, blunt trauma, any penetrating injury involving platysma, inhalational injury (e.g. burns)
  - triad: hoarseness, subcutaneous emphysema, palpable fracture
  - other symptoms: hemoptysis, dyspnea, dysphonia
  - investigations: CXR, CT scan, arteriography (if penetrating)
  - management
    - airway: manage early because of edema
    - C-spine may also be injured, consider mechanism of injury
    - surgical: tracheotomy vs. repair
- trachea/bronchus
  - frequently missed
  - history: deceleration, penetration, increased intrathoracic pressure, complaints of dyspnea, hemoptysis
  - examination: subcutaneous emphysema, Hamman's sign (crunching sound synchronous with heartbeat)
  - CXR: mediastinal air, persistent pneumothorax, or persistent air leak after chest tube inserted for pneumothorax
  - management
    - surgical repair if >1/3 circumference

**Abdominal Trauma**

- two mechanisms
  - blunt: usually causes solid organ injury (spleen = most common, liver = second most common)
  - penetrating: usually causes hollow organ injury or liver injury (most common)

**BLUNT TRAUMA**

- results in two types of hemorrhage: intraperitoneal and retroperitoneal
- adopt high clinical suspicion of bleeding in multi-system trauma

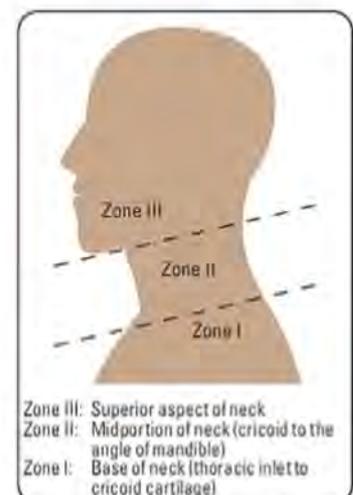

Ruptured diaphragm is more often diagnosed on the left side, as the liver conceals right side defects

**Aortic Tear****ABC WHITE**

Xray features of Aortic tear  
Depressed left mainstem Bronchus  
pleural Cap  
Wide mediastinum (most consistent)  
Hemothorax  
Indistinct aortic knuckle  
Tracheal deviation to right side  
Esophagus (NG tube) deviated to right  
(Note: these features are present in 85% of cases, but cannot rule out if absent)

**If Penetrating Neck Trauma Present, DON'T:**

- Clamp structures (can damage nerves)
- Probe
- Insert NG tube (leads to bleeding)
- Remove weapon/impaed object

**Figure 5. Zones of the neck in trauma**

**History**

- mechanism of injury, SAMPLE history

**Physical Exam**

- often unreliable in multi-system trauma, wide spectrum of presentations
  - slow blood loss not immediately apparent
  - tachycardia, tachypnea, oliguria, febrile, hypotension
  - other injuries may mask symptoms
  - serial examinations are required
- abdomen
  - inspect: contusions, abrasions, seat-belt sign, distention
  - auscultate: bruits, bowel sounds
  - palpate: tenderness, rebound tenderness, rigidity, guarding
  - DRE: rectal tone, blood, bone fragments, prostate location
  - placement of NG and Foley catheter should be considered part of the abdominal exam
- other systems to assess: cardiovascular, respiratory (possibility of diaphragm rupture), genitourinary, pelvis, back/neurological

**Investigations**

- labs: CBC, electrolytes, coagulation, cross and type, glucose, Cr, CK, lipase, amylase, liver enzymes, VBG, blood EtOH,  $\beta$ -hCG, U/A, toxicology screen

**Table 9. Imaging in Abdominal Trauma**

Imaging	Strengths	Limitations
<b>Ultrasound: FAST</b>	Identifies presence/absence of free fluid in peritoneal cavity RAPID exam: less than 5 min Can also examine pericardium and pleural cavities Can do serial examinations quickly	NOT used to identify specific organ injuries If patient has ascites, FAST will be falsely positive False negatives with small amounts of blood, retroperitoneal blood, delayed presentations, prior abdominal surgery, or incorrect positioning Technically difficult if patient is obese
<b>X-Ray</b>	Chest (looking for free air under diaphragm, diaphragmatic hernia, air-fluid levels), pelvis, cervical, thoracic, lumbar spines	Soft tissue not well visualized
<b>CT Scan</b>	Most specific test	Radiation exposure 20x more than x-ray Use with caution if hemodynamic instability
<b>Diagnostic Peritoneal Lavage (rarely used)</b>	Most sensitive test Tests for intraperitoneal bleed	Cannot test for retroperitoneal bleed or diaphragmatic rupture Cannot distinguish lethal from trivial bleed Results can take up to 1 h

- imaging must be done if:
  - equivocal abdominal examination, altered sensorium, or distracting injuries (e.g. head trauma, spinal cord injury resulting in abdominal anesthesia)
  - unexplained shock/hypotension
  - patients have multiple traumas and must undergo general anesthesia for orthopaedic, neurosurgical, or other injuries
  - fractures of lower ribs, pelvis, spine
  - positive FAST

**Management**

- general: ABCs, early blood products, and stabilization
- surgical: watchful waiting vs. laparotomy
- solid organ injuries: decision based on hemodynamic stability, not the specific injuries
- hemodynamically unstable or persistently high transfusion requirements: laparotomy
- hollow organ injuries: laparotomy
- even if low suspicion of injury: admit and observe for 24 h

**PENETRATING TRAUMA**

- high-risk of gastrointestinal perforation and sepsis
- history: size of blade, calibre/distance from gun, route of entry
- local wound exploration under direct vision may determine lack of peritoneal penetration (not reliable in inexperienced hands) with the following exceptions:
  - thoracoabdominal region (may cause pneumothorax)
  - back or flanks (muscles too thick)

**Management**

- general: ABCs, fluid resuscitation, and stabilization
- gunshot wounds always require laparotomy

**Seatbelt Injuries May Cause**

- Retroperitoneal duodenal trauma
- Intraperitoneal bowel transection
- Mesenteric injury
- L-spine injury

**Indications for Foley and NG Tube in Abdominal Trauma**

**Foley catheter:** unconscious or patient with multiple injuries who cannot void spontaneously  
**NG tube:** used to decompress the stomach and proximal small bowel. Contraindicated if suspected facial or basal skull fractures

**Point-of-Care Ultrasonography for Diagnosing Thoracoabdominal Injuries in Patients with Blunt Trauma**

Cochrane DB Syst Rev 2018;CD012660  
**Purpose:** Determine the diagnostic accuracy of POCUS for detecting and excluding free fluid, organ injuries, vascular lesions, and other injuries compared to diagnostic reference standards in patients with blunt trauma.  
**Methods:** Systematic review of prospective or retrospective diagnostic cohort studies of patients with any type of blunt trauma.  
**Results:** 34 studies, 8635 participants. For abdominal trauma, POCUS had a sensitivity of 0.68 (95% CI 0.59-0.75) and a specificity of 0.95 (95% CI 0.92-0.97). In children, pooled sensitivity of POCUS was 0.63 (95% CI 0.46-0.77), as compared to 0.78 (95% CI 0.69-0.84) in an adult/mixed population. For chest injuries, POCUS had a sensitivity of 0.96 (95% CI 0.88-0.99) and a specificity of 0.95 (95% CI 0.97-1.00).  
**Conclusions:** In patients with blunt thoracoabdominal trauma, positive POCUS findings are helpful for guiding treatment decisions. However, with regard to abdominal trauma, a negative POCUS does not rule out injuries and must be verified. This is of particular importance in paediatric trauma, where the sensitivity of POCUS is poor. Based on a small number of studies in a mixed population, POCUS may have a higher sensitivity in chest injuries.

**Laparotomy is Mandatory if Penetrating Trauma and:**

- Shock
- Peritonitis
- Evisceration
- Free air in abdomen
- Blood in NG tube, Foley catheter, or on DRE

**"Rule of Thirds" for Stab Wounds**

- 1/3 do not penetrate peritoneal cavity
- 1/3 penetrate but are harmless
- 1/3 cause injury requiring surgery

## Genitourinary Tract Injuries

- see [Urology, U35](#)

### Etiology

- blunt trauma: often associated with pelvic fractures
  - upper tract
    - renal
      - contusions (minor injury – parenchymal ecchymoses with intact renal capsule)
      - parenchymal tears/laceration: non-communicating (hematoma) vs. communicating (urine extravasation, hematuria)
    - ureter: rare, at uretero-pelvic junction
  - lower tract
    - bladder
      - extraperitoneal rupture of bladder from pelvic fracture fragments
      - intraperitoneal rupture of bladder from trauma and full bladder
    - urethra
      - posterior urethral injuries: MVCs, falls, pelvic fractures
      - anterior urethral injuries: blunt trauma to perineum, straddle injuries/direct strikes
  - external genitalia
- penetrating trauma
  - damage to: kidney, bladder, ureter (rare), external genitalia
- acceleration/deceleration injury
  - renal pedicle injury: high mortality rate (laceration and thrombosis of renal artery, renal vein, and their branches)
- iatrogenic
  - ureter and urethra (from instrumentation)

### History

- mechanism of injury
- hematuria (microscopic or gross), blood on underwear
- dysuria, urinary retention
- history of hypotension

### Physical Exam

- abdominal pain, flank pain, CVA tenderness, upper quadrant mass, perineal lacerations
- DRE: sphincter tone, position of prostate, presence of blood
- scrotum: ecchymoses, lacerations, testicular disruption, hematomas
- bimanual exam, speculum exam
- extraperitoneal bladder rupture: pelvic instability, suprapubic tenderness from mass of urine or extravasated blood
- intraperitoneal bladder rupture: acute abdomen
- urethral injury: perineal ecchymosis, blood at penile meatus, high riding prostate, pelvic fractures

### Investigations

- urethra: retrograde urethrography
- bladder: U/A, CT scan, urethrogram ± retrograde cystoscopy ± cystogram (distended bladder + post-void)
- ureter: retrograde ureterogram
- renal: CT scan (best, if hemodynamically stable), intravenous pyelogram

### Management

- urology consult
- renal
  - minor injuries: conservative management
    - bed rest, hydration, analgesia, antibiotics
  - major injuries: admit
    - conservative management with frequent reassessments, serial U/A ± re-imaging
    - surgical repair (exploration, nephrectomy): hemodynamically unstable or continuing to bleed >48 h, major urine extravasation, renal pedicle injury, all penetrating wounds and major lacerations, infections, renal artery thrombosis
- ureter
  - ureteroureterostomy
- bladder
  - extraperitoneal
    - minor rupture: Foley drainage x 10-14 d
    - major rupture: surgical repair
  - intraperitoneal
- urethra
  - anterior: conservative, if cannot void, Foley or suprapubic cystostomy and antibiotics
  - posterior: suprapubic cystostomy (avoid catheterization) ± surgical repair

Gross hematuria suggests bladder injury

In the case of gross hematuria, the genitourinary system is investigated from distal to proximal (i.e. urethrogram, cystogram, etc.)

## Orthopaedic Injuries

- see [Orthopaedic Surgery](#) (see *Shoulder OR2, Knee OR34, Wrist OR23, Ankle OR41*)

### Goals of ED Treatment

- diagnose potentially life/limb-threatening injuries
- reduce and immobilize fractures (cast/splint) as appropriate
- provide adequate pain relief
- arrange proper follow-up if necessary

### History

- use SAMPLE, mechanism of injury may be very important

### Physical Exam

- look (inspection): "SEADS" = swelling, erythema, atrophy, deformity, and skin changes (e.g. bruises)
- feel (palpation): all joints/bones for local tenderness, swelling, warmth, crepitus, joint effusions, and subtle deformity
- move: joints affected plus those above and below injury – active ROM preferred to passive
- neurovascular status: distal to injury (before and after reduction)

### LIFE- AND LIMB-THREATENING INJURIES

**Table 10. Life- and Limb-Threatening Orthopaedic Injuries**

Life-Threatening Injuries (usually blood loss)	Limb-Threatening Injuries (usually interruption of blood supply)
Major pelvic fractures	Fracture/dislocation of ankle (talar AVN)
Traumatic amputations	Crush injuries
Massive long bone injuries and associated fat emboli syndrome	Compartment syndrome
Vascular injury proximal to knee/elbow	Open fractures
	Dislocations of knee/hip
	Fractures above knee/elbow

### Open Fractures

- communication between fracture site and external surface of skin – increased risk of osteomyelitis
- remove gross debris, irrigate, cover with sterile dressing – formal irrigation and debridement often done in the OR
- control bleeding with pressure (no clamping)
- splint
- antibiotics (1st generation cephalosporin and aminoglycoside) and tetanus prophylaxis
- standard of care is to secure definitive surgical management within 6 h, time to surgery may vary from case-to-case

### Vascular Injuries

- realign limb/apply longitudinal traction and reassess pulses (e.g. Doppler probe)
- surgical consult
- direct pressure if external bleeding

### Compartment Syndrome

- when the intracompartmental pressure within an anatomical area (e.g. forearm or lower leg) exceeds the capillary perfusion pressure, eventually leading to muscle/nerve necrosis
- clinical diagnosis: maintain a high index of suspicion
  - pain out of proportion to the injury
  - pain worse with passive stretch
  - tense compartment
  - look for "The 6 Ps" (note: radial pulse pressure is 120/80 mmHg while capillary perfusion pressure is 30 mmHg, seeing any of the 6 Ps indicates advanced compartment syndrome, therefore do not wait for these signs to diagnose and treat)
    - in the unconscious patient, a Stryker compartment pressure monitor can be used
- requires prompt decompression: remove constrictive casts, dressings; emergent fasciotomy may be needed

### Description of Fractures

#### SOLARTAT

Site  
Open vs. closed  
Length  
Articular  
Rotation  
Translation  
Alignment/Angulation  
Type e.g. Salter-Harris, etc.

### Effect of a Single Dose of Oral Opioid and Nonopioid Analgesics on Acute Extremity Pain in the ED

JAMA 2017;318:1661-1667

**Purpose:** To compare the efficacy of 4 analgesics on acute extremity pain.

**Methods:** RCT including 416 patients with moderate to severe acute extremity pain. Participants received ibuprofen 400 mg and acetaminophen 1000 mg; oxycodone 5 mg and acetaminophen 325 mg; hydrocodone 5 mg and acetaminophen 300 mg; or codeine 30 mg and acetaminophen 300 mg. The primary outcome was the difference in decline in pain 2 h after ingestion. Pain was assessed using an 11-point numerical rating scale (NRS).

**Results:** At 2 h, the mean NRS pain score decreased by 4.3 in the ibuprofen and acetaminophen group; by 4.4 in the oxycodone and acetaminophen group; by 3.5 in the hydrocodone and acetaminophen group; and by 3.9 in the codeine and acetaminophen group ( $P=0.053$ ).

**Conclusions:** For patients presenting to the ED with acute extremity pain, there were no statistically significant or clinically important differences in pain reduction at 2 h among single-dose treatment with ibuprofen and acetaminophen or with 3 different opioid and acetaminophen combination analgesics.

### When Dealing with an Open Fracture, Remember "STAND"

Splint  
Tetanus prophylaxis  
Antibiotics  
Neurovascular status (before and after)  
Dressings (to cover wound)

### Vascular injury/compartment syndrome is suggested by "The 6 Ps" Injury Compartment Syndrome -

6 Ps  
Pulse discrepancies  
Pallor  
Paresthesia/hypoesthesia  
Paralysis  
Pain (especially when refractory to usual analgesics)  
Polar (cold)

**UPPER EXTREMITY INJURIES**

- anterior shoulder dislocation
  - axillary nerve (lateral aspect of shoulder) and musculocutaneous nerve (extensor aspect of forearm) at risk
  - seen on lateral view: humeral head anterior to glenoid
  - many techniques for reduction (e.g. traction, scapular manipulation), immobilize in internal rotation, repeat x-ray, out-patient follow-up with orthopaedics
  - with forceful injury, look for fracture
- Colles' fracture
  - distal radius fracture with dorsal displacement from "Fall on Outstretched Hand" (FOOSH)
  - anteroposterior film: radial shortening, radial deviation, radial displacement
  - lateral film: dorsal displacement, volar angulation
  - reduce, immobilize with splint, out-patient follow-up with orthopaedics or immediate orthopaedic referral if complicated fracture
  - if involvement of articular surface, consider outpatient fracture clinic or orthopaedic referral if unsatisfactory reduction in ED
- scaphoid fracture
  - tenderness in anatomical snuff box, pain on scaphoid tubercle, pain on axial loading of thumb
  - negative x-ray: thumb spica splint, repeat x-ray in 1 wk ± CT scan/bone scan
  - positive x-ray: thumb spica splint x 6-8 wk, repeat x-ray in 2 wk
  - treat based on clinical suspicion even in absence of radiological scaphoid fracture
  - risk of AVN of scaphoid if not immobilized
  - outpatient orthopaedic follow-up

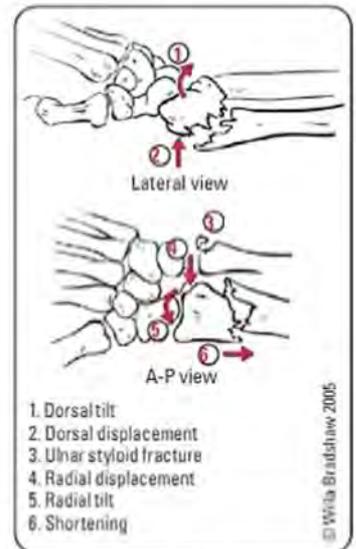

Figure 6. Colles' fracture

**LOWER EXTREMITY INJURIES**

- knee injuries
  - see *Ottawa Knee Rules*
- ankle and foot fractures
  - see *Ottawa Ankle and Foot Rules*
- avulsion of the base of 5th metatarsal
  - occurs with inversion injury
  - supportive tensor or below knee walking cast for 3 wk
- calcaneal fracture
  - associated with fall from height
  - associated with axial loading (other injuries may involve ankles, knees, hips, pelvis, lumbar spine)

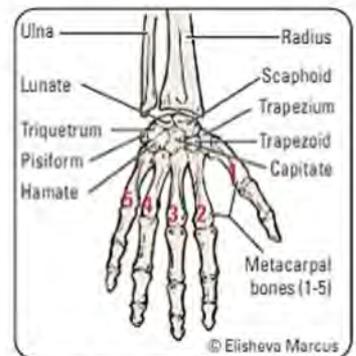

Figure 7. Carpals bones

**A knee x-ray examination is required only for acute injury patients with one or more of:**

- Age 55 yr or older
- Tenderness at head of fibula
- Isolated tenderness of patella
- Inability to flex to 90°
- Inability to bear weight both immediately and in the ED (four steps)

Figure 8. Ottawa knee rules

Adapted from: Stiell IG, Wells GA, Hoag RH, et al. JAMA 1997;278:2075-2079.

**LATERAL VIEW**

**MEDIAL VIEW**

An ankle radiographic series is required only if there is any pain in malleolar zone and any of these findings:

1. Bony tenderness at A or
2. Bony tenderness at B or
3. Inability to bear weight both immediately and in ED

A radiographic series is required only if there is any pain in midfoot zone and any of these findings:

1. Bony tenderness at C or
2. Bony tenderness at D or
3. Inability to bear weight both immediately and in ED

©Natalie Cormier 2016

Figure 9. Ottawa ankle and foot rules

Adapted from: Stiell IG, McKnight RD, Greenberg GH, et al. JAMA 1994;271:827-832.

## Wound Management

### Goals of ED Treatment

- identify injuries and stop any active bleeding – direct pressure
- manage pain
- wound examination and exploration
- cleansing ± antibiotic and tetanus prophylaxis
- closure and dressing

### Tetanus Prophylaxis

- both tetanus toxoid (Td) and immunoglobulin (TIG) are safe in pregnancy

**Table 11. Guidelines for Tetanus Prophylaxis for Wounds**

	Clean, Minor Wounds		All Other Wounds*	
	Tdap or Td†	TIG	Tdap or Td†	TIG
Vaccination History				
Unknown or fewer than 3 doses	Yes	No	Yes	Yes
3 or more doses	No‡	No	No§	No

\*Such as, but not limited to, wounds contaminated with dirt, feces, soil, and saliva; puncture wounds; avulsions; and wounds resulting from missiles, crushing, burns, and frostbite

†Tdap is preferred to Td for adults who have never received Tdap. Single antigen tetanus toxoid (TT) is no longer available in the United States

‡Yes, if more than ten years since the last tetanus toxoid-containing vaccine dose

§Yes, if more than five years since the last tetanus toxoid-containing vaccine dose

Source: MMWR 1991;40(No. RR-10):1-28

### Bruises

- non-palpable = ecchymosis
- palpable collection (not swelling) = hematoma following blunt trauma
- assess for coagulopathy (e.g. liver disease), anticoagulant use

### Abrasions

- partial to full thickness break in skin
- management
  - clean thoroughly with brush to prevent foreign body impregnation ± local anesthetic antiseptic ointment (Polysporin® or Vaseline®) for 7 d ± tetanus prophylaxis

### Lacerations

- see [Plastic Surgery](#), PLS, sidebar PL24
- consider every structure deep to a laceration injured until proven otherwise
- in hand injury patients, include the following in history: handedness, occupation, mechanism of injury, previous history of injury
- physical exam
  - think about underlying anatomy
  - examine tendon function actively against resistance and neurovascular status distally
  - clean and explore under local anesthetic; look for partial tendon injuries
  - x-ray or U/S wounds if a foreign body is suspected (e.g. shattered glass) and not found when exploring wound (remember: not all foreign bodies are radiopaque), or if suspect intra-articular involvement
- management
  - disinfect skin/use sterile techniques
  - irrigate copiously with normal saline or tap water
  - analgesia ± anesthesia
  - maximum dose of lidocaine
    - 7 mg/kg with epinephrine
    - 5 mg/kg without epinephrine
  - in children, topical anesthetics such as LET (lidocaine, epinephrine, and tetracaine), distraction provided by Child Life Specialist or parent; and in selected cases a short-acting benzodiazepine (midazolam or other agents) for sedation and amnesia are useful
  - secure hemostasis
  - evacuate hematomas, debride non-viable tissue, remove hair and foreign bodies
  - ± prophylactic antibiotics (consider for animal/human bites, intra-oral lesion, or puncture wounds to the foot)
  - suture unless: delayed presentation (>24 h), puncture wound, mammalian bite, crush injury, or retained foreign body
  - take into account patient and wound factors when considering suturing
  - advise patient when to have sutures removed
  - cellulitis and necrotizing fasciitis (see [Plastic Surgery](#), PL16)

### Acute Treatment of Contusions

RICE  
Rest  
Ice  
Compression  
Elevation

### High-Risk Factors for Infection Wound Factors

- Puncture wounds
- Crush injuries
- Wounds >12 h old
- Hand or foot wounds

### Patient Factors

- Age >50 yr
- Prosthetic joints or valves (risk of endocarditis)
- Immunocompromised

### Suture Use and Duration

Suture to:	Close with Nylon or Other Non-absorbable Suture	Approx. Duration (d)
Face	6-0 or 5-0	5
Not Joint	4-0	7
Joint	3-0	10
Scalp	4-0	7
Mucous Membrane	Absorbable (vicryl)	N/A

N.B. Patients on steroid therapy may need sutures for longer periods of time

Early wound irrigation and debridement are the most important factors in decreasing infection risk

### Alternatives to Sutures

- Tissue glue
- SteriStrips®
- Staples

# Approach to Common ED Presentations

## Abdominal Pain

Table 12. Selected Differential Diagnosis of Abdominal Pain

	Emergent	Usually Less Emergent
GI	Perforated viscus, bowel obstruction, ischaemic bowel, appendicitis, strangulated hernia, IBD flare, esophageal rupture, peptic ulcer disease	Diverticulitis, gastroenteritis, GERD, esophagitis, gastritis, IBS
Hepatobiliary	Hepatic/splenic injury, pancreatitis, cholangitis, spontaneous bacterial peritonitis	Biliary colic, cholecystitis, hepatitis
Genital	Female: Ovarian torsion, ectopic pregnancy, tubo-ovarian abscess Male: Testicular torsion	Female: PID, ovarian cyst, salpingitis, endometriosis Male: epididymitis, prostatitis, orchitis
Urinary	Pyelonephritis	Renal colic, cystitis
CVS	MI, aortic dissection, AAA	Pericarditis
Respirology	PE, empyema	Pneumonia
Metabolic	DKA, sickle cell crisis, toxin, Addisonian crisis	Toxic ingestions (e.g. acetaminophen, iron, NSAIDs, etc.), lead poisoning, porphyria
Other	Significant trauma, acute angle closure glaucoma	Abdominal wall injury, herpes zoster, psychiatric, abscess, hernia, mesenteric adenitis

- differential can be focused anatomically by location of pain: right upper quadrant, left upper quadrant, right lower quadrant, left lower quadrant, epigastric, periumbilical, diffuse

### History

- pain: OPQRST
- review symptoms from genitourinary, gynecological, gastrointestinal, respiratory, and cardiovascular systems
- abdominal trauma/surgeries, most recent colonoscopy, most recent endoscopy, last FOBT/FIT test

### Physical Exam

- vitals, abdominal (including DRE, CVA tenderness), pelvic/genital, respiratory, and cardiac exams as indicated by history

### Investigations

- ABCs, do not delay management and consultation if patient unstable
- labs: CBC, electrolytes, glucose, BUN/Cr, U/A  $\pm$  liver enzymes, LFTs, lipase,  $\beta$ -hCG, ECG, troponins,  $\pm$  VBG/lactate
- AXR: if suspicious of foreign body or SBO (small bowel obstruction) in low resource setting. Can also use if frequent SBOs and usual conservative management
- CXR upright: look for pneumoperitoneum (free air under diaphragm), lung disease
- U/S: all gynaecologic structure, testicles, biliary tract, ectopic pregnancy, appendicitis in children and young adults, nephro-urolithiasis in young patients, AAA, free fluid; in select cases, can proceed to CT if U/S if non-diagnostic but there is high clinical suspicion
- CT: SBO, trauma, AAA, pancreatitis, nephro-/urolithiasis, appendicitis, and diverticulitis

### Management

- NPO, IV, NG tube (if SBO), analgesics, consider antibiotics and anti-emetics
- growing evidence that small amounts of opioid analgesics improve diagnostic accuracy of physical exam of surgical abdomen
- consult as necessary: internal medicine, general surgery, vascular surgery, gynecology, etc.

### Disposition

- admission: surgical abdomen, workup of significant abnormal findings, need for IV antibiotics or pain control
- discharge: patients with a negative lab and imaging workup who improve clinically during their stay; instruct the patient to return if severe pain, fever, or persistent vomiting develops

## Acute Pelvic Pain

### Etiology

- gynecological
  - ovaries: ruptured ovarian cysts (most common cause of pelvic pain), ovarian abscess, ovarian torsion (rare, 50% will have ovarian mass)
  - fallopian tubes: salpingitis, tubal abscess, hydrosalpinx
  - uterus: leiomyomas (uterine fibroids) – especially with torsion of a pedunculated fibroid or in a pregnant patient (degeneration), PID
  - other: ectopic pregnancy (ruptured/expanding/leaking), spontaneous abortion (threatened or incomplete), endometriosis and dysmenorrhea, sexual or physical abuse
- non-gynecological (see causes of lower abdominal pain above)

### History and Physical Exam

- pain: OPQRST
- associated symptoms: vaginal bleeding, discharge, dyspareunia, bowel and/or bladder symptoms
- pregnancy and sexual history, including oligo/amenorrhea, menorrhagia, and fibroids
- vitals
- gynecological exam: assess for cervical motion tenderness/“chandelier sign” (suggests PID)
- abdominal exam

### Investigations

- $\beta$ -hCG for all women of childbearing age
- CBC and differential, electrolytes, glucose, creatinine, BUN, culture and sensitivity, PTT/INR
- U/A to rule out urologic causes
- vaginal and cervical swabs for culture and sensitivity if performing a pelvic exam or urine NAAT for STI testing if no pelvic exam is performed
- pelvic and abdominal U/S: evaluate adnexa, thickness of endometrium, pregnancy, free fluid or masses in the pelvis
- Doppler flow studies for ovarian torsion

### Management

- general: analgesia, determine if admission and consults are needed
- specific:
  - ovarian cysts
    - ♦ unruptured or ruptured, and hemodynamically stable: analgesia and follow-up
    - ♦ ruptured with significant hemoperitoneum: may require surgery
  - ovarian torsion: surgical detorsion or removal of ovary
  - uncomplicated leiomyomas, endometriosis, and secondary dysmenorrhea can usually be treated on an outpatient basis, discharge with gynecology follow-up
  - PID: broad spectrum antibiotics, recommend low threshold to treat empirically

### Disposition

- referral: gynecological or obstetrical causes requiring surgical intervention, requiring admission, or oncological in nature
- admission: patients requiring surgery, IV antibiotics/pain management
- discharge: negative workup and resolving symptoms; give clear instructions for appropriate follow-up

## Altered Level of Consciousness

### Definitions

- altered mental status: collective, non-specific term referring to change in cognitive function, behaviour, or attentiveness, including:
  - delirium (see [Psychiatry, PS23](#))
  - dementia (see [Psychiatry, PS24](#))
  - lethargy: state of decreased awareness and alertness (patient may appear wakeful)
  - stupor: unresponsiveness but rousable
  - coma: a sleep-like state, not rousable to consciousness

### Gynaecological Causes of Pelvic Pain

- Ovarian cyst
- Dysmenorrhea
- Mittelschmerz
- Endometriosis
- Ovarian torsion
- Uterine fibroids/neoplasm
- Adnexal neoplasm
- PID + cervicitis

U/S is the preferred imaging modality in the assessment of acute pelvic pain

### Possible Causes of Coma

#### AEIOU TIPS

- Acidosis/Alcohol
- Epilepsy
- Infection
- Oxygen (hypoxia)/Opiates
- Uremia
- Temperature/Trauma (especially head)
- Insulin (too little or too much)
- Psychogenic/Poisoning
- Structural or space-occupying lesion

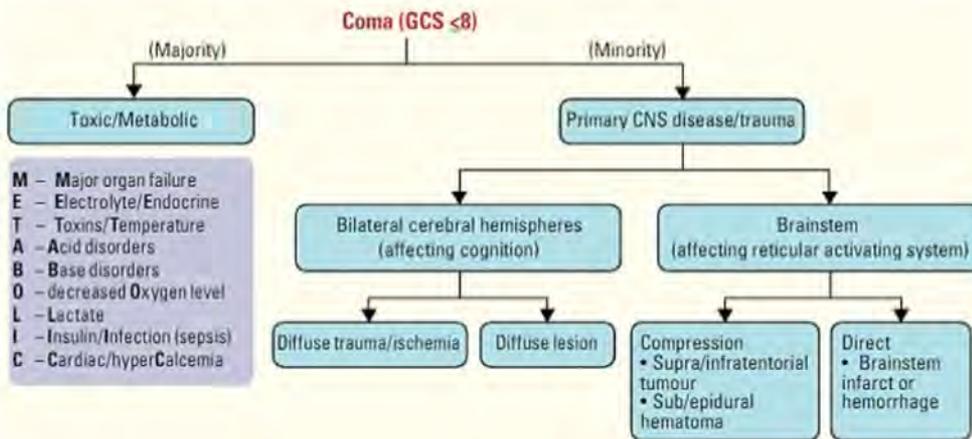

Figure 10. Etiology of coma

## MANAGEMENT OF ALTERED LOC

### History

- obtain collateral from family, friends, police, paramedics, patient record, MedicAlert® bracelet, etc.
- onset and progression
  - antecedent trauma, seizure activity, fever
  - abrupt onset suggests CNS hemorrhage/ischaemia, cardiac cause, or poisoning
  - progression over hours to days suggests progressive CNS lesion or toxic/metabolic cause
- determine patient's baseline LOC
- past medical history (e.g. similar episode(s), depression, overdose)

### Physical Exam

- ABCs, vitals including temperature; cardiac, respiratory, abdominal exams
- complete neurological exam; in particular, examination of the eyes ("PEARL" pupils equal and reactive to light)
- use the GCS to evaluate LOC (see *Patient Assessment/Management, ER2*)

### Investigations

- blood work
  - serum glucose level, electrolytes, creatinine, BUN, LFTs, serum osmolality, CBC, VBG, lactate, PT/PTT/INR, troponins
  - serum acetaminophen, salicylate levels, ethanol (± toxic alcohols)
- imaging
  - CT head, CXR (if respiratory compromise or symptoms)
- other tests
  - ECG, U/A, urine toxicology

### Diagnosis

- distinguish between structural and toxic-metabolic coma
  - structural coma
    - pupils, extraocular movements, and motor findings, if present, are usually asymmetric
    - look for focal or lateralizing abnormalities
  - toxic-metabolic coma
    - dysfunction at lower levels of the brainstem (e.g. caloric unresponsiveness)
    - respiratory depression with intact upper brainstem (e.g. equal and reactive pupils)
    - extraocular movements and motor findings are symmetric or absent
    - essential to re-examine frequently because status can change rapidly
- diagnosis may become apparent only with the passage of time
  - delayed deficit after head trauma suggestive of epidural hematoma (characteristic "lucid interval")

Classically, intubate if GCS<8, but ability to protect airway is primary consideration

**Table 13. Toxic-Metabolic Causes of Fixed Pupils**

Dilated	Dilated to Normal	Constricted
Anoxia	Hypothermia	Cholinergic agents (e.g. organophosphates)
Anticholinergic agents (e.g. atropine, tricyclic antidepressants)	Barbiturates	Opioids (e.g. heroin), except meperidine
Methanol	Antipsychotics	
Cocaine		
Opioid withdrawal		
Amphetamines		
Hallucinogens		
Serotonin syndrome (MAOI + SSRI)		

**Management**

- administer appropriate universal antidotes (mnemonic DON'T)
  - D50W (50 mL) if hypoglycemic on point-of-care test (POCT) capillary blood glucose
  - oxygen if needed
  - naloxone 0.4 mg, up to 10 mg IV if opiate overdose suspected
  - thiamine 100 mg IV if history of EtOH or patient looks malnourished

**Disposition**

- admission: if ongoing decreased LOC, admit to service based on tentative diagnosis, or transfer patient if appropriate level of care not available
- discharge: readily reversible alteration of LOC; ensure adequate follow-up care

**Chest Pain**

**Table 14. Differential Diagnosis for Chest Pain**

	Emergent	Usually Less Emergent
CVS	MI, unstable angina, aortic dissection, cardiac tamponade, arrhythmia	Stable angina, pericarditis, myocarditis
Respirology	PE, pneumothorax	Pneumonia, pleural effusion, malignancy
GI	Esophageal rupture, Mallory-Weiss tear or pneumomediastinum	Mallory-Weiss tear or esophageal rupture, pneumomediastinum
MSK		Rib fracture, costochondritis
Other		Herpes zoster, psychiatric/panic attack

**History and Physical Exam**

- OPQRST, previous episodes and change in pattern
- cardiac risk factors (HTN, DM, dyslipidemia, smoking, FHx)
- inquire about any previous cardiac procedures, last stress test, last angiogram and if they are currently followed by a cardiologist
- vitals, cardiac, respiratory, peripheral vascular, abdominal exams

**Investigations**

- ECG (most important): assess for STEMI (or those that may evolve to STEMI), always compare with previous; may be normal in up to 50% of PE and acute MI
- CBC, electrolytes, Cr, BUN, glucose, PTT/INR, cardiac biomarkers (troponin)
- CXR: compare with previous
- CT: if indicated (e.g. aortic dissection, PE)

**Management and Disposition**

- ABCs, O<sub>2</sub> (if needed), cardiac monitors, IV access
- treat underlying cause and involve consultants as necessary
- consider further observation/monitoring if unclear diagnosis or risk of dysrhythmia
- can refer to HEART score to risk stratify patients with chest pain
- discharge: patients with a low probability of life-threatening illness due to resolving symptoms and negative workup; arrange follow-up (e.g. rapid/acute cardiac clinic) and instruct to return if SOB or increased chest pain develops

**Life-Threatening Causes of Chest Pain**

**PET MAP**

- PE
- Esophageal rupture
- Tamponade
- MI/angina
- Aortic dissection
- Pneumothorax

Imaging is necessary for all suspected aortic dissections, regardless of BP

**Angina Characteristics**

- Retrosternal location
- Provoked by exertion
- Relieved by rest or nitroglycerin

**Risk for Coronary Artery Disease**

- 3/3 = "typical angina" - high-risk
- 2/3 = intermediate risk for women >50 yr, all men
- 1/3 = intermediate risk in men >40 yr, women >60 yr

**HEART Score**

<b>H (History)</b>	
Highly suspicious history	2 pts
Moderately suspicious history	1 pt
Slightly or non-suspicious history	0 pts
<b>E (ECG)</b>	
Acute ischemia	2 pts
LRBB, RBBB, LVP, PM	1 pt
No signs of acute ischemia	0 pts
<b>A (Age)</b>	
>65 yr	2 pts
age 45 - 65 yr	1 pt
<45 yr	0 pts
<b>R (Risk factors)</b>	
3 risk factors*, or history of atherosclerotic disease	2 pts
1 or 2 risk factors	1 pt
No risk factors known	0 pts
<b>T (Troponin)</b>	
troponin >42 ng/L	2 pts
troponin 15-42 ng/L	1 pt
troponin <14 ng/L	0 pts

\* Risk factors: Diabetes mellitus, current or recent (<30 days) smoker, hypertension, hypercholesterolemia, and family history of coronary artery disease  
 0 to 3 points = low risk (0.6% to 1.7% risk of major adverse cardiac events); 4 to 6 points = intermediate risk (16.6% risk); 7 to 10 points = high risk (50.3% risk)

Table 15. Comparison of Chest Pain Diagnoses

	Classic History	Classic Findings	Diagnostic Investigations	Management and Disposition
<b>Acute Coronary Syndrome</b>	New or worsening pattern of retrosternal squeezing/pressure pain, radiation to arm/neck, dyspnea, worsened by exercise, relieved by rest, N/V, syncope	New or worsened murmur, hypotension, diaphoresis, pulmonary edema	ECG: ischaemia (15-lead if hypotensive, AV node involvement or inferior MI), serial troponin I (sensitive 6-8 h after onset), CXR	ABCs, Aspirin <sup>®</sup> , anticoagulation and emergent cardiology consult to consider percutaneous intervention or thrombolytic
<b>Pulmonary Embolism</b>	Pleuritic chest pain (75%), dyspnea; risk factors for venous thromboembolism	Tachycardia, hypoxemia; evidence of DVT	Wells' criteria: D-dimer, CT pulmonary angiogram, ventilation-perfusion (V/Q) scan; leg Doppler, CXR	ABCs, anticoagulation; consider airway management and thrombolysis if massive PE (hypotension and cardiovascular collapse)
<b>Acute Pericarditis</b>	Viral prodrome, anterior precordial pain, pleuritic, relieved by sitting up and leaning forward	Friction rub	ECG: sinus tachycardia, diffuse ST elevation, PR depression in II, III, aVf and V4-6; reciprocal PR elevation and ST depression in aVR +V1; echocardiography	ABCs, rule out MI, high dose NSAIDs ± colchicine; consult if chronic/recurrent, large pericardial effusion, or non-viral cause (e.g. SLE, renal failure, requires surgery)
<b>Pneumothorax</b>	Trauma or spontaneous pleuritic chest pain often in tall, thin, young male athlete	Hemithorax with decreased/absent breath sounds, hyper-resonance; deviated trachea and hemodynamic compromise (if tension pneumothorax)	Clinical diagnosis CXR: posteroanterior view, lateral, expiratory views – lung edge, loss of lung markings, tracheal shift; deep sulcus sign on supine view POCUS: Loss of lung slide, lack of comet tails, barcode sign, ± transition point	ABCs, if unstable, needle to 2nd ICS at mid-clavicular line; urgent surgical consult/thoracostomy 4th intercostal space and chest tube
<b>Aortic Dissection</b>	Sudden severe tearing retrosternal or midscapular pain ± focal pain/neurologic loss in extremities in context of HTN	HTN; systolic BP difference >20 mmHg or pulse deficit between arms; aortic regurgitant murmur	CT angiogram; CXR - wide mediastinum, left pleural effusion, indistinct aortic knob, ≥4 mm separation of intimal calcification from aortic shadow, 20% normal	ABCs, reduce BP and HR; classify type A (ascending aorta, urgent surgery) vs. B (not ascending aorta, medical) on CT angiogram and urgent consult
<b>Cardiac Tamponade</b>	Dyspnea, cold extremities, ± chest pain; often a recent cardiac intervention or symptoms of malignancy, connective tissue disease	Beck's triad - hypotension, elevated JVP, muffled heart sounds; tachycardia, pulsus paradoxus >10 mmHg	Clinical diagnosis CXR: may show cardiomegaly, evidence of trauma, ECG may show electrical alternans	ABCs, cardiac surgery or cardiology consult, pericardiocentesis if unstable, treat underlying cause
<b>Esophageal Rupture</b>	Sudden onset severe pain after endoscopy, forceful vomiting, labour, or convulsion, or in context of corrosive injury or cancer	Subcutaneous emphysema, findings consistent with sepsis	CXR: pleural effusion (75%), pneumomediastinum; CT or water soluble contrast esophagogram	ABCs, early antibiotics, resuscitation, thoracics consult, NPO, consider chest tube
<b>Esophagitis or GERD</b>	Frequent heartburn, acid reflux, dysphagia, relief with antacids	Oral thrush or ulcers (rare)	None acutely	ABCs, PPI medication, avoid EtOH, tobacco, trigger foods
<b>Herpes Zoster</b>	Abnormal skin sensation – itching/tingling/pain – preceding rash by 1-5 d	None if early; maculopapular rash developing into vesicles and pustules that crust	Clinical diagnosis; direct immunofluorescence assay	ABCs, anti-virals (if < 48 h onset), analgesia ± steroids, dressing; r/o ocular involvement/refer if necessary
<b>MSK</b>	History of injury	Reproduction of symptoms with movement or palpation (not specific – present in 25% of MI)	MSK injury or fracture on x-rays	ABCs, NSAIDs, rest, orthopaedics consultation for fractures
<b>Anxiety</b>	Symptoms of anxiety, depression, history of psychiatric disorder; may coexist with physical disease	Tachycardia, diaphoresis, tremor	Diagnosis of exclusion	ABCs, arrange social supports, rule out suicidality and consider psychiatry consult

ACS more likely to be atypical in females, diabetics, and >80 yr. Atypical equivalents include dyspnea, diaphoresis, fatigue, non-retrosternal pain

It is important to look for reciprocal changes in STEMI in order to differentiate from pericarditis (diffuse elevations)

Tracheal deviation is away from tension or towards non-tension pneumothorax

**Does this Patient with Chest Pain have Acute Coronary Syndrome? The Rational Clinical Examination Systematic Review**

JAMA 2015;314:1955-1965

**Purpose:** To review accuracy of the initial history, physical examination, ECG, and risk scores incorporating these elements with the first cardiac-specific troponin.

**Methods:** Systematic review of prospective studies among patients admitted to the ED with symptoms suggesting ACS.

**Results:** Prior abnormal stress test (specificity 96%; LR 3.1, 95% CI 2.0-4.7), peripheral artery disease (specificity 97%; LR 2.7, 95% CI 1.5-4.8), and pain radiating to both arms (specificity 96%; LR 2.6, 95% CI 1.8-3.7) were most suggestive of ACS. The most suggestive ECG findings were ST-segment depression and any evidence of ischaemia. The History, ECG, Age, Risk Factors, Troponin (HEART) (LR 13, 95% CI 7-24) and the Thrombolysis in MI (TIMI) risk scores (LR 6.8, 95% CI, 5.2-8.9) were both predictive of ACS in the high-risk scores.

**Conclusions:** Among patients with suspected ACS presenting to the ED, the initial history, physical examination, and ECG alone did not confirm or exclude the diagnosis of ACS. Instead, the HEART or TIMI risk scores, which incorporate the first cardiac troponin, provided more diagnostic information.

**Conservative vs. Interventional Treatment for Spontaneous Pneumothorax**  
N EJM 2020;382:405-415

**Purpose:** Determine whether conservative management is an acceptable alternative to interventional management for uncomplicated, moderate-to-large primary spontaneous pneumothorax.

**Methods:** Open-label, multicenter, noninferiority trial. Patients 14-50 yr were recruited with a first-known, unilateral, moderate-to-large primary spontaneous pneumothorax. Patients (n=316) were randomly assigned to immediate interventional management of the pneumothorax or a conservative observational approach and were followed for 12 mo. The primary outcome was lung re-expansion within 8 wk.

**Results:** Re-expansion within 8 wk occurred in 129 of 131 patients with interventional management and in 118 of 125 with conservative management (P=0.02, for noninferiority). Conservative management resulted in a lower risk of serious adverse events or pneumothorax recurrence than interventional management.

**Conclusions:** The trial provides modest evidence that conservative management of primary spontaneous pneumothorax was noninferior to interventional management, with a lower risk of serious adverse events.

Table 16. Common Life-Threatening ECG Changes

Pathology	ECG Findings
<b>Dysrhythmia</b>	
Torsades de pointes	Ventricular complexes in upward-pointing and downward-pointing continuum (160-250 bpm)
Ventricular tachycardia	3 or more consecutive premature ventricular beats ( $>100$ bpm, QRS $>120$ ms)
Ventricular flutter	Smooth sine wave pattern of similar amplitude ( $>200$ bpm)
Ventricular fibrillation	Erratic ECG tracing, no identifiable waves
<b>Conduction</b>	
2nd degree heart block (Mobitz Type II)	PR interval stable, some QRSs dropped
3rd degree heart block	Prolonged QRS complex ( $>0.12$ s) RSR' in V5 or V6 Total AV dissociation, but stable P-P and R-R intervals
Left bundle branch block	Monophasic I and V6 May see ST elevation Difficult to interpret, new LBBB is considered STEMI equivalent
<b>Ischaemia</b>	
STEMI	ST elevation in leads associated with injured area of heart and reciprocal lead changes (depression)
<b>Metabolic</b>	
Hyperkalemia	Initially, tall T-waves Followed by PR prolongation, QRS widening, loss of P waves Finally, sinusoidal pattern and pulse electrical activity (PEA)/Vfib/Asystole
Hypokalemia	P wave flattening QRS complex widening and flattening U waves appear Flattened T waves
<b>Digitalis Toxicity</b>	
	Supraventricular tachycardia Slow ventricular response Frequent premature ventricular contractions At risk for AV blocks and ventricular irritability
<b>Syndromes</b>	
Brugada	RBBB with ST elevation in V1, V2, and V3 Susceptible to deadly dysrhythmias, including Vfib
Wellens	Marked T wave inversion in V2 and V3 Left anterior descending coronary stenosis
Long QT syndrome	QT interval longer than $\frac{1}{2}$ of cardiac cycle Predisposed to ventricular dysrhythmias

## Headache

- see [Neurology, N46](#)

### Etiology

- common and less serious
  - common migraine (without aura)/classic migraine (with aura)
    - common: unilateral, throbbing, aggravated by activity, moderate/severe intensity, N/V, photo-/phonophobia
    - classic: fully reversible aura symptoms that precede headache, e.g. flashing lights, pins and needles (paresthesia), loss of vision, dysarthria
    - treatment: simple analgesics (NSAIDs, acetaminophen, Aspirin<sup>®</sup>), antiemetics, triptans
    - family physician to consider prophylactic treatment
  - tension headache
    - bilateral, non-throbbing, not aggravated by routine physical activity, mild-moderate intensity.
    - can last between 30 min to 7 d
    - triggered with stress, sleep deprivation
    - treatment: modify stressor(s), simple analgesics (NSAIDs, acetaminophen, Aspirin<sup>®</sup>)
- less common but potentially fatal
  - subarachnoid hemorrhage (SAH) (see [Neurosurgery, NS22](#))
    - sudden onset, "worst headache of life," maximum intensity within minutes, "thunderclap headache"
    - increased pain with exertion, N/V, meningeal signs
    - diagnosis
      - new generation CT 100% sensitive within 6 h of onset (hyperattenuating signal around Circle of Willis)
      - LP to look for xanthochromia if suspected SAH and normal CT after 6 h
    - management: urgent neurosurgery consult
  - increased ICP
    - worse in morning, when supine or bending down, with cough or Valsalva
    - physical exam: neurological deficits, cranial nerve palsies, papilledema

### Diagnosis of Pulmonary Embolism with D-Dimer Adjusted to Clinical Probability

NEJM 2019;381:2125-2134

**Purpose:** Retrospective analyses suggest that PE is ruled out by a D-dimer level of  $<1000$  ng/mL in patients with a low clinical pretest probability (C-PTP) and by a d-dimer level of  $<500$  ng/mL in patients with a moderate C-PTP.

**Methods:** Prospective study in which PE was considered to be ruled out without further testing in 2017 outpatients with a low C-PTP and a d-dimer level of  $<1000$  ng/mL or with a moderate C-PTP and a d-dimer level of  $<500$  ng/mL. If PE was not diagnosed, patients did not receive anticoagulant therapy. Patients were followed for 3 mo for VTE.

**Results:** Of the 1325 patients who had a low C-PTP or moderate C-PTP and a negative d-dimer test, none had VTE during follow-up. This diagnostic strategy resulted in the use of chest imaging in 34.3% of patients. A strategy in which PE is considered to be ruled out with a low C-PTP and a d-dimer level of  $<500$  ng/mL would result in the use of chest imaging in 51.9%.

**Conclusion:** A combination of a low C-PTP and a d-dimer level of  $<1000$  ng/mL identified a group of patients at low-risk for PE during follow-up.

### Common Therapeutic Approach to Severe Migraine

- 1 L bolus of NS
- prochlorperazine/metoclopramide 10 mg IV
- diphenhydramine 25 mg IV
- ketorolac 30 mg IV
- dexamethasone 10 mg IV
- Other options include haloperidol, metoclopramide, ergotamine, sumatriptan, analgesics

### Ottawa SAH Rule

JAMA 2013;310(12):1248-1255

Use for alert patients older than 15 yr with new severe non-traumatic headache reaching maximum intensity within 1 h

Not for patients with new neurologic deficits, previous aneurysms, SAH, brain tumours, or history of recurrent headaches ( $\geq 3$  episodes over the course of  $\geq 6$  mo)

Investigate if  $\geq 1$  high-risk variables present:

- Age  $\geq 40$  yr
  - Neck pain or stiffness
  - Witnessed loss of consciousness
  - Onset during exertion
  - Thunderclap headache (instantly peaking pain)
  - Limited neck flexion on examination
- Subarachnoid hemorrhage can be predicted with 100% sensitivity using this rule.

- diagnosis: CT head, LP if suspect idiopathic intracranial hypertension (risk of blindness if missed)
- management: consult neurosurgery
- meningitis (see [Infectious Diseases, ID17](#))
  - at least two of the following features suggests that the headache could be due to meningitis: fever, neck stiffness, altered mental status
  - possible clinical/laboratory findings: nausea, focal neurologic signs, seizure, papilledema, petechial rash, high CSF WBC count, growth of organism in blood culture
  - investigations: rule out increased ICP (CT head, mental status normal, no neurological signs, no papilledema), if ruled out then perform diagnostic LP
  - treatment: early empiric antibiotics (high dose ceftriaxone + vancomycin ± ampicillin if >50 y/o or immunocompromised) ± acyclovir ± steroid therapy (administer based on clinical suspicion, DO NOT wait for LP)
- giant cell arteritis/temporal arteritis (causes significant morbidity, blindness) (see [Ophthalmology, OP36](#))
  - vasculitis of large and mid-sized arteries, gender 3:1 F:M, most commonly ages >70 yr
  - headache, scalp tenderness, jaw claudication, arthralgia, myalgia, fever, malaise or weight loss
  - temporal artery tender on palpation, RAPD, optic disc edema on fundoscopy
  - labs: elevated ESR, CRP
  - temporal artery biopsy is gold standard for diagnosis
  - associated with polymyalgia rheumatica
  - treatment: high-dose steroids immediately if suspected, no need to hold treatment until pathology results
- cerebral venous sinus thrombosis
  - physical symptoms depend heavily on location, size, and extent of the clot. They may include gradual or sudden onset headache, vomiting, papilledema, visual disturbances, focal neurological deficits, seizures, and acute mental status changes
  - investigations: neuroimaging (e.g. CT head, CT venography) to assess and r/o other acute processes (e.g. intracranial hemorrhage), CBC with coagulation studies and/or D-dimer, consider LP to r/o meningitis
  - treatment: anticoagulation (most commonly LMWH or heparin)

### Disposition

- admission: if underlying diagnosis is critical or emergent, if there are abnormal neurological findings, if patient is elderly or immunocompromised (atypical presentation), or if pain is refractory to oral medications
- discharge: assess for risk of narcotic misuse; most patients can be discharged with appropriate analgesia and follow-up with their family physician; instruct patients to return for fever, vomiting, neurologic changes, or increasing pain

## Joint and Back Pain

### JOINT PAIN (see [Rheumatology, RH3](#))

- rule out life-threatening causes e.g. septic joint (see [Orthopaedic Surgery, OR11](#))

### History and Physical Exam

- history: recent trauma, drug use (anticoagulants, glucocorticoids)
- associated symptoms: fever, constitutional symptoms, skin lesions, conjunctivitis, urethritis
- patterns of joint involvement: polyarticular vs. monoarticular, symmetric vs. asymmetric
- inflammatory symptoms: morning stiffness  $\geq 30$  min, pain/stiffness that ease with activity, mid-day fatigue, soft tissue swelling
- non-inflammatory symptoms: morning stiffness <30 min, stiffness short-lived after inactivity, increasing pain with activity
- assess for pain with ROM, localized joint pain, effusion, erythema, warmth, swelling, inability to bear weight, fever; may indicate presence of septic joint

### Investigations

- blood work: CBC, ESR, CRP, INR/PTT, blood cultures, urate
- joint x-ray ± contralateral joint for comparison
- bedside U/S to identify effusion ± joint aspiration
- test joint aspirate for: culture, WBC, polynuclear cells, glucose, Gram stain, crystals

### Management

- septic joint: empiric IV antibiotics ± orthopaedic consultation for joint decompression and drainage
- crystalline synovitis: NSAIDs at high dose, colchicine within first 24 h, corticosteroids
  - do not use allopurinol for acute flares, as it may worsen acute attack
- acute polyarthritis: NSAIDs, analgesics (acetaminophen ± opioids), local or systemic corticosteroids
- osteoarthritis: NSAIDs, acetaminophen
- soft tissue pain:
  - non-pharmacologic treatment: local heat or cold, electrical stimulation, massage
  - pharmacologic: oral analgesics, NSAIDs, muscle relaxants, corticosteroid injections, topical agents

### Validation of the Ottawa Subarachnoid Hemorrhage Rule in Patients with Acute Headache

CMAJ 2017;189:E1379-E1385

**Purpose:** Validate the Ottawa SAH Rule in emergency department patients.

**Methods:** Prospective cohort study at 6 university-affiliated tertiary-care hospital emergency departments in Canada from 2010-2014. Included alert, neurologically intact adult patients with headache peaking within 1 hour of onset. The rule was scored before investigations.

**Results:** 1153/1743 potentially eligible patients were enrolled, 67 had subarachnoid hemorrhage. Ottawa SAH rule had 100% sensitivity and 13.6% specificity with similar neuroimaging rates (87%).

**Conclusions:** The Ottawa SAH Rule was sensitive for identifying subarachnoid hemorrhage in otherwise alert and neurologically intact patients.

### Meningitis

- Do not delay IV antibiotics for LP
- Deliver first dose of dexamethasone with or before first dose of antibiotic therapy

### Parenteral Dexamethasone for Preventing Recurrence of Acute Severe Migraine Headache

B MJ 2008;336(7657):1359

**Purpose:** To examine effectiveness of parenteral corticosteroids for relief of acute severe migraine headache and prevention of recurrent headaches.

**Methods:** Meta-analysis of RCTs comparing corticosteroids (alone or in combination with standard abortive therapy) to placebo or any other standard treatment for acute migraine in adults.

**Results:** Seven RCTs met eligibility criteria, all of which used standard abortive therapy and subsequently compared single dose parenteral dexamethasone to placebo. All trials examined pain relief and recurrence of headache within 72 h. While dexamethasone and placebo were comparable for acute pain reduction (mean difference 0.37, 95% CI -0.20 to 0.94) and side effect profiles, dexamethasone provided lower recurrence rates (relative risk 0.75, 0.60 to 0.90; number needed to treat 9).

**Conclusion:** Single dose parenteral dexamethasone with standard abortive therapy is associated with a 26% relative reduction in headache recurrence within 72 h.

### Red Flags for Back Pain

Bo wel or bladder dysfunction  
Anesthesia (saddle)  
Constitutional symptoms  
K - Chronic disease. Constant pain  
Paresthesia  
Age >50 and mild trauma  
IV drug use/infection  
Neuromotor deficits

**BACK PAIN** (see [Family Medicine, FM41](#))

- rule out extraspinal emergencies: aortic dissection, AAA, PE, MI, retroperitoneal bleed, pancreatitis
- rule out spinal emergencies: osteomyelitis, cauda equina syndrome, epidural abscess or hematoma, spinal fracture, or malignancy

**History and Physical Exam**

- evaluate risk for fracture (osteoporosis, age, trauma), infection (IV drug user, recent spinal intervention, immunosuppression), cancer, vascular causes (cardiac risk factors), neurological symptoms (e.g. saddle anesthesia)
- typical musculoskeletal back pain is moderate, worse with movement or cough with no visceral symptoms
- assess vital signs, perform precordial, abdominal, and neurologic examination of lower extremities

**Investigations**

- WBC, ESR, CRP, U/A, post-void residual bladder scan
- reserve imaging for neurological deficits, metastases, and patients at high-risk of fracture, infection, cancer, or vascular cause
  - consider x-ray ± CT if trauma or fracture risk
  - urgent MRI if neurological findings

**Management**

- treat underlying cause
- lumbosacral strain and disc herniation: analgesia and continue daily activities as much as tolerated; discuss red flags and organize follow-up
- spinal infection: early IV antibiotics and infectious disease consultation
- cauda equina syndrome: dexamethasone, early neurosurgical consultation

**Seizures**

- see [Neurology, N18](#)

**Definition**

- paroxysmal alteration of behaviour and/or EEG changes resulting from abnormal, excessive activity of neurons
- status epilepticus: continuous or intermittent seizure activity for greater than 5 min without regaining consciousness (life-threatening)

**Categories**

- generalized seizure (consciousness always lost): tonic/clonic, absence, myoclonic, atonic
- partial seizure (focal): simple partial, complex partial
- causes: primary seizure disorder, structural (trauma, intracranial hemorrhage, infection, increased ICP), metabolic disturbance (hypo-/hyperglycemia, hypo-/hypernatremia, hypocalcemia, hypomagnesemia, toxins/drugs)
- differential diagnosis: syncope, stroke/TIA, psychogenic non-epileptic seizure, migraines, movement disorders, narcolepsy/cataplexy

**History and Physical Exam**

- history of seizures, identify potential precipitants (illness, alcohol withdrawal, sleep deprivation)
- preceding aura, rapid onset, brief duration, alterations in consciousness, tonic-clonic movements, and post-ictal symptoms would suggest a seizure
- common signs include tongue biting (high specificity), loss of bladder/bowel control, emesis, and aspiration
- perform vitals, complete neurologic examination and look for injuries to head, spine, and shoulder (particularly posterior dislocations)

**Minimum Workup in an Adult with 1st Time Seizure**  
 CBC and differential  
 Electrolytes including Ca<sup>2+</sup>, Mg<sup>2+</sup>, PO<sub>4</sub><sup>3-</sup>–  
 CT Head

If administering phenytoin, patient must be on a cardiac monitor as dysrhythmias and/or hypotension may occur

If IV access is not feasible, midazolam 0.2 mg/kg IM up to 10 mg can be used for initial control of seizure in adults

**Table 17. Concurrent Investigation and Management of Status Epilepticus**

Timing	Steps
<b>Immediate</b>	Protect airway with positioning; intubate if airway compromised or elevated ICP Monitor: vital signs, ECG, oximetry; POCT capillary blood glucose Establish IV access Benzodiazepine - lorazepam 2 mg IV at 2 mg/min up to 10 mg or midazolam 5 mg IM up to 10 mg; repeat at 10 min if ineffective; intranasal or IO if no IV access Fluid resuscitation IV dextrose if glucose <60 mg/dL Give 50% glucose 50 mL (preceded by thiamine 100 mg IM if concerned about alcohol withdrawal) Obtain CBC, electrolytes, Ca <sup>2+</sup> , Mg <sup>2+</sup> , VBG, serum blood glucose, toxins, and antiepileptic drug levels; β-hCG Vasopressor support if sBP <90 or MAP <70 mmHg after aggressive fluid resuscitation
<b>Urgent</b>	Establish second IV line, urinary catheter If status persists, phenytoin 20 mg/kg IV at 25-50 mg/min in adults; may give additional 10 mg/kg IV 10 min after loading infusion If seizure resolves, antiepileptic drug still required to prevent recurrence EEG monitoring to evaluate for non-convulsive status epilepticus
<b>Refractory</b>	If status persists after maximum doses above, consult ICU and start one or more of: Phenobarbital 20 mg/kg IV at 50 mg/min Midazolam 0.2 mg/kg IV loading dose and 0.1-0.4 mg/kg/h Propofol 2 mg/kg IV at 2-5 mg/kg/h then loading dose then 2-10 mg/kg/h Requires definitive airway management including rapid sequence intubation and assisted ventilation. Electroencephalography (EEG) for continuous monitoring
<b>Post-Seizure</b>	Investigate underlying cause: consider CT, LP, MRI, ICP monitoring

Note: All interventions should be done as soon as possible adapted from Brophy et al. Guidelines for the evaluation and management of status epilepticus. Neurocrit Care 2012;17:3-23

### Disposition

- decision to admit or discharge should be based on the underlying disease process identified
  - if a patient had a brief generalized seizure and has returned to baseline function and is neurologically intact, then consider discharge with outpatient follow-up
- first-time seizure patients being discharged should be referred to a neurologist for follow-up
- admitted patients should generally have a neurology consult
- patient should not drive until medically cleared (local regulations vary)
  - complete notification form to appropriate authority regarding ability to drive (based on local legal requirements)
- warn regarding other safety concerns (e.g. no swimming, bathing children alone, etc.)

## Shortness of Breath

- see [Respirology, R3](#) and [Cardiology and Cardiac Surgery, C6](#)

**Table 18. Differential Diagnosis for Dyspnea**

	High Mortality/Morbidity	Usually Less Emergent
<b>Respiratory</b>	Airway obstruction (foreign body, epiglottitis, abscess, anaphylaxis) Pneumo/hemothorax Gas exchange – pulmonary edema, PE, pneumonia, acute exacerbations of asthma or COPD	Chronic obstructive, interstitial or restrictive lung disease Pleural effusion
<b>Cardiac</b>	CHF, MI, valvular disease, tamponade, arrhythmia	Chronic CHF, angina
<b>Metabolic</b>	Metabolic acidosis NYD, toxin ingestion	Anemia, Hemoglobinopathy
<b>Neuromuscular</b>	Myasthenia gravis, diaphragmatic paralysis	CNS lesion, primary muscle weakness
<b>Other</b>	Deconditioning, respiratory splinting due to unrelated pain	Anxiety

### History and Physical Exam

- acute SOB is often due to a relatively limited number of conditions; associated symptoms and signs are key to the appropriate diagnosis
  - substernal chest pain with cardiac ischaemia
  - fever, cough, and sputum with respiratory infections
  - urticaria with anaphylaxis
  - wheezing with acute bronchospasm
  - environmental or occupational exposures
- dyspnea may be the sole complaint and the physical exam may reveal few abnormalities (e.g. PE, pneumothorax)
- vitals including pulse oximetry
  - wheeze and stridor (ventilatory) vs. crackles (parenchymal), JVP, and murmurs

### Investigations

- blood work
  - CBC and differential (hematocrit to exclude anemia), electrolytes, consider ABG/VBG
  - serial cardiac enzymes and ECG if considering cardiac source
  - PERC or Wells scores to consider appropriateness of D-dimer
- imaging
  - CXR (hyperinflation and bullous disease suggestive of obstructive lung disease, or changes in interstitial markings consistent with inflammation, infection, or interstitial fluid)
  - CT chest may be indicated in acute dyspnea, specifically when suspicion for thromboembolic disease (i.e. PE)

### Disposition

- history and physical exam lead to accurate diagnoses in patients with dyspnea in approximately two-thirds of cases; the decision to admit or discharge should be based on the underlying disease process identified and its severity
  - non-invasive positive pressure ventilation (NIPPV) should be considered in patients with severe COPD or CHF, may reduce the need for intubation in this patient population
  - consider intubation in COPD and CHF if NIPPV will not be tolerated (e.g. decreased LOC, vomiting)
- if discharging, organize follow-up and educate regarding signs to return to hospital

## Syncope

### Definition

- sudden, transient loss of consciousness and postural tone with spontaneous recovery
- usually caused by generalized cerebral or reticular activating system (brainstem) hypoperfusion

### Etiology

- cardiogenic: dysrhythmia, outflow obstruction (e.g. PE, pulmonary HTN), MI, valvular disease
- non-cardiogenic: peripheral vascular (hypovolemia), vasovagal, orthostatic, cerebrovascular disorders, CNS, metabolic disturbances (e.g. EtOH intoxication)

### Intramuscular vs. Intravenous Therapy for Prehospital Status Epilepticus

NE JM 2012;366:591-600

**Purpose:** To investigate the efficacy of intramuscular (IM) midazolam with that of IV lorazepam for children and adults in status epilepticus treated by paramedics.

**Methods:** Double-blind, randomized, non-inferiority trial. Subjects whose convulsions had persisted more than 5 min and were still convulsing after paramedics arrived were given the study medication by either IM or IV infusion. Primary outcome: absence of seizures at the time of arrival in the emergency department without the need for rescue therapy.

**Results:** Seizures were absent without rescue therapy in 73% of the IM-midazolam group and in 63.4% of the IV-lorazepam group ( $P < 0.001$  for noninferiority and superiority). The median times to active treatment were 1.2 min in the IM midazolam group and 4.8 min in the IV-lorazepam group, with corresponding median times from active treatment to cessation of convulsions of 3.3 min and 1.6 min. Adverse-event rates were similar.

**Conclusions:** For subjects in status epilepticus, IM midazolam is at least as safe and effective as IV lorazepam for prehospital seizure cessation.

**History**

- gather details from witnesses, and clarify patient's experience (e.g. dizziness, ataxia, or true syncope)
  - two key historical features: prodrome and situation (setting, patient posture)
- distinguish between syncope and seizure (see [Neurology, N19](#))
  - some patients may have myoclonic jerks with syncope – NOT a seizure
    - signs and symptoms during presyncope, syncope, and postsyncope (seizure has post-ictal period afterwards, syncope does not).
    - past medical history, drugs
    - think anatomically in differential: pump (heart), blood, vessels, brain
- syncope is cardiogenic until proven otherwise if
  - there is sudden loss of consciousness with no warning or prodrome
  - syncope is accompanied by chest pain

**Physical Exam**

- postural BP and HR
- cardiac, respiratory, and neurological exams
- examine for signs of secondary injury caused by syncopal episode (e.g. head injury)

**Investigations**

- ECG (tachycardia, bradycardia, blocks, Wolff-Parkinson White, long QT interval, Brugada Syndrome, right ventricular strain, hypertrophic cardiomyopathy),
- POCT capillary blood glucose
- consider blood work: CBC, electrolytes, BUN/Cr, VBG, troponin, Ca<sup>2+</sup>, Mg<sup>2+</sup>, β-hCG, D-dimer
- consider toxicology screen

**Management**

- ABCs, IV, O<sub>2</sub>, monitor
- cardiogenic syncope: admit to medicine/cardiology
- low-risk syncope: discharge with follow-up as indicated by cause (non-cardiogenic syncope may still be admitted)

**Disposition**

- decision to admit is based on etiology
- most patients will be discharged
- on discharge, instruct patient to follow up with family physician
  - educate about avoiding orthostatic or situational syncope
  - evaluate the patient for fitness to drive or work
  - patients with recurrent syncope should avoid high-risk activities (e.g. driving)

**Sexual Assault****Epidemiology**

- 1 in 5 women and 1 in 50 men will be sexually assaulted in their lifetime; only 7% are reported

**General Approach**

- ABCs, treat acute, serious injuries; physician priority is to treat medical issues and provide clearance
- ensure patient is not left alone and provide ongoing emotional support
- obtain consent for medical exam and treatment, collection of evidence, disclosure to police (notify police as soon as consent obtained)
- Sexual Assault Kit (document injuries, collect evidence) if <72 h since assault
- label samples immediately and pass directly to police
- offer community crisis resources (e.g. shelter, hotline)
- do not report unless victim requests or if <16 yr old (i.e. legally required)

Interprofessional teams are key; many centres or regions have sexual assault teams who specialize in the assessment and treatment of sexual assault victims, leaving emergency physicians responsible only for significant injuries and medical clearance

**History**

- ensure privacy for the patient – others should be asked to leave
- questions to ask: who, when, where did penetration occur, what happened, any weapons, or physical assault?
- post-assault activities (urination, defecation, change of clothes, shower, douche, etc.)
- gynaecologic history
  - gravidity, parity, last menstrual period
  - contraception use
  - last voluntary intercourse (sperm motile 6-12 h in vagina, 5 d in cervix)
- medical history: acute injury/illness, chronic diseases, psychiatric history, medications, allergies, etc.

**Physical Exam**

- never re-traumatize a patient with the examination
- intimate exams and specimen collection should ideally be deferred to a sexual assault nurse if there is one available. This is to avoid re-traumatization and for medico-legal reasons (samples once collected must be secured, otherwise their validity will be questioned during legal proceedings)

- general examination
  - mental status
  - sexual maturity
  - patient should remove clothes and place in paper bag
  - document abrasions, bruises, lacerations, torn frenulum/broken teeth (indicates oral penetration)
- pelvic exam and specimen collection
  - ideally before urination or defecation
  - examine for seminal stains, hymen, signs of trauma
  - collect moistened swabs of dried seminal stains
  - pubic hair combings and cuttings
  - speculum exam
    - ◆ lubricate with water only
    - ◆ vaginal lacerations, foreign bodies
    - ◆ Pap smear, oral/cervical/rectal culture for gonorrhea and chlamydia
    - ◆ posterior fornix secretions if present or aspiration of saline irrigation
    - ◆ immediate wet smear for motile sperm
    - ◆ air-dried slides for immotile sperm, acid phosphatase, ABO group
- fingernail scrapings and saliva sample from victim

### Investigations

- Venereal Disease Research Lab (VDRL): repeat in 3 mo if negative
- serum  $\beta$ -hCG
- blood for ABO group, Rh type, baseline serology (e.g. hepatitis, HIV)

### Management

- involve local/regional sexual assault team (sexual assault forensic examiner or sexual assault nurse examiner)
- medical
  - suture lacerations, tetanus prophylaxis
  - gynecology consult for foreign body, complex lacerations
  - assume positive for gonorrhea and chlamydia
    - ◆ management: azithromycin 1 g PO x 1 dose (alt: doxycycline 100 mg PO BID x 10 d) and ceftriaxone 250 mg IM x 1 dose
  - may start post-exposure prophylaxis for hepatitis B, syphilis, HIV
  - pre and post counselling for HIV testing
  - pregnancy prophylaxis offered
    - ◆ levonorgestrel 1.5 g PO STAT (Plan B\*)
- psychological
  - high incidence of psychological sequelae
  - have victim change and shower after exam completed

### Disposition

- discharge if injuries/social situation permit
- follow-up with physician in rape crisis center within 24 h for repeat pregnancy and STI testing
- best if patient does not leave ED alone

### INTIMATE PARTNER VIOLENCE

- women are usually the victims, but male victimization also occurs
- identify the problem (need high index of suspicion)
  - suggestive injuries (bruises, sprains, abrasions, occasionally fractures, burns, or other injuries; often inconsistent with history provided)
  - somatic symptoms (chronic and vague complaints)
  - psychosocial symptoms
    - clinician impression (your 'gut feeling' e.g. overbearing partner that won't leave patient's side)
- if disclosed, be supportive and assess danger
- patient must consent to follow-up investigation/reporting (unless patient is <16 y/o)

### Management

- treat injuries and document findings
- ask about sexual assault and children at home (encourage notification of police)
- safety plan with good follow-up with family physician/social worker

# Medical Emergencies

## Anaphylaxis and Allergic Reactions

### Etiology

- anaphylaxis is an exaggerated immune-mediated hypersensitivity reaction that leads to systemic histamine and vasoactive mediator release leading to increased vascular permeability and vasodilation
- regardless of the etiology, the presentation and management of anaphylactic reactions are the same
  - epinephrine (1:1000) 0.3-0.5 mg (IM in anterolateral thigh)
- allergic (e.g. re-exposure to allergen)
- non-allergic (e.g. exercise-induced)

### Diagnostic Criteria

- diagnosis of anaphylaxis is highly likely with any of the following:
  1. acute onset of an illness (min to h) with involvement of the skin, mucosal tissue, and at least one of
    - respiratory compromise (e.g. dyspnea, wheeze, stridor, hypoxemia)
    - hypotension/end-organ dysfunction (e.g. hypotonia, collapse, syncope, incontinence)
  2. two or more of the following after exposure to a LIKELY allergen for that patient (min to h)
    - involvement of the skin-mucosal tissue
    - respiratory compromise
    - hypotension or associated symptoms
    - persistent gastrointestinal symptoms (e.g. crampy abdominal pain, vomiting)
  3. hypotension after exposure to a KNOWN allergen for that patient (min to h)
    - management is also appropriate in cases which do not fulfill criteria, but who have had previous episodes of anaphylaxis
    - life-threatening differentials for anaphylaxis include asthma and septic shock
    - angioedema may mimic anaphylaxis but tends not to improve with standard anaphylaxis treatment

### Management

- moderate reaction: generalized urticaria, angioedema, wheezing, tachycardia
  - epinephrine (1:1000) 0.3-0.5 mg (IM in anterolateral thigh)
  - antihistamine: cetirizine 10 mg PO/IV
  - salbutamol (Ventolin®) 1 cc via MDI
- severe reaction/evolution: severe wheezing, laryngeal/pulmonary edema, shock
  - ABCs, may need definitive airway (e.g. ETT) due to airway edema
  - epinephrine (1:1000) 1-10 µg/min IV (or via ETT if no IV access) titrated to desired effect
  - antihistamine: diphenhydramine (Benadryl®) 50 mg IV (~1 mg/kg) or cetirizine (Reactine®) 10 mg IV
  - glucocorticoids: methylprednisolone 125-250 mg IV or prednisone/prednisolone 40-60 mg PO
  - large volumes of crystalloid may be required
- patients on β-blockers may not respond to epinephrine in an anaphylactic reaction and may benefit from glucagon for reversal

### Disposition

- monitor for 4-8 h in ED (minimum) and arrange follow-up with family physician in 24-48 h
- can have second phase (biphasic) reaction up to 72 h later, patient may need to be supervised
- educate patient on avoidance of allergens
- instructions to seek immediate medical attention in ED during any future anaphylaxis reaction, even when self-treatment has been self-initiated
- medications
  - epinephrine auto-injector
  - H1 antagonist (cetirizine 10 mg PO once daily or Benadryl® 50 mg PO q4-6 h x3 d)
  - Second-generation H1 antagonists (e.g. cetirizine) are less sedating than first-generation H1 antagonists (e.g. Benadryl®)
  - glucocorticoids not recommended if good response to epinephrine and absence of asthma; if indicated, methylprednisolone 1-2 mg/kg/d for 2 d is sufficient

## Asthma

- see [Respirology, R7](#) and [Paediatrics, P91](#)
- chronic inflammatory airway disease with episodes of bronchospasm and inflammation resulting in reversible airflow obstruction

### History and Physical

- find cause(s) of asthma exacerbation (e.g. viral, environmental, etc.)
- history of asthma control; severity of exacerbations (e.g. ICU, intubation history)
- signs of respiratory distress (e.g. accessory muscle use)
- vitals, specifically O<sub>2</sub> saturation

### Most Common Triggers for Anaphylaxis

- Foods (nuts, shellfish, etc.)
- Stings
- Drugs (penicillin, NSAIDs, ACEI)
- Radiographic contrast media
- Blood products
- Latex

Anaphylaxis should be suspected if airway, breathing, or especially circulation compromise is present after exposure to a known allergen

Hypotension is defined as sBP >30% decrease from baseline or

- ≥11 yr: <90 mmHg
- 1-10 yr: <70 mmHg + (2 x age)
- 1 mo-1 yr: <70 mmHg

Early epinephrine is lifesaving and there are no absolute contraindications

### Paediatric Dosing

Epinephrine: 0.01 mg/kg IM up to 0.5 mg q5-10 min  
 Initial crystalloid bolus: 20-30 mL/kg, reassess  
 Epinephrine infusion: 0.1-1.5 µg/kg/min  
 Diphenhydramine: 1 mg/kg PO/IV q4-6 h  
 Methylprednisolone: 1-2 mg/kg IV

Beware of the silent chest in asthma exacerbations. This is a medical emergency and requires aggressive treatment. Intubation of patients with severe asthma is extremely high risk and maximum medical therapy should be used to avoid it if possible

## Investigations

- peak flow meter
- $\pm$  ABG if in severe respiratory distress
- CXR if diagnosis is uncertain to rule out pneumonia, pneumothorax, etc.

**Table 19. Asthma Assessment and Management**

Classifications	History and Physical Exam	Management
<b>Respiratory Arrest Imminent</b>	Exhausted, confused, diaphoretic, cyanotic Silent chest, ineffective respiratory effort Decreased HR, respiratory rate (RR) >30, pCO <sub>2</sub> >45 mmHg O <sub>2</sub> sat <90% despite supplemental O <sub>2</sub>	Anticipate need for intubation 100% O <sub>2</sub> , cardiac monitor, IV access Intubate (consider induction with ketamine) Short acting $\beta$ -agonist (Ventolin <sup>®</sup> ): nebulizer 5 mg continually Short-acting anticholinergic (Atrovent <sup>®</sup> ): nebulizer 0.5 mg x 3 IV steroids: methylprednisolone 125 mg
<b>Severe Asthma</b>	Agitated, diaphoretic, laboured respirations Speaking in words No relief from $\beta$ -agonist O <sub>2</sub> sat <90%, FEV <sub>1</sub> <50%	Similar to above management Magnesium sulphate 2 g IV O <sub>2</sub> to achieve O <sub>2</sub> sat >92%
<b>Moderate Asthma</b>	SOB at rest, cough, congestion, chest tightness Speaking in phrases Inadequate relief from $\beta$ -agonist FEV <sub>1</sub> 50-80%	O <sub>2</sub> to achieve O <sub>2</sub> sat >92% Short-acting $\beta$ -agonist (Ventolin <sup>®</sup> ): MDI or nebulizer q5 min Short-acting Anticholinergic (Atrovent <sup>®</sup> ): MDI or nebulizer x 3 Steroids: prednisone 40-60 mg PO
<b>Mild Asthma</b>	Exertional SOB/cough with some nocturnal symptoms Difficulty finishing sentences FEV <sub>1</sub> >80%	$\beta$ -agonist Monitor FEV <sub>1</sub> Consider steroids (MDI or PO)

## Disposition

- discharge is safe in patients with FEV<sub>1</sub> or peak expiratory flow (PEF) >60% predicted, and may be safe if FEV<sub>1</sub> or PEF 40-60% predicted based on the patient's risk factors for recurrence of severe attack
  - risk factors for recurrence: frequent ED visits, frequent hospitalizations, recent steroid use, recent exacerbation, poor medication compliance, prolonged use of high dose  $\beta$ -agonists
- $\beta$ -agonist MDI with aerochamber 2-4 puffs q2-4 h until symptoms controlled, then PRN
- initiate inhaled corticosteroids with aerochamber if not already prescribed
- if moderate to severe attack, administer prednisone 30-60 mg/d for 5-10 d with no taper
- counsel on medication adherence and educate on use of aerochamber
  - follow up with primary care physician or asthma specialist

## Cardiac Dysrhythmias

- see [Cardiology and Cardiac Surgery, C19](#)

### Bradycardias and AV Conduction Blocks

- AV conduction blocks
  - 1st degree: prolonged PR interval (>200 msec), no treatment required
  - 2nd degree
    - Mobitz I: gradual prolongation of PR interval then dropped QRS complex, usually benign
    - Mobitz II: PR interval constant with dropped QRS complex, can progress to 3rd degree AV block
  - 3rd degree: P wave unrelated to QRS complex, PP and RR intervals constant
    - atropine and transcutaneous/transvenous pacing (atropine with caution)
    - if transcutaneous/transvenous pacing fails consider IV dopamine, epinephrine
- long-term treatment for Mobitz II and 3rd degree block – internal pacemaker
- sinus bradycardia (rate <60 bpm)
  - can be normal (especially in athletes)
  - causes: vagal stimulation, vomiting, MI/ischemia, increased ICP, sinus node dysfunction, hypothyroidism, drugs (e.g.  $\beta$ -blockers, calcium channel blockers)
  - treat if symptomatic (hypotension, chest pain)
    - acute: atropine  $\pm$  transcutaneous/transvenous pacing
    - sick sinus: transcutaneous/transvenous pacing
    - drug induced: discontinue/reduce offending drug, consider antidotes

### Supraventricular Tachydysrhythmias (narrow QRS)

- sinus tachycardia (rate >100 bpm)
  - causes: increased sympathetic tone, drugs, fever, shock, anemia, thyrotoxicosis, MI, PE, emotional, pain, etc.
  - search for and treat underlying cause
- regular rhythm (i.e. not sinus tachycardia)
  - vagal maneuvers (e.g. carotid massage, Valsalva), adenosine 6 mg IV push, if no conversion give 12 mg, can repeat 12 mg dose once, electrical cardioversion if vagal maneuvers and adenosine unsuccessful
  - rhythm converts: probable reentrant tachycardia (atrioventricular (AV) nodal reentrant tachycardia (AVNRT) more common than AV reentrant tachycardia (AVRT)
    - monitor for recurrence
    - treat recurrence with adenosine or longer acting medications

### Elements of Well-Controlled Asthma

Can Respir J 2010;17(1):15-24

- Daytime symptoms <4x/wk
- Nocturnal symptoms <1x/wk
- No limitation in activity
- No absence from work/school
- Rescue inhaler use <4x/wk
- FEV<sub>1</sub> >90% personal best
- PEF <10-15% diurnal variation
- Mild infrequent exacerbations

### Combined Inhaled $\beta$ -Agonist and Anticholinergic Agents for Emergency Management in Adults with Asthma

Cochrane DB Syst Rev 2017;CD001284

**Purpose:** Determine the effectiveness of combined short-acting  $\beta$ -agonist (SABA) + short-acting anticholinergic (SAAC) vs. SABA alone to reduce hospitalization in adult patients presenting to the ED with an exacerbation of asthma.

**Methods:** Systematic review of RCTs.

**Results:** 23 trials, 2724 patients. Combination inhaled therapy was associated with reduced likelihood of hospitalization (RR 0.72, 95% CI 0.59-0.87) for severe but not mild or moderate asthma exacerbations. Combination therapy was also associated with improved FEV<sub>1</sub> (MD 0.25L, 95% CI 0.02-0.48) and PEF (MD 24.88, 95% CI 14.83-34.93) and patients were less likely to return to ED for additional care (RR 0.80, 95% CI 0.66-0.98). In contrast, patients receiving combination therapy were more likely to experience adverse events than those treated with SABA alone (OR 2.03, 95% CI 1.28-3.20).

**Conclusions:** Combination SAAC + SABA therapy reduces hospitalizations and improves pulmonary function in adults presenting to the ED with acute asthma. However, adults receiving combination therapy were more likely to experience adverse events, such as tremor, agitation, and palpitations, compared to patients receiving SABA alone.

### Adenosine vs. Intravenous Calcium Channel Antagonists for Supraventricular Tachycardia

Cochrane DB Syst Rev 2017;CD005154

**Purpose:** Compare adenosine vs. calcium channel antagonists in terminating supraventricular tachycardia.

**Methods:** Systematic review of RCTs for any patient presenting with supraventricular tachycardia.

**Results:** 7 RCTs, 622 participants. Moderate-quality evidence shows no differences in the number or people reverting to sinus rhythm who were treated with adenosine or calcium channel antagonist (89.7% vs. 92.9%, OR 1.51). Low-quality evidence suggests no differences in major adverse event rates.

**Conclusions:** Moderate-quality evidence shows no differences in effects of adenosine and calcium channel antagonists for treatment of supraventricular tachycardia on reverting to sinus rhythm, and low-quality evidence suggests no differences in the incidence of hypotension.

If a patient with tachydysrhythmia is unstable, perform immediate synchronized cardioversion

- rhythm does not convert: atrial flutter, ectopic atrial tachycardia, junctional tachycardia
  - rate control (diltiazem,  $\beta$ -blockers) or rhythm control with cardioversion
  - consult cardiology if refractory
- irregular rhythm
  - probable AFib, atrial flutter, or multifocal atrial tachycardia
  - rate control (e.g. diltiazem,  $\beta$ -blockers), or rhythm control if AFib/flutter and at least <48h from onset

### Atrial Fibrillation

- most common sustained dysrhythmia; no organized P waves (atrial rate >300/min), irregularly irregular heart rate, narrow QRS (typically)
- etiology: HTN, CAD, thyrotoxicosis, EtOH (holiday heart), valvular disease, pericarditis, cardiomyopathy, sinus node dysfunction
- treatment principles: stroke prevention, treat symptoms, identify/treat underlying cause
- decreases cardiac output by 20-30% (due to loss of organized atrial contractions)
- acute management
  - if unstable: immediate synchronized cardioversion
  - hemodynamically stable patients with AFib <48 h: rhythm or rate control  $\pm$  electrical or chemical cardioversion
- electrical cardioversion: synchronized direct current (DC) cardioversion
- chemical cardioversion: procainamide, flecainide, propafenone
- long-term management: rate or rhythm control, consider anticoagulation (see [Cardiology and Cardiac Surgery](#), CHADS2 score, C23)

### Ventricular Tachydysrhythmias (wide QRS)

- VTach (rate usually 140-200 bpm)
  - definition: 3 or more consecutive ventricular beats at >100 bpm
  - etiology: CAD with MI is the most common cause
  - treatment: sustained VTach (>30 s) is an emergency
    - hemodynamic compromise: synchronized DC cardioversion
    - no hemodynamic compromise: synchronized DC cardioversion, amiodarone, procainamide
- VFib: call a code blue, follow ACLS for pulseless arrest
- torsades de pointes
  - looks like VTach but QRS 'rotates around baseline' with changing axis and amplitude (twisted ribbon)
  - etiology: prolonged QT due to drugs (e.g. quinidine, TCAs, erythromycin, quinolones), electrolyte imbalance (hypokalemia, hypomagnesemia), congenital
  - treatment
    - IV  $Mg^{2+}$ , temporary overdrive pacing, isoproterenol
    - correct cause of prolonged QT

## Acute Exacerbation of COPD

- see [Respirology](#), R8
- progressive development of irreversible airway obstruction, typically caused by smoking

### History and Physical Exam

- cardinal symptoms of acute exacerbation of COPD (AECOPD): increased dyspnea, increased coughing frequency or severity, increased sputum volume or purulence
- triggers: virus, pneumonia, PE, CHF, MI, drugs
- characterize previous episodes and hospitalizations, smoking history
- vital signs, LOC, signs of respiratory distress, respiratory exam

### Investigations

- CBC, electrolytes, CXR, ECG, consider ABG
- Pulmonary Function Tests are NOT useful in managing acute exacerbations

### Management

- oxygen: keep O<sub>2</sub> saturation 88-92% (be aware of chronic hypercapnic/CO<sub>2</sub> retainers but do not withhold O<sub>2</sub> if hypoxic)
- bronchodilators: short-acting  $\beta$ -agonist (salbutamol 4-8 puffs via MDI with spacer q15 min x3 PRN)  $\pm$  short-acting anticholinergic (ipratropium 0.5 mg via MDI q30 min x3 PRN)
- steroids: prednisone 40-60 mg PO for 7-14 d, or methylprednisolone 1-2 mg/kg IV if severe exacerbation, or unable to take PO
- antibiotics: trimethoprim/sulfamethoxazole, cephalosporins, respiratory quinolones (given if all 3 cardinal symptoms present or 2 cardinal symptoms with increased sputum purulence or mechanical ventilation); no antibiotics for mild exacerbation (only 1 of 3 cardinal symptoms)
- ventilation: apply noninvasive positive-pressure ventilation (CPAP or Bi-PAP) if severe distress or signs of fatigue, arterial pH <7.35, or hypercapnic
- if life-threatening, intubate in ED and refer to ICU admission for ventilation (chance of ventilation dependency)

If patient has Wolff-Parkinson-White and is in AFib, use amiodarone or procainamide or cardiovert; avoid AV nodal blocking agents (adenosine, digoxin, diltiazem, verapamil,  $\beta$ -blockers), as these can increase conduction through bypass tract, leading to cardiac arrest

### Causes of Atrial Fibrillation

#### C ("sea") PIRATES

CHF, Cardiomyopathy  
Pulmonary embolism  
Ischaemic heart disease  
Rheumatic or valvular disease  
Anemia  
Thyroid (hyperthyroidism)  
EtOH, Elevated blood pressure  
Sick Sinus, Stress - surgery, sepsis

### Early or Delayed Cardioversion in Recent-Onset Atrial Fibrillation

NEJM 2019;380:1499-1508

**Purpose:** Patients with recent-onset AFib commonly undergo immediate restoration of sinus rhythm by cardioversion. Whether this is necessary is not known, since AFib often terminates spontaneously.

**Methods:** Randomly assigned patients with stable, recent-onset (<36 h), symptomatic AFib in the ED to be treated with a wait-and-see approach (delayed-cardioversion group) or early cardioversion. The wait-and-see approach involved initial treatment with rate-control medication only and delayed cardioversion if the AFib did not resolve within 48 h.

**Primary endpoint:** presence of sinus rhythm at 4 wk.

**Results:** The presence of sinus rhythm at 4 wk occurred in 91% of patients in the delayed-cardioversion group and in 94% in the early-cardioversion group ( $P=0.005$  for noninferiority). Among the patients who completed remote monitoring during 4 wk of follow-up, a recurrence of AFib occurred in 30% of the delayed-cardioversion group and in 29% of the early-cardioversion group.

**Conclusions:** Wait-and-see approach was non-inferior to early cardioversion in stable AFib patients.

### Physical Exam Findings in COPD

- Wheeze
- Maximum laryngeal height  $\leq$  4 cm
- Forced expiratory time  $\geq$  6 s
- Decreased breath sounds
- Decreased cardiac dullness

### Need to Rule Out with COPD

- Exacerbation
- Pneumothorax
- CHF exacerbation
- Acute MI
- Pneumonia and other infectious causes
- PE

Activate Windows

Go to Settings to activate Windows

**Disposition**

- no guidelines for admission - based on clinical judgment, comorbidities, and presence/absence of ongoing symptoms
- lower threshold to admit if comorbid illness (e.g. diabetes, CHF, CAD, alcohol use disorder)
- if discharging, use antibiotics, taper steroids, up to 4-6 puffs QID of ipratropium and salbutamol, and organize follow-up

**Heart Failure**

- see [Cardiology and Cardiac Surgery, C40](#)

**Etiology**

- causes of chronic heart failure: decreased myocardial contractility (ischaemia, infarction, cardiomyopathy, myocarditis), pressure overload states (HTN, valve abnormalities, congenital heart disease), restricted cardiac output (myocardial infiltrative disease, cardiac tamponade)
- precipitants of acute decompensated heart failure (ADHF)
  - cardiac (ischaemia, infarction, arrhythmia, e.g. AFib)
  - medications ( $\beta$ -blockers, calcium channel blockers, NSAIDs, steroids, non-compliance)
  - dietary (increased sodium and/or water intake)
  - high output (anemia, infection, pregnancy, hyperthyroid)
  - other (renal failure, hypertensive crisis, iatrogenic fluid overload - blood transfusions or IV fluids)

**Presentation**

- left-sided heart failure
  - dyspnea, SOB on exertion, orthopnea, paroxysmal nocturnal dyspnea, nocturia, fatigue, altered mental status, presyncope/syncope, angina, systemic hypotension
  - hypoxia, decreased air entry to lungs, crackles, S3 or S4, pulmonary edema (on CXR), pleural effusion (usually right-sided)
- right-sided heart failure
  - dependent bilateral pitting edema, JVP elevation and positive abdominojugular test, ascites, hepatomegaly
- patients often present with a combination of right-sided and left-sided symptoms

**Investigations**

- blood work: CBC, electrolytes, AST, ALT, bilirubin, Cr, BUN, cardiac enzymes, brain natriuretic peptide
- CXR: most useful test (see sidebar)
- ECG: look for MI, ischaemia (ST elevation/depression, T-wave inversion), LVH, atrial enlargement, conduction abnormalities
- bedside ultrasound: B-lines, rule out cardiac tamponade
- echocardiogram: left ventricular function, structural heart disease
- rule out other serious diagnoses: PE, pneumothorax, pneumonia/empyema, AECOPD

**Management**

- ABCs, may require intubation if severe hypoxia
- sit upright, cardiac monitoring, and continuous pulse oximetry
- saline lock IV, Foley catheter only if patient cannot void in a commode at bedside
- 100% O<sub>2</sub> by mask
  - if poor response, may require Bi-PAP (preferred) or intubation
- medical
  - diuretic (if volume overloaded): furosemide 0.5-1 mg/kg IV, titrate to response
  - vasodilators (if sBP >100 mmHg): nitroglycerin 0.4 mg SL q5 min PRN  $\pm$  topical Nitrodur<sup>®</sup> patch (0.4-0.8 mg/h)
    - if patient not responding to treatment or showing signs of ischaemia (angina): nitroglycerine 5-10  $\mu$ g/min IV, titrate to response
  - inotropes/vasopressors (if sBP <90 mmHg)
    - without signs of shock: dobutamine 2.5  $\mu$ g/kg/min IV, titrate up to sBP >90 mmHg, always have norepinephrine or epinephrine running alongside as dobutamine can cause reflex tachycardia and hypotension
    - with signs of shock: norepinephrine 8-12  $\mu$ g/min IV, titrate up to sBP >90 mmHg
- treat precipitating factor - e.g. rate control ( $\beta$ -blocker, calcium channel blockers) or rhythm-control (electrical or chemical cardioversion) if new AFib
- cardiology or medicine consult

**Venous Thromboembolism**

- see [Respirology, R19](#)

**Risk Factors**

- Virchow's triad: alterations in blood flow (venous stasis), injury to endothelium (smoking, HTN, surgery, catheter, trauma), hypercoagulable state (including pregnancy, use of oral contraceptive pills, malignancy)
- clinical risk factors (see sidebar, [Risk Factors for VTE, ER33](#))

**Precipitants of CHF Exacerbation****FAILURE**

- For got medication
- Arrhythmia (Dysrhythmia)/Anemia
- Ischaemia/Infarction/Infection
- Lifestyle (e.g. high salt intake)
- Upregulation of cardiac output (e.g. pregnancy, hyperthyroidism)
- Renal failure
- Embolism (pulmonary)

**CHF on CXR**

- Pulmonary vascular redistribution
- Perihilar infiltrates
- Interstitial edema, Kerley B lines
- Alveolar edema, bilateral infiltrates
- May see cardiomegaly, pleural effusions
- Peribronchial cuffing
- Fissural thickening (fluid in fissure)

**Acute Treatment of CHF****LMNOP**

- La six<sup>®</sup> (furosemide)
- Morphine
- Nitroglycerin
- Oxygen
- Position (sit upright), Pressure (Bi-PAP)

**Hospital Management Required if**

- Acute MI
- Pulmonary edema or severe respiratory distress
- Severe complicating medical illness (e.g. pneumonia)
- Anasarca
- Symptomatic hypotension or syncope
- Refractory to outpatient therapy
- Thromboembolic complications requiring interventions
- Clinically significant dysrhythmias
- Inadequate social support for safe outpatient management
- Persistent hypoxia requiring supplemental oxygen

**Diagnostic Accuracy of POCUS and CXR in Adults With Symptoms Suggestive of ADHF**

JAMA 2019;2:e190703

**Purpose:** To compare the accuracy of Point-of-Care Lung Ultrasonography (LUS) with the accuracy of CXR in the diagnosis of cardiogenic pulmonary edema.

**Methods:** Systematic review with inclusion criteria of patients presenting with dyspnea who underwent both LUS and CXR on initial assessment. Imaging results were compared by a clinical expert after either a medical record review or a combination of echocardiography findings and B-type natriuretic peptide (BNP) criteria. Primary outcome was the comparative accuracy of LUS and CXR in diagnosing ADHF as measured by the differences between the 2 modalities in pooled sensitivity and specificity. Results: 6 studies met the inclusion criteria; a total of 1827 patients. Pooled estimates for LUS were 0.88 for sensitivity and 0.90 for specificity. Pooled estimates for CXR were 0.73 for sensitivity and 0.90 for specificity. The relative sensitivity ratio of LUS, compared with CXR, was 1.2. No difference was found in specificity between tests.

**Conclusions:** The findings suggest that LUS is more sensitive than CXR in detecting pulmonary edema in ADHF; LUS should be considered as an adjunct imaging modality in the evaluation of patients with dyspnea at risk for ADHF.

## DEEP VEIN THROMBOSIS

### Presentation

- calf pain, unilateral leg swelling/erythema/edema, palpable cord along the deep venous system on exam
- clinical signs/symptoms are unreliable for diagnosis and exclusion of DVT (may be asymptomatic; bilateral leg presentation unlikely but does not rule out diagnosis; think inferior vena cava (IVC) occlusion if bilateral DVT)
  - further investigation is often needed

### Investigations

- use Wells' criteria for DVT to guide investigations (see *Figure 12, ER34*)
- D-dimer is only useful for ruling out DVT, and a D-dimer test result should only be considered in cases where a low-moderate risk patient has a negative test (high sensitivity)
  - high-risk of false positives in: elderly, infection, recent surgery, trauma, hemorrhage, late in pregnancy, liver disease, cancer
- U/S has high sensitivity & specificity for proximal clot but only 73% sensitivity for calf DVT (may need to repeat in 1 wk)
  - if positive – treat for DVT unless anticoagulation is contraindicated
  - if negative and low-risk – rule out DVT
  - if negative and moderate to high-risk – repeat U/S in 5-7 d to rule out DVT

### Management

- direct oral anticoagulants (DOAC) can be used in acute management of symptomatic DVT
  - rivaroxaban: 15 mg PO BID for first 21 d; 20 mg PO once daily for remaining treatment (taken with food at the same time each day)
  - apixaban: 10 mg PO BID for first 7 d; 5 mg PO BID for remaining treatment
- low molecular weight heparin (LMWH) unless patient also has renal failure
  - dalteparin 200 IU/kg SC q24 h or enoxaparin 1 mg/kg SC q24 h
- warfarin started at same time as LMWH (5 mg PO once daily initially followed by dosing based on INR)
- LMWH discontinued when INR has been therapeutic (2-3) for 2 consecutive days
- consider thrombolysis if extensive DVT threatening limb compromise
- IVC filter or surgical thrombectomy considered if anticoagulation is contraindicated
- duration of anticoagulation: 3 mo if transient coagulopathy; 6 mo if unprovoked DVT; life-long if ongoing coagulopathy

## PULMONARY EMBOLISM

### Presentation

- dyspnea, pleuritic chest pain, hemoptysis, tachypnea, cyanosis, hypoxia, fever
- clinical signs/symptoms are unreliable for diagnosis and exclusion of PE; investigation often needed

### Investigations

- use Wells' criteria for PE to guide investigations (see *Figure 13, ER46*)
- pulmonary embolism rule-out criteria (PERC) score (see EBM on sidebar, [Respirology, R21](#)) alone can rule out PE in low-risk patients unless pregnant
- ECG and CXR are useful to rule out other causes (e.g. ACS, pneumonia, pericarditis) or to support diagnosis of PE
  - ECG changes in PE: sinus tachycardia, right ventricular strain (SIQ3T3, see [Cardiology and Cardiac Surgery, C10](#)), T wave inversions in anterior and inferior leads, AFib
  - CXR findings in PE: Hampton's hump (triangular density extending from pleura, sign of pulmonary infarct) or Westermark's sign (dilatation of vessels proximal to an obstruction, with collapse of vessels distal to obstruction, often with a sharp cutoff)
- D-dimer is only useful at ruling out a PE if it is negative in low-moderate risk patients (highly sensitive)
  - if positive D-dimer or high-probability patient, then pursue CT pulmonary angiography or V/Q scan
- CT pulmonary angiography has high sensitivity and specificity for PE, may also indicate an alternative diagnosis
- V/Q scan useful in pregnancy, when CT pulmonary angiography not available, or IV contrast contraindicated

### Management

- treatment of PE with anticoagulation and duration of treatment is the same as for DVT (see above)
- thrombolysis indicated in massive PE, which is defined as acute PE with sustained hypotension (sBP <90 mmHg for at least 15 min or requiring inotropic support, not due to a cause other than PE)
- catheter-directed thrombolysis or surgical thrombectomy may be considered in massive PE or if anticoagulation is contraindicated
- often can be treated as an outpatient, may require analgesia for chest pain (narcotic or NSAID)
- admit if hemodynamically unstable, require supplemental O<sub>2</sub>, major comorbidities, lack of sufficient social supports, unable to ambulate, need invasive therapy
  - referral to medicine for coagulopathy and malignancy workup

### Risk Factors for VTE

#### THROMBOSIS

Trauma, travel  
Hypercoagulable, hormone replacement therapy (HRT)  
Recreational drugs (IV drug use)  
Old (age >60 yr)  
Malignancy  
Birth control pill  
Obesity, obstetrics  
Surgery, smoking  
Immobilization  
Sickness (CHF, MI, nephrotic syndrome, vasculitis)

### Wells' Criteria for DVT

Active cancer	+1
Paralysis, paresis or recent immobilization of leg	+1
Recently bedridden x3 d or major surgery within 4 wk	-1
Local tenderness	+1
Entire leg swollen	+1
Calf swelling 3 cm	+1
> asymptomatic leg	
Unilateral pitting edema	+1
Collateral superficial veins	+1
Alternative Dx more likely	-2

0: Low probability  
1-2: Moderate probability  
+3: High probability

### Wells' Criteria for PE

Previous Hx of DVT/PE	+1.5
HR >100	+1.5
Recent immobility or surgery	+1.5
Clinical signs of DVT	+3
Alternate Dx less likely than PE	+3
Hemoptysis	+1
Cancer	+1

-2: Low probability  
2-6: Intermediate probability  
+6: High probability

### Signs of PE on CXR

**Westermark's sign:** abrupt tapering of a vessel on chest film  
**Hampton's hump:** a wedge-shaped infiltrate that abuts the pleura  
Effusion, atelectasis, or infiltrates 50% normal  
Both signs are specific but not sensitive  
A normal CXR in the hypoxic patient warrants a work-up for PE

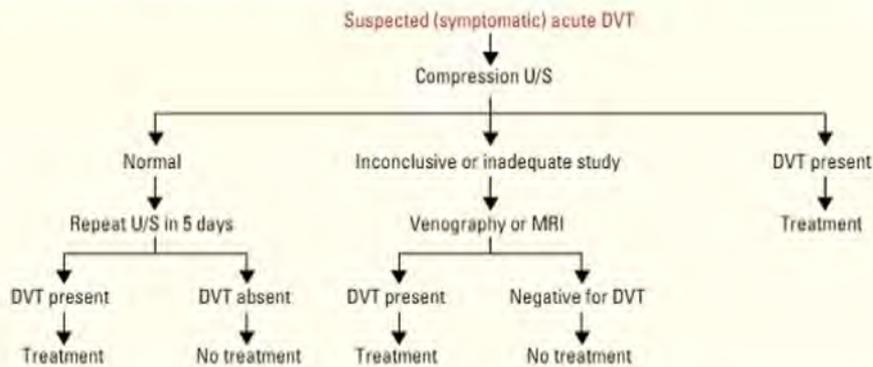

Figure 11. Approach to suspected DVT

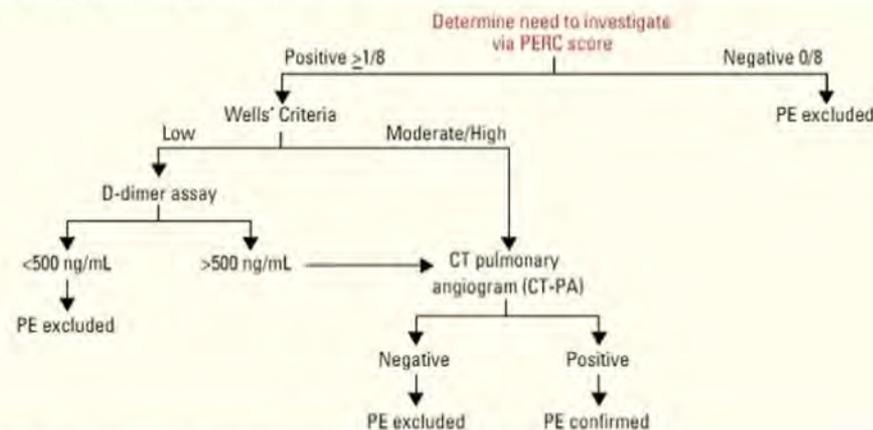

Figure 12. Approach to PE in patients with low clinical suspicion of a PE

**PERC Score**

- Age >50 yr
- HR >100 bpm
- O<sub>2</sub> saturation on room air <95%
- Prior Hx of DVT/PE
- Recent trauma or surgery
- Hemoptysis
- Exogenous estrogen
- Clinical signs suggesting DVT

Score 1 for each question; a score 0/8 means patient has <1.6% chance of having a PE and avoids further investigation. Caution using the PERC score in pregnant women as the original study excluded pregnant women

D-dimer is only useful if it is negative; negative predictive value >99%

50% of patients with symptomatic proximal DVT will develop PE, often within days to weeks of the event

**Oral Direct Thrombin Inhibitors or Oral Factor Xa Inhibitors for the Treatment of Pulmonary Embolism**

Cochrane DB Syst Rev 2015;CD010957

**Purpose:** Assess effectiveness of oral direct thrombin inhibitors and oral factor Xa inhibitors for long-term treatment of PE.

**Methods:** Systematic review of RCTs in patients with confirmed PE receiving oral direct thrombin inhibitors or factor Xa inhibitors for minimum 3 mo.

**Results:** 5 RCTs, 7897 participants. No difference in the effectiveness of oral direct thrombin inhibitors vs. standard anticoagulation in preventing recurrent PE (OR 1.02, 95% CI 0.50-2.04), recurrent VTE (OR 0.93, 95% CI 0.52-1.66), DVT (OR 0.72, 95% CI 0.39-1.32), all-cause mortality (OR 1.16, 95% CI 0.79-1.70), or major bleeding (OR 0.97, 95% CI 0.59-1.62).

**Conclusions:** High quality evidence suggests there is no difference between oral direct thrombin inhibitors and standard anticoagulation in the prevention of recurrent pulmonary embolism. Moderate-high evidence suggests there is no difference in recurrent VTE, DVT, all-cause mortality, and major bleeding between DOACs and standard anticoagulation.

## Diabetic Emergencies

- see [Endocrinology](#), E14

### Diabetic Ketoacidosis

- triad of hyperglycemia, ketosis, and acidosis due to severe insulin deficiency and counter-regulatory hormone excess
- precipitating factors: infection, cardiac or mesenteric ischaemia, MI, intoxication, insulin omission, or SGLT2i (euglycemic DKA)
- clinical features
  - often young, T1DM patients (may rarely be first presentation of undiagnosed T2DM), with symptoms evolving within a day
  - early signs and symptoms: polyuria, polydipsia, malaise, nocturia, weight loss
  - late signs and symptoms
    - GI: anorexia, nausea, vomiting, abdominal pain
    - neurological: fatigue, drowsiness, stupor, coma
    - respiratory: Kussmaul's respiration, dyspnea (often due to acidosis), fruity ketotic breath
- investigations
  - blood work: CBC, electrolytes, Ca<sup>2+</sup>, Mg<sup>2+</sup>, PO<sub>4</sub><sup>3-</sup>, Cr, BUN, glucose, ketones, osmolality, AST/ALT/ALP, amylase, troponin
  - urine: glucose and ketones
  - ABG or VBG
  - ECG (electrolyte disturbances may predispose to dysrhythmia, MI is rarely a precipitant)
- management
  - rehydration
    - bolus of NS, then high rate NS infusion (beware of overhydration and cerebral edema in paediatric patients (see Paediatrics, P31))
    - beware of a pseudohyponatremia due to hyperglycemia (add 3 Na<sup>+</sup> per 10 glucose over 5.5 mmol/L)
  - potassium
    - essential to avoid hypokalemia: replace KCl 20 mEq/L (only if patient is voiding, adequate renal function, and initial K<sup>+</sup> <5.5 mmol/L)
    - use cardiac monitoring if potassium levels normal or low

- insulin
  - critical, as this is the only way to inhibit gluconeogenesis/ketosis
  - do not give insulin if  $K^+ < 3.3$  mmol/L as insulin will exacerbate hypokalemia
  - continuous infusion at 0.1 U/kg/h
  - once the blood glucose  $< 14$  mmol/L, dextrose should be added to the patient's IV fluids
- bicarbonate is not given unless patient is at risk of shock or death (typically pH  $< 7.0$ )

### Hyperosmolar Hyperglycemic State

- hyperosmolar hyperglycemic state (HHS) is characterized by extreme hyperglycemia ( $> 33.3$  mmol/L) due to relative insulin deficiency, counter-regulatory hormones excess, gluconeogenesis, and dehydration (due to osmotic diuresis)
- clinical features
  - often older, T2DM patients with more comorbid illnesses and larger fluid losses with symptoms evolving over days to weeks, fewer GI symptoms and more neurological deficits than DKA including: mental disturbances, coma, delirium, seizures
  - polyuria, N/V
- investigations
  - blood work: CBC, electrolytes,  $Ca^{2+}$ ,  $Mg^{2+}$ ,  $PO_4^{3-}$ , Cr, BUN, glucose, ketones, osmolality
  - urine: glucose and ketones
  - ABG or VBG
  - find underlying cause: ECG, CXR, blood and urine C&S
- management
  - rehydration with IV NS (total water deficit estimated at average 100 cc/kg body weight)
  - O<sub>2</sub>, cardiac monitoring, frequent electrolyte, and glucose monitoring
  - insulin management as per DKA
  - identify and treat precipitating factors, similar to DKA but HHS has also been noted following cardiac surgery and with the use of certain drugs (e.g. diuretics, glucocorticoids, lithium, atypical antipsychotics)
  - admission to medicine

### Hypoglycemia

- characterized by Whipple's triad: low plasma glucose, symptoms suggestive of hypoglycemia, prompt resolution of symptoms when glucose administered
- clinical features
  - neuroglycopenic symptoms: headaches, confusion, seizures, loss of consciousness, coma
  - autonomic symptoms: diaphoresis, nausea, tremor, hunger, tachycardia, palpitations
- history and physical exam
  - last meal, known DM, prior similar episodes, drug therapy, and compliance
  - liver/renal/endocrine/neoplastic disease
  - depression, alcohol or drug use
- management
  - check a bedside capillary blood glucose
  - oral sugar if possible (juice, sugar tablets)
  - IV access if oral route not possible
  - D50W 50 mL IV push
    - use lower concentration dextrose solutions in children (rule of 50's: 1 mL/kg of D50W, 2 mL/kg of D25W, 5 mL/kg of D10W, 10 mL/kg of D5W)
  - if IV access and oral replacement not possible, glucagon 1-2 mg IM, repeat in 10-20 min
  - O<sub>2</sub>, cardiac, frequent blood glucose monitoring
  - thiamine 300 mg IM (if alcohol use disorder is suspected)
  - full meal as soon as mental status permits
  - if due to long-acting insulin, or sulfonylureas, watch for prolonged hypoglycemia due to long half-life (may require admission for monitoring)
  - search for cause (common causes include exogenous insulin, alcohol, or sulfonylureas)

#### Four Criteria for DKA Dx

- Hyperglycemia
- Metabolic acidosis
- Hyperketonemia
- Ketonuria

#### Signs and Symptoms of DKA

Diuresis, dehydration, drowsy, delirium, dizziness  
Kussmaul's breathing, ketotic breath  
Abdominal pain, anorexia

#### Precipitating Factors in DKA

##### The 5 Is

Infection  
Ischaemia  
Infarction  
Intoxication  
Insulin missed

#### Causes of Hypoglycemia

- **Most common:** excessive insulin use in setting of poor PO intake
- **Common:** alcohol intoxication, sepsis, liver disease, oral anti-hyperglycemics
- **Rare:** insulinomas, hypopituitarism, adrenal insufficiency, medication side effects

Cerebral edema may occur if hyperosmolality is treated too aggressively

## Electrolyte Disturbances

- see [Nephrology, NP8](#)

**Table 20. Electrolyte Disturbances**

Electrolyte Disturbance	Common Causes	Symptoms	Treatment	Special Considerations
<b>Hypernatremia</b>	Inadequate H <sub>2</sub> O intake (elderly/disabled) or inappropriate excretion of H <sub>2</sub> O (diuretics, Li, and diabetes insipidus)	Lethargy, weakness, irritability, and edema; seizures and coma occur with severe elevations of Na <sup>+</sup> levels (>158 mmol/L)	Salt restrict and give normal saline until hemodynamically stable. Use half-normal saline once vitals are stable	No more than 12 mmol/L in 24 h drop in Na <sup>+</sup> (0.5 mmol/L/h) due to risk of cerebral edema, seizures, death
<b>Hyponatremia</b>	Hypovolemic (GI, renal, skin, blood fluid loss), euvolemic (syndrome of inappropriate antidiuretic hormone secretion (SIADH)/ stress, adrenal insufficiency, hypothyroid, diet/intake), hypervolemic (CHF, cirrhosis, nephrotic syndrome)	Neurologic symptoms secondary to cerebral edema, headache, seizure, decreased LOC, depressed reflexes; chronic milder than acute	Hypovolemic: normal saline Euvolemic: restrict water, eliminate underlying cause Hypervolemic: restrict fluid and sodium, loop diuretic if severe 3% hypertonic saline if seizure or coma	Limit total rise to 8 mmol/L in 24 h (0.25 mmol/L/h maximum) as patients are at risk of osmotic demyelinating syndrome (ODS)
<b>Hyperkalemia</b>	Rhabdomyolysis, insulin deficiency, metabolic acidosis (e.g. acute renal failure, missed dialysis), medications (e.g. K <sup>+</sup> -sparing diuretics, ACEI, NSAIDs)	Nausea, palpitations, dysrhythmias, muscle stiffness, areflexia	Protect heart: calcium gluconate Shift K <sup>+</sup> into cells: D50W + insulin, NaHCO <sub>3</sub> , salbutamol Remove K <sup>+</sup> : fluids + furosemide, dialysis	High-risk of dysrhythmia - ECG: peaked/narrow T wave, decreased P wave, prolonged PR interval, widening of QRS, sine wave, AV block, VFib, bradycardia
<b>Hypokalemia</b>	Metabolic alkalosis (e.g. diarrhea), insulin, diuretics (except K <sup>+</sup> -sparing), anorexia, salbutamol	N/V, fatigue, muscle cramps, constipation, dysrhythmias	K-Dur <sup>®</sup> , K <sup>+</sup> -sparing diuretics, IV solutions with 20-40 mEq/L KCl over 3-4 h	ECG: U waves most important, flattened/inverted T waves, prolonged QT, depressed ST May need to restore Mg <sup>2+</sup>
<b>Hypercalcemia</b>	Hyperparathyroidism and malignancy account for ~90% of cases, medications (e.g. thiazide diuretics, lithium)	Multisystem including CVS, GI (groans), renal (stones), rheumatological, MSK (bones), psychiatric (moans)	Isotonic saline (+ furosemide if hypervolemic) Bisphosphonates, dialysis, chelation (Ethylene diamine tetraacetic acid (EDTA) or oral PO <sub>4</sub> <sup>3-</sup> )	Patients with more severe or symptomatic hypercalcemia are usually dehydrated and require saline hydration as initial therapy
<b>Hypocalcemia</b>	Iatrogenic, hypoalbuminemia, liver dysfunction, primary hypo-parathyroid hormone	Laryngospasm, hyperreflexia, paresthesia, tetany, Chvostek's and Trousseau's sign	Acute (ionized Ca <sup>2+</sup> < 0.7 mM) requires immediate treatment: IV calcium gluconate 1-2 g in 10-20 min followed by slow infusion	Prolonged QT interval can arise (leading to dysrhythmia as can upper airway obstruction)

## Hypertensive Emergencies

### Hypertensive Emergency (Hypertensive Crisis)

- definition: severe elevation of BP with evidence of end-organ damage (CNS, retinal, CVS, renal, GI)
- etiology
  - essential HTN, emotional exertion, pain, use of sympathomimetic drugs (cocaine, amphetamine, etc.), MAOI use with ingestion of tyramine-containing food (cheese, red wine, etc.), pheochromocytoma, pregnancy
- clinical features

**Table 21. Signs and Symptoms of Hypertensive Emergencies**

	CNS	Retinal	Renal	Cardiovascular	Gastrointestinal
<b>Complication</b>	Stroke/TIA, headache, altered mental status, seizures, hemorrhage	Vision change, hemorrhage, exudates, papilledema	Nocturia, elevated Cr, proteinuria, hematuria, oliguria	Ischaemia/angina, infarction, dissection (back pain), CHF	N/V, abdominal pain, elevated liver enzymes

- investigations
  - blood work: CBC, electrolytes, BUN, Cr
  - urinalysis
  - peripheral blood smear: to detect microangiopathic hemolytic anemia
  - CXR: if SOB or chest pain
  - ECG, troponins, creatine kinase (CK): if chest pain
  - CT head: if neurological findings or severe headache
    - toxicology screen if sympathomimetic overdose suspected (not needed if patient admits to taking it)
- management
  - in general, strategy is to gradually and progressively reduce BP in 24-48 h
  - lower BP by 25% over the initial 60 min by initiating antihypertensive therapy (usually nitroprusside and labetalol)
  - if preeclampsia, immediately consult obstetrician-gynaecologist (OB/GYN) (see [Obstetrics, OB26](#))
  - establish arterial line; transfer to ICU for further reduction in BP under monitored setting
  - in case of ischaemic stroke: do not rapidly reduce BP, maintain BP >150/100 for 5 d
  - in case of aortic dissection: rapid reduction of sBP to 110-120 STAT (do not resuscitate with IV fluids)
  - in case of excessive catecholamines: avoid  $\beta$ -blockers (except labetalol)
  - in case of ACS: address ischaemia initially, then BP

**HELLP Syndrome** (seen only in preeclampsia/eclampsia)

Hemolytic anemia  
Elevated Liver enzymes  
Low Platelet count

**Catecholamine-Induced Hypertensive Emergencies**

Avoid use of non-selective  $\beta$ -blockers as they inhibit  $\beta$ -mediated vasodilation and leave  $\alpha$ -adrenergic vasoconstriction unopposed

Table 22. Commonly Used Agents for the Treatment of Hypertensive Crisis

Drug	Dosage	Onset of Action	Duration of Action	Adverse Effects*	Special Indications
<b>VASODILATORS</b>					
<b>Sodium Nitroprusside (vascular smooth muscle dilator)</b> 1st line	0.25-10 µg/kg/min	Immediate	3-5 min	N/V, muscle twitching, sweating, cyanide intoxication, coronary steal syndrome	Most hypertensive emergencies (especially CHF, aortic dissection) Use in combination with β-blockers (e.g. esmolol) in aortic dissection Caution with high ICP and azotemia
<b>Nicardipine (calcium channel blocker)</b>	5 mg/h IV, then increase by 2.5 mg/h q5-10min (max 15 mg/h)	15-30 min	40 min	Tachycardia, headache, flushing, local phlebitis (e.g. encephalopathy, renal failure, eclampsia, sympathetic crisis)	Most hypertensive emergencies Caution with acute CHF
<b>Nitroglycerin</b>	5-20 µg/min IV	1-2 min	3-5 min	Hypotension, bradycardia, headache, lightheadedness, dizziness	MI, pulmonary edema
<b>Hydralazine</b>	5-10 mg IV/IM q20 min (max 20 mg)	5-20 min	2-6 h	Dizziness, drowsiness, headache, tachycardia, Na <sup>+</sup> -retention	Eclampsia
<b>ADRENERGIC INHIBITORS</b>					
<b>Labetalol</b>	20 mg IV bolus q10 min or 0.5-2 mg/min	5-10 min	3-6 h	Vomiting, scalp tingling, burning in throat, dizziness, nausea, heart block, orthostatic hypotension	Usually first choice Most hypertensive emergencies (especially eclampsia) Avoid in acute CHF, heart block >1st degree
<b>Esmolol</b>	250-500 µg/kg/min 1 min, then 50 µg/kg/min for 4 min; repeat	1-2 min	10-20 min	Hypotension, nausea, bronchospasm	Aortic dissection, acute MI supraventricular tachycardia (SVT) dysrhythmias, perioperative HTN Avoid in acute CHF, heart block >1st degree
<b>Phentolamine</b>	5-15 mg q5-15 min	1-2 min	3-10 min	Tachycardia, headache, flushing	Catecholamine excess (e.g. pheochromocytoma, unopposed alpha - e.g. cocaine)

\*Hypotension may occur when using any of these agents

With CNS manifestations of severe HTN, it is often difficult to differentiate causal relationships (i.e. HTN could be secondary to a cerebral event with an associated Cushing reflex)

## Acute Coronary Syndrome

- see [Cardiology and Cardiac Surgery, C32](#)
- definition: new onset of chest pain (cardiac type), or acute worsening of previous chest pain (cardiac type), or chest pain (cardiac type) at rest with:
  - negative cardiac biomarkers and no ECG changes = unstable angina (UA)
  - positive cardiac biomarkers (elevated troponin), NSTEMI on ECG, ± other changes (NSTEMI)
  - positive cardiac biomarkers (elevated troponin) and STEMI on ECG
- investigations
  - ECG STAT (as soon as history suggests possible ACS), serial troponins (2-6 h after symptom onset), CXR (to rule out other causes of the patient's presentation)
- management
  - stabilize: ABCs, oxygen, IV access, cardiac monitors, oximetry
  - ASA 162-325 mg chewed and swallowed
  - nitroglycerin 0.3 mg SL q5 min x 3; IV only if persistent pain, CHF, or hypertensive
    - contraindications: hypotension, phosphodiesterase inhibitor use, right ventricular infarctions (1/3 of all inferior MIs, as these MIs are preload-dependent)
    - symptom relief only, no mortality benefit
  - anticoagulation: choice of anticoagulation (unfractionated heparin, LMWH, or fondaparinux) and additional antiplatelet therapy (clopidogrel, ticagrelor, or prasugrel) depends on STEMI vs. NSTEMI and reperfusion strategy
  - early cardiology consult for reperfusion therapy
    - UA/NSTEMI: early coronary angiography recommended if high thrombolysis in MI (TIMI) risk score
    - STEMI: primary percutaneous coronary intervention (PCI) (within 90 min) preferred; thrombolytics if PCI unavailable within 120 min of medical contact, symptoms <12 h and no contraindications

## Sepsis

- see [Infectious Diseases](#), ID20 and [Respirology](#), R32
- definitions
  - overall, sepsis can be thought of as a life-threatening organ dysfunction caused by a dysregulated host response to infection; however, definitions exist on a spectrum, as outlined below
  - systemic inflammatory response syndrome (SIRS): two or more of T >38°C or <36°C, HR >90, RR >20, WBC >12
  - sepsis: SIRS and suspected or present source of infection
  - septic shock: sepsis and either initial lactate >4 or hypotension
  - qSOFA score ≥2: high risk for in-hospital mortality (see [Infectious Diseases](#), ID20)
  - although the presence of a positive qSOFA should alert clinicians to the possibility of sepsis in all resource settings, it should not be used as a single screening tool given its poor sensitivity.
- management
  - early recognition of sepsis and investigations to locate source of infection
  - identify severe sepsis with lactate or evidence of tissue hypoperfusion
  - sepsis standard operating procedures, initially specified as Early Goal Directed Therapy have evolved to “usual care” which includes a standard approach with components of the sepsis bundle, early identification, lactate, cultures, antibiotics, and fluids
  - treatment priorities:
    - ABCs, monitors, lines
    - aggressive fluid resuscitation; consider ventilatory and inotropic support
    - cultures, then early empiric appropriate antibiotics - consider broad spectrum and atypical coverage
    - source control - e.g. remove infected Foley or surgery for ischaemic gut
    - monitor adequate resuscitation with vital signs, inferior vena cava on U/S, and serial measurement of serum lactate
    - in patients presenting with septic shock, goal-directed therapy and aggressive management should not be delayed while waiting for lab values
    - patients failing initial therapy should be resuscitated more aggressively (e.g. use of vasopressors, glucocorticoids, inotropic therapy, blood transfusion, etc.)

### Surviving Sepsis Campaign 1 Hour Bundle

- J Intensive Care Med 2018;44:925-928  
 Update sepsis bundle from 3 to 1 h time frame with time zero being time of triage in the ED
- Actions include:
- Measure lactate level. Remeasure if initial lactate is >2 mmol/L
  - Obtain blood cultures prior to administration of antibiotics
  - Administer broad spectrum antibiotics
  - Begin rapid administration of 30 mL/kg crystalloid for hypotension or lactate >4 mmol/L
  - Apply vasopressors if the patient is hypotensive during or after fluid resuscitation to maintain MAP >65 mmHg

## Stroke and Transient Ischaemic Attack

- see [Neurology](#), N51
- definitions
  - stroke: sudden loss of brain function due to ischaemia (87%) or hemorrhage (13%) with persistence of symptoms >24 h or neuroimaging evidence
  - TIA: transient episode of neurologic dysfunction from focal ischaemia without acute infarction or neuroimaging evidence
- clinical features

Table 23. Signs and Symptoms of Stroke

	General	Language/Throat	Vision	Coordination	Motor	Sensation	Reflex
Signs/Symptoms	Decreased LOC, changed mental status, confusion, neglect	Dysarthria, aphasia, swallowing difficulty	Diplopia, eye deviation, asymmetric pupils, visual field defect	Ataxia, intention tremor, lack of coordination	Increased tone, loss of power, spasticity	Loss of sensation	Hyper-reflexia, clonus

- patients with hemorrhagic stroke resulting in subarachnoid hemorrhage can present with sudden onset thunderclap headache that is usually described as “worst headache of life” and can often recall the exact moment their headache started
- stroke mimickers: seizure, Todd’s paresis (period of partial or complete paralysis following a seizure), migraine, hypoglycemia, peripheral nerve injury, Bell’s palsy, tumour, syncope, somatic symptom disorder

Table 24. Stroke Syndromes

Region of Stroke	Stroke Syndrome
Anterior Cerebral Artery	Contralateral hemianesthesia and hemiparesis (legs > arms/face), gait apraxia, altered mental status, impaired judgement
Middle Cerebral Artery	Contralateral hemianesthesia and hemiparesis (arms/face > legs), contralateral homonymous hemianopsia, ipsilateral gaze
Posterior Cerebral Artery	Contralateral homonymous hemianopsia, cortical blindness, impaired memory
Vertebrobasilar Artery	Wide variety of cranial nerve, cerebellar, and brainstem deficits: vertigo, nystagmus, diplopia, visual field deficits, dysphagia, dysarthria, facial hypoesthesia, syncope, ataxia Loss of pain and temperature sensation in ipsilateral face and contralateral body

### Seven Causes of Emboli from the Heart

- AFib
- MI
- Endocarditis
- Valvular disease
- Dilated cardiomyopathy
- Left heart myxoma
- Prosthetic valves

### Differentiation of Upper Motor Neuron (UMN) Disease vs. Lower Motor Neuron (LMN) Disease

Category	UMN Disease	LMN Disease
Muscular deficit	Muscle groups	Individual muscles
Reflexes	Increased	Decreased/absent
Tone	Increased	Decreased
Fasciculations	Absent	Present
Atrophy	Absent/minimal	Present
Plantar Response	Upgoing	Downgoing

### Investigations

- CBC, electrolytes, blood glucose, coagulation studies ± cardiac biomarkers ± toxicology screen
- CT angiography and perfusion of the head and neck
- ECG: rule out AFib, acute MI as source of emboli
- other imaging: if you are suspicious of a TIA a plain CT followed by carotid Doppler, outpatient CT angiography neck and/or head, magnetic resonance angiography (MRA) can be arranged based on local resources

### Management

- ABCs; intubation with RSI if GCS ≤8, rapidly decreasing GCS, or inadequate airway protective reflexes
- thrombolysis (rt-PA, e.g. alteplase): immediate assessment for eligibility; need acute onset, <4.5 h from last seen normal AND compatible physical findings AND no evidence of hemorrhage on CT scan
  - thrombectomy: may be an option in some centres as an alternative to thrombolysis in the first 4.5 to 6 hours, and in some instances up to 24 hours after symptom onset or last seen normal
- dual antiplatelet therapy for 21 days
  - this should be initiated for high risk TIA in the ED.
- elevating head of bed if suspicious of increased ICP, aspiration, or worsening cardiopulmonary status
- NPO, IV ± cardiac monitoring
  - judge fluid rate carefully to avoid overhydration (cerebral edema) as well as underhydration (underperfusion of the ischaemic penumbra)
- BP control: only treat severe HTN (sBP >200 mmHg, dBP >120 mmHg, MAP >140 mmHg) or HTN associated with hemorrhagic stroke transformation, cardiac ischaemia, aortic dissection, or renal damage; use IV nitroprusside or labetalol
- glycemic control serum glucose of 7.8 - 10 mmol/L
- cerebral edema control: hyperventilation, mannitol to decrease ICP if necessary
- consult neurosurgery, neurology, medicine as indicated
- following acute event:
  - antiplatelet agents to: prevent recurrent stroke or stroke after TIAs, e.g. Aspirin® (1st line); clopidogrel, Aggrenox® (2nd line)
  - consider anticoagulation: if Afib present or if immobile for DVT prophylaxis
  - follow-up for consideration of carotid endarterectomy, cardiovascular risk optimization

If a patient presents within 4.5 h of onset of disabling neurological deficits >60 min with no signs of resolution, they may be a candidate for thrombolysis. Do brief assessment and order CT head STAT

#### Absolute Exclusion Criteria for Tissue Plasminogen Activator (tPA)

- Suspected subarachnoid hemorrhage
- Previous intracranial hemorrhage
- Cerebral infarct or severe HI within the past 3 mo
- sBP >185 mmHg, or dBP >110 mmHg
- Bleeding diathesis
- Prolonged PT >15 s or INR >1.7
- Platelet count <100000
- Heparin received within last 48 h
- Current use of thrombin inhibitors or direct factor Xa inhibitors
- Blood glucose <2.8 mmol/L (<50 mg/dL)
- Intracranial hemorrhage on CT or large volume infarct

#### Relative Exclusion Criteria for tPA

- Only minor or rapidly improving symptoms
- Pregnancy
- GI or urinary hemorrhage within the past 21 d
- Seizure at onset causing postictal impairments

## Otolaryngological Presentations and Emergencies

- ear symptoms: otalgia, aural fullness, otorrhea, hearing loss, tinnitus, vertigo, pruritus, fever
- risk factors for hearing loss: Q-tip use, hearing aids, headphones, occupational noise exposure

### Dizziness and Vertigo

- distinguish four types of dizziness: vertigo ("room spinning"), lightheadedness ("disconnected from environment"), presyncope ("almost blacking out"), dysequilibrium ("unstable," "off-balance")
- broad differential and diverse management (see [Family Medicine, FM28](#) and [Otolaryngology, O16](#))
- rule out stroke
- consider adverse drug events

### Otalgia (see [Otolaryngology, O16](#))

- differential diagnosis
  - infections: acute otitis externa, acute otitis media, otitis media with effusion, mastoiditis, myringitis, malignant otitis externa in patients with diabetes, herpes simplex/zoster, auricular cellulitis, external canal abscess, dental disease
  - others: trauma, temporomandibular joint dysfunction, neoplasm, foreign body, cerumen impactions, trigeminal neuralgia, granulomatosis with polyangiitis
- inspect for otorrhea, palpate outer ear/mastoid, otoscopic examination to look for bulging erythematous tympanic membrane, perforation, membrane retraction, infiltration, vesicles, ulcers, masses, lesions
- C&S of ear canal discharge, if present
- CT head if suspicion of mastoiditis, malignant otitis externa
- antibiotics/antifungals/antivirals for respective infections

### Hearing Loss (see [Otolaryngology, O19](#))

- differentiate conductive vs. sensorineural hearing loss
- rule out sudden sensorineural hearing loss (SSNHL), a medical emergency requiring high dose steroids and urgent referral
- an elderly patient presenting with unilateral tinnitus or SSNHL must be presumed to have an acoustic neuroma (vestibular schwannoma) until proven otherwise
- consider audiogram and referral to or follow-up with family physician

## Epistaxis

- see [Otolaryngology](#), OT27
- 90% of nosebleeds stem from the anterior nasal septum (Kiesselbach's plexus located in Little's area)
- can be life-threatening

### Etiology

- most cases of epistaxis are caused by trauma (e.g. digital, blunt, foreign bodies)
- other causes: barometric changes, nasal dryness, chemicals (e.g. cocaine, Otrivin<sup>®</sup>), or systemic disease (e.g. coagulopathies, HTN)

### Investigations

- blood work: CBC, PT/PTT/INR/platelet function assay (if suspicious of bleeding disorder)
- imaging: x-ray, CT as needed (e.g. trauma)

### Treatment

- goals of treatment: localize bleeding and achieve haemostasis
- first-aid: ABCs, clear clots by blowing nose or suctioning, lean forward, pinch cartilaginous portion of nose for 20 min twice (note: best to use a compression device and not the patient's fingers)
- assess blood loss: vitals; if severe bleeding or unstable patient IV NS, cross match 2 units pRBC
- if first aid measures fail twice, proceed to packing
- apply an anterior pack
  - clear nose of any clots
  - apply topical anesthesia vasoconstrictors (lidocaine with epinephrine, cocaine, or soaked pledgets)
  - insert either a traditional Vaseline<sup>®</sup> gauze pack or a commercial nasal tampon or balloon
  - N.B. if the site of bleeding is identified, cautery with silver nitrate can be performed as an alternative to packing (only cauterize one side of the septum because if both are cauterized this can lead to septal perforation)
  - if bleeding stops, arrange follow-up in 48-72 h for reassessment and pack removal
  - if packing both nares, prophylactic anti-staphylococcal antibiotics to prevent sinusitis or TSS
- if suspect posterior bleed or anterior packing does not provide haemostasis, consult ENT for posterior packing and further evaluation
  - though posterior packing may be placed by an ED physician, it requires monitoring; can cause significant vagal response and posterior bleeding source can lead to significant blood loss, therefore usually requires admission

### Disposition

- discharge: discharged upon stabilization and appropriate follow-up; educate patients about prevention (e.g. topical vaseline, humidifiers, saline spray, avoiding irritants, managing HTN)
- admission: severe cases of refractory bleeding, and most cases of posterior packing

Thrombocytopenic patients – use resorbable packs to avoid risk of re-bleeding caused by pulling out the removable pack

### Complications of Nasal Packing

- Hypoxemia
- TSS
- Aspiration
- Pharyngeal fibrosis/stenosis
- Alar/septal necrosis

### Tranexamic Acid For Patients with Nasal Haemorrhage (Epistaxis)

Cochrane DB Syst Rev 2018:CD004328

**Purpose:** Determine the effects of tranexamic acid compared to placebo, no additional intervention or any other haemostatic agent in the management of patients with epistaxis.

**Methods:** Systematic review of RCTs comparing tranexamic acid, in addition to standard care, compared to usual care plus placebo in adults and children.

**Results:** 6 RCTs, 692 participants. Oral (RR 0.73, 95% CI 0.55-0.96) and topical (RR 0.66, 95% CI 0.41-1.05) reduced risk of re-bleeding compared to placebo. There was no difference in time to stop initial bleeding. The proportion of patients whose bleeding stopped within 10 min was higher with topical tranexamic acid than other haemostatic agents (RR 2.35, 95% CI 1.90-2.92).

**Conclusions:** Moderate-quality evidence that risk of re-bleeding with oral or topical tranexamic acid, in addition to usual care, is lower in adult patients with epistaxis, compared to placebo with usual care. Further, topical tranexamic acid is probably better than other topical agents in stopping bleeding in the first 10 min.

## Gynaecologic/Urologic Emergencies

### Vaginal Bleeding

- see [Gynaecology](#), GY20 and [Obstetrics](#), OBI4

### Etiology

- pregnant patient
  - 1st/2nd trimester: ectopic pregnancy, abortion (threatened, incomplete, complete, missed, inevitable, septic), molar pregnancy, implantation bleeding, friable cervix (most common cause), subchorionic hemorrhage
  - 2nd/3rd trimester: placenta previa, placental abruption, premature rupture of membranes, preterm labour
  - other: trauma, bleeding cervical polyp, passing of mucous plug, incompetent cervix
- postpartum
  - postpartum hemorrhage, uterine inversion, retained placental tissue, endometritis
- non-pregnant patients
  - structural (PALM- polyps, adenomyosis, leiomyoma, malignancies/hyperplasia)
  - non-structural (COEIN - coagulopathy, ovulatory, endometrial, iatrogenic, not yet diagnosed)

### History

- characterize bleeding (frequency, duration, number of pads/tampons, types of pads used, cyclicality)
- pain, if present (OPQRSTUV)
- menstrual history, sexual history, STI history, syncope/presyncope, malignancy history, family history, hematological history, cardiac history, abdominal history
- details of pregnancy, including gush of fluid and fetal movement (>20 wk)

**Physical Exam**

- ABCs (especially noting postural BP/HR and mucous membranes)
- abdominal examination (signs of peritoneal pathology, tenderness, distension, mass)
- speculum examination (NOT if 2nd/3rd trimester bleeding as may worsen bleeding; perform only if placenta previa has been ruled out with U/S)
  - look for active bleeding, trauma/anomaly, and cervical dilatation
- bimanual examination (NOT if 2nd/3rd trimester bleeding as may worsen bleeding; perform only if placenta previa has been ruled out with U/S)
  - cervical motion tenderness, size of uterus, cervical length/dilatation
- sterile gloves and speculum if pregnant and beyond the first trimester
- POCUS: rule in intra-uterine pregnancy, check for free fluid in pelvis/right upper quadrant (RUQ)/left upper quadrant (LUQ), consider assessment of fluid responsiveness (intra-hepatic IVC collapsibility, carotid flow measurement)

**Investigations**

- $\beta$ -hCG test for all patients with childbearing potential
- CBC, blood and Rh type, quantitative  $\beta$ -hCG, PTT, INR
- type & cross if significant blood loss
- transvaginal U/S (rule out ectopic pregnancy and spontaneous abortion)
- abdominal U/S (rule out placenta previa, fetal demise, or retained products postpartum)

**Management**

- ABCs
- pulse oximeter and cardiac monitors if unstable
- Rh immune globulin (Rhogam<sup>®</sup>) for vaginal bleeding in pregnancy and Rh-negative mother
- 1st/2nd trimester pregnancy
  - ectopic pregnancy: definitive treatment with surgery or methotrexate
  - intrauterine pregnancy, no concerns of coexistent ectopic: discharge patient with obstetrics follow-up
  - U/S indeterminate or  $\beta$ -hCG >1000-2000 IU: further workup and/or gynaecology consult
  - abortions: if complete, discharge if stable; for all others, consult gynaecology
- 2nd/3rd trimester pregnancy
  - placenta previa or placental abruption: obstetrics consult for possible admission
- postpartum
  - manage ABCs: start 2 large bore IV rapid infusion, type & cross 4 units of blood, consult OB/GYN immediately
- non-pregnant
  - if unstable admit to gynaecology for IV hormonal therapy, possible dilation and curettage
  - non-structural abnormalities
    - ♦ tranexamic acid to stabilize clots
    - ♦ medroxyprogesterone acetate 10 mg PO once daily x10 d, warn patient of a withdrawal bleed
  - stable structural abnormalities (fibroids, polyps, endometrial thickening, adenomyosis), outpatient gynaecology referral once stable

**Disposition**

- decision to admit or discharge should be based on the stability of the patient, as well as the nature of the underlying cause; consult OB/GYN for patients requiring admission
- if patient can be safely discharged, ensure follow-up with family physician or OB/GYN
- instruct patient to return to ED for increased bleeding or presyncope

**Pregnant Patient in the ED**

Table 25. Complications of Pregnancy

Trimester	Fetal	Maternal
First 1-12 wk	Pregnancy failure Spontaneous abortion Fetal demise Gestational trophoblastic disease	Ectopic pregnancy Anemia Hyperemesis gravidarum UTI/pyelonephritis
Second 13-27 wk	Disorders of fetal growth Intrauterine growth restriction Oligo/polyhydramnios	Gestational DM Rh incompatibility UTI/pyelonephritis Cervical incompetence
Third 28-41 wk	Vasa previa	Preterm labour/preterm premature rupture of the membranes Preeclampsia (hypertension in pregnancy)/eclampsia Placenta previa Placental abruption Uterine rupture DVT/PE

Vaginal bleeding can be life-threatening. Always start with ABCs and ensure your patient is stable

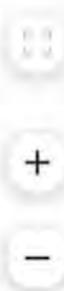

Need  $\beta$ -hCG  $\geq 1200$  to see intrauterine changes on transvaginal U/S

An ectopic pregnancy can be ruled out by confirming an intrauterine pregnancy by bedside U/S unless the patient is using *in vitro* fertilization (IVF) due to the associated high-risk of heterotopic pregnancy

Vaginal bleeding (and its underlying causes) can be a very distressing event for patients; ensure appropriate support is provided

## Nephrolithiasis (Renal Colic)

- see [Urology](#), U18

### Epidemiology and Risk Factors

- 10% of population (twice as common in males)
- recurrence 50% at 5 yr
- peak incidence 30-50 yr
- 75% of stones <4 mm pass spontaneously within 2 wk, larger stones may require consultation

### Clinical Features

- urinary obstruction → upstream distention of ureter or collecting system → severe colicky pain
- may complain of pain at flank, groin, testes, or tip of penis
- writhing, N/V, hematuria (90% microscopic), diaphoresis, tachycardia, tachypnea
- occasionally symptoms of trigonal irritation (frequency, urgency)
- fever, chills, rigors in secondary pyelonephritis
- peritoneal findings/anterior abdominal tenderness usually absent

### Differential Diagnosis of Renal Colic

- acute ureteric obstruction
- acute abdomen: biliary, bowel, pancreas, AAA
- urogynaecological: ectopic pregnancy, torsion/rupture of ovarian cyst, testicular torsion
- pyelonephritis (fever, chills, pyuria, vomiting)
- radiculitis (L1): herpes zoster, nerve root compression

### Investigations

- CBC: elevated WBC in presence of fever may support an infectious cause
- electrolytes, Cr, BUN to assess renal function
- U/A: routine and microscopy (WBCs, RBCs, crystals), C&S
- non-contrast CT is the study of choice
- consider abdominal U/S in females of childbearing age, children, or if patient has another contraindication to CT scanning: may demonstrate stone(s), hydronephrosis, debris in the collecting system, reduced cortical vascularity, abnormal renal parenchyma
- AXR will identify large radiopaque stones (calcium, struvite, and cystine stones) but may miss smaller stones, uric acid stones, or stones overlying bony structures; consider as an initial investigation in patients who have a history of radiopaque stones and similar episodes of acute flank pain (CT necessary if film is negative)

### Management

- analgesics: NSAIDs (usually ketorolac (Toradol<sup>®</sup>), preferable over opioids), antiemetics, IV fluids if indicated
- urology consult indicated, especially if stone >5 mm, or if patient has signs of obstruction leading to renal dysfunction or infection
- α-blocker (e.g. tamsulosin) may be helpful to increase stone passage in select cases

### Disposition

- most patients can be discharged
- ensure patient is stable, has adequate analgesia, and able to tolerate oral medications
- may advise hydration and limitation of protein, sodium, oxalate, and alcohol intake

#### Kidney Stones

- 80% calcium oxalate
- 10% struvite
- 10% uric acid

**Obstruction + Infection**  
= Urological Emergency  
Urgent urology consult

#### Indications for Admission to Hospital

- Intractable pain
- Fever (suggests infection) or other evidence of pyelonephritis
- Single kidney with ureteral obstruction
- Bilateral obstructing stones
- Intractable vomiting
- Compromised renal function

## Ophthalmologic Emergencies

- see [Ophthalmology](#), OP5

### History and Physical Exam

- patient may complain of pain, tearing, itching, redness, photophobia, foreign body sensation, trauma
- mechanism of foreign body insertion – if high velocity injury suspected (welding, metal grinding, metal striking metal), must obtain orbital x-rays, U/S, or CT scan to exclude presence of intraocular metallic foreign body
- ask about sexual partners and exposure of eye(s) to bodily fluids (semen, urine, blood, vaginal fluids, saliva, etc.)
- visual acuity in both eyes, pupils, extraocular structures, extraocular movements, fundoscopy, tonometry, slit lamp exam, visual fields

### Management of Ophthalmologic Foreign Body

- copious irrigation with saline for any foreign body
- remove foreign body under slit lamp exam with cotton swab, sterile needle, or electric burr tool
- antibiotic drops if indicated (e.g. organic foreign body)
- patching may not improve healing or comfort – do not patch contact lens wearers
- limit use of topical anesthetic to examination only

- tetanus prophylaxis
- ophthalmology consult if globe penetration suspected

**Table 26. Differential Diagnosis of Red Eye in the Emergency Department**

Symptom	Possible Serious Etiology
Light Sensitivity	Iritis, keratitis, abrasion, ulcer
Unilateral	Above + herpes simplex, acute angle closure glaucoma
Significant Pain	Above + scleritis
White Spot on Cornea	Corneal ulcer
Non-Reactive Pupil	Acute glaucoma, iritis
Copious Discharge	Gonococcal conjunctivitis
Blurred Vision	All of the above

**Table 27. Select Ophthalmologic Emergencies**

Condition	Signs and Symptoms	Management
<b>Acute Angle Closure Glaucoma</b>	Unilateral red, painful eye Decreased visual acuity, halos around lights Fixed, mid-dilated pupil N/V Marked increase in intraocular pressure (IOP) (~40 mmHg) Shallow anterior chamber ± cells	Ophthalmology consult for laser iridotomy Medications: AABCDE/EAT PAL α-agonist: epinephrine α2-agonist: apraclonidine β-blocker: timolol Cholinomimetic: pilocarpine Diuretic: acetazolamide, mannitol Eicosanoid:latanoprost
<b>Corneal Abrasion</b>	Pain, redness, tearing, photophobia, foreign body sensation De-epithelialized area stains with fluorescein dye	Most clear spontaneously within 24-48 h If due to foreign body, remove under magnification using local anesthetic and sterile needle, or consult ophthalmology for removal under magnification Topical antibiotic (drops or ointment)
<b>Chemical Burn</b>	Known exposure to acids or alkali (worse) Pain, decreased visual acuity Vascularization or defects of cornea Iris and lens damage	Irrigate site of accident with NS with eyelid retracted until neutral pH achieved Sweep fornices Cycloplegic drops and topical antibiotics
<b>Orbital Cellulitis</b>	Red, painful eye, decreased visual acuity Headache, fever Lid erythema, edema, and difficulty opening eye Conjunctival injection and chemosis Proptosis, ophthalmoplegia ± RAPD	Admission, ophthalmology consult Blood cultures, orbital CT IV antibiotics (ceftriaxone + vancomycin) Drainage of abscess
<b>Retinal Artery Occlusion</b>	Sudden, painless, monocular vision loss RAPD Cherry red spot and retinal pallor on fundoscopy if central retinal artery occlusion	Restore blood flow <2 h Massage globe Decrease IOP (topical β-blockers, inhaled O <sub>2</sub> /CO <sub>2</sub> mix, IV Diamox <sup>®</sup> , IV mannitol, drain aqueous fluid)
<b>Retinal Vein Occlusion</b>	Painless, monocular, gradual, or sudden vision loss ±RAPD On fundoscopy: "blood and thunder" appearance, diffuse retinal hemorrhages, cotton wool spots, venous engorgement, swollen optic disc, macular edema	Ophthalmology consult for retinal laser photocoagulation, anti-VEGF, and/or corticosteroid injection
<b>Retinal Detachment</b>	Flashes of light, floaters, and curtains of blackness/peripheral vision loss Painless Loss of red reflex, decreased IOP Detached areas are grey Visible detachment orbital POCUS ± RAPD	Ophthalmology consult for scleral buckle/pneumatic retinopexy

**Contraindications to Pupil Dilation**

- Shallow anterior chamber
- Iris-supported lens implant
- Potential neurological abnormality requiring pupillary evaluation
- Caution with CV disease – mydriatics can cause tachycardia

**Other Ophthalmologic Emergencies**  
**Infectious:** Red eye, endophthalmitis, hypopyon**Trauma:** Globe rupture, orbital blow-out fractures, corneal injuries, eyelid laceration, hyphema, lens dislocation, retrobulbar hemorrhage**Painful vision loss:** Acute iritis, corneal abrasion, globe rupture, lens dislocation, retrobulbar hemorrhage, optic neuritis, temporal arteritis, endophthalmitis, keratitis**Painless vision loss:** Central retinal vein occlusion, amaurosis fugax, occipital stroke**POCUS for the Diagnosis of Retinal Detachment: A Systematic Review and Meta-Analysis**

Acad Emerg Med 2019;26:931-939

**Purpose:** POCUS has been suggested to identify retinal detachment rapidly. The primary outcome for this review was to determine the test characteristics of POCUS for the diagnosis of retinal detachment.**Methods:** Systematic review and meta-analysis looking for all prospective trials and RCTs assessing the accuracy of POCUS for identifying retinal detachment.**Results:** 11 studies (n = 844) were identified. Overall, ultrasound was 94.2% (95% CI 78.4% to 98.6%) sensitive and 96.3% (95% CI 89.2% to 98.8%) specific for the diagnosis of retinal detachment with a positive likelihood ratio of 25.2 (95% CI 8.1 to 78.0) and a negative likelihood ratio of 0.06 (95% CI = 0.01 to 0.25).**Conclusions:** POCUS is sensitive and specific for the diagnosis of retinal detachment.

Visual acuity is the "vital sign" of the eyes and should ALWAYS be assessed and documented in both eyes when a patient presents to the ED with an ophthalmologic complaint

## Dermatologic Emergencies

### Rash Characteristics

#### A. Diffuse Rashes

- Staphylococcal Scalded Skin Syndrome (SSSS)
  - caused by an exotoxin from infecting strain of coagulase-positive *S. aureus*
  - mostly occurs in children
  - prodrome: fever, irritability, malaise, and skin tenderness
  - sudden onset of diffuse erythema: skin is red, warm, and very tender
  - flaccid bullae that are difficult to see, then desquamate in large sheets
- Steven-Johnson Syndrome (SJS) and Toxic Epidermal Necrolysis (TEN)
  - see [Dermatology, D26](#)
  - caused by drugs (e.g. phenytoin, sulfas, penicillins, and NSAIDs), bone marrow transplantation, and blood product transfusions
  - usually occurs in adults
  - diffuse erythema followed by necrosis
  - severe mucous membrane blistering

- entire epidermis desquamation
- high mortality (>50%)
- Toxic Shock Syndrome (TSS)
  - see [Infectious Diseases](#), ID22
  - caused by superantigen from *S. aureus* or Group A *Streptococcus* (GAS) activating T-cells and cytokines
  - patient often presents with onset of shock and multi-organ failure, fever
  - diffuse erythematous macular rash
  - at least 3 organ systems involved: CNS, respiratory, GI, muscular, mucous membranes, renal, liver, hematologic, and skin (necrotizing fasciitis, gangrene)
  - vesiculobullous lesions
- Erythema Multiforme (EM)
  - immunologic reaction to herpes simplex
  - viral prodrome 1-14 d before rash
  - target lesion: central grey bulla or wheal surrounded by concentric rings of erythema and normal skin
  - Drug reaction with eosinophilia and systemic symptoms (DRESS) syndrome

### B. Discrete Lesions

- Pyoderma Gangrenosum
  - often associated with IBD, rheumatoid conditions, leukemia, and monoclonal gammopathies
  - often occurs in arms, hands, feet, or perineal region
  - usually begins as painless macule/vesicle/pustule/bulla on red/blue base sloughing, leaving a gangrenous ulcer
- Disseminated Gonococcal Infection (DGI)
  - see [Dermatology](#), D38
  - fever, skin lesions (pustules/vesicles on erythematous base ~5 mm in diameter), arthritis (joint swelling and tenderness), and septic arthritis (in larger joints, such as knees, ankles, and elbows)
  - most commonly in gonococcus-positive women during menstruation or pregnancy
  - skin lesions usually appear in extremities and resolve quickly (<7 d)
- Meningococemia
  - flu-like symptoms of headache, myalgia, N/V
  - petechial, macular, or maculopapular lesions with grey vesicular centres
  - usually a few millimeters in size, but may become confluent and hemorrhagic
  - usually appear in extremities, but may appear anywhere
  - look for signs of meningeal irritation: positive jolt accentuation test, Brudzinski, Kernig

### History and Physical Exam

- determine onset, course, and location of skin lesions
- fever, joint pain
- associated symptoms: CNS, respiratory, GU, GI, renal, liver, mucous membranes
- medications, sexual encounters, living environment, occupational exposures
- vitals, physical exam based on relevant history

### Investigations

- case-dependent, consider: CBC, electrolytes, Cr, AST, ALT, ALP, blood culture, skin biopsy, serum immunoglobulin levels (serum IgE)

### Management

- general: judicious IV fluids and electrolyte control, consider vasopressors if hypotensive, prevention of infection
- if patient unstable, immediately consult for admission: dermatology, or infectious diseases, allergy/immunology, plastic surgery
- specific management is determined by etiology
  - SSSS, TSS, DGI, and meningococemia
    - IV antibiotics
  - EM, SJS, TEN, and DRESS syndrome
    - stop precipitating medication
    - fluids
    - symptomatic treatment: antihistamines, antacids, topical corticosteroids, systemic corticosteroids (controversial), prophylactic oral acyclovir, consider IV immunoglobulin (IVIG), plasmapheresis
    - TEN: debride necrotic tissue

### Disposition

- most cases will require urgent care and hospitalization
- SJS & TEN: early transfer to burn centre improves outcome

For an approach to describing a rash and common skin lesions that are seen in the Emergency department please refer to [Dermatology](#)

Thorough dermatologic examinations are required; examination of asymptomatic skin may identify more lesions; ensure adequate draping during dermatologic examinations

SJS = <10% of BSA  
SJS/TEN = 10-30% BSA  
TEN = >30% BSA

## Environmental Injuries

### Heat Exhaustion and Heat Stroke

#### HEAT EXHAUSTION

- clinical features relate to loss of circulating volume caused by exposure to heat stress
- "water depletion": heat exhaustion occurs if lost fluid not adequately replaced
- "salt depletion": heat exhaustion occurs when losses replaced with hypotonic fluid

#### HEAT STROKE

- life-threatening emergency resulting from failure of normal compensatory heat-shedding mechanisms
- divided into classical and exertional subtypes
- if patient does not respond relatively quickly to cooling treatments, consider other possible etiologies of hyperpyrexia (e.g. meningitis, thyroid storm, anticholinergic poisoning, delirium tremens, infections), adverse drug events (including drug interactions)

Heat exhaustion may closely resemble heat stroke; heat exhaustion may eventually progress to heat stroke, so if diagnosis is uncertain treat as heat stroke

Table 28. Heat Exhaustion vs. Heat Stroke

	Heat Exhaustion	Classical Heat Stroke	Exertional Heat Stroke
<b>Clinical Features</b>	Non-specific malaise, headache, fatigue Body temperature <40.5°C (usually normal) No coma or seizures Dehydration (HR, orthostatic hypotension)	Occurs in setting of high ambient temperatures (e.g. heat wave, poor ventilation) Often patients are older and sedentary or immobile Dry, hot skin Temp usually >40.5°C Altered mental status, seizures, delirium, or coma May have elevated AST, ALT	Occurs with high endogenous heat production (e.g. exercise) that overwhelms homeostatic mechanisms Patients often younger, more active Skin often diaphoretic Other features as for classical heat stroke, but may also have DIC, acute renal failure, rhabdomyolysis, marked lactic acidosis
<b>Treatment</b>	Rest in a cool environment IV NS if orthostatic hypotension; otherwise replace losses slowly PO	Cool body temperature with water mist (e.g. spray bottle) and standing fans Ice water immersion also effective; monitor body temperature closely using rectal thermometer, to avoid hypothermic overshoot Secure airway because of seizure and aspiration risk Give fluid resuscitation if still hypotensive after above therapy Avoid $\beta$ -agonists (e.g. epinephrine), peripheral vasoconstriction, and antipyretics (e.g. ASA)	

### Hypothermia and Cold Injuries

#### HYPOTHERMIA

- hypothermia is defined as a core temperature below 35°C, in which the body's heat loss is greater than heat production
- etiology: increased heat loss (e.g. environmental exposure), decreased heat production (e.g. endocrine disease), impaired regulation (e.g. CNS failure)
- predisposing risk factors: ethanol use, homelessness, psychiatric disease, and older age (the elderly have increased risk due to decreased physiological reserve, chronic diseases, medication side effects, and social isolation)
- treatment based on re-warming and supporting cardiorespiratory function
- complications: coagulopathy, acidosis, dysrhythmias (AFib, VFib, profound bradycardia, asystole), and volume/electrolyte depletion
- labs: CBC, electrolytes, VBG, serum glucose, Cr/BUN, Mg<sup>2+</sup>, Ca<sup>2+</sup>, amylase, coagulation profile, troponin, lactate  $\pm$   $\beta$ -hCG
- imaging: CXR (aspiration pneumonia, pulmonary edema are common)
- monitors: ECG, initial rectal thermometer followed by transesophageal temperature probe for ongoing monitoring, Foley catheter, NG tube, monitor metabolic status frequently

Table 29. Classification of Hypothermia

Class	Temp	Symptoms/Signs
Mild	32-34.9°C	Tachypnea, tachycardia, ataxia, dysarthria, shivering
Moderate	28-31.9°C	Loss of shivering, dysrhythmias, Osborne (J) waves on ECG, decreased LOC, combative behaviour, muscle rigidity, dilated pupils
Severe	<28°C	Unresponsive, hypotension, acidemia, VFib, AFib, asystole, flaccidity, apnea

#### Re-warming Options

- gentle fluid and electrolyte replacement in all (due to cold diuresis)
- passive external re-warming
  - suitable for most stable patients with core temperature >32.2°C
  - involves first removing all wet clothes then covering patient with insulating blanket; body generates heat and re-warms through metabolic process, shivering
- active external re-warming
  - involves use of warming blankets
  - beware of "afterdrop" phenomenon
  - safer when done in conjunction with active core re-warming

**Afterdrop Phenomenon**  
Warming of extremities causes vasodilation and movement of cool pooled blood from extremities to core, resulting in a drop in core temperature leading to cardiac arrest

- active core re-warming
  - generally for patients with core temperature  $<32.2^{\circ}\text{C}$ , and/or with cardiovascular instability
  - avoids "afterdrop" seen with active external re-warming alone
  - re-warm core by using
    - warmed humidified oxygen, IV fluids
    - peritoneal dialysis with warm fluids
    - gastric/colonic/pleural/bladder/pericardial irrigation with warm fluids
    - external circulation (cardiopulmonary bypass machine) is most effective and fastest

#### Approach to Cardiac Arrest in the Hypothermic Patient

- do all procedures gently or may precipitate VFib
- check pulse and rhythm for at least 1 min; may have profound bradycardia
- if any pulse at all (even very slow) do NOT do CPR
- if in VFib try to defibrillate up to maximum 3 shocks if core temperature  $<30^{\circ}\text{C}$
- intubate if required, ventilate with warmed, humidified  $\text{O}_2$
- medications (vasopressors, antiarrhythmics) may not be effective at low temperatures (controversial); may try one dose
- focus of treatment is re-warming

#### FROSTBITE

##### Classification

- ice crystals form between cells
- classified according to depth – similar to burns (1st to 3rd degree)
- 1st degree
  - symptoms: initial paresthesia, pruritus
  - signs: erythema, edema, hyperemia, no blisters
- 2nd degree
  - symptoms: numbness
  - signs: blistering (clear), erythema, edema
- 3rd degree
  - symptoms: pain, burning, throbbing (on thawing); may be painless if severe
  - signs: hemorrhagic blisters, skin necrosis, edema, no movement
- 4th degree
  - extension into subcuticular, osseous, and muscle tissues

##### Management

- treat for hypothermia:  $\text{O}_2$ , IV fluids, maintenance of body warmth
- remove wet and constrictive clothing
- immerse in  $40\text{--}42^{\circ}\text{C}$  agitated water for 10-30 min (very painful; administer adequate analgesia)
- clean injured area and leave it open to air
- consider aspiration/debridement of blisters (controversial)
- debride skin
- tetanus prophylaxis
- consider penicillin G as frostbite injury has high-risk of infection
- surgical intervention may be required to release restrictive eschars
- never allow a thawed area to re-chill/freeze

#### Burns

- see [Plastic Surgery, PL18](#)

##### Clinical Features/Physical Exam Findings

- burn size
  - rule of nines; does not include 1st degree (superficial) burns
- burn depth
  - superficial (1st degree): epidermis only (e.g. sunburn), painful and tender to palpation
  - superficial partial thickness (2nd degree): extends to epidermis and superficial dermis, blister formation occurs, very painful
  - deep partial thickness (2nd degree): involves hair follicles, sebaceous glands; skin is blistered, exposed dermis is white to yellow, absent sensation
  - full thickness (3rd degree): epidermis and all dermal layers; skin is pale, insensate, and charred or leathery
  - deep (4th degree): involvement of fat, muscle, even bone

##### Management

- remove noxious agent/stop burning process and consider appropriate PPE usage
- establish airway if needed (indicated with burns  $>40\%$  BSA or smoke inhalation injury)
- resuscitation for 2nd and 3rd degree burns (after initiation of 2 large bore IVs)
- fluid boluses if unstable
  - Parkland Formula: Ringer's lactate  $4\text{ cc/kg/\% BSA}$  burned; give half in first 8 h, half in next 16 h; maintenance fluids are also required if patient cannot tolerate PO hydration
  - urine output is best measure of resuscitation, should be  $40\text{--}50\text{ cc/h}$  or  $0.5\text{ cc/kg/h}$ ; avoid diuretics

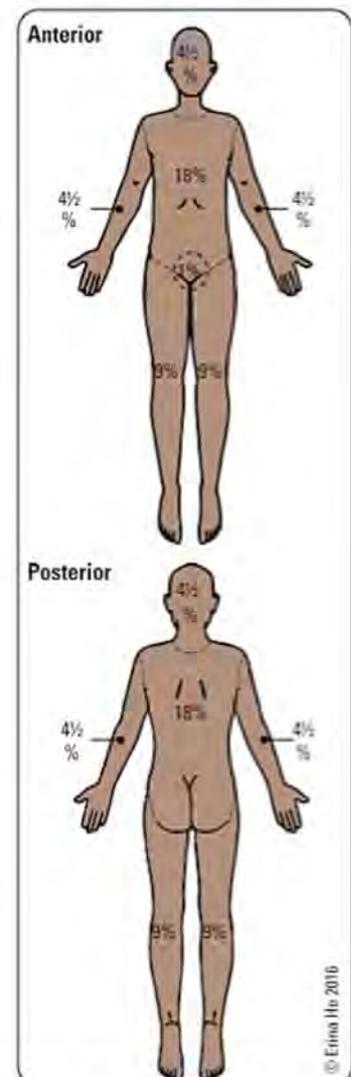

Figure 13. Rule of 9s for total BSA

- pain relief: continuous opioid (e.g. hydromorphone, fentanyl, morphine) infusion for pain with breakthrough doses PRN
- investigations: CBC, electrolytes, U/A, CXR, ECG, ABG, carboxyhemoglobin
- burn wound care: prevent infection, clean/debride with mild soap and water, sterile dressings
- escharotomy or fasciotomy for circumferential burns (chest, extremities)
- topical antibiotics, burn victims are highly susceptible to infection (portal of entry with reduced immune function) – systemic antibiotics are often required
- tetanus prophylaxis if burn is deeper than superficial dermis

### Disposition

- admit
  - 2nd degree burns >10% BSA, or any significant 3rd degree burns
  - 2nd degree burns on face, hands, feet, perineum, or across major joints
  - electrical, chemical burns, and inhalation injury
  - burn victims with chronic medical conditions or immunosuppressed patients

Use palm of the patient's hand to estimate 1% of BSA affected

### Burn Causes

- Thermal (flame, scald)
- Chemical
- Radiation (UV, medical/therapeutic)
- Electrical

## Inhalation Injury

### Etiology

- carbon monoxide (CO) or cyanide (poisoning through dermal contact or inhalation)
- direct thermal injury: limited to upper airway (above the vocal cords)
- smoke causes bronchospasm and edema from particulate matter and toxic inhalants (tissue asphyxiates, pulmonary irritants, systemic toxins)

### History and Physical Exam

- risk factors: closed space fires, period of unconsciousness, noxious chemicals involved
- cherry red skin and bitter almond odour are classic findings of cyanide toxicity but are often not present clinically
- singed nasal hairs, soot on oral/nasal membranes, sooty sputum
- hoarseness, stridor, dyspnea
- decreased LOC, confusion
- PO<sub>2</sub> normal but O<sub>2</sub> saturation low suggests CO poisoning

### Investigations

- measure carboxyhemoglobin levels, co-oximetry
- ABG
- CXR ± bronchoscopy

### Management

- CO poisoning: 100% O<sub>2</sub> ± hyperbaric O<sub>2</sub> (controversial, specific scenarios where it can be considered)
- cyanide poisoning: hydroxocobalamin 70 mg/kg IV over 15 min (max 5 g), up to two doses
- direct thermal injury: humidified oxygen, early intubation, pulmonary toilet, bronchodilators, and mucolytics (N-acetylcysteine)

Always look for inhalational injury in patients with burns. Intubate early (prior to fluid boluses) if you suspect inhalation injury as airway can become obstructed due to edema

## Bites

### MAMMALIAN BITES

- see [Plastic Surgery, PL11](#)

### History

- time and circumstances of bite, symptoms, allergies, tetanus immunization status, comorbid conditions, risk of rabies exposure/transmission, HIV/hepatitis risk (human bite)
- high morbidity associated with clenched fist injuries, "fight bites"

### Physical Exam

- assess type of wound: abrasion, laceration, puncture, crush injury
- assess for direct tissue damage: skin, bone, tendon, neurovascular status, joints (if applicable)

### Investigations

- if bony injury or infection suspected, check for fracture and gas in tissue with x-rays
- get skull films in children with scalp bite wounds ± CT to rule out cranial perforation
- ultrasound may be helpful for identifying abscess formation as well as locating radiolucent foreign bodies in infected wounds

### Initial Management

- wound cleaning and copious irrigation as soon as possible
- irrigate/debride puncture wounds if feasible, but not if sealed or very small openings; avoid hydrodissection along tissue planes
- debridement is important in crush injuries to reduce infection and optimize cosmetic and functional repair
- culture wound if signs of infection (erythema, necrosis, or pus); obtain anaerobic cultures if wound is foul smelling, necrotizing, or if abscess is present; notify lab that sample is from bite wound

- suturing
  - vascular structures (i.e. face and scalp) are less likely to become infected, therefore consider suturing
  - allow avascular structures (i.e. pretibial regions, hands, and feet) to heal by secondary intention or delayed primary closure
- tetanus immunization if >5 yr or incomplete primary series (see *Table 11, ER17*)

### Prophylactic Antibiotics

- types of infections resulting from bites: cellulitis, lymphangitis, abscesses, tenosynovitis, osteomyelitis, septic arthritis, sepsis, endocarditis, meningitis
- a 3-5 d course of antibiotics is recommended for all bite wounds to the hand and should be considered in other bites if any high-risk factors present
- dog and cat bites (pathogens: *Pasteurella multocida*, *S. aureus*, *S. viridans*)
  - 10-50% of cat bites, and 5% of dog bites become infected
  - 1st line: amoxicillin + clavulanic acid (not cefalexin as it does not cover *Pasteurella* spp. or *Eikenella corrodens*)
- human bites (pathogens: *Eikenella corrodens*, *S. aureus*, *S. viridans*, oral anaerobes)
  - 1st line: amoxicillin + clavulanic acid
- rabies (see *Infectious Diseases, 1D19*)
  - reservoirs: warm-blooded animals except rodents (primarily bats and raccoons in Canada), lagomorphs (e.g. rabbits)
  - post-exposure vaccine is effective; treatment depends on local prevalence

## Near Drowning

- most common in children <4 yr and teenagers
- causes lung damage, hypoxemia, and may lead to hypoxic encephalopathy
- must also assess for shock, C-spine injuries, hypothermia, and scuba-related injuries (barotrauma, air emboli, lung re-expansion injury)
- complications: volume shifts, electrolyte abnormalities, hemolysis, rhabdomyolysis, renal, DIC

### Physical Exam

- ABCs, vitals: watch closely for hypotension
- respiratory: rales (ARDS, pulmonary edema), decreased breath sounds (pneumothorax)
- CVS: murmurs, dysrhythmias, JVP (CHF, pneumothorax)
- H&N: assess for C-spine injuries
- neurological: GCS or AVPU, pupils, focal deficits

### Investigations

- labs: CBC, electrolytes, ABGs, Cr, BUN, INR, PTT, U/A (drug screen, myoglobin)
- imaging: CXR (pulmonary edema, pneumothorax) ± C-spine imaging
- ECG

### Management

- ABCs, treat for trauma, shock, hypothermia
- cardiac and O<sub>2</sub> monitors, IV access
- intensive respiratory care
  - ventilator assistance if decreased respirations, pCO<sub>2</sub> >50 mmHg, or pO<sub>2</sub> <60 mmHg on maximum FIO<sub>2</sub>
  - may require intubation for airway protection, ventilation, pulmonary toilet
  - high flow O<sub>2</sub>/CPAP/Bi-PAP may be adequate but some may need mechanical ventilation with positive end-expiratory pressure
- dysrhythmias: usually respond to corrections of hypoxemia, hypothermia, and acidosis
- vomiting: very common, NG suction to avoid aspiration
- convulsions: usually respond to O<sub>2</sub>; if not, lorazepam 4 mg IV slowly
- bronchospasm: bronchodilators
- bacterial pneumonia: prophylactic antibiotics not necessary unless contaminated water or hot tub (*Pseudomonas*)
- always initiate CPR in drowning-induced cardiac arrest even if patient is hypothermic; continue CPR until patient is fully rewarmed

### Disposition

- non-significant submersion (duration of submersion ≤ 5 min) discharge after short observation
- significant submersion (even if asymptomatic): long period of observation (72 h) as pulmonary edema may appear late
- CNS symptoms or hypoxemia: admit
- severe hypoxemia, decreased LOC: ICU

"Secondary drowning" where the onset of symptoms, as a result of pulmonary edema or infection, can be insidious. It can develop over hours, or possibly even days, and must be anticipated in the near drowning patient

# Toxicology

## Approach to the Overdose Patient

### History

- age, weight, underlying medical problems, medications
- substance, route, and quantity
- time and symptoms since exposure determines prognosis and need for decontamination
- route
- intention, suicidality

### Physical Exam

- focus on: ABCs, LOC/GCS, vitals, pupils

## “ABCD3EFG” of Toxicology

- basic axiom of care is symptomatic and supportive treatment
- address underlying problem only once patient is stable

- |           |  |
|-----------|--|
| <b>A</b>  | Airway (consider stabilizing C-spine)  |
| <b>B</b>  | Breathing  |
| <b>C</b>  | Circulation  |
| <b>D1</b> | Drugs <ul style="list-style-type: none"> <li>– ACLS as necessary to resuscitate the patient</li> <li>– universal antidotes (DONT)</li> </ul> |
| <b>D2</b> | Draw bloods  |
| <b>D3</b> | Decontamination (decrease absorption)  |
| <b>E</b>  | Expose (look for specific toxidromes)/examine the patient  |
| <b>F</b>  | Full vitals, ECG monitor, foley, x-rays  |
| <b>G</b>  | Give specific antidotes and treatments   |

### Further Steps following ABCD3EFG

- reassess
- call Poison Information Centre
- obtain corroborative history from family and bystanders

## D1 – Universal Antidotes

- treatments that will not harm patients and may be essential

### Dextrose (glucose)

- give to any patient presenting with altered LOC
- measure blood glucose prior to glucose administration if possible
- adults: D50W 0.5-1.0 g/kg (1-2 mL/kg) IV
- children: D25W 0.25 g/kg (2-4 mL/kg) IV

### Oxygen

- do not deprive a hypoxic patient of oxygen regardless of the antecedent medical history (i.e. even COPD with CO<sub>2</sub> retention)
- if depression of hypoxic drive, intubate and ventilate

### Naloxone (central $\mu$ -receptor competitive antagonist, shorter half-life than naltrexone)

- antidote for opioids: administration is both diagnostic and therapeutic (<1 min onset of action)
- used for the undifferentiated comatose patient
- loading dose
  - adults
    - response to naloxone can be drastic, so stepwise delivery is recommended
    - 0.05 or 0.1 mg IV with escalation of doses PRN
    - naloxone administration during cardiac arrest:
      - begin ACLS protocol and administer 2 mg IV/IM every 3 min, may increase dose by doubling up to maximum of 12 mg
  - child
    - 0.01 mg/kg initial bolus IV/IO/ETT (max 2 mg per dose)
    - children over 20 kg can receive naloxone 2 mg IV
  - maintenance dose
    - may be required because half-life of naloxone (30-80 min) is much shorter than many opioids
    - hourly infusion rate at 2/3 of initial dose that allowed patient to be roused

### Indications to Suspect Overdose

- Altered LOC/coma
- Young patient with life-threatening dysrhythmia
- Trauma patient
- Bizarre or puzzling clinical feature

### Principles of Toxicology

4 principles to consider with all ingestions:

- Resuscitation (ABCD3EFG)
- Screening (toxidrome, clinical clues)
- Decrease absorption of drug
- Increase elimination of drug

### Universal Antidotes

#### DONT

- Dextrose
- Oxygen
- Naloxone
- Thiamine (must give BEFORE dextrose)

Although doses in the ED are generally small, administration of naloxone can cause acute opioid withdrawal in people who are chronic opioid users (Ultrarapid Opioid Detoxification, UROD):

- Minor withdrawal may present as lacrimation, restlessness, rhinorrhea, diaphoresis, yawning, piloerection, HTN, myalgia, N/V, tachycardia
- Severe withdrawal may present as hot and cold flashes, arthralgias, myalgias, N/V, and abdominal cramps

**Thiamine (Vitamin B1)**

- 200 mg IV/IM with IV/PO glucose to all patients
- given to prevent/treat Wernicke's encephalopathy
- a necessary cofactor for glucose metabolism (may worsen Wernicke's encephalopathy if glucose given before thiamine), but do not delay glucose if thiamine is unavailable
- must assume all undifferentiated comatose patients are at risk

Thiamine is deficient in the malnourished. Consider in patients with alcohol use disorder, anorexia, or malnutrition states

**D2 – Draw Bloods**

- essential tests
  - CBC, electrolytes, BUN/Cr, glucose, INR/PTT, osmolality
  - ABGs, O<sub>2</sub> sat
  - ASA, acetaminophen, EtOH levels
- potentially useful tests
  - drug levels – this is NOT a serum drug screen (e.g. digoxin, iron)
  - Ca<sup>2+</sup>, Mg<sup>2+</sup>, PO<sub>4</sub><sup>3-</sup>
  - protein, albumin, lactate, ketones, liver enzymes, CK – depending on drug and clinical features

Urine drug screen is costly and generally not helpful in the ED management of the poisoned patient unless suspicion of A SA, acetaminophen, or toxic EtOH ingestion

**Serum Drug Levels**

- treat the patient, not the drug level
- negative toxicology screen does not rule out a toxic ingestion – signifies only that the specific drugs tested were not detectable in the specimen
- specific drugs available on general screen vary by institution; check before ordering
- urine screens also available (qualitative only; not often thought to change management)

**Table 30. Toxic Gaps (see [Nephrology, NP18](#))**

METABOLIC ACIDOSIS	
<b>Increased AG: "GOLDMARK"</b> (* = toxic)	<b>Increased osmolar gap: "MAE DIE"</b> (if it ends in "-ol", it will likely increase the osmolar gap)
Glycols* (ethylene glycol, propylene glycol)	Methanol
Oxoproline (metabolite of acetaminophen)*	Acetone
L-lactate	Ethanol
D-lactate (acetaminophen, short bowel syndrome, propylene glycol infusions for lorazepam & phenobarbital)	Diuretics (glycerol, mannitol, sorbitol)
Methanol*	Isopropanol
ASA*	Ethylene glycol
Renal failure	
Ketoacidosis (DKA, EtOH*, starvation)	
	Note: normal osmolar gap does not rule out toxic alcohol; only an elevated gap is helpful
<b>Decreased AG</b>	<b>Increased O<sub>2</sub> saturation gap</b>
Electrolyte imbalance (increased Na <sup>+</sup> /K <sup>+</sup> 1Mg <sup>2+</sup> )	Carboxyhemoglobin
Hypoalbuminemia (50% fall in albumin ~5.5 mmol/L decrease in the AG)	Methemoglobin
Lithium, bromine elevation	Sulfmethemoglobin
Paraproteins (multiple myeloma)	
<b>Normal AG</b>	
Renal HCO <sub>3</sub> <sup>-</sup> loss: renal tubular acidosis, hyperparathyroidism	
GI HCO <sub>3</sub> <sup>-</sup> loss: diarrhea, fistula	
Other: NS infusion, acetazolamide, hyperkalemia, hypoaldosteronism	

**Table 31. Use of the Clinical Laboratory in the Initial Diagnosis of Poisoning**

Test	Finding	Selected Causes
ABG	Hypoventilation (high pCO <sub>2</sub> ) Hyperventilation (low pCO <sub>2</sub> )	CNS depressants (opioids, sedative-hypnotic agents, phenothiazines, EtOH) Salicylates, CO, other asphyxiants
Electrolytes	AG metabolic acidosis Hyperkalemia Hypokalemia	"GOLDMARK": see Table 30 Digitalis glycosides, fluoride, potassium Theophylline, caffeine, β-adrenergic agents, soluble barium salts, diuretics, insulin
Glucose	Hypoglycemia	Oral hypoglycemic agents, insulin, EtOH, ASA
Osmolality and Osmolar Gap	Elevated osmolar gap	"MAE DIE": see Table 30
ECG	Wide QRS complex Prolonged QT interval Atrioventricular block	TCAs, quinidine, other class Ia and Ic antiarrhythmic agents Terfenadine, astemizole, antipsychotics, hydroxychloroquine Ca <sup>2+</sup> antagonists, digitalis glycosides, phenylpropanolamine, hydroxychloroquine
Abdominal X-Ray	Radiopaque pills or objects	"CHIPES": Calcium, Chloral hydrate, CCl <sub>4</sub> , Heavy metals, Iron, Potassium, Enteric coated Salicylates, and some foreign bodies
Serum Acetaminophen	Elevated level (1000 μmol/L 4 h after ingestion) Consult Rumack-Matthew nomogram in single ingestion cases	May be only sign of acetaminophen poisoning

**Anion Gap**  
= Na<sup>+</sup> - Cl<sup>-</sup> - HCO<sub>3</sub><sup>-</sup>  
Normal A G ≤12 mM/L

**Osmolar Gap**  
= [(2 x Na<sup>+</sup>) + Glu + Urea] - Measured Osmolality  
Normal <10

## D3 – Decontamination and Enhanced Elimination

### Ocular Decontamination

- saline irrigation to neutralize pH; alkali exposure requires ophthalmology consult

### Dermal Decontamination

- wear protective gear
- remove clothing, brush off toxic agents, irrigate all external surfaces

### Gastrointestinal Decontamination

- single dose activated charcoal
  - use of activated charcoal is a source of much debate amongst toxicologists, evidence of effectiveness is not strong and risk of aspiration is high
  - consider if recent ingestion, delayed absorption medication, can consult poison control PRN
  - adsorption of drug/toxin to activated charcoal decreases toxin bioavailability
  - contraindications: unprotected airway, late presentation after ingestion (1-2 h post ingestion), small bowel obstruction, poor toxin adsorption
  - dose: 10 g/g drug ingested or 1g/kg body weight (may vary depending on ingestion)
  - odourless, tasteless, prepared as slurry with H<sub>2</sub>O
- whole bowel irrigation (occasionally used)
  - 500 mL/h (child) to 2000 mL/h (adult) of polyethylene glycol solution by mouth until clear effluent per rectum
    - start slow (500 mL in an adult) and aim to increase rate hourly as tolerated
  - indications
    - awake, alert, can be nursed upright, with an NG tube who cannot tolerate drinking it, or intubated and airway protected
    - delayed release product
    - drug/toxin not bound to charcoal
    - drug packages (if any evidence of breakage emergency surgery)
    - recent toxin ingestion
  - contraindications
    - evidence of ileus, perforation, or obstruction
- multidose activated charcoal
  - may be used for: carbamazepine, phenobarbital, quinine, theophylline, for toxins which undergo enterohepatic recirculation
  - removes drug that has already been absorbed by drawing it back into GI tract
  - various regimens: 12.5 g (1/4 bottle) PO q1 h or 25 g (1/2 bottle) PO q2 h until non-toxic
- surgical removal in extreme cases
  - surgical indicated for drugs that are toxic, form concretions, or cannot be removed by conventional means
- use of cathartics (i.e. ipecac) and gastric lavage in the ED is generally not recommended

### Lipid Emulsification

- new therapy used in cardiogenic shock due to toxins
- may be used for: anesthetics (e.g. lidocaine),  $\beta$ -blocker/calcium channel blocker, atypical antidepressant overdose
- initial bolus lipid solution 20% 1.5 mL/kg over 3 min then infusion of 0.25 mL/kg/min

### Urine Alkalinization

- may be used for: ASA, methotrexate, phenobarbital, chlorpropamide
- weakly acidic substances can be trapped in alkaline urine (pH >7.5) to increase elimination

### Hemodialysis

- indications/criteria for hemodialysis
  - toxins that have high water solubility, low protein binding, low molecular weight, adequate concentration gradient, small volume of distribution, or rapid plasma equilibration
  - clinical deterioration despite maximal medical support
- useful for the following toxins
  - methanol
  - ethylene glycol
  - salicylates
  - lithium
  - phenobarbital
  - chloral hydrate (trichloroethanol)
- others include theophylline, carbamazepine, valproate, methotrexate

## E – Expose and Examine the Patient

- vital signs (including temperature), skin (needle tracks, colour), mucous membranes, pupils, odours, and CNS
- head-to-toe survey including
  - C-spine
  - signs of trauma, seizures (incontinence, "tongue biting," etc.), infection (meningismus), or chronic alcohol/drug misuse (track marks, nasal septum erosion)
  - feel the patient's axillae; in the average patient, should be somewhat moist (if dry, may indicate anticholinergic toxicity)
- mental status

Table 32. Specific Toxidromes

Toxidrome	Overdose Signs and Symptoms	Examples of Drugs
<b>Anticholinergic</b>	Hyperthermia Dilated pupils Dry skin Vasodilation Agitation/hallucinations Ileus Urinary retention Tachycardia	"Hot as a hare" "Blind as a bat" "Dry as a bone" "Red as a beet" "Mad as a hatter" "The bowel and bladder lose their tone and the heart goes on alone"
<b>Cholinergic</b>	"DUMBELS" Diaphoresis, Diarrhea, Decreased BP Urination Miosis Bronchospasm, Bronchorrhea, Bradycardia Emesis, Excitation of skeletal muscle Lacrimation Salivation, Seizures	Antidepressants (e.g. TCAs) Cyclobenzaprine (Flexeril®) Carbamazepine Antihistamines (e.g. diphenhydramine) Antiparkinsonians Antipsychotics Antispasmodics Belladonna alkaloids (e.g. atropine)
<b>Extrapyramidal</b>	Dysphonia, dysphagia Rigidity and tremor Motor restlessness, crawling sensation (akathisia) Constant movements (dyskinesia) Dystonia (muscle spasms, laryngospasm, trismus, oculogyric crisis, torticollis)	Natural plants: mushrooms, trumpet flower Anticholinesterases: physostigmine Insecticides (organophosphates, carbamates) Nerve gases
<b>Hemoglobin Derangements</b>	Increased respiratory rate Decreased LOC Seizures Cyanosis unresponsive to O <sub>2</sub> Lactic acidosis	Major tranquilizers Antipsychotics
<b>Opioid, Sedative/Hypnotic, EtOH</b>	Hypothermia Hypotension Respiratory depression (opioid) Dilated or constricted pupils (pinpoint in opioid) CNS depression	CO poisoning (carboxyhemoglobin) Drug ingestion (methemoglobin, sulfmethemoglobin)
<b>Sympathomimetic</b>	Increased temperature CNS excitation (including seizures) Tachycardia, HTN NIV Diaphoresis Dilated pupils	EtOH Benzodiazepines Opioids (morphine, heroin, fentanyl, etc.) Barbiturates GHB ("G," "liquid gold")
<b>Serotonin Syndrome</b>	Mental status changes, autonomic hyperactivity, neuromuscular hyperactivity, hyperthermia, diarrhea, HTN	Amphetamines, caffeine, cocaine, LSD, phencyclidine Ephedrine and other decongestants Thyroid hormone Sedative or EtOH withdrawal
		MAOI, TCA, SSRI, opiate analgesics Cough medicine, weight reduction medications

Note: ASA poisoning and hypoglycemia mimic sympathomimetic toxidrome

## F – Full Vitals, ECG Monitor, Foley, X-Rays

## G – Give Specific Antidotes and Treatments

### Urine Alkalinization Treatment for ASA Overdose

- urine pH >7.5
- fluid resuscitate first, then 3 amps NaHCO<sub>3</sub>/L of D5W at 1.5x maintenance
- add 20-40 mEq/L KCl if patient is able to urinate

**Table 33. Protocol for Warfarin Overdose**

<b>INR</b>	<b>Management:</b> Consider Prothrombin Complex Concentrate (Octaplex <sup>®</sup> , Beriplex <sup>®</sup> ) for any elevated INR. AND either life-threatening bleeding, or a plan for the patient to undergo a surgical procedure within the next 6 h (vitamin K takes 4-6 h post IV administration to work)
<b>&lt;5.0</b>	Cessation of warfarin administration, observation, serial INR/PT
<b>5.1-9.0</b>	If no risk factors for bleeding, hold warfarin x1-2 d and reduce maintenance dose OR Vitamin K 1-2 mg PO if patient at increased risk of bleeding
<b>9.1-20.0</b>	Hold warfarin, vitamin K 2-4 mg PO, serial INR/PT, additional vitamin K if necessary
<b>&gt;20.0</b>	Hold warfarin, vitamin K 10 mg IV over 10 min, increase vitamin K dosing (q4 h) if needed

**Table 34. Specific Antidotes and Treatments for Common Toxins\***

Toxin	Treatment	Considerations
<b>Acetaminophen</b>	Decontaminate (activated charcoal) N-acetylcysteine	Often clinically silent; evidence of liver/renal damage delayed >24 h Toxic dose >200 mg/kg (>7.5 g adult) Monitor drug level 4 h post-ingestion; also liver enzymes, INR, PTT, BUN, Cr Hypoglycemia, metabolic acidosis, encephalopathy poor prognosis Dialysis may be required to manage in very high overdoses
<b>Acute Dystonic Reaction</b>	Benzotropine: 1-2 mg IM/IV then 2 mg PO 3 d OR Diphenhydramine 1-2 mg/kg IV, then 25 mg PO QID x3 d	Benzotropine (Cogentin <sup>®</sup> ) has euphoric effect and the potential for misuse
<b>Anticholinergics</b>	Consider decontamination (activated charcoal) Supportive care	Special antidotes available; consult Poison Information Centre
<b>ASA</b>	Consider decontamination (activated charcoal) Alkalinize urine; want urine pH >7.5	Monitor serum pH and drug levels closely Monitor K <sup>+</sup> level; may require supplement for urine alkalinization Hemodialysis may be needed if intractable metabolic acidosis, very high levels, or end-organ damage (i.e. unable to diurese)
<b>Benzodiazepines</b>	Consider decontamination (activated charcoal) Flumazenil (only use in iatrogenic overdose (operative oversedation) due to extensive contraindications (mixed overdose, Hx of ETOH, seizures)) Supportive care	
<b>β-blockers</b>	Consider decontamination (activated charcoal, consider whole bowel irrigation for extended-release ingestion) IV glucagon, IV calcium chloride, IV high-dose insulin (with dextrose), IV lipid emulsification	
<b>Calcium Channel Blockers</b>	Consider decontamination (activated charcoal, consider whole bowel irrigation for extended-release ingestion) IV glucagon, IV calcium chloride, IV high-dose insulin (with dextrose), IV intralipid	Order ECG, electrolytes (especially Ca <sup>2+</sup> , Mg <sup>2+</sup> , Na <sup>+</sup> , K <sup>+</sup> )
<b>Cocaine</b>	Decontaminate (activated charcoal) if oral Aggressive supportive care	β-blockers are contraindicated in acute cocaine toxicity Intralipid for life-threatening symptoms Consider benzodiazepines for any major side effect of cocaine overdose (agitation, hypertension, tachycardia, etc.)
<b>CO Poisoning</b>	See <i>Alcohol Intoxication, ER47</i> Supportive care 100% O <sub>2</sub> ; may require hyperbaric O <sub>2</sub>	Order ECG, YBG. Consider lactate and Troponin depending on specific presentation
<b>Cyanide</b>	Hydroxocobalamin 5 g IV (Cyanokit <sup>®</sup> )	Consider in all patients found in a fire
<b>Digoxin</b>	Consider decontamination (activated charcoal) Digoxin-specific antibody fragments 10-20 vials IV if acute; 3-6 if chronic 1 vial (40 mg) neutralizes 0.5 mg of toxin	Use for life-threatening dysrhythmias unresponsive to conventional therapy, 6 h serum digoxin >12 nmol/L, initial K <sup>+</sup> >5 mmol/L, ingestion >10 mg (adult)/>4 mg (child) Common dysrhythmias include VFib, VTach, and conduction blocks
<b>Ethanol</b>	Thiamine 100 mg IM/IV Manage airway and circulatory support	Mouthwash = 70% ETOH; perfumes and colognes = 40-60% ETOH Order serum ETOH level and glucose level; treat glucose level appropriately
<b>Ethylene Glycol/Methanol</b>	Fomepizole (4-methylpyrazole) 15 mg/kg IV load over 30 min, then 10 mg/kg q12 h OR Ethanol (10%) 10 mL/kg over 30 min, then 1.5 mL/h	CBC, electrolytes, glucose, ethanol level Consider hemodialysis
<b>Heparin</b>	Protamine sulfate 25-50 mg IV	For unfractionated heparin overdose only
<b>Insulin IM/SC/Oral Hypoglycemic</b>	Glucose IV/PO/NG tube Glucagon: 1-2 mg IM (if no access to glucose)	Glyburide carries highest risk of hypoglycemia among oral agents Consider octreotide for oral hypoglycemics (50-100 µg SC q6 h) in these cases; consult local Poison Information Centre
<b>MDMA</b>	Consider decontamination (activated charcoal) Supportive care	Monitor CK; treat rhabdomyolysis with high flow fluids; aggressive external cooling for hyperthermia Review medical history if possible for serotonergic use
<b>Opioids</b>	See <i>Universal Antidotes, ER49</i>	
<b>TCA's</b>	Consider decontamination (activated charcoal) Aggressive supportive care NaHCO <sub>3</sub> bolus for wide QRS/seizures	Flumazenil antidote contraindicated in combined TCA and benzodiazepine overdose Also consider cardiac and hypotension support, seizure control Intralipid therapy
<b>Organophosphate</b>	100% O <sub>2</sub> + endotracheal intubation Atropine Pralidoxime (2-PAM)	Succinylcholine

\* Call local Poison Information Centre for reporting of cases, specific doses, and treatment recommendations. Most toxicology cases should involve communication with your local Poison Information Centre

## Alcohol Related Emergencies

- see [Psychiatry](#), PS29

### Acute Intoxication

- slurred speech, CNS depression, disinhibition, lack of coordination
- nystagmus, diplopia, dysarthria, ataxia, may progress to coma
- hypotension (peripheral vasodilation)
- if obtunded, rule out
  - head trauma/intracranial hemorrhage
  - associated depressants, toxic alcohols
- may also contribute to respiratory/cardiac depression
  - hypoglycemia (screen with bedside glucometer)
  - hepatic encephalopathy: confusion, altered LOC, coma
- precipitating factors: GI bleed, infection, sedation, electrolyte abnormalities, protein meal
  - Wernicke's encephalopathy (ataxia, ophthalmoplegia, delirium)
  - post-ictal state, basilar stroke

Alcohol levels correlate poorly with intoxication

Alcohol intoxication may invalidate informed consent

### Withdrawal

- beware of withdrawal signs
- treatment
  - diazepam 10-20 mg IV/PO or lorazepam 2-4 mg IV/PO q1 h (if known liver dysfunction) until two negative CIWA scores
- frequency of dosing may have to be increased depending on clinical response
  - may use CIWA protocol and give benzodiazepines as above until CIWA <10
  - thiamine 200 mg IM/IV then 50-100 mg/d
    - naltrexone & gabapentin if no improvement
  - magnesium sulfate 4 g IV over 1-2 h (if hypomagnesemic)
  - admit patients with delirium tremens or multiple seizures or persistently high CIWA (symptoms) despite high doses of benzodiazepines

### CIWA Withdrawal Symptoms

- N/V
- Tremor
- Paroxysmal sweats
- Anxiety
- Agitation
- Visual disturbances
- Tactile disturbances
- Auditory disturbances
- Headache
- Disorientation
- 10 symptoms each scored out of 7 except orientation, which is scored out of 4

Table 35. Alcohol Withdrawal Signs

Time Since Last Drink	Syndrome	Description
6-8 h	Mild withdrawal	Generalized tremor, anxiety, agitation, but no delirium Autonomic hyperactivity (sinus tachycardia), insomnia, N/V
1-2 d	Alcoholic hallucinations	Visual (most common), auditory, and tactile hallucinations Vitals often normal
8 h-2 d	Withdrawal seizures	Typically brief generalized tonic-clonic seizures May have several within a few hours CT head if focal seizures have occurred
3-5 d	DT	5% of untreated withdrawal patients Severely confused state, fluctuating LOC Agitation, insomnia, hallucinations/delusions, tremor Tachycardia, hyperpyrexia, diaphoresis High mortality rate

### Cardiovascular Complications

- HTN
- cardiomyopathy: SOB, edema
- dysrhythmias ("holiday heart")
- AFib (most common), atrial flutter, SVT, VTach (especially Torsades if hypomagnesemic/hypokalemic)

### Metabolic Abnormalities

- alcoholic ketoacidosis
  - metabolic acidosis, urine ketones, low glucose, and normal osmolality
  - history of chronic alcohol intake with abrupt decrease/cessation
  - malnourished, abdominal pain with N/V
  - treatment: thiamine (250-500 mg IM/IV prior to dextrose), dextrose, volume repletion (with NS)
  - generally resolves in 12-24 h
- toxic alcohols
  - ethylene glycol: CNS, CVS, renal findings
  - methanol
    - early: lethargy, confusion
    - late: headache, visual changes, N/V, abdominal pain, tachypnea
  - toxic alcohols initially produce a high osmolar gap, as the toxic alcohol is metabolized the osmolar gap drops and an anion gap develops leading to a severe metabolic acidosis, the goal of treatment is to block this pathway
  - EtOH co-ingestion is protective

- treatment
  - urgent hemodialysis required
  - fomepizole 15 mg/kg IV bolus (treatment of choice) or 10% EtOH IV bolus and infusion to achieve blood level of 22 mmol/L (EtOH loading may be done PO)
  - consider folic acid for methanol, and pyridoxine and thiamine for ethylene glycol – both help reduce conversion to active metabolites
- other abnormalities associated with alcohol: hypomagnesemia, hypophosphatemia, hypocalcemia, hypoglycemia, hypokalemia

### Gastrointestinal Abnormalities

- gastritis
  - common cause of abdominal pain and GI bleed in chronic alcohol users
- pancreatitis
  - serum amylase very unreliable in patients with chronic pancreatitis, may need serum lipase
  - hemorrhagic form (15%) associated with increased mortality
  - fluid resuscitation very important
- hepatitis
  - AST/ALT ratio >2 suggests alcohol as the cause
- peritonitis/spontaneous bacterial peritonitis
  - leukocytosis, fever, generalized abdominal pain/tenderness
  - occasionally accompanies cirrhosis
  - paracentesis for diagnosis (common pathogens: *E. coli*, *Klebsiella*, *Streptococcus*)
  - albumin shown to improve outcomes in sBP patients
- GI bleeds
  - most commonly gastritis or ulcers, even if patient known to have varices
  - consider Mallory-Weiss tear secondary to retching
  - often complicated by underlying coagulopathies
  - minor: treat with antacids
  - severe or recurrent: endoscopy
  - variceal bleeds: octreotide

## Disposition from the Emergency Department

- alcohol
  - before patient leaves ED ensure stable vital signs, can walk unassisted, and fully oriented
  - offer social services to find shelter or detox program
  - ensure patient can obtain any medications prescribed and can complete any necessary follow-up
- methanol, ethylene glycol
  - delayed onset, admit, and watch clinical and biochemical markers
- TCAs
  - prolonged/delayed cardiotoxicity warrants admission to monitored ICU bed
  - if asymptomatic and no clinical signs of intoxication: 6 h ED observation adequate with proper decontamination and no ECG abnormalities
  - sinus tachycardia alone (most common finding) with history of overdose warrants observation in ED
- hydrocarbons/smoke inhalation
  - pneumonitis may lag 6-8 h
  - consider observation for repeated clinical and radiographic examination
- ASA, acetaminophen
  - if borderline level, get second level 2-4 h after first
  - for ASA, must have at least 2 measurements showing decreasing toxin serum concentration before discharge (3 levels minimum)
- oral hypoglycemics
  - admit all patients for minimum 24 h if hypoglycemic and 12 h after last octreotide dose
  - observe asymptomatic patient for at least 8 h
- opioids
  - administer naloxone, a short-acting opioid antagonist, preferably IV in incremental doses (0.2-1 mg)
  - patients in cardiorespiratory arrest following possible opioid overdose should be given 2 mg of naloxone minimum
  - admit and observe for 24h
  - referral to rapid access clinic and offer a naloxone kit

### Psychiatric Consultation

- once patient medically cleared, arrange psychiatric intervention if required
- beware – suicidal ideation may not be expressed

# Psychiatric Emergencies

## Approach to Common Psychiatric Presentations

- see [Psychiatry](#), PS2
- before seeing patient, ensure your own safety; have security/police available if necessary

### History

- safety
  - assess suicidality: suicidal ideation (SI; passive/active), intent, plan, lethal means, past attempts, protective factors
  - assess homicidality: homicidal ideation (HI), access to weapons, intended victim, and history of violence
  - driving and children
  - command hallucinations
- identify current stressors and coping strategies
- mood symptoms: manic, depressive
- anxiety: panic attacks, generalized anxiety, phobias, obsessive-compulsive disorder, post-traumatic stress disorder
- psychotic symptoms: delusions, hallucinations, disorganized speech, disorganized or catatonic behaviour, negative symptoms (affective flattening, alogia, avolition)
- substance use history: most recent use, amount, previous withdrawal reactions
- past psychiatric history, medications, adherence with medications, admissions
- medical history: obtain collateral if available

### Physical Exam

- complete physical exam focusing on: vitals, neurological exam, signs of head trauma, signs of drug toxicity, signs of metabolic disorder; which could be contributing or causing psychiatric presentation
- mental status exam: general appearance, behaviour, cooperation, speech, mood and affect, thought content and form, perceptual disturbances, cognition (including MMSE if indicated), judgment, insight, reliability

### Investigations

- investigations vary with age, established psychiatric diagnosis vs. first presentation, history and physical suggestive of organic cause
- as indicated: blood glucose, urine and serum toxicology screen, pregnancy test, electrolytes, TSH, AST/ALT, bilirubin, serum Cr, BUN, and osmolality
- blood levels of psychiatric medications
- CT head if suspect neurological etiology
- LP if indicated (anti-NMDA receptor encephalitis)

## Acute Psychosis

### Differential Diagnosis

- primary psychotic disorder (e.g. schizophrenia)
- secondary to medical condition (e.g. delirium)
- drugs: substance intoxication or withdrawal, medications (e.g. steroids, anticholinergics)
- infectious (CNS)
- metabolic (hypoglycemic, hepatic, renal, thyroid)
- structural (hemorrhage, neoplasm)
  - autoimmune (anti-NMDA receptor encephalitis)

### Management

- violence prevention
  - remain calm, empathic, and reassuring
  - ensure safety of staff and patients, have extra staff and/or security on hand
  - patients demonstrating escalating agitation or overt violent behaviour may require physical restraint and/or chemical restraint
- treat agitation: whenever possible, offer medication to patients as opposed to administering with force (helps calm and engage patient)
  - benzodiazepines: lorazepam 2 mg PO/IM/SL
  - antipsychotics: olanzapine 5-10 mg PO/IM, haloperidol 5 mg PO/IM
- treat underlying medical condition
- psychiatry or Crisis Intervention Team consult

## Suicidal Patient

### Epidemiology

- attempted suicide F>M, completed suicide M>F
- second leading cause of death in people <24 yr
- significantly increased incidence among marginalized communities, particularly Indigenous peoples and 2SLGBTQIA Canadians

### Key Functions of Emergency Psychiatric Assessment

- Is the patient medically stable?
- Rule out medical cause
- Is psychiatric consult needed?
- Are there safety issues (SI, HI)?
- Is patient certifiable? (must demonstrate risk (present/past test) and apparent mental illness (future test))

### Psychiatric Review of Systems

#### MOAPS

Mood  
Organic  
Anxiety  
Psychosis  
Safety

See [Psychiatry, Common Forms](#), PS62 for certification (involuntary assessment/admission) considerations

**Management**

- ensure patient safety: close observation, remove potentially dangerous objects from person and room
- assess thoughts (ideation), means, action (preparatory, practice attempts), previous attempts, protective factors
- admit if there is evidence of: active intent and organized plan, access to lethal means, psychiatric disorder, intoxication (suicidal ideation may resolve with few days of abstinence)
- patient may require certification (completion of Forms 1 and 42) if unwilling to stay voluntarily
- do not start long-term medications in the ED
- psychiatry or Crisis Intervention Team consult

**High-Risk Patients**

**SAD PERSONS**

- Sex = male
- Age >45 yr
- Depression
- Previous attempts
- Ethanol use
- Rational thinking loss
- Suicide in family
- Organized plan
- No spouse, no support system
- Serious illness

**Common Paediatric ED Presentations**

**Modified Glasgow Coma Score**

Table 36. Modified GCS

Modified GCS for Infants		
<b>Eye Opening</b>	<b>Verbal Response</b>	<b>Motor Response</b>
4 – spontaneously	5 – coos, babbles	6 – normal, spontaneous movement
3 – to speech	4 – irritable cry	5 – withdraws to touch
2 – to pain	3 – cries to pain	4 – withdraws to pain
1 – no response	2 – moans to pain	3 – decorticate flexion
	1 – no response	2 – decerebrate extension
		1 – no response

Modified GCS for Infant (<2 years) or Non-verbal Patients		
<b>Eye Opening</b>	<b>Verbal Response</b>	<b>Motor Response</b>
4 – spontaneously	5 – oriented, social, speaks, interacts	6 – normal, spontaneous movement
3 – to speech	4 – confused speech, disoriented, consolable	5 – localizes to pain
2 – to pain	3 – inappropriate words, not consolable/aware	4 – withdraws to pain
1 – no response	2 – incomprehensible, agitated, restless, not aware	3 – decorticate flexion
	1 – no response	2 – decerebrate extension
		1 – no response

Consider Alert, Pain, Verbal, Unconscious (AVPU) scale

Any trauma or suspected trauma patient <1 yr with a large, boggy scalp hematoma requires U/S or CT

**Respiratory Distress**

- see Paediatrics, P80, P93

**History and Physical Exam**

- infants not able to feed, older children not able to speak in full sentences
- anxious, irritable, lethargic – may indicate hypoxia
- tachypnea >60 (>40 if preschool age, >30 if school age), retractions, tracheal tug
  - see Paediatrics, P3 for age specific vital signs
- pulsus paradoxus (rarely used clinically)
- wheezing, grunting, vomiting

Table 37. Stridorous Upper Airway Diseases: Differential Diagnosis

Feature	Croup	Bacterial Tracheitis	Epiglottitis <sup>1</sup>
Age Range (yr)	0.5-4	5-10	2-8
Prodrome	Mild for days then acutely severe	Hours to days	Minutes to hours
Temperature	Low grade	High	High
Radiography	Steeple sign	Exudates in trachea <sup>2</sup>	Thumb sign
Etiology	Parainfluenza	<i>S. aureus</i> /GAS	<i>H. influenzae</i> type b
Barky Cough	Yes	Yes	No
Drizzling	Occasionally	No	Yes
Appear Toxic	No	Yes	Yes
Intubation/ICU	No but yes if severe (rare)	Yes	Yes
Antibiotics	No	Yes	Yes
NOTE	Oral exam	Oral exam	No oral exam, consult ENT

<sup>1</sup>Now rare with Hib vaccine in common use

<sup>2</sup>Found as diffuse haziness and irregularity of the anterior wall of trachea; consider imaging only after ruling out epiglottitis

**Management**

- croup (usually laryngotracheitis caused by parainfluenza viruses)
  - dexamethasone x 1 dose
  - if moderate-severe, add nebulized or MDI epinephrine (racemic has limited availability)
  - consider bacterial tracheitis/epiglottitis if unresponsive to croup therapy
  - humidified O<sub>2</sub> has no evidence for efficacy
- bacterial tracheitis
  - airway maintenance - usually require intubation, ENT consult, ICU
  - start antibiotics (e.g. cloxacillin), pending C&S
- epiglottitis
  - 4 D's: drooling, dyspnea, dysphagia, dysphonia + tripod sitting
  - do not examine oropharynx or agitate patient
  - immediate anesthesia/ENT call - intubate
  - then IV fluids, antibiotics, blood cultures

**Febrile Infant and Febrile Seizures****FEBRILE INFANT**

- for fever >38°C without obvious focus
  - <28 d
    - admit
    - full septic workup (CBC and differential, CRP, blood C&S, urine C&S, LP ± stool C&S, CXR if indicated)
    - treat empirically with broad spectrum IV antibiotics (ampicillin, and ceftazidime or cefepime or cefotaxime (if available) or gentamicin (add acyclovir or vancomycin when indicated))
  - 28-90 d
    - as above unless infant meets Rochester criteria, if so, complete a partial septic workup (CBC and differential, blood C&S, urine C&S, CXR if indicated)
    - antibiotics (ceftriaxone or cefotaxime (if available), add acyclovir or vancomycin when indicated)
  - >90 d
    - toxic: admit, treat, full septic workup
    - non-toxic and no focus: investigate as indicated by history and physical
    - antibiotics (Ceftriaxone or cefotaxime (if available), add acyclovir or vancomycin when indicated)

**FEBRILE SEIZURES**

- see [Paediatrics, p88](#)

**Etiology**

- children ages 6 mo-6 yr with fever or history of recent fever
- typical vs. atypical febrile seizures
- normal neurological exam afterward
- no evidence of intracranial infection or history of previous non-febrile seizures
- often positive family history of febrile seizures
- relatively well-looking after seizure

**Investigations and Management**

- if confirmed febrile seizure: treat fever and look for source of fever
- if not a febrile seizure: treat seizure and look for source of seizure
  - note: may also have fever but may not meet criteria for febrile seizure
- ± EEG (especially if first seizure), head U/S (if fontanelle open)

**Table 38. Typical vs. Atypical Febrile Seizures**

Characteristic	Typical	Atypical
Duration	<5 min	>5 min
Type of Seizure	Generalized	Focal features
Frequency	1 in 24 h	>1 in 24 h

**Rochester Criteria for Febrile Infants Ages 28-90 Days Old**

- Helps identify SBI (serious bacterial infection) and guide testing/work-up for well-looking febrile neonates
- Non-toxic looking
- Previously well (>37 wk gestational age, home with mother, no hyperbilirubinemia, no prior antibiotics or hospitalizations, no chronic/underlying illness)
- No skin, soft tissue, bone, joint, or ear infection on physical exam
- WBC 5000-15000, bands <1500, urine <10 WBC/HPF, stool <5 WBC/HPF

## Abdominal Pain

• see Paediatrics, P46

### History

- neuro, infections, autoimmune, hematology, trauma, abuse Hx questions
- nature of pain, associated fever
- associated GI, GU symptoms
- anorexia, decreased fluid intake
  - stress and/or social issues (most common in middle aged children)

### Physical Exam

- HEENT, respiratory, abdominal exam including DRE, testicular/genital exam

**Table 39. Differential Diagnosis of Abdominal Pain in Infants/Children/Adolescents**

Medical	Surgical
Colic	Malrotation with volvulus
UTI	Hirschsprung's disease
Constipation	Necrotizing enterocolitis
Gastroenteritis	Incarcerated hernia
Sepsis	Intussusception
Henoch-Schönlein purpura	Duodenal atresia
IBD	Appendicitis
Hemolytic uremic syndrome	Cholecystitis
Pneumonia	Pancreatitis
Strep throat	Adnexal torsion (testicular or ovarian)
Sickle cell disease crisis	Ectopic pregnancy
DKA	Trauma
Functional	Pyloric stenosis

\*Remember to keep an index of suspicion for child abuse

### Red Flags for Abdominal Pain

- Significant weight loss or growth retardation (need growth chart)
- Fever
- Joint pain with objective physical findings
- Rash
- Rectal bleeding
- Rebound tenderness and radiation of pain to back, shoulders, or legs
- Pain wakes from sleep
- Severe diarrhea and encopresis

## Common Infections

• see Paediatrics, P62

**Table 40. Antibiotic Treatment of Paediatric Bacterial Infections**

Infection	Pathogens	Treatment
<b>MENINGITIS SEPSIS</b>		
Neonatal	Group B <i>Streptococcus</i> (GBS), <i>E. coli</i> , <i>Listeria</i> , Gram-negative bacilli	ampicillin + cefotaxime
1-3 mo	Same pathogens as above and below	ceftriaxone/cefotaxime + vancomycin + ampicillin (if immunocompromised)
>3 mo	<i>S. pneumoniae</i> , <i>H. influenzae</i> type B (>5 yr), meningococcus	ceftriaxone + vancomycin
<b>OTITIS MEDIA</b>		
1st Line	<i>S. pneumoniae</i> , <i>H. influenzae</i> type B, <i>M. catarrhalis</i>	amoxicillin 75-90 mg/kg/d BID OR 45-60 mg/kg/day TID
1st Line with Penicillin Allergy		1. cefuroxime-axetil 30 mg/kg/d BID/TID OR ceftriaxone 50 mg/kg/day IM x 3 d (if minor allergy) 2. clarithromycin 15 mg/kg/d BID (for severe allergy)
Treatment Failure		7:1 amoxicillin to clavulanate ratio <35 kg: 45-60 mg/kg/d TID >35 kg: 50 mg PO TID
<b>STREP PHARYNGITIS</b>		
	Group A β-hemolytic <i>Streptococcus</i>	penicillin/amoxicillin, cefalexin, or erythromycin (can cause GI upset)
<b>UTI</b>		
	<i>E. coli</i> , <i>Proteus</i> , <i>H. influenzae</i> , <i>Pseudomonas</i> , <i>S. saprophyticus</i> , <i>Enterococcus</i> , GBS	Oral: cefalexin IV: aminoglycoside (gentamycin) + ampicillin
<b>PNEUMONIA</b>		
1-3 mo	Viral, <i>S. pneumoniae</i> , <i>C. trachomatis</i> , <i>B. pertussis</i> , <i>S. aureus</i> , <i>H. influenzae</i>	cefuroxime ± macrolide (erythromycin) OR ampicillin ± macrolide
3 mo-5 yr	Viral, <i>S. pneumoniae</i> , <i>S. aureus</i> , <i>H. influenzae</i> , <i>Mycoplasma pneumoniae</i>	ampicillin/amoxicillin or cefuroxime
>5 yr	As above	ampicillin/amoxicillin + macrolide OR cefuroxime + macrolide

## Child Abuse and Neglect

- see [Paediatrics](#), P18
- obligation to report any suspected/known case of child abuse or neglect to CAS yourself (do not delegate)
- document injuries
- consider skeletal survey x-rays (especially in non-ambulatory child), ophthalmology consult, CT head
- injury patterns associated with child abuse
  - HI: torn frenulum, dental injuries, bilateral black eyes, traumatic hair loss, diffuse severe CNS injury, retinal hemorrhage
  - Shaken baby syndrome: diffuse brain injury, subdural/SAH, retinal hemorrhage, minimal/no evidence of external trauma, associated bony fractures
  - skin injuries: bites, bruises/burns in shape of an object, glove/stocking distribution of burns, bruises of various ages, bruises in protected areas
  - bone injuries: rib fractures without major trauma, femur fractures <1 yr, spiral fractures of long bones in non-ambulatory children, metaphyseal fractures in infants, multiple fractures of various ages, complex/multiple skull fractures
  - GU/GI injuries: chronic abdominal/perineal pain, injury to genitals/rectum, STI/pregnancy, recurrent vomiting or diarrhea

## Common Medications

Table 41. Commonly Used Medications

Drug	Dosing Schedule	Indications	Comments
Acetaminophen	325-650 mg PO q4-6h PRN	Pain control	Max 4 g daily
Activated charcoal	30-100 g PO in 250 mL H <sub>2</sub> O	Poisoning/overdose	Efficacy and safety are case-dependent and are a source of debate
ASA	325-650 mg PO q4 h max 4 g/d stroke/MI risk: 81-325 mg PO once daily 160 mg chewed	Pain control Prevention of adverse cardiac events ACS	
β-blockers (metoprolol)	5 mg slow IV q5 min x3 if no contraindications Or 25 mg PO BID up to 100 mg PO BID	Acute MI CAD	
Diazepam	anxiety: 2-10 mg PO TID/QID alcohol withdrawal: 10-20 mg PO/IV q1 h titrated to signs/symptoms	Anxiety Alcohol withdrawal	
Enoxaparin	1 mg/kg SC BID	Acute MI DVT Prophylaxis/treatment	
Epinephrine	anaphylaxis: 0.3-0.5 mg IM; ACLS cardiac arrest: 1 mg IV q3-5 min ACLS bradycardia: 2-10 µg/min IV infusion	Anaphylaxis, ACLS cardiac arrest, ACLS bradycardia Hypotension	Max 1 mg/dose
Fentanyl	0.5-1.0 µg/kg IV	Procedural sedation Pain control	Very short acting narcotic (complication=apnea)
Flumazenil	0.3 mg IV bolus q5 min x3 doses	Reversal of procedural sedation	Benzodiazepine antagonist Can cause seizures/status epilepticus in chronic benzodiazepine users
Furosemide (Lasix®)	CHF: 40-80 mg IV HTN: 10-40 mg PO BID	CHF HTN	Monitor for electrolyte imbalances; also risk of ototoxicity with high dose
Glucose	0.5-1.0 g/kg (1-2 mL/kg) IV of D50W	Hypoglycemia/DKA	In conjunction with Insulin for hyperkalemia
Haloperidol	2.5-5.0 mg PO/IM initial effective dose 6-20 mg/d	Psychosis Cannabis Hyperemesis Syndrome (any N/V) Sedation	Monitor for side effects if prescribing to a patient with Parkinson's disease (extrapyramidal side effects); results in CNS depression
Ibuprofen	200-800 mg PO TID PRN max 1200 mg/d	Mild to moderate acute pain Analgesic and anti-inflammatory properties	
Insulin	bolus 5-10 U (0.2 U/kg) then 5-10 U (0.1 U/kg) per h	Hyperglycemia CCB/BB overdose	Monitor blood glucose levels Consider K <sup>+</sup> replacement, also measure blood glucose levels before administration
Ipratropium bromide	2-3 puffs inhaled TID-QID, max 12 puffs/d	Asthma	Contraindications include: peanut/soy allergy Caution with narrow-angle glaucoma
Lidocaine with epi	max 7 mg/kg SC	Local anesthetic	Not to be used in fingers, nose, toes, penis, ears
Lidocaine w/o epi	max 5 mg/kg SC	Local anesthetic	
Lorazepam	anxiety: 0.5-2 mg PO/IM/IV q6-8 h status epilepticus: 4 mg IV repeat up to q5 min	Anxiety Status epilepticus Alcohol withdrawal	

### Association of 2 Social Needs Interventions with Child Emergency Department Use and Hospitalizations

JAMA Pediatr. Published online April 11, 2022. doi:10.1001/jamapediatrics.2022.0503

**Purpose:** To link social needs interventions to healthcare outcomes among paediatric populations.

**Methods:** 604 child-caregiver pairs were randomized to groups in which they are given a social resources handout (SRH) with and without the help of a patient navigator support.

**Results:** During the 90 d of follow-up, pairs that navigated the SRH alone were associated with increased probability of hospitalization when compared to those given professional help.

### Presentation of Neglect

- Failure to thrive, developmental delay
- Inadequate or dirty clothing, poor hygiene
- Child exhibits poor attachment to parents

### Procedures that may Require Sedation

- Setting fractures
- Reducing dislocations
- Draining abscesses
- Exploring wounds/ulcers/superficial infections
- Endoscopic examination
- Reduce patient anxiety/agitation for imaging/procedures

Table 41. Commonly Used Medications

Drug	Dosing Schedule	Indications	Comments
Midazolam	50 µg/kg IV	Procedural sedation Sedation for agitation	Short acting benzodiazepine (complication = apnea when used with narcotic) Fentanyl and midazolam often used together for procedural sedation
Morphine	10-30 mg PO q4 h 2.5-5 mg IV q4 h	Mild to moderate acute/chronic pain Prescribed in combination with NSAIDs or acetaminophen	GI and constipation side effects DO NOT CRUSH, CUT, or CHEW Risk of tolerance
Naloxone	0.5-2 mg or 0.01-0.02 mg/kg initial bolus IV/IM/SL/SC or via ETI (2-2.5x IV dose), increase dose by 2 mg until response/max 10 mg	Comatose patient Opioid overdose Reversal in procedural sedation	If patient is a chronic opioid user begin with very small doses, and go up with small increments as needed
Nitroglycerin	acute angina: 0.3-0.6 mg SL q5 min, OR 5 µg/min IV increasing by 5-20 µg/min q3-5 min	Angina Acute MI Heart failure	Not to be used with other antihypertensives Not in right ventricular MI
Percocet 10/325 <sup>®</sup>	1-2 tabs PO q6 h PRN	Moderate pain control	Oxycodone + acetaminophen Max 4 g acetaminophen daily
Phenytoin	Status epilepticus: see <i>table 17</i> , <i>ER25</i>	Status epilepticus Epilepsy	Begin maintenance dose 12 h after loading dose Continuous ECG, BP monitoring mandatory
Polysporin <sup>®</sup>	Apply to affected area BID/TID	Superficial infections	
Propofol	0.25-1 mg/kg IV	Procedural sedation, also refractory status epilepticus Rapid sequence intubation	Short acting Anesthetic/sedative (complication = apnea, decreased BP)
Salbutamol	2 puffs inhaled q4-6 h max 12 puffs/d	Asthma Reactive airways	Caution with cardiac abnormalities
Thiamine	100 mg IV/IM initially, then 50-100 mg IM/IV/PO once daily x3 d	To treat/prevent Wernicke's encephalopathy	Caution use in pregnancy
Tylenol #3 <sup>®</sup>	1-2 tabs PO q4-6 h PRN	Pain control	Acetaminophen + codeine Metabolism of codeine is highly variable Max 4 g acetaminophen daily

## Landmark Emergency Medicine Trials

Trial Name	Reference	Clinical Trial Details
<b>DIVERTICULITIS</b>		
DINAMO	Ann Surg. 2021;274(5):e435	Title: Efficacy and Safety of Nonantibiotic Outpatient Treatment in Mild Acute Diverticulitis Purpose: To support that uncomplicated acute diverticulitis can be treated using outpatient care without antibiotics. Methods: A Prospective, multicentre, open-label, RCT trial was conducted with 480 patients diagnosed with uncomplicated mild diverticulitis using CT. Patients were randomized to the classical treatment with antibiotics and without antibiotics. The outcome of interest was hospital admission. Results: 14/238 patients treated with antibiotics were admitted to hospital and 8/242 patients treated without antibiotics were admitted to hospital. Conclusion: The results show that treatment of uncomplicated mild diverticulitis can be effectively conducted as an outpatient without use of antibiotics.
<b>CONCUSSION</b>		
NCT02564210	JAMA Pediatr. 2021;175(11):1124	Title: Effect of Screen Time on Recovery from Concussion Purpose: To determine if screen time during the first 48 h after injury has an impact on the duration of concussive symptoms. Methods: RCT consisting of 125 patients who were permitted to engage in unrestricted screen time or advised to abstain from screen time for 48 h after injury. The primary outcome of concern was days needed for resolution of concussive symptoms (<3 on Post-concussive symptom scale). Results: The treatment group with unrestricted screen time had a significantly longer recovery time when compared to the group advised to abstain from screen time - 8 d and 3.5 d, respectively. Conclusion: The results of this study show that abstinence from screen time during the first 48 h may reduce the duration of concussive symptoms.

# Basic Anatomy Review

## Major Endocrine Organs

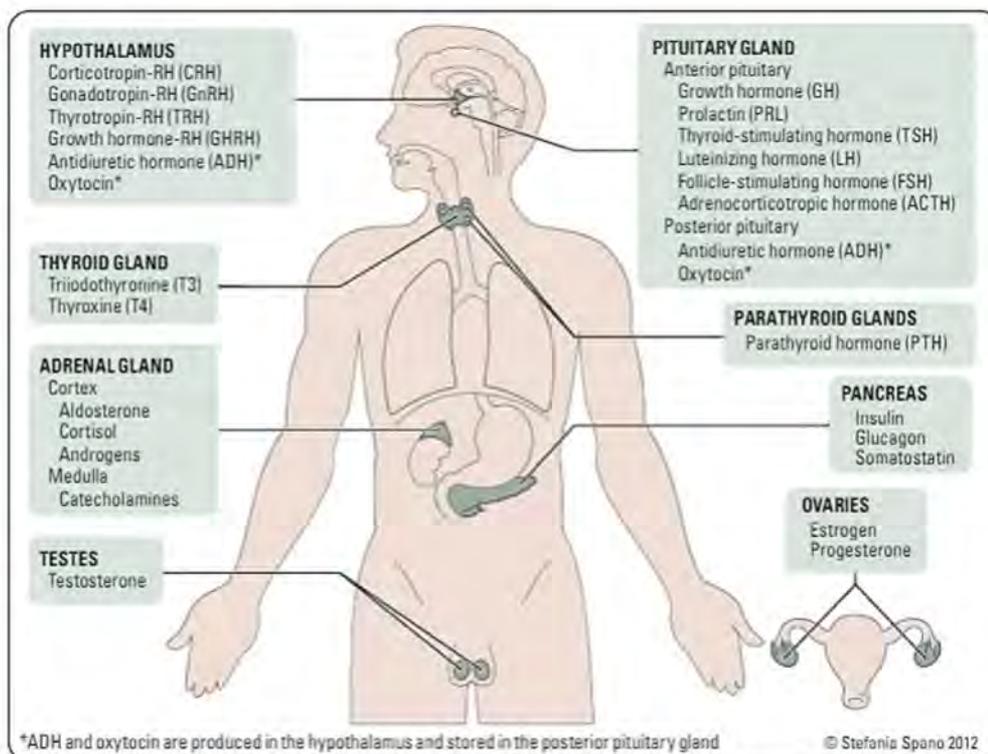

Figure 1. Endocrine system

# Dyslipidemias

## Definition

- metabolic disorders characterized by elevations of fasting plasma LDL-C and/or TG, and/or low HDL-cholesterol

## Overview of Lipid Transport

- lipoproteins are spherical complexes that consist of a lipid core surrounded by a shell of water-soluble cholesterol, apolipoproteins, and phospholipids
- lipoproteins transport lipids within the body
- apolipoproteins serve as enzyme cofactors, promote clearance of the particle by interacting with cellular receptors, and stabilize the lipoprotein micelle

Table 1. Lipoproteins

Lipoprotein	Function
Chylomicron	Transports dietary TG from gut to adipose tissue and muscle
VLDL	Transports hepatic synthesized TG from liver to adipose tissue and muscle
IDL	Product of hydrolysis of TG in VLDL by lipoprotein lipase resulting in depletion of TG core Enriched in cholesterol esters
LDL	Cholesterol rich atherogenic particles Formed by further removal of residual TG from IDL core by hepatic lipase
HDL	Transports cholesterol from peripheral tissues to liver Acts as a reservoir for apolipoproteins

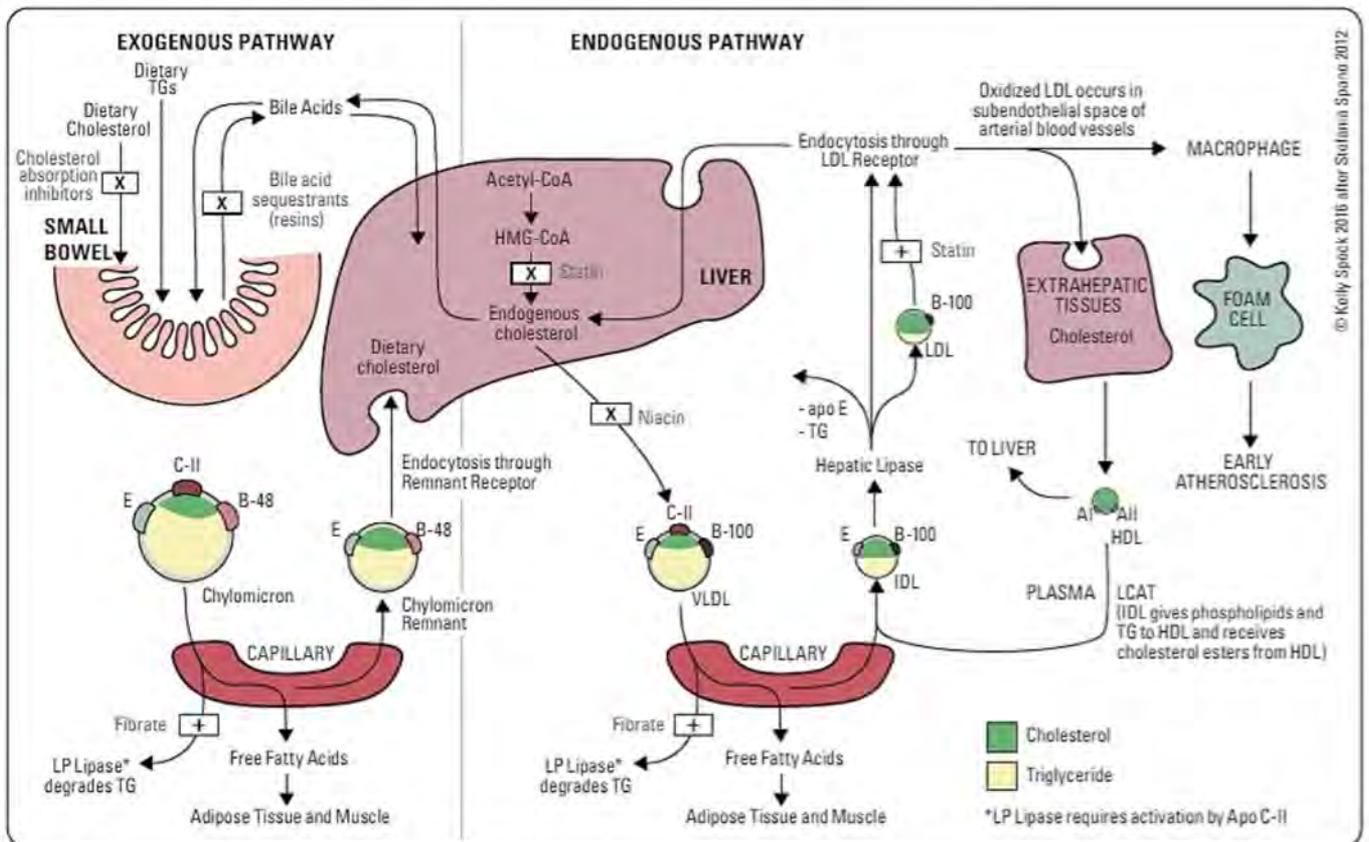

Figure 2. Exogenous and endogenous biosynthetic lipid pathways

## Primary Dyslipidemias (rare)

### Definition

- caused by a genetic defect in lipid metabolism

**Table 2. Primary Dyslipidemias**

Condition	Main Lab Abnormality	Mechanism	Clinical Features	Treatment
<b>Familial Hypercholesterolemia</b>	↑ Total cholesterol ↑ LDL cholesterol	Genetic defect in LDLR (most common), PCSK9, or ApoB An autosomal dominant condition that can be homozygous or heterozygous Impacts liver's ability to clear LDL from the circulation	Tendinous xanthomatosis (achilles, patellar, and extensor tendons of hand) Arcus cornealis Xanthelasmata Heterozygotes: premature CAD, 50% risk of MI in men by age 30 Homozygotes: manifest CAD and other vascular disease early in childhood which can be fatal (in <20 y/o)	Maximally tolerated statin as initial drug therapy, addition of second drug (ezetimibe and/or PCSK9 inhibitor) as second line, third line for homozygotes is portacaval shunt or LDL apheresis; potential liver transplant Refer to lipid specialist in drug-resistant hypercholesterolemia
<b>Familial Combined Hyperlipidemia</b>	↑ ApoB ↑ TGs ↑ LDL	Increased production of ApoB-100-containing lipoproteins from the liver	Premature coronary heart disease, xanthelasma, and obesity	Statins as initial drug therapy Addition of ezetimibe and/or PCSK9 inhibitor if LDL lowering is not achieved. May consider fibrate if elevated TG
<b>Polygenic Familial Hypercholesterolemia</b>	↑ LDL	Mild defects in multiple genes responsible for LDL metabolism: LDL-R, ApoB, ApoE4	Higher risk of cardiovascular disease similar to familial hypercholesterolemia for patients older than 40	Statins as first line Use ezetimibe, bile acid sequestrants, PCSK9 inhibitor, or nicotinic acid as alternatives (if not tolerated) or in addition
<b>Hereditary Chylomicronemia</b> Familial lipoprotein lipase deficiency (e.g. Familial Hypertriglyceridemia/type IV familial dyslipidemia) ApoC2 deficiency	↑ TG from excess chylomicron particles	Lipoprotein lipase deficiency: prevents proper digestion and storage of fats leading to massive accumulation of triglyceride rich chylomicron particles ApoC2 deficiency: prevents activation of lipoprotein lipase leading to massive accumulation of triglyceride rich chylomicron particles	Presents at infancy (LPL), adolescence to adulthood (ApoC2) Abdominal complaints (pain, hepatosplenomegaly, pancreatitis) Lipemia retinalis Eruptive xanthomata	<10-15% of calories from fat Supplement with essential fatty acids, fat-soluble vitamins Plasmapheresis may help individuals with ApoC2 mutation
<b>Familial Hypoalphalipoproteinemia</b>	↓ HDL cholesterol	Autosomal dominant inheritance of a mutation in the ABCA1 or the ApoA1 gene	Premature atherosclerosis Cerebrovascular disease	Reduce the risk of atherosclerosis with lifestyle changes, management of concomitant hypercholesterolemia, hypertriglyceridemia, and metabolic syndrome if present
<b>Tangier Disease</b>	↓ HDL cholesterol	Autosomal recessive inheritance of mutations in the ABCA1 gene Impaired HDL-mediated cholesterol efflux from macrophages and impaired intracellular lipid trafficking	Mild hypertriglyceridemia Neuropathy Enlarged, orange-coloured tonsils Premature atherosclerosis Splenomegaly Hepatomegaly Corneal clouding T2DM	Reduce the risk of atherosclerosis with lifestyle changes, management of concomitant hypercholesterolemia, hypertriglyceridemia, and metabolic syndrome if present

## Secondary Dyslipidemias

### Definition

- caused by acquired medical conditions or lifestyle factors that affect lipid metabolism

**Table 3. Etiology of Secondary Dyslipidemias**

Hypercholesterolemia	Low HDL	Hypertriglyceridemia
<b>Endocrine:</b> hypothyroidism (small dense LDL with T2DM and obesity, with normal LDL level)	<b>Endocrine:</b> obesity/metabolic syndrome, DM	<b>Endocrine:</b> obesity/metabolic syndrome, DM
<b>Renal:</b> nephrotic syndrome, CKD	<b>Drugs:</b> β-blockers, anabolic steroids	<b>Renal:</b> nephrotic syndrome, CKD
<b>Immunologic:</b> monoclonal gammopathy	<b>Other:</b> acute infections, inflammatory conditions	<b>Drugs:</b> corticosteroids, estrogen, hydrochlorothiazide, retinoic acid, β-blockers without intrinsic sympathomimetic action (ISA), anti-retroviral drugs, atypical antipsychotics, oral contraceptive pills
<b>Hepatic:</b> cholestatic liver disease (e.g. primary biliary cirrhosis)		<b>Lifestyle:</b> alcohol, high carbohydrate/high fat diet
<b>Nutritional:</b> anorexia nervosa		<b>Other:</b> pregnancy
<b>Drugs:</b> cyclosporin, carbamazepine, steroids		
<b>Lifestyle:</b> smoking, obesity		

## Dyslipidemia and the Risk for Coronary Artery Disease

- increased LDL is a major risk factor for atherosclerosis and CAD
- increased HDL is associated with decreased CVD and mortality
- moderate hypertriglyceridemia (triglyceride level 2.3-9 mmol/L) is an independent risk factor for CAD, especially in people with DM and in post-menopausal women

### Screening

- screen men and women ≥40 yr or post-menopausal women
- if the following risk factors are present, screen at any age:
  - DM
  - current cigarette smoking or COPD
  - HTN (sBP >140, dBP >90), hypertensive diseases of pregnancy
  - obesity (BMI ≥30 kg/m<sup>2</sup>)

### Familial Hypercholesterolemia and Cardiovascular Risk Calculators

- Risk calculators such as Framingham and SCORE do not apply to patients with familial hypercholesterolemia
- Consider all adults with familial hypercholesterolemia as "high-risk"

### Treatment Effect

- Each 1.0 mmol/L decrease in LDL corresponds to approximately 20-25% relative risk reduction in cardiovascular disease
- Statins lower LDL by about 30-40%
- Ezetimibe lowers LDL by about 18%
- PCSK9 inhibitors lowers LDL by about 50%

### 6% Rule

- If the dose of a statin is doubled, there is approximately a 6% increase in the LDL lowering efficacy

- family history of premature CVD or dyslipidemia
- clinical signs of hyperlipidemia (xanthelasma, xanthoma, arcus cornealis)
- clinical or radiological evidence of AAA
- clinical evidence of atherosclerosis
- inflammatory disease (rheumatoid arthritis, SLE, psoriatic arthritis, ankylosing spondylitis, inflammatory bowel disease)
- HIV infection on highly active antiretroviral therapy (HAART)
- CKD (estimated GFR <60 mL/min/1.73 m<sup>2</sup>)
- erectile dysfunction
- high-risk ethnicity: South Asian, Indigenous peoples
- screen children with a family history of hypercholesterolemia or chylomicronemia
- components of screening:
  - history and physical examination, lipid panel (total cholesterol, LDL-C, HDL-cholesterol, TG), non-HDL cholesterol, BG, eGFR
  - optional: urine ACR, ApoB
- ApoB
  - each atherogenic particle (VLDL, IDL, LDL, and lipoprotein A) contains one molecule of ApoB
  - serum (ApoB) reflects the total number of particles and may be useful in assessing cardiovascular risk and adequacy of treatment in high-risk patients and those with metabolic syndrome
- Lp(a) levels may help stratify those at intermediate risk, but is not recommended for routine measurement (only measured once in a patient's lifetime)
- coronary artery calcium (CAC) may help stratify those at intermediate risk
- CRP levels
  - highly sensitive acute phase reactant (non-specific)
  - may be clinically useful to identify those at a higher risk of CVD than predicted by the global risk assessment

**CVD Risk Assessment**

- Framingham Risk Score (FRS): 10 yr risk of major CVD event. Calculated based on gender, age, total cholesterol, HDL-cholesterol, sBP, and smoking (>20%: high-risk; 10-19%: moderate risk; <10%: low-risk)
- Reynolds Risk Score: 10 yr risk of major CVD event. Calculated based on age, sBP, total cholesterol, HDL-cholesterol, high sensitivity CRP, family history of MI

**Treatment of Dyslipidemias**

**Approach to Treatment**

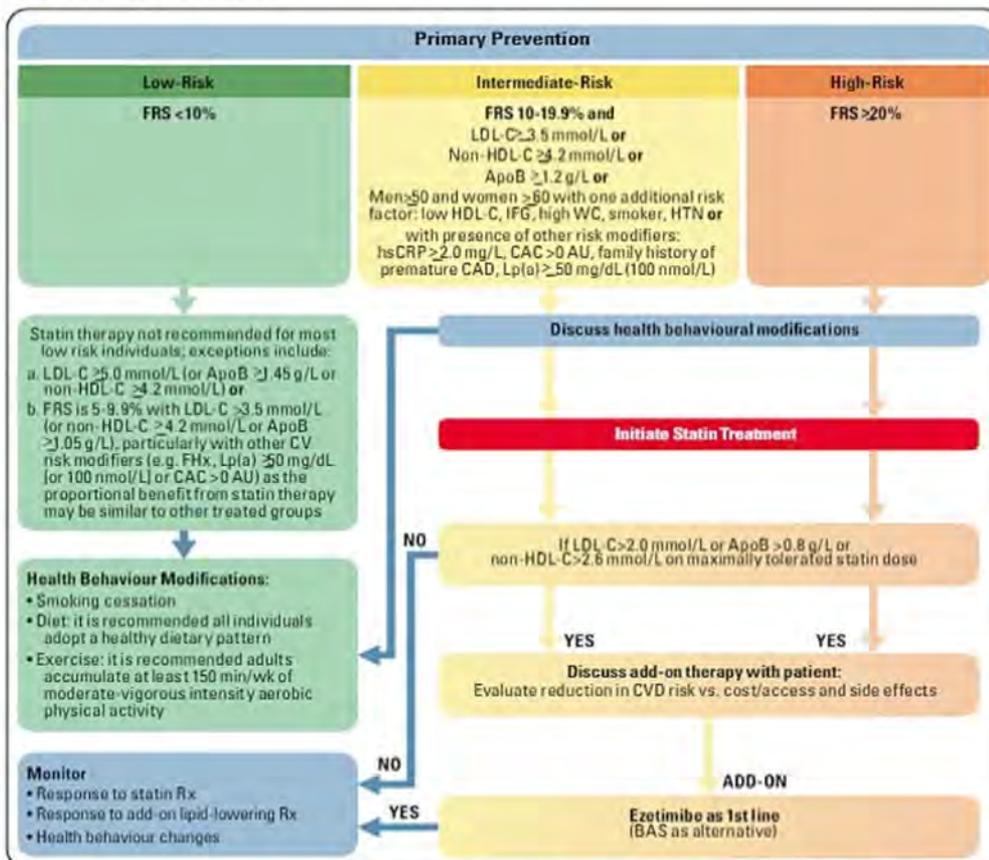

Figure 3a. Treatment approach for primary prevention patients (without a statin indicated condition<sup>†</sup>) Adapted from 2021 Canadian Cardiovascular Society Guidelines for the Management of Dyslipidemia for the Prevention of Cardiovascular Disease in the Adult. Canadian Cardiovascular Society.

**For Statin Follow-Up**

- Liver enzymes and lipid profile: liver enzymes measured at the beginning of treatment, then once after therapy initiated. Lipids (once stabilized) measured annually. Order both if patient complains of jaundice, right upper quadrant pain, dark urine
- CK at baseline and if patient complains of myalgia
- Discontinue statin if CK >10x upper limit of normal or patient has persistent myalgia

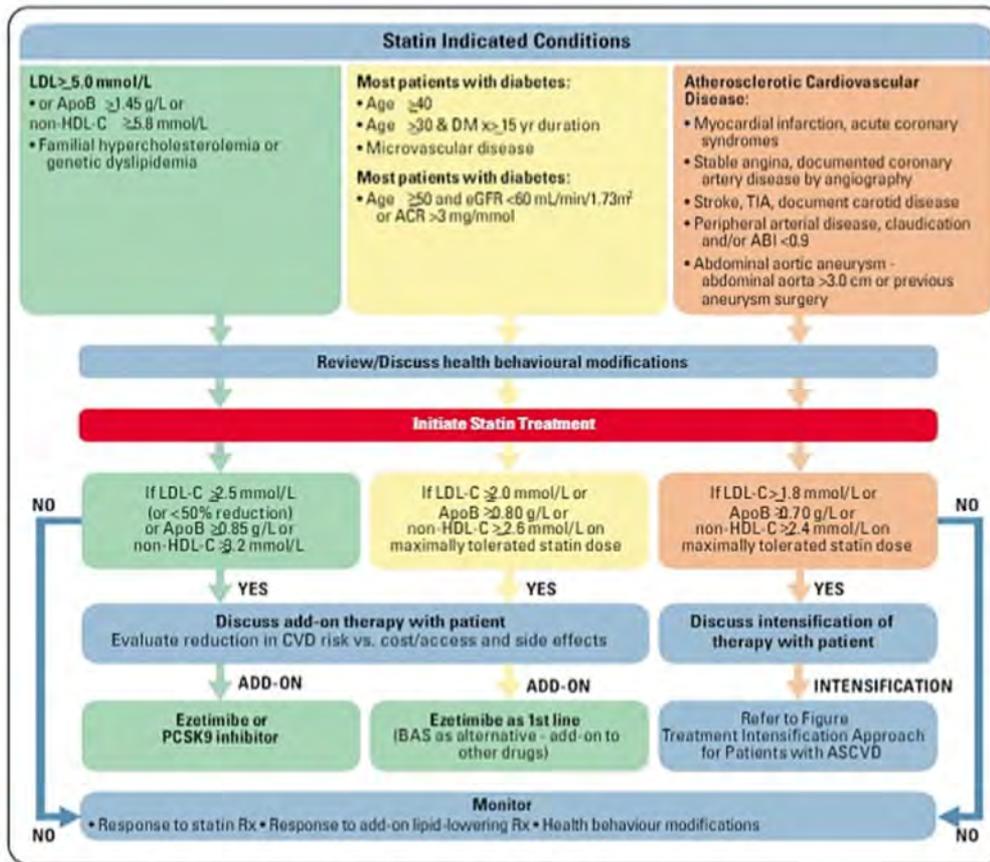

**2021 Canadian Cardiovascular Society Guidelines on the Management of Dyslipidemia for the Prevention of Cardiovascular Disease in the Adult**

Can J Cardiol 2021; 50828-282X(21)00165-3

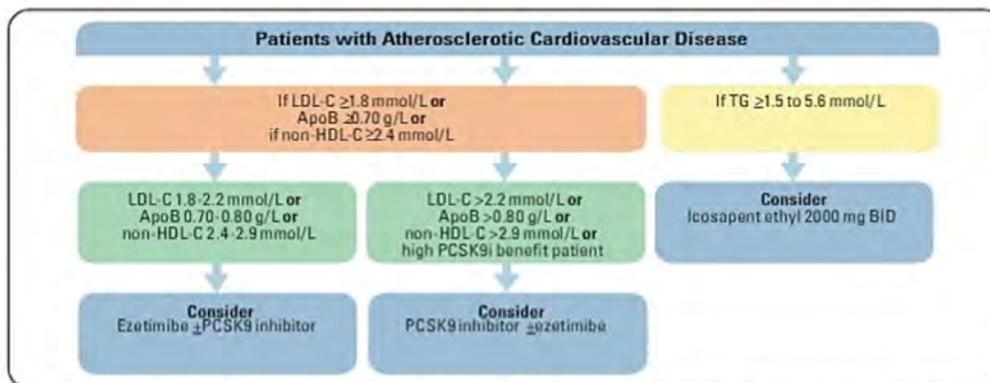

- Patients with clinical atherosclerosis, AAA, LDL-C ≥5.0 mmol/L, and most with diabetes or CKD should be started on statin therapy
- Lipid/lipoprotein screening is recommended in patients >40 yr or at any age for those at increased risk
- Non-HDL cholesterol or ApoB are preferred to LDL-C as lipid parameters for screening in patients with TG >1.5 mmol/L
- LP(a) should be measured once in a person's lifetime as part of initial lipid screening to assess cardiovascular risk
- Lipid-lowering therapy should be intensified with ezetimibe and/or PCSK9 inhibitors in patients with LDL-C remaining ≥1.8 mmol/L (or non-HDL cholesterol ≥2.4 mmol/L or ApoB ≥0.7 g/L) on a maximally tolerated statin dose

See Landmark Endocrinology Trials for more information on the JUPITER trial. It details the effects of statin treatment on cardiovascular events in patients with elevated high-sensitivity CRP levels.

**Figure 3b. Treatment approach for patients with a statin indicated condition**

## Disorders of Glucose Metabolism

### Overview of Glucose Regulation

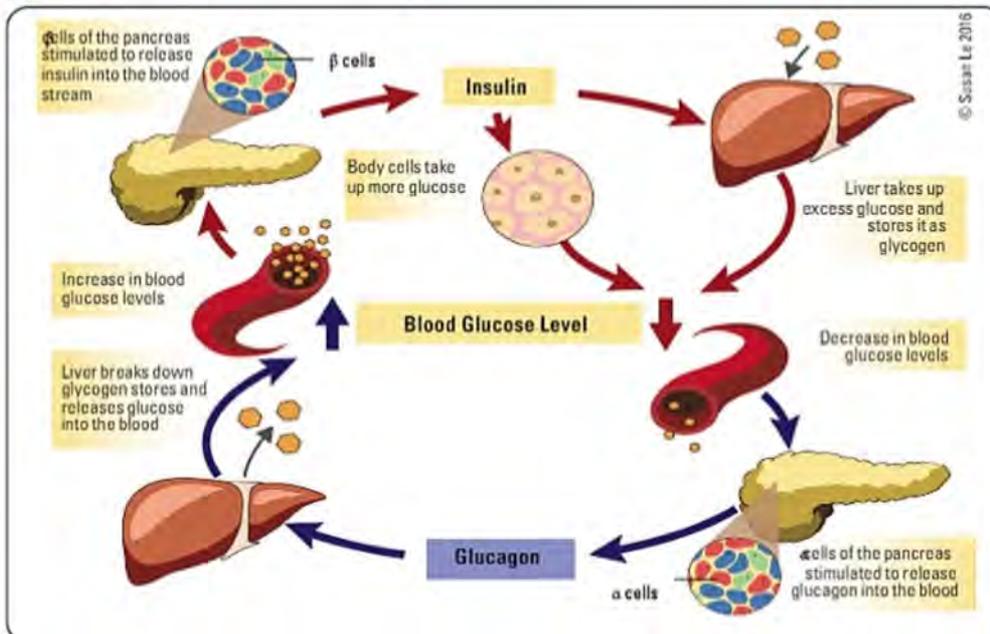

Figure 4. Blood glucose regulation

### Pre-Diabetes (Impaired Glucose Tolerance/Impaired Fasting Glucose)

- 1-5% per yr go on to develop DM
- 50-80% revert to normal glucose tolerance
- weight loss may improve glucose tolerance (5-10% of body weight)
- increased risk of developing macrovascular complications
- lifestyle modifications decrease progression to DM by 58%

#### Diagnostic Criteria (Diabetes Canada 2018 Guidelines) (any of the following)

- IFG: FPG 6.1-6.9 mmol/L
- IGT: 2 h 75 g OGTT 7.8-11.0 mmol/L
- A1c: 6.0-6.4%

### Diabetes Mellitus

#### Definition

- DM is a heterogeneous metabolic disorder characterized by the presence of hyperglycemia
- chronic hyperglycemia of diabetes is associated with relatively specific long-term microvascular complications affecting the eyes, kidneys, and nerves, as well as an increased risk for macrovascular complications such as CVD, stroke, and peripheral vascular disease. Diabetes also increases the risk of heart failure

#### Diagnostic Criteria (as per Diabetes Canada 2018 Clinical Practice Guidelines)

- any one of the following is diagnostic:

Table 4. Diagnosis of Diabetes

<b>FPG ≥7.0 mmol/L</b> Fasting = no caloric intake for at least 8 h or <b>A1c ≥6.5% (in adults)</b> Not for diagnosis of suspected T1DM, children, adolescents, or pregnant women or <b>2hPG in a 75 g OGTT ≥11.1 mmol/L</b> or <b>Random PG ≥11.1 mmol/L</b> Random = any time of the day, without regard to the interval since last meal
---

- in the presence of hyperglycemia symptoms (polyuria, polydipsia, polyphagia, weight loss, blurry vision), a confirmatory test is not required
- in the absence of hyperglycemia symptoms, a **repeat confirmatory test** (FPG, A1c, 2hPG in a 75 g OGTT) on another day is required for diagnosis of diabetes

#### Reduction of Cardiovascular Events with Icosapent Ethyl-Intervention Trial - REDUCE-IT

NEJM 2019; 380:11-22

**Study:** Multicenter, randomized, double-blind, placebo-controlled trial with 5 yr of follow-up. Population: 8179 patients with established CVD or with diabetes and other risk factors, who had been receiving statin therapy and who had a fasting TG level of 135-499 mg/dL and a LDL level of 41-100 mg/dL.

**Intervention:** Randomly assigned to receive 2 g of icosapent ethyl BID or placebo.

**Primary Outcome:** Composite of cardiovascular death, nonfatal MI, nonfatal stroke, coronary revascularization or unstable angina.

**Results:** A primary endpoint event occurred in 17.2% of the patients in the icosapent ethyl group compared to 22% of the patients in the placebo group (HR=0.75, 95% CI: 0.68-0.83, P<0.001). The rates of additional ischemic end points were significantly lower in the icosapent ethyl group than in the placebo group, including the rate of cardiovascular death. A larger percentage of patients in the icosapent ethyl group than in the placebo group were hospitalized for atrial fibrillation or flutter (P=0.004) and serious bleeding occurred in 2.7% of the patients in the icosapent ethyl group as compared to 2.1% in the placebo group (P=0.06).

**Conclusions:** Among patients with elevated TG levels despite statin therapy, the risk of cardiovascular events was significantly lower in the group who received 2 g of icosapent ethyl BID compared to those who received placebo.

See trial for more details, outlining specific endpoints and results.

See Landmark Endocrinology Trials for more information on the 4T trial. It details the efficacy of complex insulin regimen for patients with T2DM.

See Landmark Endocrinology Trials for more information on the UKPDS trial. It compares the safety and efficacy of intensive blood-glucose control with sulphonylurea or insulin vs. conventional treatment on the risk of complications in T2DM.

See Landmark Endocrinology Trials for more information on the DCCT trial. It details the use of intensive insulin injection therapy for the treatment of T1DM in patients with no cardiovascular history or severe diabetic complications.

**Etiology and Pathophysiology**

**Diabetes Canada 2018 Clinical Practice Guidelines**

	Target
<b>A1c</b>	<7.0% (most adults)
<b>Fasting plasma glucose</b>	4-7 mmol/L
<b>2h post-prandial glucose</b>	5-10 mmol/L 5-8 mmol/L if not meeting target A1c and can be safely achieved
<b>Lipids</b>	LDL <2.0 or 50%
<b>Blood pressure</b>	<130/80

**Table 5. Etiologic Classification of Diabetes Mellitus**

- I. **T1DM** immune-mediated or idiopathic  $\beta$  cell destruction, usually leading to absolute insulin deficiency (includes latent autoimmune diabetes in adults (LADA))
- II. **T2DM** occurs when the pancreas does not produce enough insulin or when the body does not effectively use the insulin that is produced
- III. **Other Specific Causes of DM**
  - a. Genetic defects of  $\beta$  cell function (e.g. Maturity-Onset Diabetes of the Young (MODY; also known as monogenic diabetes)) or insulin action
  - b. Diseases of the exocrine pancreas:
    - Pancreatitis, pancreatectomy, neoplasia, cystic fibrosis, hemochromatosis ("bronze diabetes")
  - c. Endocrinopathies:
    - Acromegaly, Cushing's syndrome, glucagonoma, pheochromocytoma, hyperthyroidism
  - d. Drug-induced:
    - Glucocorticoids, thyroid hormone,  $\beta$ -adrenergic agonists, thiazides, phenytoin, antipsychotics
  - e. Infections:
    - Congenital rubella, CMV, coxsackie
  - f. Genetic syndromes associated with DM:
    - Down's syndrome, Klinefeller's syndrome, Turner's syndrome
- IV. **Gestational Diabetes Mellitus** (see *Obstetrics, 0829*)

**Table 6. Comparison of Type 1 and Type 2 Diabetes Mellitus**

	Type 1	Type 2
<b>Onset</b>	Usually <30 yr of age	Usually >40 yr of age Increasing incidence in paediatric population 2 <sup>o</sup> to obesity
<b>Epidemiology</b>	Traditionally more common in European populations Less common in Asian, Hispanic, Indigenous, and Black populations Accounts for 5-10% of all DM	More common in Black, Hispanic, Indigenous, and Asian populations Accounts for >90% of all DM
<b>Etiology</b>	Autoimmune or idiopathic	Complex and multifactorial
<b>Genetics</b>	Monozygotic twin concordance is 30-40% Associated with HLA class II DR3 and DR4, with either allele present in up to 95% of T1DM Certain DD alleles also confer a risk	Greater heritability than T1DM Monozygotic twin concordance is 70-90% Polygenic Non-HLA associated
<b>Pathophysiology</b>	Synergistic effects of genetic, immune, and environmental factors that cause $\beta$ cell destruction resulting in impaired insulin secretion Autoimmune process is believed to be triggered by environmental factors (e.g. viruses, bovine milk protein, urea compounds) Pancreatic cells are infiltrated with lymphocytes resulting in islet cell destruction 80% of $\beta$ cell mass is destroyed before features of DM present	Impairment of insulin secretion, excess glucose production by the liver, insulin resistance in fat and muscle, impaired renal handling of glucose (SGLT2i), impaired incretin activity (decreased insulin production, excess glucagon production, enhanced carbohydrate absorption in the gut and increased appetite from the hypothalamus)
<b>Natural History</b>	<p>After initial presentation, honeymoon period often occurs where glycemic control can be achieved with little or no insulin treatment as residual cells are still able to produce insulin Once these cells are destroyed, there is complete insulin deficiency</p>	<p>Early on, glucose tolerance remains normal despite insulin resistance as <math>\beta</math> cells compensate with increased insulin production As insulin resistance and compensatory hyperinsulinemia continue, the <math>\beta</math> cells are unable to maintain the hyperinsulinemic state which results in glucose intolerance and DM</p>
<b>Circulating Autoantibodies</b>	Islet cell Ab present in up to 60-85% Most common islet cell Ab is against glutamic acid decarboxylase (GAD) Up to 60% have Ab against insulin	<10%
<b>Risk Factors</b>	Personal history of other autoimmune diseases including Graves' disease, myasthenia gravis, autoimmune thyroid disease, celiac disease, and pernicious anemia Family history of autoimmune diseases	Age >40 yr Schizophrenia Abdominal obesity/overweight Fatty liver First-degree relative with DM Hyperuricemia Race/ethnicity (Black, Indigenous, Hispanic, Asian-American, Pacific Islander) Hx of IGT or IFG HTN Dyslipidemia Medications e.g. 2nd generation antipsychotics PCOS Hx of gestational DM or macrosomic baby (>9 lb or >4 kg)
<b>Body Habitus</b>	Normal to thin	Typically overweight with increased central obesity
<b>Treatment</b>	Insulin	Lifestyle modification Non-insulin antihyperglycemic agents - unless contraindicated, metformin should be the initial antihyperglycemic agent of choice. Additional agents to be selected on the basis of clinically relevant issues, such as CV risk, eGFR, glucose-lowering effectiveness, risk of hypoglycemia, and effect on body weight Insulin therapy
<b>Acute Complications</b>	DKA	HHS DKA
<b>Screening</b>	Subclinical prodrome can be detected in first and second-degree relatives of those with T1DM by the presence of pancreatic islet autoantibodies	Screen individuals with risk factors

## Treatment of Diabetes

### Glycemic Targets

- A1c reflects glycemic control over 3 mo and is a measure of long-term glycemic control
- A1c is recommended to be measured once every 3-6 mo and personalized A1c targets should be set for patients based on their frailty or functional dependence and life expectancy
- therapy for most individuals living with T1DM or T2DM (especially younger patients) should be targeted to achieve an A1c  $\leq 7.0\%$  in order to reduce the risk of microvascular and, if implemented early in the course of disease, macrovascular complications
- more intensive glucose control, A1c  $< 6.5\%$ , may be targeted to further reduce risk of nephropathy and retinopathy, provided this does not result in a significant increase in hypoglycemia
- less stringent A1c targets (7.1-8.5%) may be more appropriate in patients with limited life expectancy, higher level of functional dependency, a history of recurrent severe hypoglycemia, multiple comorbidities, extensive CAD, or a failure to achieve an A1c  $< 7.0\%$  despite intensified basal and bolus insulin therapy
- there may be harm associated with strategy to target A1c  $< 6.0\%$  (see *ACCORD Trial, E63*)
- A1c can be slightly increased in iron deficiency, vitamin B12 deficiency, alcoholism, CKD, independent of glycemic status
- A1c can be slightly decreased in chronic liver disease, reticulocytosis, ingestion of ASA, vitamin C or E, and splenomegaly, independent of glycemic status
- timing and frequency of self-monitored blood glucose is determined by the type of diabetes, treatment, and the individual's capacity to use the information
- flash glucose monitoring and continuous glucose monitoring devices may be suggested for some people living with diabetes to optimize their diabetes self-management

### Diet

- nutritional therapy can reduce A1c by 1-2%
- it is recommended to intake 45-60% carbohydrates, 15-20% protein, and  $< 35\%$  fats as a percentage of total daily energy
- it is recommended to intake  $< 7\%$  of saturated fats and  $< 10\%$  of polyunsaturated fats as a percentage of total daily calories
- it is recommended to replace high-glycemic-index carbohydrates with low-glycemic-index carbohydrates and increase fibre intake
- limit sodium, alcohol, and caffeine intake
- people with diabetes should adopt dietary patterns that result in the greatest adherence based on their values and preferences
- type 1: carbohydrate counting is used to titrate prandial insulin dose
- type 2: weight reduction to help control blood glucose levels

### Lifestyle

- losing 5-10% of the initial body weight can improve insulin sensitivity, glycemic control, hypertension, and dyslipidemia in people with T2DM
- regular physical exercise can improve insulin sensitivity, lower lipid concentrations, and control blood pressure. At least 150 min per wk of moderate-vigorous aerobic exercise and at least 2 sessions per wk of resistance exercise are recommended
- smoking cessation, referral to diabetes education clinic, psychosocial support

### Medical Treatment: Non-Insulin Antihyperglycemic Agents (T2DM)

- initiate non-insulin antihyperglycemic therapy (generally metformin first line) within 3 mo if lifestyle management does not result in adequate glycemic control
- if the initial A1c value is more than 1.5% higher than the patient's personalized A1c target, initiate pharmacologic therapy with metformin immediately, and consider insulin or a combination of therapies
- if presenting in metabolic decompensation, begin with insulin therapy immediately
- adjust dose or add additional pharmacologic therapy in a timely fashion to achieve target A1c within 3-6 mo of diagnosis
- see *Common Medications, E57* for details on antihyperglycemic agents

### Medical Treatment: Insulin

- used for T1DM at onset, may be used in T2DM at any point in treatment
- routes of administration: subcutaneous injections, continuous subcutaneous insulin infusion pump, IV infusion (regular insulin only)
- basal insulin: to control blood sugar (produced by liver) during periods of fasting; slow onset of action, long-acting
- bolus insulin: required to dispose of glucose from a meal or BG correction; rapid onset of action, short-acting
- estimated total daily insulin requirement: often start with 0.3-0.5 units/kg/d (see *Table 7, E11*)

#### Who should receive statins (regardless of LDL-C level)

- Clinical CVD
- Age  $> 40$  yr
- Microvascular complications or
- Diabetes  $> 15$  yr duration and age  $> 30$  yr
- Warrants therapy based on the 2016 Canadian Cardiovascular Society Guidelines for the Diagnosis and Treatment of Dyslipidemia

#### Who should receive ACEI/ARB (regardless of baseline BP)

- Clinical CVD
- Age  $> 55$  years with an additional CV risk factor or end organ damage (albuminuria, retinopathy, left ventricular hypertrophy)
- Microvascular complications

#### ABCDEs of Diabetes Care

- A1c targets ( $< 7.0\%$ )
- Blood pressure ( $< 130/80$ )
- Cholesterol (LDL-C  $< 2.0$  mmol/L)
- Drugs for CVD risk reduction
- Exercise goals and healthy eating
- Smoking cessation
- Screening for complications
- Stress management

#### Closed-Loop Insulin Delivery for Glycemic Control in Noncritical Care

NEJM 2018;379:547-556

**Purpose:** To determine if a closed-loop delivery system (artificial pancreas) can improve glycemic control in patients with T2DM receiving noncritical care.

**Methods:** Patients ( $n=136$ ) received either closed-loop insulin delivery or conventional subcutaneous insulin therapy. The percentage of time the sensor glucose measurement was within 5.6 to 10.0 mmol/L was measured.

**Results:** Closed-loop insulin delivery was more effective at maintaining glucose within the target range (95% CI: 18.6-30.0;  $P=0.001$ ). Patients on closed-loop insulin therapy had lower mean glucose levels ( $P<0.001$ ). There was no difference in duration of hypoglycemia or amount of insulin delivered between groups.

**Conclusions:** The use of an automated, closed-loop insulin-delivery system (artificial pancreas) resulted in significantly better glycemic control among inpatients with T2DM receiving noncritical care.

Closed-loop insulin delivery using an artificial pancreas has also shown promise in patients with T2DM (NEJM 2019;381:1707-17).

See Landmark Endocrinology Trials for more information on the ACCORD trial. It details the effects of intensive glucose control in patients with T2DM and cardiovascular risk factors.

See Landmark Endocrinology Trials for more information on the ACCORD Trial – Blood Pressure Control. It details the effects of intensive blood pressure control for patients with T2DM.

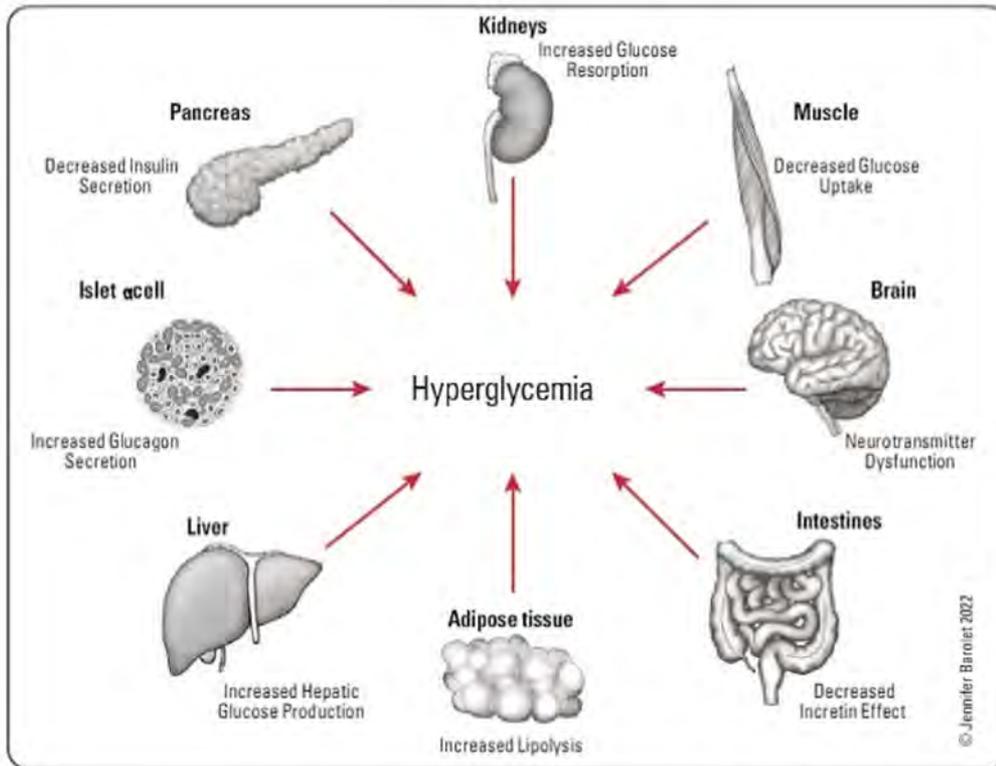

Figure 5. Ominous octet: factors leading to hyperglycemia

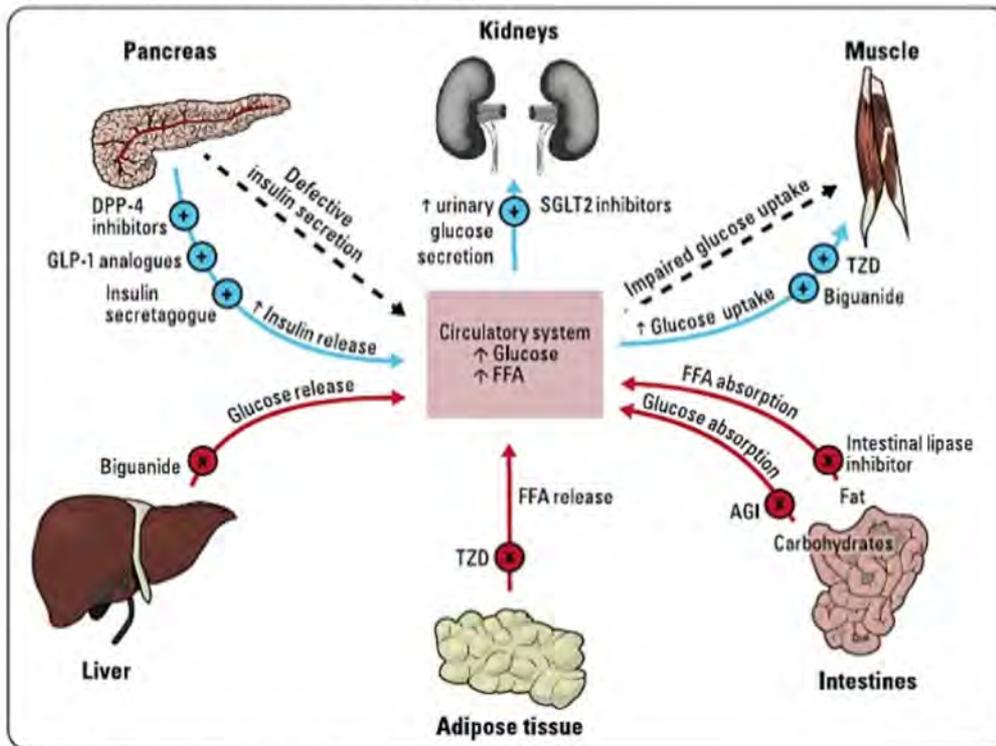

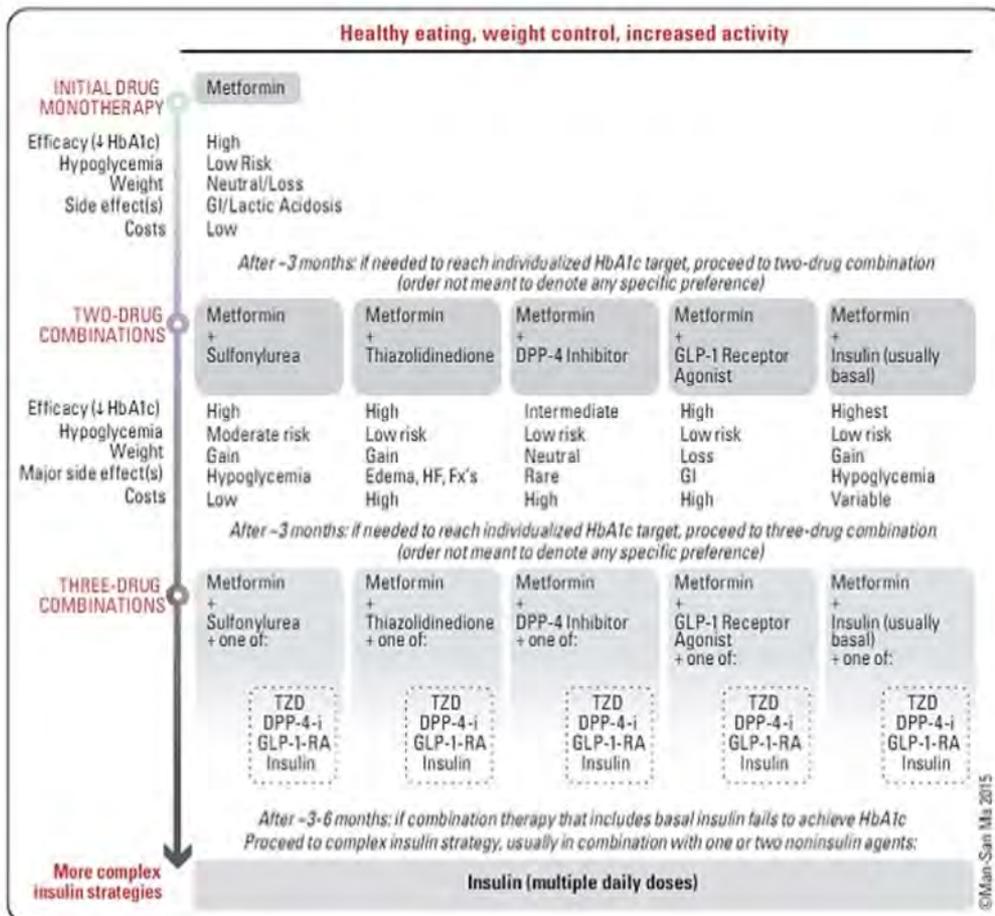

Figure 6. Antihyperglycemic agents

See Landmark Endocrinology Trials for more information on the ACCORD Trial – Combination Lipid Therapy. It details the effects of combinational lipid therapy for patients with T2DM.

See Landmark Endocrinology Trials for more information on the PREDIMED trial. It details the effects of a Mediterranean diet on reducing major cardiovascular events in patients with T2DM or other high cardiovascular risk factors.

**Sick Day Management**

If patient is ill and is unable to maintain adequate fluid intake, or has an acute decline in renal function, they should hold the following medications:

**SAD MANS**

- Sulfonylureas
- ACEIs
- Diuretics and direct renin inhibitors
- Metformin
- ARBs
- NSAIDs
- SGLT2i

**Figure 7. Management of hyperglycemia in T2DM**

**Table 7. Available Insulin Formulations**

Insulin Type (trade name)	Onset	Peak	Duration
<b>PRANDIAL (BOLUS) INSULINS</b>			
<b>Rapid-acting insulin analogues</b>			
Insulin aspart (NovoRapid <sup>®</sup> )	10-15 min	1-1.5 h	3-5 h
Insulin faster aspart (Fiasp <sup>®</sup> )	4 min	1 h	3-4 h
Insulin lispro (Humalog <sup>®</sup> , Humalog 200 units/mL)	10-15 min	1-2 h	3.5-4.75 h
Insulin glulisine (Apidra <sup>®</sup> )	10-15 min	1-1.5 h	3-5 h
<b>Short-acting insulins</b>			
Humulin R <sup>®</sup>	30 min	2-3 h	6.5 h
Novolin Toronto <sup>®</sup>			
<b>BASAL INSULINS</b>			
<b>Intermediate-acting</b>			
Humulin N <sup>®</sup>	1-3 h	5-8 h	Up to 18 h
Novolin NPH <sup>®</sup>			
<b>Long-acting basal insulin analogues</b>			
Insulin detemir (Levemir <sup>®</sup> )	90 min	Not applicable	Up to 24 h (detemir 16-24 h)
Insulin glargine 100 units/mL (Lantus <sup>®</sup> /Basaglar <sup>®</sup> )	90 min		Up to 24 h (glargine 24 h)
Insulin glargine 300 units/mL (Toujeo <sup>®</sup> )	Up to 6 h		Up to 30 h
Insulin glargine (Basaglar <sup>®</sup> )	90 min		Up to 24 h (glargine 24 h)
Insulin degludec (Tresiba <sup>®</sup> )	60 min		Ultralong acting (42 h)
<b>PRE-MIXED INSULINS</b>			
<b>Premixed regular insulin – NPH</b>			
Humulin 30/70 <sup>®</sup>	A single vial or cartridge contains a fixed ratio of insulin		
Novolin 30/70 <sup>®</sup>	(% of rapid-acting or short-acting insulin to % of intermediate-acting insulin)		
<b>Premixed insulin analogues</b>			
Biphasic insulin aspart (NovoMix 30 <sup>®</sup> )			
Insulin lispro/lispro protamine (Humulin 30/70, Novolin 30/70, Novomix 30 and Humalog Mix 25)

- Intra-abdominal process (e.g. pancreatitis, cholecystitis)
- Intraoperative/perioperative stress

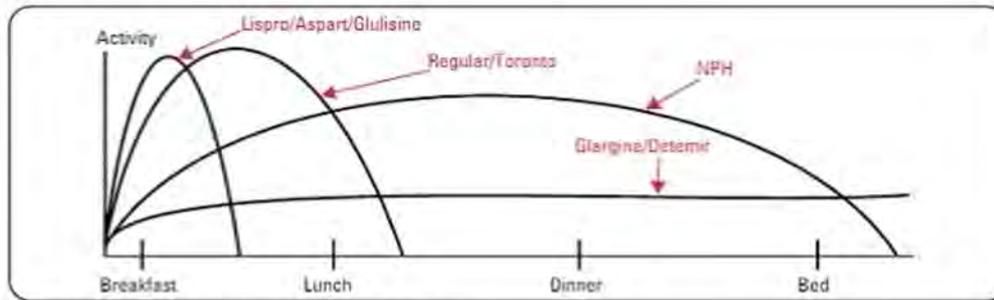

Figure 8. Duration of activity of different insulins

Table 8. Insulin Regimens for T2DM and T1DM

Regimen	Administration
<b>T1DM</b> Basal-bolus (multiple daily injections (MDI))	Estimated total insulin requirement is 0.5-0.7 U/kg 40% is given as basal insulin at bedtime 20% is given as bolus insulin before breakfast, lunch, and dinner
Pre-mixed	Estimated total insulin requirement is 0.5-0.7 U/kg 2/3 dose is given as pre-mixed insulin before breakfast 1/3 dose is given as pre-mixed insulin before dinner
<b>T2DM</b> Non-insulin antihyperglycemic agent + basal insulin	Titrate up by 1 unit until FPG < 7.0 mmol/L

\*Bolus insulin: Aspart, Glulisine, Lispro; \*Basal insulin: Glargine, Detemir, NPH; \*Pre-mixed insulin: Humulin 30/70, Novolin 30/70, Novomix 30, and Humalog Mix2

Table 9. Titrating Insulin Doses

Hyperglycemic Reading	Insulin Correction
High AM sugar	Increase bedtime basal insulin
High lunch sugar	Increase AM rapid/regular insulin
High supper sugar	Increase lunch rapid/regular insulin or increase AM basal insulin
High bedtime sugar	Increase supper rapid/regular insulin

**Insulin Dose Schedules**

Table 10. Insulin Titration and Titration Suggestions for T2DM (as per Diabetes Canada 2018 Clinical Practice Guidelines)

Basal Insulin Only – Add-on to Anti-hyperglycemic Agents	
See above summary for A1c, BG targets Most patients will need 40-50 units/d to achieve target but there is no maximum dose Start at a low dose of 10 U at bedtime (lower for lean patients <50 kg) Titrate dose accordingly until fasting BG target is achieved (see CDA guidelines for appropriate titration) If fasting hypoglycemia, dose of bedtime basal should be reduced If daytime hypoglycemia, reduce dose of oral antihyperglycemic agents (especially secretagogues)	Dosing and Titration Example Starting dose – 10 U at bedtime Increase dose by 1 U every 1 night until fasting BG has reached target of 4-7 mmol/L
Basal-Bolus Insulins	
When addition of basal insulin to anti-hyperglycemic agents is insufficient to reach target BG, bolus (prandial) insulin should be added before meals Option exists to only add bolus insulin to the meal with the highest postprandial BG as a starting point Insulin secretagogues typically stopped when bolus (prandial) insulin added; metformin is continued Maintain the basal dose and add bolus insulin with each meal at a dose equivalent to 10% of basal dose Total Daily Insulin (TDI) = 0.3-0.5 U/kg; 40% TDI = basal, 20% TDI = prandial (bolus) prior to each meal Adjust basal insulin to achieve target fasting BG, bolus insulin to achieve postprandial BG levels (5-10 mmol/L), or preprandial BG levels for subsequent meal (4-7 mmol/L)	Dosing and Titration Example TDI = 0.5 U/kg; 0.5 x 100 kg = 50 U Basal insulin = 40% of TDI 40% x 50 U = 20 U; basal bedtime = 20 U Bolus insulin = 60% of TDI 60% x 50 U = 30 U; 10 U dosed with each meal
Premixed Insulin Before Breakfast and Before Dinner	
Target fasting and pre-dinner BG levels of 4-7 mmol/L Most patients with T2DM need 40-50 U BID to achieve target, but no maximum dose Start at a low dose of 5-10 U BID (before breakfast and before dinner) Patients can self-titrate by increasing insulin dose by 1 U/d until pre-dinner (breakfast dose) or fasting BG (dinner dose) at target Continue metformin and consider stopping secretagogue	Dosing and Titration Example 10 U before breakfast, 10 U before dinner Increase breakfast dose by 1 U/d until pre-dinner BG has reached target Increase dinner dose by 1 U/d until fasting BG has reached target

- Correction Factor (CF) = 100/Total Daily Dose of insulin (TDD) = change in blood glucose per unit insulin
  - BG < 4 mmol/L: call physician and give 15 g of rapid-acting carbohydrates and recheck in 15 min
  - BG between 4 to 8: no additional insulin
  - BG between 8 to (8 + CF): give one additional unit
  - BG between (8 + CF) to (8 + 2CF): give two additional units
  - BG between (8 + 2CF) to (8 + 3CF): give three additional units

**Insulin Pump Therapy: Continuous Subcutaneous Insulin Infusion (CSII)**

- external battery-operated device provides continuous basal dose of rapid-acting insulin analogue (aspart, glulisine, or lispro) through small subcutaneous catheter
- at meals, patient programs pump to deliver insulin bolus based on carbohydrate:insulin ratios
- provides improved quality of life and flexibility
- risk of DKA if pump is inadvertently disconnected or pump malfunctions
- coverage for insulin pumps for individuals with T1DM varies by province

## Acute Complications

Table 11. Acute Complications of Diabetes Mellitus: Hyperglycemic Comatose States

	Diabetic Ketoacidosis (DKA)	Hyperosmolar Hyperglycemic State (HHS)
<b>Pathophysiology</b>	<ul style="list-style-type: none"> <li>Usually occurs in T1DM</li> <li>Insulin deficiency with ↑ counterregulatory hormones (glucagon, cortisol, catecholamines, GH)</li> <li>Can occur with lack of insulin (non-adherence, inadequate dosage, 1st presentation) or increased stress (surgery, infection, exercise)</li> <li>Unopposed hepatic glucose production → hyperglycemia → osmotic diuresis → dehydration and electrolyte disturbance → ↓ Na<sup>+</sup> (water shift to ECF causing pseudohyponatremia)</li> <li>Fat mobilization → ↑ FFA → ketoacids → metabolic acidosis</li> <li>Severe hyperglycemia exceeds the renal threshold for glucose and ketone reabsorption → glucosuria and ketonuria</li> <li>Total body K<sup>+</sup> depletion but serum K<sup>+</sup> may be normal or elevated, 2° to shift from ICF to ECF due to lack of insulin, ↑ plasma osmolality</li> </ul>	<ul style="list-style-type: none"> <li>Occurs in T2DM</li> <li>Often precipitated by sepsis, stroke, MI, CHF, renal failure, trauma, drugs (glucocorticoids, immunosuppressants, phenytoin, diuretics), dialysis, recent surgery, burns</li> <li>Partial or relative insulin deficiency decreases glucose utilization in muscle, fat, and liver while inducing hyperglucagonemia and hepatic glucose production</li> <li>Presence of a small amount of insulin prevents the development of ketosis by inhibiting lipolysis</li> <li>Characterized by hyperglycemia, hyperosmolality, and dehydration without ketosis</li> <li>More severe dehydration compared to DKA due to more gradual onset and ↑ duration of metabolic decompensation plus impaired fluid intake which is common in bedridden or elderly</li> <li>Volume contraction → renal insufficiency → ↑ hyperglycemia, ↑ osmolality → shift of fluid from neurons to ECF → mental obtundation and coma</li> </ul>
<b>Clinical Features</b>	<ul style="list-style-type: none"> <li>Hyperglycemia (polyuria, polydipsia, weakness)</li> <li>Acidosis (air hunger, nausea, vomiting, abdominal pain, Kussmaul's respiration, acetone-odoured breath)</li> <li>Precipitating conditions (insulin omission, new diagnosis of diabetes, infection, MI, thyrotoxicosis, drugs)</li> </ul>	<ul style="list-style-type: none"> <li>Onset is insidious → preceded by weakness, polyuria, polydipsia</li> <li>History of decreased fluid intake</li> <li>History of ingesting large amounts of glucose containing fluids</li> <li>Dehydration (orthostatic changes)</li> <li>↓ LOC → lethargy, confusion, comatose due to high serum osmolality</li> <li>Kussmaul's respiration is absent unless the underlying precipitant has also caused a metabolic acidosis</li> </ul>
<b>Serum</b>	<ul style="list-style-type: none"> <li>↑ BG (typically 14-55 mmol/L, ↓ Na<sup>+</sup> [2° to hyperglycemia → for every ↑ in BG by 10 mmol/L there is a ↓ in Na<sup>+</sup> by 3 mmol/L])</li> <li>Normal or ↑ K<sup>+</sup>, ↓ HCO<sub>3</sub><sup>-</sup>, ↑ BUN, ↑ Cr, ketonemia, ↓ PO<sub>4</sub><sup>3-</sup></li> <li>↑ osmolality</li> <li>corrected sodium = current sodium + [0.3 x (current glucose - 5)]</li> <li>Be aware of possible euglycemic DKA (with near normal sugars) in pregnancy and with those who use SGLT2 inhibitors</li> </ul>	<ul style="list-style-type: none"> <li>↑ BG (typically 44.4-133.2 mmol/L)</li> <li>In mild dehydration, may have hyponatremia (spurious 2° to hyperglycemia → for every ↑ in BG by 10 mmol/L there is a ↓ in Na<sup>+</sup> by 3 mmol/L) <ul style="list-style-type: none"> <li>— if dehydration progresses, may get hypernatremia</li> </ul> </li> <li>Ketosis usually absent or mild if starvation occurs</li> <li>↑ osmolality</li> </ul>
<b>ABG</b>	<ul style="list-style-type: none"> <li>Anion gap metabolic acidosis with possible 2° respiratory alkalosis</li> <li>If severe vomiting/dehydration there may also be a metabolic alkalosis</li> </ul>	<ul style="list-style-type: none"> <li>Metabolic acidosis absent unless underlying precipitant leads to acidosis (e.g. lactic acidosis in MI)</li> </ul>
<b>Urine</b>	<ul style="list-style-type: none"> <li>+ve for glucose and ketones</li> </ul>	<ul style="list-style-type: none"> <li>-ve for ketones unless there is starvation ketosis</li> <li>Glycosuria</li> </ul>
<b>Treatment</b>	<ul style="list-style-type: none"> <li>ABCs are first priority</li> <li>Monitor degree of ketoacidosis with AG, not BG or serum ketone level</li> <li>NOTE: AG is the most important endpoint used to monitor the resolution of the metabolic acidosis</li> <li>Rehydration <ul style="list-style-type: none"> <li>— 500 mL/h x4h, then 250 mL/h x4h NS if mild-moderate deficit, 1-2 L/h NS if severe deficit (shock)</li> <li>— Switch to 0.45% NaCl once euvolemic (continue NS if corrected [Na<sup>+</sup>] is low or rate of fall of plasma osmolality ≥ 3 mosm/kg/h)</li> <li>— Once BG reaches 14.0 mmol/L add D5W or D10W to maintain BG of 12-14 mmol/L</li> </ul> </li> <li>Insulin therapy <ul style="list-style-type: none"> <li>— Critical to resolve acidosis, not hyperglycemia</li> <li>— Do not use with hypokalemia (see below), until serum K<sup>+</sup> is corrected to &gt;3.3 mmol/L</li> <li>— Maintain on 0.1 U/kg/h insulin R infusion</li> <li>— Check serum glucose hourly</li> </ul> </li> <li>K<sup>+</sup> replacement <ul style="list-style-type: none"> <li>— With insulin administration, hypokalemia may develop</li> <li>— If serum K<sup>+</sup> &lt; 3.3 mmol/L, give 40 mEq/L K<sup>+</sup> replacement and hold insulin until [K<sup>+</sup>] ≥ 3.3 mmol/L</li> <li>— When K<sup>+</sup> 3.3-5.0 mmol/L add KCl 10-40 mEq/L to keep K<sup>+</sup> in the range of 3.5-5 mEq/L</li> </ul> </li> <li>HCO<sub>3</sub><sup>-</sup> <ul style="list-style-type: none"> <li>— If pH &lt; 7.0 or if hypotension, arrhythmia, or coma is present give HCO<sub>3</sub><sup>-</sup> 1 ampoule (50 mmol) in 200 mL D5W (or sterile water if available) over 1h, repeated q1-2 h until pH ≥ 7.0</li> <li>— Do not give if pH &gt; 7.1 (risk of metabolic alkalosis)</li> <li>— Can give in case of life-threatening hyperkalemia</li> </ul> </li> </ul>	<ul style="list-style-type: none"> <li>Same resuscitation and emergency measures as DKA</li> <li>Rehydration <ul style="list-style-type: none"> <li>— IV fluids: 1 L/h NS initially</li> <li>— Evaluate corrected serum Na<sup>+</sup></li> <li>— If corrected serum Na<sup>+</sup> high or normal, switch to 0.45% NaCl (4-14 mL/kg/h)</li> <li>— If corrected serum Na<sup>+</sup> low, maintain NS (4-14 mL/kg/h)</li> <li>— When serum BG reaches 13.9 mmol/L (250 mg/dL) switch to D5W</li> </ul> </li> <li>K<sup>+</sup> replacement <ul style="list-style-type: none"> <li>— Less severe K<sup>+</sup> depletion compared to DKA</li> <li>— If serum K<sup>+</sup> &lt; 3.3 mmol/L, give 40 mEq/L K<sup>+</sup> replacement and hold insulin until [K<sup>+</sup>] ≥ 3.3 mmol/L</li> <li>— When K<sup>+</sup> 3.3-5.0 mmol/L add KCl 10-40 mEq/L to keep K<sup>+</sup> in the range of 3.5-5 mEq/L</li> <li>— If serum K<sup>+</sup> ≥ 5.5 mmol/L, check K<sup>+</sup> every 2 h</li> </ul> </li> <li>Search for precipitating event</li> <li>Insulin therapy <ul style="list-style-type: none"> <li>— Achieved by monitoring plasma osmolality, adding glucose to infusions once BG reaches 14 mmol/L, using correct concentration of saline</li> <li>— Switch to 0.45% NaCl once euvolemic as urinary loss of electrolytes in osmotic diuresis are usually hypotonic</li> <li>— Increase saline concentration if falling too rapidly</li> </ul> </li> </ul>
<b>Prognosis</b>	<ul style="list-style-type: none"> <li>&lt;1-3.3% mortality in developed countries</li> <li>Serious morbidity from sepsis, hypokalemia, respiratory complications, thromboembolic complications, and cerebral edema (the latter in children)</li> </ul>	<ul style="list-style-type: none"> <li>Mortality rates between 12-17%, but studies looking at this included mixed DKA/HHS state</li> </ul>

## Macrovascular Complications

- increased risk of CAD, ischemic stroke, and peripheral arterial disease secondary to accelerated atherosclerosis
- CAD (see [Cardiology and Cardiac Surgery, C30](#))
  - risk of MI is 3-5x higher in those with DM compared to age-matched controls
  - CAD is the leading cause of death in T2DM
  - most patients with DM are considered "high-risk" under the risk stratification for CAD (see [Dyslipidemias, E3](#))
- ischemic stroke (see [Neurology, N53](#))
  - risk of stroke in those with DM is approximately 2-3x higher for men and 2-5x higher for women
  - level of glycemia is both a risk factor for stroke and a predictor of a poorer outcome in patients who suffer a stroke
  - A1c level is a significant and independent predictor of the risk of stroke
- peripheral arterial disease (see [Vascular Surgery, VS4](#))
  - manifests as intermittent claudication in lower extremities, intestinal angina, foot ulceration
  - risk of foot gangrene is 30x higher in those with DM compared to age-matched controls
  - risk of lower extremity amputation is 15x higher in those with DM
- screening: A1c every 3 mo, BP monitoring, lipid profile every 1-3 yr, resting ECG every 3-5 yr for high-risk patients
- treatment
  - tight blood pressure control (<130/80 mmHg), especially for stroke prevention
  - tight glycemic control in early DM without established CVD (refer to ACCORD, VADT, ADVANCE, DCCT, EDIC, UKPDS extension studies)
  - tight LDL control (LDL  $\leq$  2.0 mmol/L) or >50% LDL reduction from baseline
  - statin use in patients with clinical CVD, age  $\geq$  40, or either diabetes duration >15 yr and age > 30, or microvascular complications
  - ACEI or ARB in high-risk patients
  - smoking cessation, healthy diet, physical activity, and maintenance of healthy weight goals
  - for adults with CVD who do not meet glycemic targets, recommended to add anti-hyperglycemic agent with demonstrated cardiovascular benefit (SGLT2i/GLP-1 RAs) to reduce the risk of major CV events

### Laboratory Testing: Ketones

- The nitroprusside test for ketones identifies acetone and acetoacetate but does NOT detect  $\beta$ -hydroxybutyrate (BHB), the ketone most frequently in excess in DKA. This has two clinical consequences:
  - Be wary of a patient with a clinical picture of DKA but negative serum or urinary ketones. These could be false negatives because of the presence of BHB
  - As DKA is treated, BHB is converted to acetone and acetoacetate. Serum or urinary ketones may therefore rise, falsely suggesting that the patient is worsening when in fact they are improving

### Effects of ASA for Primary Prevention in Persons with Diabetes Mellitus

N *EJM* 2018;379:1529-1539

**Study:** RCT, blinded, with 7.4 yr of mean follow up  
**Population:** 15480 patients with DM with no known cardiovascular risk

**Intervention:** ASA 100mg once daily

**Primary Outcome:** Primary efficacy outcome was first instance of vascular event (composite outcome of non-fatal MI, nonfatal stroke, or transient ischemic attack, or death from any vascular cause).

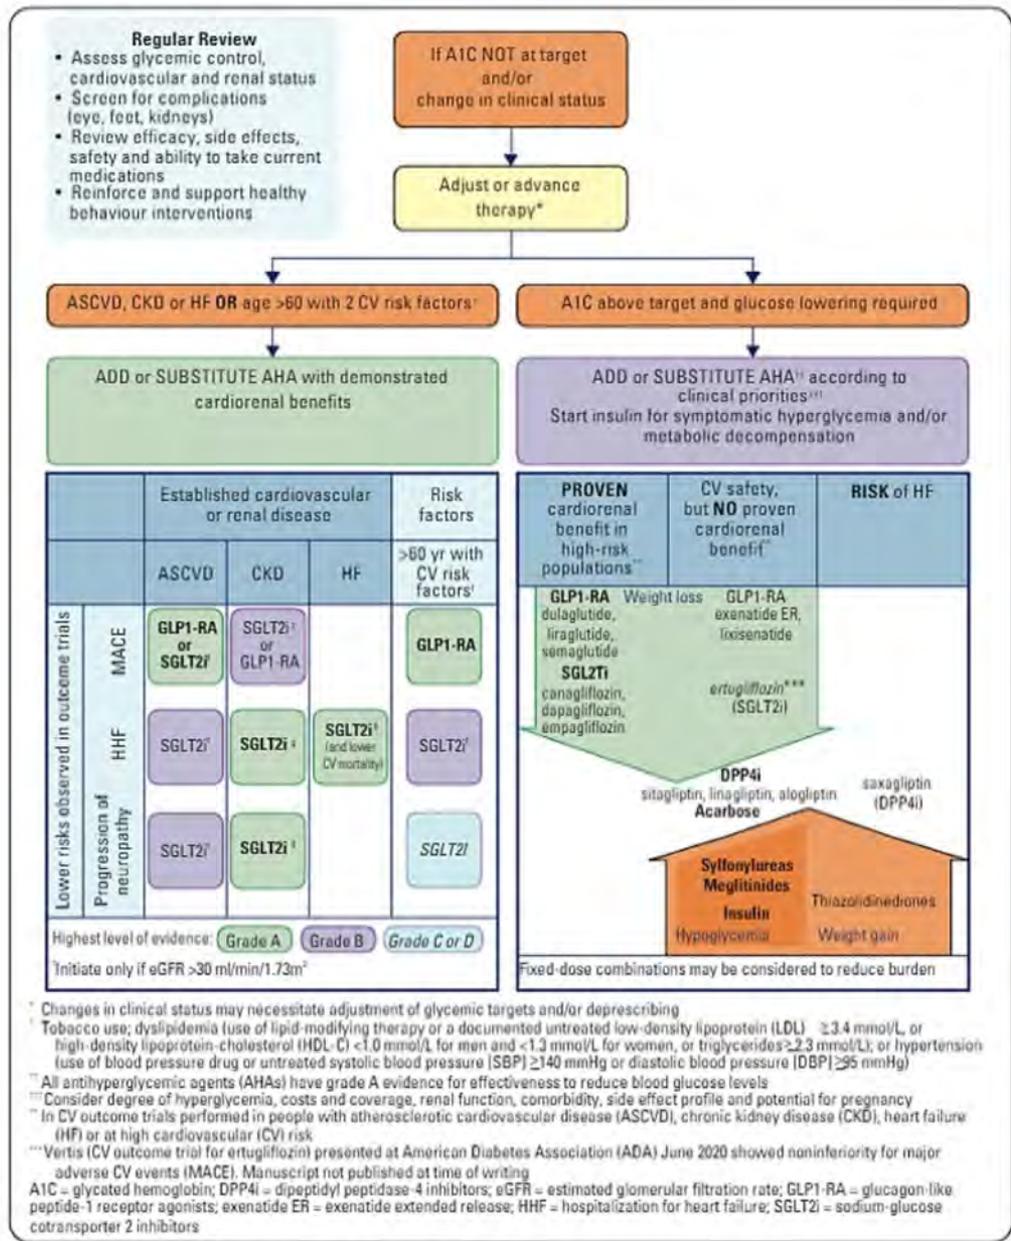

**Results:** The ASA group experienced a fewer number of vascular events ( $P=0.01$ ) but a greater number of major bleeding events ( $P=0.01$ ) compared to the placebo group.

**Conclusions:** Currently, ASA is not recommended for primary prevention in people with diabetes but is recommended for secondary prevention

See Landmark Endocrinology Trials for more information on the EMPA-REG OUTCOME trial. It details the effects of empagliflozin (SGLT2 inhibitor) on cardiovascular risk in patients with T2DM.

**Liraglutide and Cardiovascular Outcomes in T2DM**  
NEJM 2016; 375:311-322

**Purpose:** To investigate whether liraglutide (a GLP-1 analogue) has any effect on cardiovascular risk in patients with T2DM when added to standard care.

**Study:** Multi-centre, double-blind RCT comparing liraglutide to placebo control; 9340 patients (drug n=4668, placebo n=4672), median observation 3.8 yr.

**Outcome:** Death from cardiovascular causes, nonfatal MI, or nonfatal stroke.

**Results:** Both groups concurrently received the standard treatment for T2DM. The liraglutide group had significantly lower rates of death from cardiovascular causes than control (4.7%, vs. 6%; P=0.007). The drug group also had lower all-cause mortality (8.2% and 9.6%; P=0.02). Rates of nonfatal MI, nonfatal stroke, and hospitalization for heart failure were not significantly lower in the liraglutide group.

**Conclusion:** Adding liraglutide to standard treatment for patients with T2DM reduced death from cardiovascular cause and all-cause mortality when compared to placebo.

Figure 9. Treatment approach for patients living with diabetes

## Microvascular Complications

### Diabetic Retinopathy (see [Ophthalmology, OP34](#) for a more detailed description)

- Epidemiology**
- diabetic retinopathy is the most common cause of incident blindness in people of working age
  - among individuals with T1DM, limb amputation and vision loss due to diabetic retinopathy are independent predictors of early death

- Clinical Features**
- macular edema: diffuse or focal vascular leakage at the macula
  - non-proliferative (microaneurysms, intraretinal hemorrhage, vascular tortuosity, vascular malformation) and proliferative (abnormal vessel growth)
  - retinal capillary closure

- Treatment and Prevention**
- tight glycemic control (delays onset, decreases progression), tight lipid control, manage HTN, smoking cessation
  - ophthalmological treatments available (see [Ophthalmology, OP35](#) for more details)
  - annual follow-up visits with an optometrist or ophthalmologist to examine whether symptomatic or not through dilated pupils (immediate referral after diagnosis of T2DM; 5 yr after diagnosis of T1DM for those  $\geq 15$  yr)
  - interval for follow up should be tailored to severity of retinopathy

## Diabetic Nephropathy (see [Nephrology, NP33](#) for a more detailed description)

### Epidemiology

- DM-induced renal failure is the most common cause of renal failure in North America
- 20-40% of persons with T1DM (after 5-10 yr) and 4-20% with T2DM have progressive nephropathy

### Screening

- serum creatinine for eGFR, random urine ACR
- ACR is used as albuminuria is considered the earliest clinical sign of diabetic nephropathy (microalbuminuria); diagnosis requires persistent elevated urinary albumin (2 out of 3 urinary samples required over 3 mo)
- 24 h urine collection for protein/albumin is the gold standard but is difficult to perform, inconvenient, and often incorrect; random urine albumin is insufficient as albumin levels vary with urine concentration
- begin screening annually at diagnosis for all T2DM, and >5 yr after diagnosis of T1DM for postpubertal patients

### Treatment and Prevention

- appropriate glycemic control
- appropriate BP control (<130/80 mmHg)
- use either ACEI or ARB to delay progression of CKD (often used first line for CVD protection)
- use SGLT2i for nephroprotection
- limit use of nephrotoxic drugs and dyes

## Diabetic Neuropathy

### Epidemiology

- approximately 50% of patients within 10 yr of T1DM and T2DM onset

### Pathophysiology

- can have peripheral sensory neuropathy, motor neuropathy, or autonomic neuropathy
- mechanism poorly understood
- acute cranial nerve (CN) palsies and diabetic amyotrophy are thought to be due to ischemic infarction of peripheral nerves
- the more common motor and sensory neuropathies are thought to be related to metabolic, vascular, and possibly hormonal factors

### Screening

- 128 Hz tuning fork or 10 g monofilament
- begin screening annually at diagnosis for all T2DM, and >5 yr after diagnosis of T1DM for postpubertal patients

### Clinical Features

**Table 12. Clinical Features of Diabetic Neuropathies**

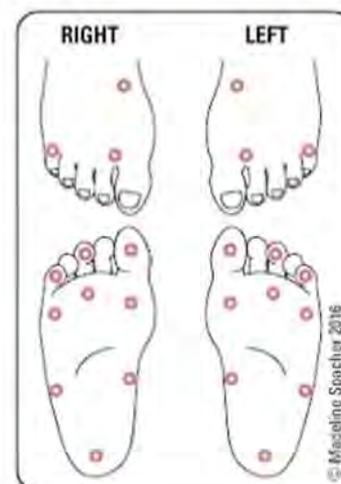

Peripheral Sensory Neuropathy	Motor Neuropathy	Autonomic Neuropathy
Paresthesias (tingling, itching), neuropathic pain, radicular pain, numbness, decreased tactile sensation	Less common than sensory neuropathy and occurs later in the disease process	Postural hypotension, tachycardia, decreased cardiovascular response to valsalva maneuver
Bilateral and symmetric with decreased perception of vibration and pain/temperature; especially true in the lower extremities but may also be present in the hands	Delayed motor nerve conduction and muscle weakness/atrophy	Gastroparesis and alternating diarrhea and constipation
Decreased ankle reflex	May involve one nerve trunk (mononeuropathy) or more (mononeuritis multiplex)	Urinary retention and erectile dysfunction
Distal-predominant as the longest nerves are affected first	Some of the motor neuropathies spontaneously resolve after 6-8 wk	
Classic stocking-glove distribution	Reversible CN palsies: III (ptosis/ophthalmoplegia, pupil sparing), VI (inability to laterally deviate eye), and VII (Bell's palsy)	
May result in neuropathic ulceration of foot	Diabetic amyotrophy i.e. Bruns-Garland Syndrome: refers to pain, weakness, and wasting of hip flexors or extensors	

### Treatment and Management

- tight glycemic control
- for neuropathic pain syndromes: tricyclic antidepressants (e.g. amitriptyline), pregabalin, duloxetine, anticonvulsants (e.g. carbamazepine, gabapentin), and capsaicin
- foot care education
- Jobst® fitted stocking and tilting of head of bed may decrease symptoms of orthostatic hypotension
- treat gastroparesis with dietary modification, domperidone and/or metoclopramide (dopamine antagonists), erythromycin (motilin receptor agonist)
- medical, mechanical, and surgical treatment for erectile dysfunction (see [Urology, U33](#))

See Landmark Endocrinology Trials for more information on the Steno-2 trial. It details the effects of intensive, multifactorial interventions on the rates of death in patients with T2DM and microalbuminuria

**Figure 10. Monofilament testing for diabetic neuropathy**

**Pharmacologic Interventions for Painful Diabetic Neuropathy: An Umbrella Systematic Review and Comparative Effectiveness Network Meta-Analysis**

*Ann Intern Med* 2014;161:639-49

**Purpose:** To compare the efficacies of various oral and topical analgesics for diabetic neuropathy.

**Study Selection:** RCTs that assessed pharmacologic treatments for painful diabetic peripheral neuropathy in adults.

**Results:** 65 RCTs involving 12632 patients were included. The following pharmacological agents demonstrated superiority over placebo for short-term pain control: serotonin and norepinephrine reuptake inhibitors (SNRIs) (standardized mean difference (SMD), -1.36; 95% credible interval (CrI), [-1.77 to -0.95]), topical capsaicin (SMD, -0.91; CrI [-1.18 to -0.64]), tricyclic antidepressants (TCAs) (SMD, -0.78; CrI [-1.24 to -0.33]), and anticonvulsants (SMD, -0.67; CrI [-0.97 to -0.37]). Specific agents included: carbamazepine (SMD, -1.57; CrI [-2.83 to -0.31]), venlafaxine (SMD, -1.53; CrI [-2.41 to -0.65]), duloxetine (SMD, -1.33; CrI [-1.82 to -0.86]), and amitriptyline (SMD, -0.72; CrI [-1.35 to -0.08]).

**Conclusion:** SNRIs, topical capsaicin, TCAs and anticonvulsants are effective in short-term management of painful diabetic neuropathy, but their relative efficacy compared to each other is unknown.

## Other Complications

### Dermatologic

- diabetic dermopathy: atrophic brown spots commonly in pretibial region ("tibia spots") secondary to increased glycosylation of tissue proteins or vasculopathy
- eruptive xanthomas secondary to increased triglycerides
- necrobiosis lipoidica diabetorum: rare complication characterized by thinning skin over the shins allowing visualization of subcutaneous vessels

### Bone and Joint Disease

- juvenile cheiroarthropathy: chronic stiffness of hand caused by contracture of skin over joints secondary to glycosylated collagen and other connective tissue proteins
- Dupuytren's contracture
- increased fracture risk in both T1DM and T2DM due to decreased bone quality
- adhesive capsulitis ("frozen shoulder")

### Cataracts

- subcapsular and senile cataracts secondary to glycosylated lens protein or increased sorbitol causing osmotic change and fibrosis

### Infections

- see [Infectious Diseases](#), *Diabetic Foot Infections*, ID14

## Hypoglycemia

### Etiology and Pathophysiology

- hypoglycemia occurs most frequently in people with DM receiving insulin or certain antihyperglycemic therapies (insulin secretagogues)
- in people without DM, care must be taken to distinguish hypoglycemia that occurs in critically ill or medicated patients from hypoglycemia that presents in individuals who are seemingly well
  - each invokes a separate DDX
  - the timing of hypoglycemia may also provide a clue to the diagnosis (e.g. individuals with an insulinoma typically have fasting hypoglycemia whereas those with non-insulinoma pancreatogenous hypoglycemia experience predominantly postprandial hypoglycemia)
  - must be distinguished from pseudohypoglycemia, defined as situations in which either BG >3.9 mmol/L with clinical signs of hypoglycemia (e.g. fatigue, headache, visual disturbances, or lightheadedness) or BG <3.9 mmol/L but patient is asymptomatic.

Table 13. Causes of Hypoglycemia

Insulin-Dependent Causes	Insulin-Independent Causes
Exogenous insulin	Hepatic failure
Sulfonylurea or meglitinide	Renal failure
Pentamidine (possibly due to $\beta$ -cell destruction resulting in insulin release)	Inanition
Autoimmune hypoglycemia (autoantibodies to insulin or insulin receptor)	Hormone deficiency (cortisol, glucagon, and epinephrine in insulin-deficient DM)
Insulinoma	Non-islet cell tumours (typically the result of mesenchymal tumour overproduction of IGF-2)
Non-insulinoma pancreatogenous hypoglycemia	Inborn error of carbohydrate metabolism, glycogen storage disease, gluconeogenic enzyme
Post-gastric bypass hypoglycemia	Alcohol
	Drugs (e.g. quinine, indomethacin, gatifloxacin, lithium, ACEI, $\beta$ -adrenergic receptor blockers)

### Clinical Features

- Whipple's triad – suggests a patient's symptoms are from hypoglycemia
  1. serum glucose <4.0 mmol/L
  2. neuroglycopenic symptoms (below)
  3. rapid relief provided by administration of glucose
- autonomic symptoms (typically occur first; caused by autonomic nervous system activity)
  - palpitations, sweating, anxiety, tremor, tachycardia, hunger
- neuroglycopenic symptoms (caused by brain glucose deprivation)
  - dizziness, headache, clouding of vision, mental dullness, fatigue, confusion, seizures, coma

### Investigations

- depend on a thorough history, physical exam, and available biochemical investigations as these may provide clues to the etiology of hypoglycemia
  - for example, if suspecting insulin and insulin secretagogues in patients with diabetes, assess for cortisol deficiency. In a patient with weight loss, hyperpigmentation, and hyperkalemia, consider the possibility of IGF-2 mediated hypoglycemia. In an individual with a gastrointestinal stromal tumour (GIST), think about renal/hepatic failure in the setting of critical illness

### Other Players in Glucose Homeostasis

These hormones act to increase:  
Blood glucose levels  
Glucagon  
Epinephrine  
Cortisol  
Growth hormone

### C-Peptide

A short peptide released into the circulation when proinsulin is cleaved to insulin

### Use of C-peptide Levels to Distinguish between Exogenous and Endogenous Source of Hyperinsulinemia

Increased = endogenous  
Decreased or normal = exogenous

### Treatment of an Acute Hypoglycemic Episode (Blood Glucose <4.0 mmol/L) in the Awake Patient (e.g. able to self-treat)

- 1) Eat 15 g of rapid-acting carbohydrates (e.g. 3 packets of sugar dissolved in water; 3/4 cup of juice)
- 2) Wait 15 min
- 3) Retest BG
- 4) Repeat steps 1-3 until BG >5 mmol/L
- 5) Eat next scheduled meal. If next meal is >1 h away, eat snack including 15 g of carbohydrate and protein

### Hypoglycemia Unawareness (T1DM >>> T2DM)

- Patient remains asymptomatic until severe hypoglycemic levels are reached
- Often occurs after repeated episodes of hypoglycemia as the patient develops blunted/minimal autonomic response
- Causes:
  - Decreased glucagon/epinephrine response
  - History of repeated hypoglycemia or low A1c
  - Autonomic neuropathy
- May not be safe for patient to drive
- Suggest that patient obtain a Medic-Alert™ bracelet if at risk for hypoglycemia, especially with hypoglycemia unawareness and consider use of advanced monitoring systems (continuous glucose monitor, flash glucose monitor)

Refer to Diabetes Canada 2018 guidelines for advice around diabetes and driving

- when the cause of hypoglycemia is not evident, screen for oral hypoglycemic agents (ideally all available sulfonylureas and glinides) and measure plasma glucose, insulin, proinsulin, C-peptide, b-hydroxybutyrate, and insulin Ab during a spontaneous hypoglycemic episode or a supervised fast of up to 72 h. If hypoglycemia occurs only in the postprandial state, evaluate the patient first with a mixed meal test
- correct hypoglycemia with injection of 1.0 mg glucagon IV with measurement of plasma glucose response. This will distinguish endogenous and exogenous hyperinsulinism from other causes of hypoglycemia

**Treatment**

- for tumoural hypoglycemia, definitive treatment requires resection of the tumour. If that is not possible certain medications can be helpful such as diazoxide for patients with insulinoma
  - for non-insulinoma pancreatogenous hypoglycemia and post-bariatric bypass hypoglycemia, dietary changes including reducing the amount of carbohydrate intake and small frequent meals may be helpful. For patients who do not respond to nutritional modification or have severe symptoms, acarbose can be utilized
- see [Emergency Medicine, ER34](#)
- treatment of hypoglycemic episode in the unconscious patient or patient NPO
  - D50W 50 mL (1 ampule) IV in 1-3 min or 1 mg glucagon SC or IM (if no IV access is available)
  - may need ongoing glucose infusion once BG >5 mmol/L

**Metabolic Syndrome**

- postulated syndrome related to insulin resistance associated with hyperglycemia, hyperinsulinemia, HTN, central obesity, and dyslipidemia
- obesity aggravates extent of insulin resistance
- complications include DM, atherosclerosis, CAD, MI, and stroke
- women with PCOS are at increased risk for developing insulin resistance, hyperlipidemia, and metabolic syndrome
- not to be confused with syndrome X related to angina pectoris with normal coronary arteries (Prinzmetal angina)

**Obesity**

- see [Family Medicine, FM9](#)

**Pituitary Gland**

**Pituitary Hormones**

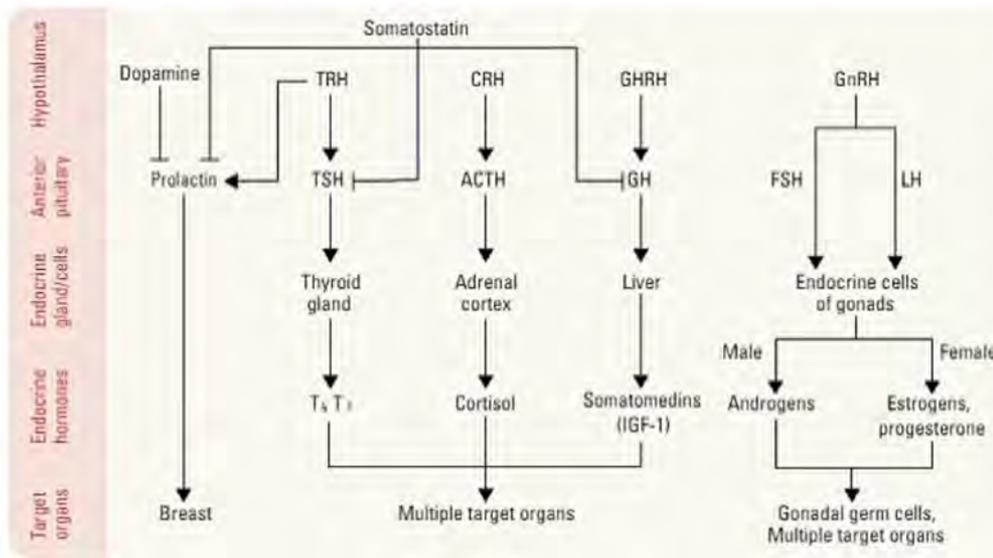

Figure 11. Hypothalamic-pituitary hormonal axes

**Features of Metabolic Syndrome (≥3 measures to make a Dx)**

Measure	Men	Women
<b>Abdominal Obesity (Elevated Waist Circumference)</b>		
Canada, USA	≥102 cm (40 inches)	≥88 cm (35 inches)
Europid, Middle Eastern, Sub-Saharan Africa, Mediterranean	≥94 cm (37 inches)	≥80 cm (31.5 inches)
Asian, Japanese, South & Central America	≥90 cm (35 inches)	≥80 cm (31.5 inches)
TG Level	≥1.7 mmol/L (150 mg/dL)	
HDL-C Level	<1.0 mmol/L (~40 mg/dL)	<1.3 mmol/L (~50 mg/dL)
Blood Pressure	≥130/85 mmHg	
Fasting Glucose Level	≥5.6 mmol/L (~100 mg/dL)	

Drug treatment for any elevated marker is an alternate indicator

**Anterior Pituitary Hormones**

FLAT PIG  
FSH  
LH  
ACTH  
TSH

PRL  
GH

**Hypothalamic Control of Pituitary**

- trophic and inhibitory factors control the release of pituitary hormones
- most hormones are primarily under trophic stimulation except PRL, which is primarily under inhibitory control by dopamine. GH and TSH are stimulated by GHRH and TRH respectively while inhibition by somatostatin is less important for control
- transection of the pituitary stalk (i.e. dissociation of hypothalamus and pituitary) leads to pituitary hypersecretion of PRL and hyposcretion of all remaining hormones

**Anterior Pituitary Hormones**

- FSH, LH, ACTH, TSH, GH, PRL
- these hormones are produced, stored, and released from the anterior pituitary but regulated by hormones produced by the hypothalamus

**Posterior Pituitary (Hypothalamic) Hormones**

- ADH and oxytocin
- peptides synthesized in the supraoptic and paraventricular nuclei of the hypothalamus
- although ADH and oxytocin are produced in the hypothalamus, these hormones are stored in and released from the posterior pituitary

**Table 14. The Physiology and Action of Pituitary Hormones**

Hormone	Function	Physiology	Inhibitory Stimulus	Secretory Stimulus
<b>LH/FSH</b>	Stimulate gonads via cAMP Ovary: LH: production of androgens (thecal cells) which are converted to estrogens (granulosa cells); induces luteinization in follicles FSH: growth of granulosa cells in ovarian follicle; controls estrogen production Testes: LH: production of testosterone (Leydig cells) FSH: production of spermatozoa (Sertoli cells)	Polypeptide Glycoproteins (same $\alpha$ subunit as TSH and hCG) Secreted in pulsatile fashion	Estrogen Progesterone Testosterone Inhibin Continuous (i.e. non-pulsatile) GnRH infusion	Pulsatile GnRH (low frequency pulsation = FSH release, high frequency pulsation = LH release)
<b>ACTH</b>	Stimulates growth of adrenal cortex and secretion of its hormones via cAMP	Polypeptide Circadian rhythm (highest in the morning, lowest at midnight)	Dexamethasone, cortisol, and other glucocorticoids	Corticotropin-Releasing Hormone Metyrapone hypoglycemia Vasopressin Fever, pain, stress
<b>TSH</b>	Stimulates growth of thyroid and secretion of T4 and T3 via cAMP	Glycoprotein Note: hCG can activate the TSH receptor and therefore have thyroid-stimulating activity	Thyroid hormones (T4 and T3) and analogues, dopamine, somatostatin, cytokines, high dose glucocorticoids	TRH AVP $\alpha$ adrenergic agonist
<b>PRL</b>	Promotes milk production and breast tissue development Inhibits gonadotropin secretion	Polypeptide Episodic secretion	Dopamine (only pituitary hormone under tonic inhibition of secretion)	Sleep Stress, hypoglycemia Pregnancy, breastfeeding Mid-menstrual cycle Sexual activity TRH (primary hypothyroidism) Drugs: antipsychotics, tricyclic antidepressants, metoclopramide, domperidone, verapamil, methyl dopa, opioids, high dose estrogen
<b>GH</b>	Has direct effects on peripheral target cells Needed for linear growth and also has metabolic effects to increase serum glucose Stimulates secretion of IGF-1 by the liver, a potent growth and differentiation factor	Polypeptide Acts indirectly through IGF-1 (somatomedin-C) synthesized in the liver and has direct effects Serum GH undetectable for most of the day and suppressed after meals high in glucose Sustained rise during sleep	Glucose challenge Glucocorticoids Somatostatin Dopamine D2 receptor agonists in some GH-secreting tumours IGF-1 (long-loop)	GHRH Insulin-induced hypoglycemia Ghrelin Exercise REM sleep Arginine, clonidine, propranolol, L-dopa Sex hormones Dopamine agonists in normal individuals
<b>ADH</b>	Acts at renal collecting ducts on V2 receptors to cause insertion of aquaporin channels and increases water reabsorption thereby concentrating urine	Octapeptide Secreted by posterior pituitary Osmoreceptors in hypothalamus detect serum osmolality Contracted plasma volume detected by baroreceptors is a more potent stimulus than $\uparrow$ osmolality	$\uparrow$ serum osmolality	Hypovolemia or $\uparrow$ effective circulatory volume $\uparrow$ serum osmolality Stress, pain, fever, system CNS disorders
<b>Oxytocin</b>	Causes uterine contraction Breast milk secretion	Nonapeptide Secreted by posterior pituitary	EtOH	Suckling Distention of female genital tract during labour via stretch receptors

## Growth Hormone

### GH Deficiency

- cause of short stature in children (see *Paediatrics*, P13)
- adults exhibit increased fat and decreased lean body mass, decreased bone mineral density, and fatigue
- diagnosis made with low serum IGF-1 levels in individuals with deficiencies in three or more pituitary axes, or by failure to increase GH with a provocative test (see above under GH secretory stimulus); insulin tolerance test to induce hypoglycemia is the gold standard dynamic test
- Tx: GH replacement is not always indicated after max linear height and peak bone mass is reached; consider in an adult patient with childhood onset irreversible GH deficiency (some children who are diagnosed with idiopathic GH deficiency will have normal GH responses when tested as adults and do not require GH treatment). GH replacement can also be provided to patients with adult onset GH deficiency who do not have an active malignancy and prefer treatment after a discussion about its potential benefits, adverse effects, and cost

### GH Excess

#### Etiology

- GH secreting pituitary adenoma, neuroendocrine tumours secreting ectopic GH or GHRH (very rare)

#### Pathophysiology

- normally GH is a catabolic hormone that acts to increase blood glucose levels
- in GH excess states, secretion remains pulsatile but there is loss of hypoglycemic stimulation, glucose suppression, and the nocturnal surge
- proliferation of bone, cartilage, soft tissues, organomegaly
- insulin resistance and IGT

#### Clinical Features

- leads to gigantism in children (before epiphyseal fusion)
- leads to acromegaly in adults (after epiphyseal fusion)
- dermatologic (thickening of skin, increased sebum production, sweating, acne, sebaceous cysts), musculoskeletal (enlargement of hands and feet, coarsening of facial features, thickening of calvarium, prognathism, carpal tunnel syndrome, osteoarthritis), cardiometabolic (HTN, DM, acanthosis nigricans, cardiomyopathy), sleep apnea, sexual (low libido)

#### Investigations

- first line test: serum IGF-1 (expected to be elevated)
- glucose suppression test is the most specific test (75 g of glucose PO suppresses GH levels in healthy individuals but not in patients with acromegaly)
- CT, MRI, or skull x-rays may show cortical thickening, enlargement of the frontal sinuses, and enlargement and erosion of the sella turcica
- MRI of the sella turcica is needed to look for a tumour

#### Treatment

- surgery is the recommended initial therapy for the majority of patients with acromegaly; second line options include somatostatin analogue (octreotide), dopamine agonist (cabergoline), GH receptor antagonist (pegvisomant), radiation
  - radiation may be considered in patients whose disease is not controlled by surgery or medical treatment

#### Risks Associated with GH Excess

- Cardiac disease (e.g. cardiomyopathy, valvulopathy, arrhythmias, CAD) in 1/3 of patients. Two-fold increase in mortality in acromegaly due to acromegaly-associated complications such as HTN, diabetes, CVD, and cerebrovascular disease
- HTN in 1/3 of patients
- Increased risk of cancer (particularly colon cancer)

## Prolactin

### Hyperprolactinemia

#### Etiology

- prolactinoma: most common pituitary adenoma
- sellar masses, disease with pituitary stalk compression, or damage causing reduced dopamine inhibition of PRL release
- primary hypothyroidism (increased TRH), PCOS, acromegaly
- decreased clearance due to CKD or severe liver disease (PRL is metabolized by both the kidney and liver)
- medications with anti-dopaminergic properties are a common cause of high PRL levels: antipsychotics (common), antidepressants, antihypertensives (verapamil/methyldopa), bowel motility agents (metoclopramide/domperidone), H2-blockers, opiates (morphine), estrogens (e.g. oral contraceptives)
- macroprolactinemia (high molecular weight PRL also known as big-big PRL) that has no action but results in falsely elevated serum prolactin
- physiologic causes: pregnancy, stress, sleep, nipple stimulation, factors affecting the chest wall

#### Clinical Features

- galactorrhea (secretion of breast milk in women and, in rare cases, men), infertility, hypogonadism, amenorrhea, oligomenorrhea, erectile dysfunction

#### Approach to Nipple Discharge

- Differentiate between galactorrhea (fat droplets present) vs. breast discharge (usually unilateral, may be bloody or serous)
- If galactorrhea, determine if physiologic (e.g. pregnancy, lactation) vs. pathologic
- If abnormal breast discharge, must rule out a breast malignancy

**Investigations**

- serum PRL, TSH, liver enzyme tests, creatinine, hCG in all women of reproductive age
- macroprolactin level in patients with hyperprolactinemia but no symptoms of PRL excess
- MRI of the sella turcica when a secondary cause is not identified or when PRL levels suggest that there may be underlying tumoural hyperprolactinemia

**Treatment**

- first line: dopamine agonists (bromocriptine, cabergoline, quinagolide)
- surgery ± radiation (rare)
- PRL-secreting tumours are often slow-growing; treatment may not be necessary in the setting of small tumours associated with hyperprolactinemia which does not result in hypogonadism or bothersome galactorrhea
- if medication-induced, consider stopping medication if possible
- in certain cases if microprolactinoma and not planning on becoming pregnant, may consider OCP

**Thyroid Stimulating Hormone**

- see *Thyroid, E24*

**Adrenocorticotrophic Hormone**

- see *Adrenal Cortex, E33*

**Luteinizing Hormone and Follicle Stimulating Hormone****Hypergonadotropic Hypogonadism**

- hypogonadism due to impaired release of FSH and LH

**Etiology**

- congenital: Kallmann syndrome, CHARGE syndrome, GnRH insensitivity
- secondary: CNS or pituitary tumours, pituitary apoplexy, hypothalamic-pituitary radiation, drugs (GnRH agonists/antagonists, glucocorticoids, narcotics, chemotherapy, drugs causing hyperprolactinemia, opioids), functional deficiency due to another cause (hyperprolactinemia, chronic systemic illnesses, eating disorders, hypothyroidism, DM, Cushing's disease), systemic diseases involving the hypothalamus/pituitary (hemochromatosis, sarcoidosis, histiocytosis)

**Clinical Features**

- amenorrhea, low libido, decrease in energy, erectile dysfunction (see [Urology, U33](#)), loss of body hair, thin skin, testicular atrophy, decrease in muscle mass, and failure of pubertal development

**Treatment**

- treat underlying cause if present
- combined FSH/LH hormone therapy, hCG, recombinant FSH, or pulsatile GnRH analogue if fertility desired
- symptomatic treatment with estrogen/testosterone

**hypogonadotropic Hypogonadism**

- hypogonadism due to impaired response of the gonads to FSH and LH

**Etiology**

- congenital:
  - chromosomal abnormalities (Turner's syndrome, Klinefelter syndrome, XX gonadal dysgenesis)
  - enzyme defects (17 $\alpha$ -hydroxylase deficiency, 17,20-lyase deficiency)
  - gonadotropin resistance (Leydig cell hypoplasia, FSH insensitivity, pseudohypoparathyroidism type 1A)
- acquired:
  - gonadal toxins (chemotherapy, radiation)
  - drugs (antiandrogens, alcohol)
  - infections (STIs, mumps)
  - gonadal failure in adults (androgen decline and testicular failure in men, premature ovarian insufficiency and menopause in women)

**Clinical Features**

- amenorrhea, erectile dysfunction (see [Urology, U33](#)), loss of body hair, fine skin, testicular atrophy, failure of pubertal development, low libido, decrease in energy, and infertility

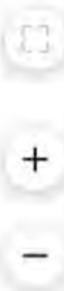

**Treatment**

- hormone replacement therapy consisting of androgen (for males) and estrogen and progesterone (for females) administration

**Diagnosis and Treatment of Hyperprolactinemia: An Endocrine Society Clinical Practice Guideline**  
 J Clin Endocr Metab 2011;96:273-88

- Indications to treat:
  - Symptomatic patients, in particular those with galactorrhea, hypogonadism-amenorrhea, low libido, or infertility
  - Adenomas  $\geq 1$  cm or any size causing structural compression
- For patients with symptomatic prolactinomas, dopamine agonist therapy should be used to lower prolactin levels, decrease tumour size, and restore gonadal function
- Cabergoline should be preferentially used due to higher efficacy in normalizing PRL levels and shrinking pituitary tumours
- For symptomatic patients with treatment-resistant prolactinomas, increase the dose to maximal tolerable dose before referring for surgery
- Most women with prolactinomas should discontinue dopamine agonist therapy immediately if they become pregnant (except for patients with large invasive tumours)

## Antidiuretic Hormone

### Diabetes Insipidus (see [Nephrology, NP12](#))

#### Definition

- disorder of ineffective ADH (decreased production or peripheral resistance) resulting in passage of large volumes of dilute urine

#### Etiology and Pathophysiology

- central DI: insufficient ADH due to pituitary surgery, tumours, idiopathic/autoimmune, infiltration or lesion of the stalk, hydrocephalus, Langerhans cell histiocytosis, trauma, familial central DI
- nephrogenic DI: collecting tubules in kidneys resistant to ADH due to drugs (e.g. lithium), hypercalcemia, hypokalemia, CKD, hereditary nephrogenic DI
- psychogenic polydipsia and osmotic diuresis must be ruled out

#### Clinical Features

- passage of large volumes of dilute urine, polydipsia, and dehydration; hypernatremia can develop with inadequate water consumption or secondary to an impaired thirst mechanism
- central DI: visual field defect, headache, other neurological features, or evidence of other pituitary hormone deficiencies may be present

#### Diagnostic Criteria

- fluid deprivation will differentiate true DI (high urine output persists, urine osmolality < plasma osmolality) from psychogenic polydipsia
- response to exogenous ADH (DDAVP) will distinguish central DI from nephrogenic DI

#### Treatment

- central DI: first line = desmopressin; second line = chlorpropamide, thiazides, NSAIDs, and carbamazepine
- nephrogenic DI: solute restriction, thiazide diuretics

### Syndrome of Inappropriate ADH Secretion

#### Diagnostic Criteria

- 1) hyponatremia (serum  $\text{Na}^+$  < 135 mEq/L) with 2) plasma hypo-osmolality (< 275 mOsm/kg), 3) urine  $\text{Na}^+$  concentration > 40 mEq/L, 4) urine osmolality > 100 mOsm/kg, 5) euvolemia (no edema), and 6) absence of adrenal, renal, or thyroid insufficiency

#### Etiology and Pathophysiology

- stress (post-surgical)
- malignancy (ectopic ADH production by tumours including small cell carcinoma of the lung, extrapulmonary small cell carcinomas, squamous cell carcinoma of the head and neck)
- CNS disease (inflammatory, hemorrhage, tumour, Guillain-Barré syndrome)
- respiratory disease (tuberculosis, pneumonia, empyema)
- drugs (SSRIs, vincristine, chlorpropamide, cyclophosphamide, carbamazepine, nicotine, morphine, DDAVP, oxytocin)

#### Clinical Features

- symptoms of hyponatremia: headaches, nausea, vomiting, muscle cramps, tremors, cerebral edema if severe (confusion, mood swings, hallucinations, seizures, coma)

#### Treatment

- goal is to increase serum sodium
- treat underlying cause, fluid restriction (800-1000 mL/d), vasopressin receptor antagonists (tolvaptan, conivaptan), demeclocycline (antibiotic with anti-ADH properties; rarely used), and furosemide

## Pituitary Pathology

### Pituitary Adenoma (see [Neurosurgery, NS17](#))

#### Clinical Features

- local mass effects
- visual field defects (bitemporal hemianopsia due to compression of the optic chiasm), diplopia (due to oculomotor nerve palsies; rare), headaches; increased ICP is rare
- hypofunction
- hypopituitarism
- hyperfunction
- PRL (galactorrhea, hypogonadism), GH (acromegaly in adults, gigantism in children), ACTH (Cushing's disease = Cushing's syndrome caused by a pituitary tumour)
- tumours secreting TSH are rare

#### Diagnosing Subtypes of Diabetes Insipidus with Desmopressin Response

Concentrated urine = Central  
No effect = Nephrogenic

#### Syndrome of inappropriate ADH secretion (SIADH) vs. Cerebral Salt Wasting (CSW)

CSW can occur in cases of subarachnoid hemorrhage.  $\text{Na}^+$  is excreted by malfunctioning renal tubules, mimicking findings of SIADH; hallmark is hypovolemia

#### Important Deficiencies to Recognize are:

- Adrenal insufficiency
- Hypothyroidism
- Concurrent adrenal insufficiency and hypothyroidism should be treated with glucocorticoids first and then with thyroid hormone to avoid adrenal crisis

### Investigations

- radiological evaluation (MRI sella is imaging procedure of choice)
- formal visual field testing for tumours compressing the optic chiasm
- laboratory tests of hypothalamic-pituitary hormonal function

### Hypopituitarism

#### Etiology (The Eight I's)

- Invasive
  - pituitary tumours, craniopharyngioma, cysts (Rathke's cleft, arachnoid, or dermoid), metastases
- Infarction/hemorrhage
  - Sheehan's syndrome (pituitary infarction due to excessive postpartum blood loss and hypovolemic shock)
  - pituitary apoplexy (acute hemorrhage/infarction of a pituitary tumour; presents with sudden loss of pituitary hormones, severe headache, and altered LOC; can be fatal if not recognized and treated early)
- Infiltrative/inflammatory
  - sarcoidosis, hemochromatosis, histiocytosis
- Infectious
  - syphilis, tuberculosis, fungal (histoplasmosis), parasitic (toxoplasmosis)
- Injury
  - severe head trauma
- Immunologic
  - autoimmune destruction (hypophysitis)
- Iatrogenic
  - following surgery or radiation
- Idiopathic
  - familial forms, congenital midline defects

#### Clinical Features

- symptoms depend on which hormone is deficient:
  - ACTH: fatigue, weight loss, hypoglycemia, anemia, hyponatremia, failure to thrive, and delayed puberty in children
  - GH: short stature in children; adults exhibit increased fat and decreased lean body mass, decreased BMD, fatigue
  - TSH: tiredness, cold intolerance, constipation, weight gain
  - LH and FSH: oligo- or amenorrhea, infertility, decreased facial/body hair and muscle mass in men, erectile dysfunction, delayed puberty
  - Prolactin: usually asymptomatic, inability to breastfeed
  - ADH: symptoms of DI (extreme thirst, polydipsia, hypernatremia)
  - Oxytocin: usually asymptomatic – only needed during labour and breastfeeding

#### Investigations

- 8 am cortisol, PRL, TSH, Free T4, LH, FSH, Estradiol or Testosterone, GH, IGF-1, Na<sup>+</sup>, Osmolality
- insulin tolerance test: insulin (usual dose 0.1 unit/kg of human regular insulin) → hypoglycemia → increased GH and cortisol (normal response)
- initial test: cosyntropin stimulation test (if results equivocal, proceed to insulin tolerance test)
- triple bolus test (rarely done)

#### The Pituitary Hormones

Compression of the pituitary by a mass leads to loss of pituitary hormones in the following usual order:

"Go Look For The Adenoma Please"

GH, LH, FSH, TSH, ACTH, PRL +

posterior pituitary hormones: ADH and oxytocin

- T3 intrathyroid (autoregulation)
  - synthesis (Wolff-Chaikoff effect, Jod-Basedow effect)
  - varying thyroid sensitivity to TSH in response to iodide availability
  - increased ratio of T3 to T4 in iodide deficiency
  - increased activity of peripheral 5'-deiodinase in hypothyroidism increases T3 production despite low T4 levels

## Tests of Thyroid Function and Structure

### TSH

- third generation TSH is the best test for assessing thyroid function
- hyperthyroidism
  - primary: TSH is low because of negative feedback from increased levels of circulating T4 and T3
  - secondary: increased TSH results in increased T4 and T3
- hypothyroidism
  - primary: increased TSH (most sensitive test) because of less negative feedback from T4 and T3
  - secondary: TSH is low or inappropriately normal with variable response to TRH depending on the site of the lesion (pituitary or hypothalamic)

### Free T4 and Free T3

- standard assessment of thyroid function measures TSH and, if necessary, free T4. Free T3 should only be measured in the small subset of patients with hyperthyroidism and suspected T3 toxicosis. In this case, TSH would be suppressed, free T4 normal, and free T3 elevated

### Thyroid Autoantibodies

- TgAb, TPOAb, and TRAb of the blocking variety are increased in Hashimoto's disease; normal variant in 10-20% of individuals
- TRAb of the stimulating variety are also referred to as TSI and can cause Graves' disease. TRAb receptor blocking and stimulating antibodies are seen in patients with Graves' disease

### Plasma Thyroglobulin

- used to monitor for residual thyroid tissue post-thyroidectomy, e.g. tumour marker for thyroid cancer recurrence
- detectable or elevated levels may suggest persistent, recurrent, or metastatic disease
- assay can be impacted by presence of TgAb. Therefore, both must be tested to ensure accurate thyroglobulin results

### Serum Calcitonin

- not routinely done to investigate thyroid nodules
- ordered if suspicion of MTC (e.g. in patients with a thyroid nodule and suspected or confirmed MEN 2A or 2B syndromes or those who have a pathogenic mutation in *RET* gene)
- used to monitor for residual or recurrent MTC

### Thyroid Imaging/Scans

- normal gland size 15-20 g (estimated by palpation)
- thyroid U/S
  - to measure size of gland, characterize thyroid nodules, facilitate FNA biopsy (FNAB)
  - U/S is the first line tool for identification of thyroid nodules that require FNAB; exception is hyperthyroid patients with thyroid nodules where use of a radioisotope thyroid scan and RAIU (see below) permits identification of hyperfunctioning nodules, which generally do not need to be biopsied
- radioisotope thyroid scan (Technetium-99) only if 1) one or more thyroid nodule(s) and 2) patient is hyperthyroid to determine whether nodules are hot (functioning → excess thyroid hormone production) or cold (non-functioning)
- hot nodule → very low chance of malignancy; treat hyperthyroidism
- cold nodule → further workup required (U/S, then FNAB if concerning sonographic features)
- RAIU
  - test of function: order if patient is thyrotoxic
  - RAIU measures the turnover of iodine by thyroid gland in vivo
  - if ↑ uptake (e.g. incorporated), gland is overproducing thyroid hormone (hyperthyroid)
  - if ↓ uptake (e.g. not incorporated), gland is leaking thyroid hormone (e.g. thyroiditis), exogenous thyroid hormone use, or excess iodine intake (e.g. amiodarone or contrast dye, which has high iodine content)
- see Figure 12 for further information regarding the utility of these scans

### Thyroid Biopsy

- FNA for cytology
  - differentiates between benign and malignant disease
  - best done under U/S guidance
  - accuracy decreased if nodule is greater than 50% cystic, or if nodule is located posteriorly in the gland

### Thyroid Assessment

- TSH
- Serum free thyroid hormones (T<sub>4</sub>, T<sub>3</sub>)
- Antibodies (TRAb, TgAb, and TPOAb)
- Thyroglobulin (to monitor thyroid cancer)
- Thyroid U/S when there is a palpable thyroid abnormality or suspected thyroid mass
- Nuclear uptake and scan (for hyperthyroidism)
- Biopsy (FNA) of thyroid nodules warranting a cytological evaluation

### Does this Patient have a Goitre?

#### From The Rational Clinical Examination

JAMA 2009; <https://jamanetwork.com/doi/full/10.1001/jama.2009.1845>

**Study:** Systematic review of articles assessing the accuracy and precision of the clinical exam in the diagnosis of a goitre.

**Results:** Clinical diagnosis was based on degree of lateral prominence, visibility, and palpability of the thyroid gland. No evidence exists to support the superiority of any one method.

The combined results of 4 studies detail the predictive ability of assessing grades of thyroid gland weight:

Weight	Reference	LR+	95% CI
0-20 g	Normal	0.15	(0.10-0.21)
20-40 g	1-2x	1.9	(1.1-3.0)
>40 g	>2x	25.0	(2.6-175)

Alternatively, defining a goitre as a mass larger than the distal phalanx of the thumb has been shown to have an LR+ of 3.0 (95% CI 2.5-3.5) and LR- of 0.30 (95% CI: 0.24-0.37) in children, and an LR+ of 4.7 (95% CI 3.6-6.0) and LR- of 0.08 (95% CI 0.02-0.27) for the presence of a goitre.

**Conclusions:** Use of weight of thyroid tissue is an appropriate method of diagnosing a goitre, while comparing the size of the thyroid mass to the distal phalanx of the thumb may be a useful alternative.

**Table 15. Summary of Diagnostic Testing in Hyperthyroidism and Hypothyroidism**

	Hyperthyroidism	Hypothyroidism
<b>TSH</b>	Decreased in 1 <sup>o</sup> hyperthyroidism Increased in 2 <sup>o</sup> hyperthyroidism	Increased in 1 <sup>o</sup> hypothyroidism Decreased in 2 <sup>o</sup> hypothyroidism
<b>Free T<sub>4</sub></b>	Increased in 1 <sup>o</sup> hyperthyroidism Increased in 2 <sup>o</sup> hyperthyroidism	Decreased in 1 <sup>o</sup> hypothyroidism Decreased in 2 <sup>o</sup> hypothyroidism
<b>Antibodies</b>	Graves': TRAb	Hashimoto's: TPOAb, TgAb
<b>RAIU</b>	Increased uptake Graves' Toxic multinodular goitre Toxic adenoma	Decreased uptake Subacute thyroiditis Recent iodine load Exogenous thyroid hormone
<b>Radioisotope Thyroid Scan</b>	Graves': homogenous diffuse uptake Multinodular goitre: heterogeneous uptake Toxic adenoma: single intense area of uptake with suppression elsewhere	

## Thyrotoxicosis

### Definition

- clinical, physiological, and biochemical findings in response to elevated thyroid hormone

### Epidemiology

- 1% of general population have hyperthyroidism
- F:M=5:1

### Etiology and Pathophysiology

**Table 16. Differential Diagnosis of Thyrotoxicosis**

Disorder	TSH	Free T <sub>4</sub> /T <sub>3</sub>	Thyroid Antibodies	RAIU	Other
<b>HYPERTHYROIDISM</b>					
Graves' Disease	Decreased	Increased	TRAb	Increased	Homogenous uptake on scan
Toxic Nodular Goitre	Decreased	Increased	None	Increased	Heterogeneous uptake on scan
Toxic Nodule	Decreased	Increased	None	Increased	Intense uptake in hot nodule on scan with suppressed uptake in the rest of the gland
<b>THYROIDITIS</b>					
Subacute, Silent, Postpartum	Decreased	Increased	Up to 50% of cases (TPOAb, TgAb)	Decreased (increases once entering hypothyroid phase, when TSH rises)	In classical subacute painful thyroiditis, ESR increased
<b>EXTRATHYROIDAL SOURCES OF THYROID HORMONE</b>					
Endogenous (struma ovarii, ovarian teratoma, metastatic follicular carcinoma)	Decreased	Increased	None	Decreased	Low thyroglobulin since endogenous thyroid hormone production suppressed
Exogenous (drugs)	Decreased	Increased (T <sub>4</sub> would be decreased if taking T <sub>3</sub> )	None	Decreased	
<b>EXCESSIVE THYROID STIMULATION</b>					
Pituitary Thyrotropinoma	Increased or inappropriately normal	Increased	None	Increased	Pituitary mass; possible PRL or GH excess
Pituitary Thyroid Hormone Receptor Resistance	Increased or normal	Increased	None	Increased	Abnormal THRB gene analysis
Increased hCG (e.g. pregnancy)	Decreased	Increased	None	Test is contraindicated in pregnancy	

### Drugs Affecting Thyroid Function

Thyroid 2010;20(7):763-770

- Lithium plays an inhibitory role in thyroid hormone release, resulting in clinical hypothyroidism and goitre.
- Amiodarone-Induced Hypothyroidism (AIH): Amiodarone, a class III antiarrhythmic drug, contains 2 atoms of iodine per molecule and is structurally similar to thyroid hormones, and may exert antagonistic effects on TSH receptors. It is also shown to inhibit type I deiodinases resulting in high T<sub>4</sub> and low T<sub>3</sub> levels. AIH occurs in 5-15% of patients on amiodarone. AIH can also occur in people without pre-existing thyroid dysfunction.
- Amiodarone-Induced Thyrotoxicosis (AIT): occurs in 2-12% of patients on amiodarone. This may be due to either an increased iodine load in patients with a previously autonomous thyroid such as in Graves' disease and toxic multinodular goitre (AIT type I) or amiodarone-induced destructive thyroiditis (AIT type II).

### Signs and Symptoms of HYPERTHYROIDISM

#### THYROIDISM

Tremor  
Heart rate up  
Yawning (fatigue due to insomnia)  
Restlessness  
Oligomenorrhea/amenorrhea  
Intolerance to heat  
Diarrhea  
Irritability  
Sweating  
Muscle wasting/weight loss

### Common Etiologies

Thyrotoxicosis	Hypothyroidism
Graves' Disease	Hashimoto's
Toxic Nodular Goitre	Congenital
Toxic Nodule	Iatrogenic (thionamides, radioactive iodine, or surgery)
Hyperthyroid phase of thyroiditis	Hypothyroid phase of thyroiditis

## Clinical Features

**Table 17. Clinical Features of Thyrotoxicosis**

General	Fatigue, heat intolerance, irritability, fine tremor
CVS	Tachycardia, atrial fibrillation, palpitations Elderly patients may have only cardiovascular symptoms, commonly new onset atrial fibrillation
GI	Weight loss with increased appetite, thirst, increased frequency of bowel movements (hyperdefecation)
Neurology	Proximal muscle weakness, hypokalemic periodic paralysis (more common in Asian individuals)
GU	Oligomenorrhea, amenorrhea, decreased fertility
Dermatology	Fine hair, moist and warm skin, vitiligo, soft nails with onycholysis (Plummer's nails), palmar erythema, pruritus Graves' disease: clubbing (acropachy), pretibial myxedema (rare)
MSK	Decreased bone mass, proximal muscle weakness
Hematology	Graves' disease: leukopenia, lymphocytosis, splenomegaly, lymphadenopathy (occasionally)
Eye	Graves' disease: lid lag, retraction, proptosis, diplopia, decreased acuity, puffiness, conjunctival injection NOTE: Lid lag is a reflection of a hyperadrenergic state and can be present in any form of thyrotoxicosis

## Treatment

- $\beta$ -blockers for control of adrenergic symptoms
- antithyroidals (thionamides): propylthiouracil (PTU) or methimazole (MMI); MMI recommended
  - to prepare patients with endogenous hyperthyroidism for surgery, for patients with Graves' disease, and for patients with toxic nodules who do not wish to have definitive treatment with radioactive iodine or surgery
- radioactive iodine thyroid ablation for Graves' disease and toxic nodules/adenoma
- surgery in the form of hemi, subtotal, or complete thyroidectomy for toxic nodules
- surgery in the form of total thyroidectomy for Graves' disease

## Graves' Disease

### Definition

- an autoimmune disorder characterized by autoantibodies that stimulate the TSH receptor leading to hyperthyroidism

### Epidemiology

- most common cause of hyperthyroidism
- occurs at any age with peak in 3rd and 4th decade
- F:M=7:1, 1.5-2% of women in the United States
- familial predisposition: 15% of patients have a close family member with Graves' disease and 50% have family members with positive circulating antibodies
- association with HLA-B8 and DR3
- may be associated with other autoimmune disorders (e.g. pernicious anemia, Hashimoto's disease)

### Etiology and Pathophysiology

- autoimmune disorder due to breakdown in thyroid tolerance likely due to a combination of factors including autoreactive B lymphocytes and an imbalance favouring a TH2 vs. TH1 immune response
- B lymphocytes produce TSI that binds and stimulates the TSH receptor, and thus, the thyroid gland
- immune response can be triggered by postpartum state, iodine excess, viral or bacterial infections, and glucocorticoid withdrawal
- ophthalmopathy (thyroid associated orbitopathy) is a result of increased connective and extraocular muscle tissue volume due to inflammation and accumulation of glycosaminoglycans, stimulated by TSI, that increase osmotic pressure within the orbit; this leads to fluid accumulation and forward displacement of the eyeball
- dermatopathy (pretibial or localized myxedema) may be related to cutaneous glycosaminoglycan deposition

### Clinical Features

- signs and symptoms of thyrotoxicosis
- diffuse goitre  $\pm$  thyroid bruit secondary to increased blood flow through the gland
- ophthalmopathy: proptosis, diplopia, conjunctival injection, corneal abrasions, periorbital puffiness, lid lag, decreased visual acuity (plus signs of hyperthyroidism: lid retraction, characteristic stare)
- dermatopathy (rare): pretibial myxedema (thickening of dermis that manifests as non-pitting edema)
- acropachy: clubbing and thickening of distal phalanges

### Investigations

- low TSH
- increased free T4 (and/or increased T3)
- positive for TRAb (the currently available third-generation TRAb tests have sensitivity and specificity over 98%, allowing their use for determining the etiology of hyperthyroidism)
- increased RAIU
- homogeneous uptake on thyroid scan

### Graves' Ophthalmopathy

#### NO SPECS (in the usual order of changes)

#### No signs

Only signs: lid lag, lid retraction

Soft tissue: periorbital puffiness,

conjunctival injection, chemosis

Proptosis/exophthalmos

Extraocular (diplopia)

Corneal abrasions (unable to close

eyes)

Sight loss

### Other Medications Used in the Treatment of Graves'

**Glucocorticoids** have been useful in the treatment of severe Graves' hyperthyroidism and thyroid storm, by inhibiting the conversion of peripheral T<sub>4</sub> to T<sub>3</sub>

**Lithium** can also be used to treat Graves' hyperthyroidism. It acts by blocking thyroid hormone release, but its toxicity has limited its use in practice

### Caution with Thionamides

These drugs are highly effective inhibitors of thyroid hormone synthesis, inducing permanent remission in 20-30% of patients with Graves' disease. They are most often employed to achieve a euthyroid state before definitive treatment. Adverse effects include teratogenicity, agranulocytosis, hepatotoxicity, and ANCA-positive vasculitis

### Treatment

- thionamides (antithyroid medications): PTU or methimazole MMI. In 2020, PTU became unavailable in Canada and it is unclear whether it will be available in the future
  - PTU and MMI inhibit thyroid hormone synthesis by inhibiting peroxidase-catalyzed reactions, thereby inhibiting organification of iodide, blocking the coupling of iodotyrosines
  - PTU also inhibits peripheral deiodination of T<sub>4</sub> to T<sub>3</sub>
  - treat for approximately 12-18 mo aiming for a normal TSH and TRAb prior to consideration of treatment discontinuation
  - small goitre, mild hyperthyroidism, and low TRAb titres are good predictors for long-term remission with medical therapy
  - remission (normal thyroid indices one yr after discontinuation of PTU or MMI) rates range between 20-50% following 12-18 mo of antithyroid medication
  - major side effects: hepatotoxicity (cholestasis, hepatitis), agranulocytosis, vasculitis
  - minor side effects: minor rash, pruritus
  - MMI is preferred to PTU due to longer duration of action (once daily dosing for most), more rapid resolution of hyperthyroidism, and lower incidence of side effects
  - in pregnancy: use PTU during first 16 wk of pregnancy and MMI after. MMI is contraindicated in the first trimester due to risk of aplasia cutis; MMI is preferred in the second and third trimester due to the potential risk of hepatotoxicity with PTU in the second and third trimesters
- symptomatic treatment with  $\beta$ -blockers
- thyroid ablation with radioactive I-131 if PTU or MMI trial does not produce disease remission or patient prefers definitive treatment with RAI
  - high incidence of hypothyroidism after I-131 requiring lifelong thyroid hormone replacement
  - contraindicated in pregnancy
  - may worsen ophthalmopathy; concurrent treatment with prednisone if high risk for or if ophthalmopathy present
- total or near total thyroidectomy (indicated for large goitres, suspicious nodule for cancer, if patient is intolerant to thionamides and declines/is not a candidate for RAI ablation, women who wish to conceive in the near future warranting rapid control of hyperthyroidism, uncontrolled hyperthyroidism not responding to anti-thyroid drugs in pregnancy (surgery safest in second trimester), patient preference)
  - risks: permanent hypothyroidism, hypoparathyroidism, and vocal cord palsy due to potential laryngeal nerve damage
- ophthalmopathy/orbitopathy
  - smoking cessation is important
  - prevent drying of eyes and ulceration of cornea by using artificial tears during the day and lubricants at night
  - high dose prednisone or IV methylprednisolone in severe cases
  - high dose glucocorticoids preferably IV as well as potential orbital decompression surgery for sight threatening orbitopathy
  - orbital radiation, surgical decompression

### Prognosis

- course involves remission and exacerbation unless gland is destroyed by radioactive iodine or surgery
- total and subtotal thyroidectomy are rapid cures with low-risk of recurrence (2% and 10%, respectively)
- radioactive iodine is less invasive than surgery, but also results in permanent hypothyroidism and requires precautions in contacts several days after treatment
- medical therapy with thionamides is not invasive, but has high recurrence rate at ~50%
- lifetime follow-up needed

## Subacute Thyroiditis (Thyrotoxic Phase)

- there are two main types: painful (de Quervain's) and painless (silent)

**Table 18. Painful vs. Painless Subacute Thyroiditis**

	Painful Thyroiditis (de Quervain's, granulomatous)	Painless Thyroiditis (silent, autoimmune)
<b>Pathophysiology</b>	Presumed to be caused by viral infection or postviral inflammatory process Strongly associated with HLA-D35 Thyroid inflammation damages thyroid follicles, resulting in release of large amounts of T <sub>4</sub> and T <sub>3</sub> until stores are exhausted State of hypothyroidism often persists until thyroid can generate sufficient thyroid hormones	Considered variant of Hashimoto's thyroiditis Associated with HLA-DR3 Postpartum subtype occurs following pregnancy Also caused by inflammatory damage leading to unregulated release of T <sub>4</sub> and T <sub>3</sub> into circulation
<b>Clinical Features</b>	Painful swelling of the thyroid (may radiate to jaw and ears), transient vocal cord paresis, malaise, fatigue, myalgia, fever Often preceded by URTI Painful condition lasts for a week to few months Signs of hyperthyroidism during hyperthyroid phase (palpitations, tachycardia, stare)	Thyroid enlargement without discomfort in association with the typical thyroid function test abnormalities consisting of hyperthyroidism, hypothyroidism, and recovery Signs of hyperthyroidism during hyperthyroid phase (palpitations, tachycardia, stare) Affects women more than men
<b>Laboratory Investigations</b>	Initial elevated T <sub>4</sub> and T <sub>3</sub> Near absent RAIU ESR and CRP often elevated	Initial elevated T <sub>4</sub> and T <sub>3</sub> Near absent RAIU
<b>Treatment</b>	NSAID/prednisone for pain β-adrenergic blockade is usually effective in reversing most of the hypermetabolic and cardiac symptoms If symptomatically hypothyroid, may treat short-term with thyroxine	β-adrenergic blockade is usually effective in reversing most of the hypermetabolic and cardiac symptoms If symptomatically hypothyroid, may treat short-term with thyroxine
<b>Prognosis</b>	Complete spontaneous recovery to normal thyroid function in 90% of patients 10% of patients may become hypothyroid and require permanent replacement	10% of patients may become permanently hypothyroid At risk of recurrent episodes of thyroiditis

## Toxic Adenoma/Toxic Multinodular Goitre

### Etiology and Pathophysiology

- autonomous thyroid hormone production from a functioning adenoma that is hypersecreting T<sub>4</sub> and T<sub>3</sub>
- may be singular (toxic adenoma) or multiple (toxic multinodular goitre (Plummer's disease))
- more common in elderly people as opposed to Graves' disease which is more common in younger individuals

### Clinical Features

- multinodular goitre
- tachycardia, heart failure, arrhythmia, weight loss, nervousness, weakness, tremor, and sweats
- local neck compression symptoms such as dysphagia, dysphonia, or dyspnea may be present with large goitres

### Investigations

- low TSH, high free T<sub>4</sub> and free T<sub>3</sub>
- thyroid scan with increased RAIU in nodule(s) and suppression of the remainder of the gland

### Treatment

- use high dose radioactive iodine (I-131) to ablate hyperfunctioning nodules
- β-blockers often necessary for symptomatic treatment prior to definitive therapy
- surgical excision may also be used as first-line treatment
- initiate therapy with PTU or MMI to attain euthyroid state in individuals who do not wish to have definitive treatment of their disease, in preparation for thyroidectomy, or prior to RAI in patients at risk for complications due to exacerbation of hyperthyroidism following RAI such as the elderly with cardiovascular disease

## Thyrotoxic Crisis/Thyroid Storm

### Definition

- medical emergency – acute exacerbation of all of the symptoms of thyrotoxicosis presenting in a life-threatening state secondary to uncontrolled hyperthyroidism
- rare, but serious with mortality rate between 10-30%

### Etiology and Pathophysiology

- often precipitated by infection, trauma, or surgery in a hyperthyroid patient

**Differential Diagnosis**

- sepsis, pheochromocytoma, malignant hyperthermia, drug overdose, neuroleptic malignant syndrome

**Clinical Features**

- hyperthyroidism
- extreme hyperthermia ( $\geq 40^{\circ}\text{C}$ ), tachycardia, vomiting, diarrhea, hepatic failure with jaundice, atrial fibrillation, CHF
- CNS manifestations including agitation, delirium, psychosis, lethargy, seizures, coma

**Laboratory Investigations**

- increased free T<sub>4</sub> and T<sub>3</sub>, undetectable TSH
- $\pm$  anemia, leukocytosis, hyperglycemia, hypercalcemia, elevated LFTs

**General Measures**

- fluids, electrolytes, and vasopressor agents should be used as indicated
- a cooling blanket and acetaminophen can be used to treat the pyrexia
- propranolol or other  $\beta$ -blockers can additionally be used, but should be used with caution in patients with decompensated heart failure as they may worsen condition
  - propranolol is frequently used because it decreases peripheral conversion of T<sub>4</sub> to T<sub>3</sub>

**Specific Measures**

- PTU is the anti-thyroid drug of choice and is used in high doses (200 mg q4 h)
- give iodide, which acutely inhibits the release of thyroid hormone, 1 h after the first dose of PTU is given
  - sodium iodide 1 g IV drip over 12 h q12 h
  - OR
  - Lugol's solution 10 drops q8 h
  - OR
  - potassium iodide (SSKI) 5 drops q6 h
- hydrocortisone 100 mg IV q8 h or dexamethasone 2-4 mg IV q6 h for the first 24-48 h; inhibits peripheral conversion of T<sub>4</sub> to T<sub>3</sub>

## Hypothyroidism

**Definition**

- clinical syndrome caused by insufficient thyroid hormone production

**Epidemiology**

- 2-3% of general population
- F:M=10:1
- 10-20% of women >50 have subclinical hypothyroidism (normal T<sub>4</sub>, TSH mildly elevated)
- iodine deficiency is the most common cause worldwide, but not in North America

**Etiology and Pathophysiology**

- primary hypothyroidism (90%)
  - inadequate thyroid hormone production due to an intrinsic thyroid defect
  - iatrogenic: post-ablative (I-131 or surgical thyroidectomy)
  - autoimmune: Hashimoto's thyroiditis
  - hypothyroid phase of subacute thyroiditis
  - drugs: goitrogens (iodine), PTU, MMI, lithium
  - infiltrative disease (progressive systemic sclerosis, amyloid)
  - iodine deficiency
  - congenital (1/4000 births)
  - neoplasia
- secondary hypothyroidism: pituitary hypothyroidism
- insufficiency of pituitary TSH
- tertiary hypothyroidism: hypothalamic hypothyroidism
- decreased TRH from hypothalamus (rare)
- peripheral tissue resistance to thyroid hormone (Refetoff syndrome)

**Table 19. Interpretation of Serum TSH and Free T<sub>4</sub> in Hypothyroidism**

	Serum TSH	Free T <sub>4</sub>
Overt Primary Hypothyroidism	Increased	Decreased
Subclinical Primary Hypothyroidism	Increased	Normal
Secondary Hypothyroidism	Decreased or not appropriately elevated	Decreased

**Factors Affecting Gastrointestinal Absorption of Levothyroxine: A Review**

Clin Ther 2017;39(2):378-403

- GI disorders such as celiac disease, atrophic gastritis, lactose intolerance, H. pylori infection may impede levothyroxine absorption.
- Drugs decreasing stomach acidity have been shown to significantly reduce exogenous thyroid hormone absorption from the GI tract. These include proton-pump inhibitors, H<sub>2</sub> receptor antagonists, calcium carbonate, sucralfate, and aluminum hydroxide.
- Iron citrate is shown to reduce intestinal absorption of levothyroxine.
- Food, especially soybeans and coffee, have been shown to reduce absorption of levothyroxine significantly.
- Roughly 80% of levothyroxine is absorbed within 3 h after administration of the drug. Thus, patients should be educated to take levothyroxine on an empty stomach at least 1 h prior to eating breakfast.

## Clinical Features

**Table 20. Clinical Features of Hypothyroidism**

<b>General</b>	Fatigue, cold intolerance, slowing of mental and physical performance, hoarseness, macroglossia
<b>CVS</b>	Pericardial effusion, bradycardia, hypotension, worsening CHF + angina, hypercholesterolemia, hyperhomocysteinemia, myxedema heart
<b>Respiratory</b>	Decreased exercise capacity, hypoventilation secondary to weak muscles, decreased pulmonary responses to hypoxia, sleep apnea due to macroglossia
<b>GI</b>	Weight gain despite poor appetite, constipation
<b>Neurology</b>	Paresthesia, slow speech, muscle cramps, delayed deep tendon reflex relaxation ("hung reflexes"), carpal tunnel syndrome, asymptomatic elevated CK, seizures
<b>GU</b>	Menorrhagia, amenorrhea, impotence, pre-menopausal abnormal vaginal bleeding
<b>Dermatology</b>	Facial puffiness, periorbital edema, cool and pale, dry and rough skin, dry and coarse hair, eyebrows thinned (lateral 1/3), discoloration (carotenemia)
<b>Hematology</b>	Anemia: 10% pernicious due to presence of anti-parietal cell antibodies with Hashimoto's thyroiditis

### Treatment

- L-thyroxine (dose range: 0.05-0.2 mg PO once daily, up to 1.6 µg/kg/d)
- elderly patients and those with CAD: start at 0.025 mg daily and increase gradually every 6 wk (start low, go slow)
- after initiating L-thyroxine, TSH needs to be evaluated in 6 wk; adjust dose until TSH returns to normal reference range
- once maintenance dose achieved, follow up TSH with patient annually
- secondary/tertiary hypothyroidism: monitor via measurement of free T<sub>4</sub> (TSH is unreliable in this setting)

### CONGENITAL HYPOTHYROIDISM

- see [Paediatrics](#), P34

## Hashimoto's Thyroiditis

### Definition

- most common form of primary hypothyroidism in North America
- chronic autoimmune thyroiditis characterized by both cellular and humoral factors in the destruction of thyroid tissue
- two major forms: goitrous and atrophic; both forms share same pathophysiology but differ in the extent of lymphocytic infiltration, fibrosis, and thyroid follicular cell hyperplasia
- goitrous variant usually presents with a small, rubbery goitre and euthyroidism, then hypothyroidism becomes evident
  - associated with fibrosis
- atrophic variant patients are hypothyroid from onset
- risk factor for rare primary thyroid lymphoma

### Etiology and Pathophysiology

- defect in a T-suppressor clone leads to cell-mediated destruction of thyroid follicles
- B lymphocytes produce antibodies against thyroid components including thyroglobulin, thyroid peroxidase, TSH receptor, Na<sup>+</sup>/I<sup>-</sup> symporter

### Risk Factors

- F:M=7:1
- genetic susceptibility: increased frequency in patients with Down's syndrome, Turner's syndrome, certain HLA alleles, cytotoxic T-lymphocyte-associated protein 4 (CTLA-4)
- family Hx or personal Hx of other autoimmune diseases
- cigarette smoking
- high iodine intake

### Investigations

- high TSH, low T<sub>4</sub> (not necessary to measure T<sub>3</sub> as it will be low as well)
- presence of TPOAb and TgAb in serum

### Treatment

- if hypothyroid, replace with L-thyroxine (analog of T<sub>4</sub>)

## Myxedema Coma

### Definition

- medical emergency – severe hypothyroidism complicated by trauma, sepsis, cold exposure, MI, inadvertent administration of hypnotics or narcotics, and other stressful events
- rare; high level of mortality (up to 40%, despite therapy)

### Subclinical Hypothyroidism: A Review

JAMA 2019;322:153-160

**Background:** Up to 10% of the adult population experiences subclinical hypothyroidism, defined as elevated TSH (>4.4 mU/L) with normal levels of free T<sub>4</sub>. The degree of abnormality that warrants management is controversial.

**Observations:** Subclinical hypothyroidism is most often caused by autoimmune thyroiditis. It may be associated with increased risk of CHF and CAD events. Further, a substantial portion of patients with subclinical hypothyroidism progress to overt hypothyroidism. Evidence from large RCTs to support levothyroxine therapy in these patients is lacking. The rationale for treatment is therefore based on levothyroxine's potential to prevent cardiovascular events and progression to overt hypothyroidism.

**Recommendations:** Most individuals with subclinical hypothyroidism can be observed without treatment. Candidates for levothyroxine therapy include those with serum TSH levels >10 mU/L and young and middle-aged patients with symptoms of mild hypothyroidism.

### Signs and Symptoms of HYPOTHYROIDISM

#### HIS FIRM CAP

Hypoventilation  
Intolerance to cold  
Slow HR  
Fatigue  
Impotence  
Renal impairment  
Menorrhagia/amenorrhea  
Constipation  
Anemia  
Paresthesia

**Clinical Features**

- decreased mental status and hypothermia are hallmark symptoms
- hyponatremia, hypotension, hypoglycemia, bradycardia, hypoventilation, and generalized non-pitting edema often present

**Investigations**

- decreased T<sub>4</sub>, increased TSH, decreased glucose
- check ACTH and cortisol for evidence of adrenal insufficiency

**Treatment**

- aggressive and immediate treatment required
- ABCs: ICU admission
- corticosteroids (for risk of concomitant adrenal insufficiency): hydrocortisone 100 mg q8 h
- L-thyroxine 0.2-0.5 mg IV loading dose, then 0.1 mg IV once daily until oral therapy tolerated; also consider T<sub>3</sub> therapy
- supportive measures: mechanical ventilation, vasopressors, passive rewarming, IV dextrose, fluids if necessary (risk of overload)
- monitor for arrhythmia

**Non-Thyroidal Illness (Sick Euthyroid Syndrome)****Definition**

- changes in the regulation of the hypothalamic-pituitary-thyroid axis, and thyroid hormone metabolism and transport among patients with severe illness, trauma, surgery, or starvation
- not due to intrinsic thyroid, pituitary, or hypothalamic disease
- initially low free T<sub>3</sub> may be followed by low TSH and, if severe illness, low free T<sub>4</sub>
- with recovery of illness, TSH may become transiently high

**Pathophysiology**

- abnormalities include alterations in:
  - peripheral transport and metabolism of thyroid hormone
  - regulation of TSH secretion
- may be protective during illness by reducing tissue catabolism

**Labs**

- initially decreased free T<sub>3</sub> followed by decreased TSH and finally decreased free T<sub>4</sub>
- with recovery of illness, TSH may become elevated

**Treatment**

- treat the underlying disease; thyroid hormone replacement has not shown to be beneficial
- thyroid function tests normalize once patient is well (initially with a transient increase in TSH)

**Non-Toxic Goitre****Definition**

- generalized enlargement of the thyroid gland in a euthyroid individual that does not result from inflammatory or neoplastic processes

**Pathophysiology**

- the appearance of a goitre is more likely to present during adolescence, pregnancy, and lactation due to increased thyroid hormone requirements
- early stages: goitre is usually diffuse
- later stages: multinodular non-toxic goitre with nodule, cyst formation, and areas of ischemia, hemorrhage, and fibrosis

**Etiology**

- iodine deficiency or excess
- goitrogens: brassica vegetables (e.g. turnip, cassava)
- drugs: iodine, lithium, para-aminosalicylic acid
- any disorder of hormone synthesis with compensatory growth
- peripheral resistance to thyroid hormone

**Treatment**

- remove goitrogens
- radiiodine therapy (very high doses required given low iodine uptake, used as last resort in very highly selected cases where the goiter is causing symptoms and surgery is not feasible)
- suppression with L-thyroxine (rarely done)
- surgery may be necessary if severe compressive symptoms develop (rare); patients are often asymptomatic

**Complications**

- compression of neck structures causing stridor, dysphagia, pain, and hoarseness of voice
- multinodular goitre may become autonomous leading to toxic multinodular goitre and hyperthyroidism

## Thyroid Nodules

### Definition

- discrete lesion that can be distinguished sonographically from the rest of the thyroid parenchyma
- 19-67% prevalence based on incidentally found nodules on U/S

### Etiology

- benign tumours (e.g. follicular adenoma)
- thyroid malignancy
- hyperplastic area in a multinodular goitre
- cyst: true thyroid cyst, area of cystic degeneration in a multinodular goitre

### Investigations

- approach to thyroid biopsy depending on U/S characteristics of the nodule
- benign or very small nodules suspicious for thyroid cancer do not require ongoing surveillance
- small nodules suspicious for thyroid cancer require up to five years of surveillance
- larger nodules suspicious for thyroid cancer require biopsy

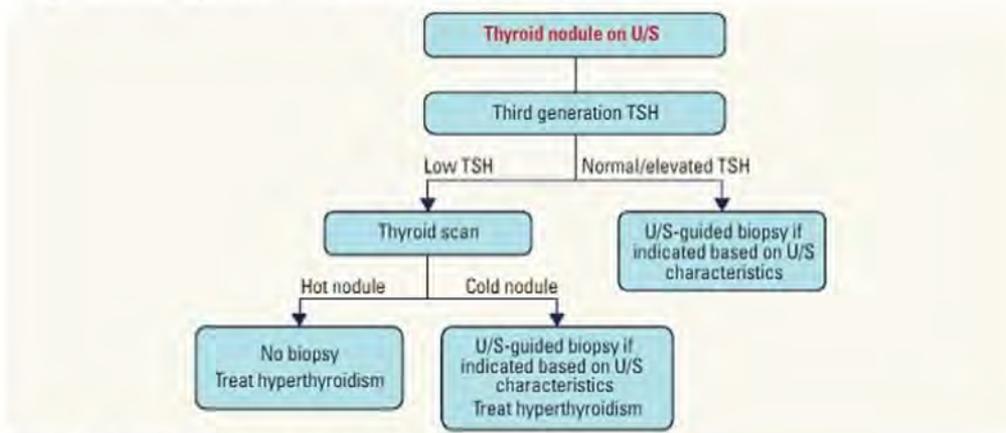

Figure 13. Approach to the evaluation of a thyroid nodule  
Adapted from Dr. J Goguen, University of Toronto, MMD 2013

## Thyroid Malignancies

- see [Otolaryngology, OT37](#)

## Adrenal Cortex

### Adrenocorticotropic Hormone

- a polypeptide (cleaved from prohormone POMC), secreted in a pulsatile fashion from the anterior pituitary with diurnal variability (peak: 0200-0400 h; trough: 1800-2400 h)
- secretion regulated by CRH and AVP
- stimulates growth of adrenal cortex and release of glucocorticoids, adrenal androgens and, to a very limited extent, mineralocorticoids
- ACTH can directly bind to MSH receptors on melanocytes, enhancing melanogenesis

### Adrenocortical Hormones

#### Aldosterone

- a mineralocorticoid which regulates ECFV through  $\text{Na}^+$  (and  $\text{Cl}^-$ ) retention and  $\text{K}^+$  (and  $\text{H}^+$ ) excretion (stimulates distal tubule  $\text{Na}^+/\text{K}^+$  ATPase)
- regulated by the RAAS and hyperkalemia
- negative feedback to juxtaglomerular apparatus (JGA) by long loop (aldosterone  $\uparrow$  volume expansion) and short loop (angiotensin II  $\uparrow$  peripheral vasoconstriction)

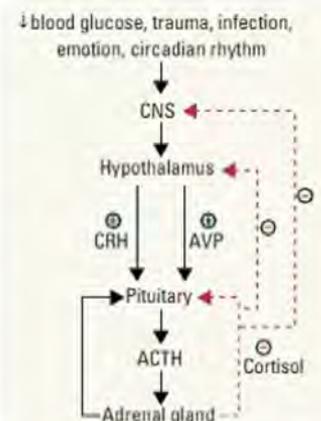

Figure 14. Regulation of CRH-ACTH-adrenal gland axis

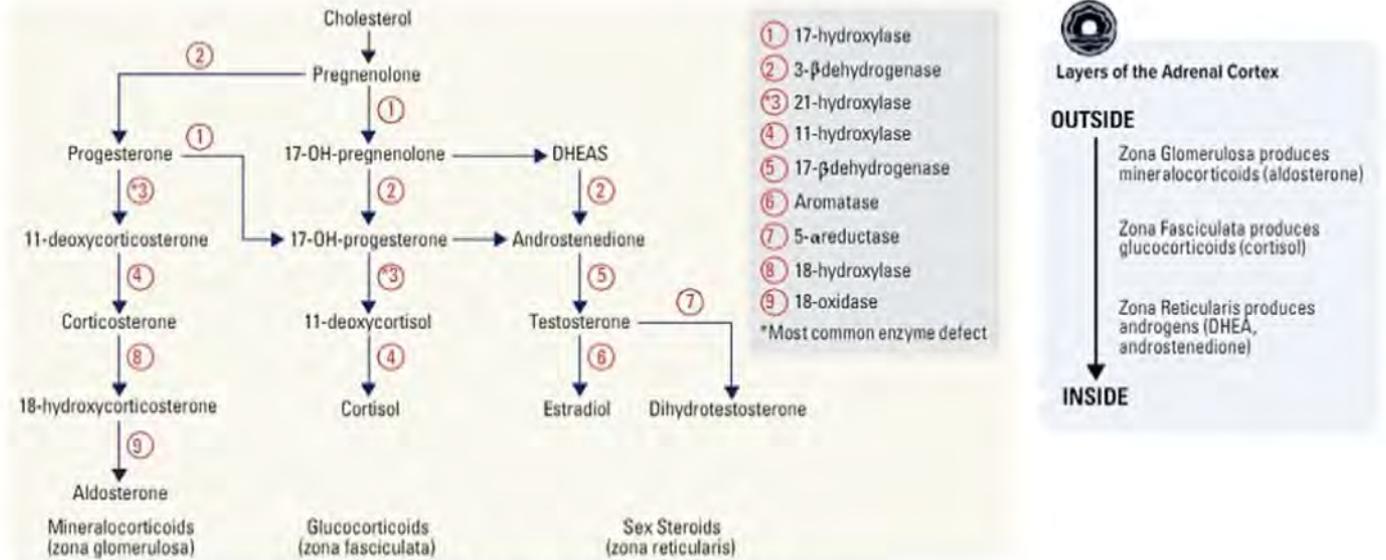

Figure 15. Pathways of major steroid synthesis in the adrenal gland and their enzymes

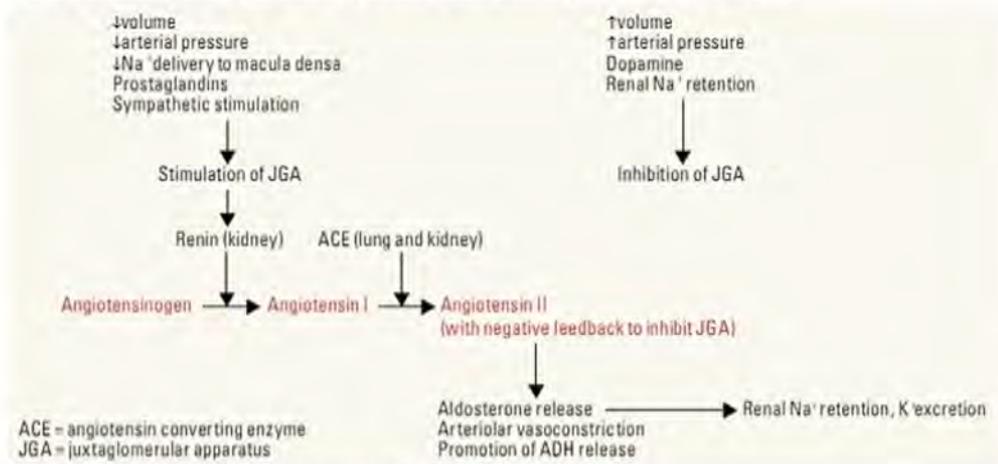

Figure 16. Renin-angiotensin-aldosterone axis (see [Nephrology, NP4](#))

**Cortisol**

- a glucocorticoid regulated by the HPA axis
- involved in metabolism regulation
- supports blood pressure and vasomotor tone
- also involved in behavioural regulation and immunosuppression

**Table 21. Physiological Effects of Glucocorticoids**

Stimulatory Effects	Inhibitory Effects
Stimulate hepatic glucose production (gluconeogenesis)	Inhibit bone formation; stimulate bone resorption
Increase insulin resistance in peripheral tissues	Inhibit fibroblasts, causing collagen and connective tissue loss
Increase protein catabolism	Suppress inflammation; impair cell-mediated immunity
Stimulate leukocytosis and lymphopenia	Inhibit growth hormone axis*
Increase cardiac output, vascular tone, Na <sup>+</sup> retention	Inhibit reproductive axis*
Increase PTH release, urine calcium excretion	Inhibit vitamin D and inhibit calcium uptake

\*Typically only occurs with cortisol excess

**Androgens**

- sex steroids regulated by ACTH; primarily responsible for adrenarche (growth of axillary and pubic hair)
- principal adrenal androgens are: DHEA, androstenedione, and 11-hydroxyandrostenedione
- proportion of total androgens (adrenal to gonadal) increases with age

## Adrenocortical Functional Workup

### STIMULATION TEST

- purpose: diagnose hormone deficiencies
- method: measure target hormone after stimulation with tropic (pituitary) hormone

### Tests of Glucocorticoid Reserve

- Cosyntropin (ACTH analogue) Stimulation Test
  - administer 250 µg cosyntropin IV/IM, and measure plasma cortisol levels before and 30 and 60 min after administration
  - physiologic response: stimulated plasma cortisol of >500 nmol/L (>18 µg/dL) at 30 or 60 min
    - physiologic response rate threshold may be lower with newer assays and should be confirmed with local lab
  - inappropriate response: inability to stimulate increased plasma cortisol; peak cortisol levels below 500 nmol/L (18 µg/dL) at 30 or 60 min

### SUPPRESSION TESTS

- purpose: diagnose of hormone hypersecretion
- method: measure target hormone after suppression of its tropic (pituitary) hormone

#### 1. Tests of Pituitary-Adrenal Suppressibility

- DXM suppression test
- principle: DXM suppresses pituitary ACTH, plasma cortisol should be lowered if HPA axis is normal
- screening test: low-dose overnight DXM suppression test
  - oral administration of 1 mg DXM between 11 pm and midnight, then measure plasma cortisol levels the following day between 8 am and 9 am
  - physiologic response: plasma cortisol <50 nmol (<1.8 µg/dL)
  - inappropriate response: failure to suppress plasma cortisol
  - false positive results due to obesity, depression, alcoholism, medications inducing the metabolism of DXM
- testing of excess cortisol production
  - elevated 24 h urine free cortisol (shows overproduction of cortisol)
  - midnight salivary cortisol (if available) shows lack of diurnal variation
    - inappropriately remains high, >145 ng/dL (4 nmol/L) (normally will be low at midnight)

#### 2. Tests of Mineralocorticoid Suppressibility

- multiple medications can interfere with the interpretation of screening and confirmatory tests for PA and these may need to be held prior to testing
- positive screen for PA is elevated aldosterone:renin ratio in the presence of high aldosterone
  - there is variability in the interpretation of aldosterone:renin ratio depending on the assays used
- confirmation of PA requires lack of aldosterone suppression: with expansion of ECFV, plasma aldosterone should be lowered
- ECFV Expansion with NS
  - IV infusion of 500 mL/h of NS for 4 h, then measure plasma aldosterone levels
  - plasma aldosterone >277 pmol/L is consistent with PA, <140 pmol/L is normal
  - inappropriate response: failure to suppress plasma aldosterone

## Mineralocorticoid Excess Syndromes

### Definition

- PA: excess aldosterone production (intra-adrenal cause) (previously called hyperaldosteronism)
- SA: aldosterone production in response to excess RAAS (extra-adrenal cause)

### Etiology

- aldosterone-producing adrenal adenoma (Conn's syndrome)
- bilateral or idiopathic adrenal hyperplasia
- glucocorticoid-remediable aldosteronism
- aldosterone-producing adrenocortical carcinoma
- unilateral adrenal hyperplasia
- ectopic aldosterone-producing tumours
- familial hyperaldosteronism (FH) types I-IV

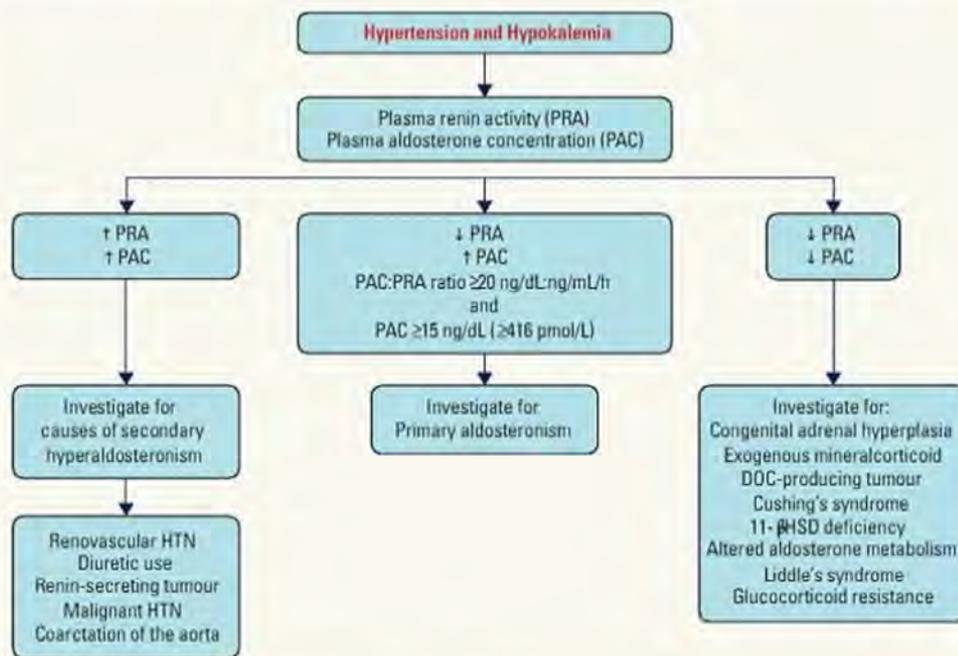

Figure 17. Approach to mineralocorticoid excess syndromes

**Clinical Features**

- HTN
- hypokalemia ( $\pm$  mild hypernatremia), metabolic alkalosis
- normal  $K^+$  hyponatremia in secondary hyperaldosteronism (low effective circulating volume leads to ADH release)
- increased cardiovascular risk: LV hypertrophy, atrial fibrillation, stroke, and MI
- elevated risk of metabolic syndrome and T2DM
- fatigue, weakness, paresthesia, headache; severe cases present with tetany, intermittent paralysis (only if  $K^+ < 2.5$  mEq/L)

**Diagnosis**

- investigate plasma aldosterone:renin ratio in patients with HTN and hypokalemia, drug resistant HTN, HTN and a first degree relative with PA, HTN and a family history of stroke in a first degree relative  $\leq 40$  yr, HTN and adrenal incidentaloma
- confirmatory testing for PA: aldosterone suppression test (demonstrate inappropriate aldosterone secretion with ECF volume expansion), adrenal vein sampling may be required to determine whether there is lateralization of aldosterone excess
- imaging: CT adrenal glands

Table 22. Diagnostic Tests in Hyperaldosteronism

Test	Primary Hyperaldosteronism	Secondary Hyperaldosteronism
Plasma Aldosterone to Renin Ratio (PAC/PRA)	Elevated ( $\uparrow$ aldosterone, $\uparrow$ renin)	Normal ( $\uparrow$ aldosterone, $\uparrow$ renin)
Salt Loading Test (confirmatory test)		
A) Oral Salt Test	$\uparrow$ 24 hour urine aldosterone	Not performed
B) IV Saline Test	Plasma aldosterone concentration $> 277$ pmol/L (140-277 indeterminate range)	Not performed

**Treatment**

- inhibit action of aldosterone: spironolactone, eplerenone, triamterene, amiloride (act on sodium channels)
- surgical excision of adrenal adenoma
- secondary hyperaldosteronism: treat underlying cause

## Cushing's Syndrome

### Definition

- metabolic disorder caused by chronic glucocorticoid excess

### Etiology

- ACTH-dependent (85%) – bilateral adrenal hyperplasia and cortisol hypersecretion due to:
  - ACTH-secreting pituitary adenoma (Cushing's disease; 80% of ACTH-dependent)
  - ectopic ACTH-secreting tumour (e.g. small cell lung carcinoma, bronchial, pancreatic islet cell, pheochromocytoma, or medullary thyroid tumour)
- ACTH-independent (15%)
  - primary adrenocortical tumours: adenoma and carcinoma (uncommon)
  - bilateral adrenal nodular hyperplasia
- iatrogenic Cushing's syndrome is likely more common than endogenous cortisol excess but is infrequently reported; it is ACTH-independent

### Clinical Features

- symptoms: weakness, insomnia, mood disorders, impaired cognition, easy bruising, oligo-/amenorrhea, hirsutism, and acne (ACTH dependent)
- signs: central obesity, round face ("moon face"), supraclavicular and dorsal fat pads, facial plethora, proximal muscle wasting, purple abdominal striae, skin atrophy, acanthosis nigricans, HTN, hyperglycemia, osteoporosis, pathologic fractures, hyperpigmentation, hyperandrogenism (if ACTH-dependent)

### Diagnosis

- rule out excessive glucocorticoid exposure leading to iatrogenic Cushing's syndrome by conducting a thorough drug history before conducting biochemical testing
- perform one of: 1) 24 h urine free cortisol ( $\geq 2$  tests), 2) low dose DXM suppression test, or 3) late night salivary cortisol ( $\geq 2$  tests)
- consider reasons for a false positive (e.g. pregnancy, depression, alcoholism, morbid obesity, poorly controlled DM, glucocorticoid resistance, physical stress, malnutrition, anorexia nervosa, intense chronic exercise, hypothalamic amenorrhea)
- confirm with one of the remaining tests

### Treatment

- adrenal
  - adenoma: unilateral adrenalectomy (curative) with glucocorticoid supplementation postoperatively, tapering slowly until HPA axis has recovered
  - carcinoma: adrenalectomy in patients with disease localized to the adrenal, adjunctive mitotane for individuals with high-risk for current disease Mitotane  $\pm$  chemotherapy for patients with metastatic disease
  - medical treatment: ketoconazole to reduce cortisol, mitotane can be used – typically reserved for patients with malignant disease
- pituitary
  - transsphenoidal resection, with glucocorticoid supplementation postoperatively
  - if surgery delayed, contraindicated, or unsuccessful, consider medical management e.g. ketoconazole, mitotane, pasireotide, or cabergoline
- ectopic ACTH tumour (paraneoplastic syndrome): usually bronchogenic cancer (poor prognosis) - surgical resection, if possible; chemotherapy/radiation for primary tumour
  - medical treatment with mitotane or ketoconazole to reduce cortisol synthesis. Often required when surgery is delayed, contraindicated, or unsuccessful
- treat comorbidities associated with hypercortisolism

## Congenital Adrenal Hyperplasia

- see [Paediatrics, P35](#)

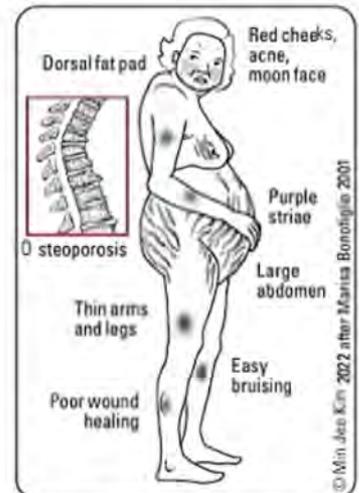

Figure 18. Clinical features of Cushing's syndrome

## Hyperandrogenism

### Definition

- state of having excessive secretion of androgens (DHEA, DHEA-sulfate, testosterone)

### Etiology and Pathophysiology

**Table 23. Etiology of Hyperandrogenism**

Medications	Androgen-Mediated
	Anabolic steroids, ACTH, androgens, progestational agents
Ovarian	PCOS Ovarian hyperthecosis Theca cell tumours Pregnancy: placental sulfatase/aromatase deficiency
Adrenal	Congenital adrenal hyperplasia (CAH, late-onset CAH) Tumours (adenoma, carcinoma)
Pituitary	Cushing's disease – high ACTH Hyperprolactinemia

### Clinical Features

#### Females

- hirsutism
  - male pattern growth of androgen-dependent terminal body hair in women: back, chest, upper abdomen, face, linea alba
  - Ferriman-Gallwey scoring system is used to quantify severity of hirsutism (score of >8 is abnormal for white/black women, ≥9 abnormal for Mediterranean/Hispanic/Middle-Eastern women, ≥2 for Asian women)
    - scores should be interpreted in the context of the specific patient and acknowledge limitations such as the use of cosmetic hair removal
    - scores between 8-15 are mild, 16-25 moderate, and >25 severe hirsutism
- virilization
  - frontal balding, clitoromegaly, increased muscle mass, deepening of the voice
- amenorrhea, ↑ breast size, infertility, anabolic appearance, acne

#### Males

- minimal effects on hair, muscle mass, etc.
- inhibition of gonadotropin secretion may cause reduction in testicular size, testicular testosterone production, and spermatogenesis

### Investigations

- testosterone, DHEA-S as a measure of adrenal androgen production
- LH/FSH (commonly in PCOS >2.5)
- 17-OH progesterone, elevated in CAH due to 21-OH deficiency; check on day 3 of menstrual cycle with a progesterone level
- for virilization: CT/MRI of adrenals and ovaries (identify tumours)
- if PCOS, check blood glucose and lipids

### Treatment

- discontinue causative medications (e.g. oral DHEA, valproate, danazol)
- antiandrogens, e.g. spironolactone
- oral contraceptives (increase sex hormone binding globulin, which binds androgens > estrogens; reduces ovarian production of androgens)
- surgical resection of tumour
- glucocorticoid ± mineralocorticoid if CAH confirmed
- treat specific causative disorders, e.g. tumours, Cushing's, etc.
- cosmetic therapy (laser, electrolysis)

#### Conditions that do Not Represent True Hirsutism

- Androgen-independent hair (e.g. lanugo hair)
- Drug-induced hypertrichosis (e.g. phenytoin, diazoxide, cyclosporine, minoxidil)
- Topical steroid use

## Adrenocortical Insufficiency

### Definition

- state of inadequate cortisol and/or aldosterone production by the adrenal glands

### Etiology

#### PRIMARY ADRENOCORTICAL INSUFFICIENCY

**Table 24. Etiology of Primary Adrenocortical Insufficiency**

<b>Autoimmune (70-90%)</b>	Isolated adrenal insufficiency (Addison's Disease) Polyglandular autoimmune syndromes types I and II Antibodies often directed against adrenal enzymes and 3 cortical zones
<b>Infections</b>	Tuberculosis (7-20%) (most common in developing world) Fungal: histoplasmosis, paracoccidioidomycosis HIV, CMV Syphilis African trypanosomiasis
<b>Infiltrative</b>	Metastatic cancer (lung>stomach>esophagus>colon>breast); lymphoma Sarcoidosis, amyloidosis, hemochromatosis
<b>Vascular</b>	Bilateral adrenal hemorrhage (risk increased by heparin and warfarin) Sepsis (meningococcal, Pseudomonas) Coagulopathy in adults or Waterhouse-Friderichsen syndrome in children Thrombosis, embolism, adrenal infarction
<b>Drugs</b>	Inhibit cortisol: ketoconazole, etomidate, megestrol acetate Increase cortisol metabolism: rifampin, phenytoin, barbiturates
<b>Others</b>	Adrenoleukodystrophy and adrenomyeloneuropathy Congenital adrenal hypoplasia (impaired steroidogenesis) Familial glucocorticoid deficiency or resistance Defective cholesterol metabolism

#### SECONDARY ADRENOCORTICAL INSUFFICIENCY

- inadequate pituitary ACTH secretion
- multiple etiologies (see *Hypopituitarism, E23*), including withdrawal of exogenous steroids

### Clinical Features

**Table 25. Clinical Features of Primary and Secondary Adrenal Insufficiency (AI)**

	Primary AI (Addison's or Acute AI)	Secondary AI
<b>Skin and Mucosa</b>	Dark (palmar crease, extensor surface)	Pale
<b>Potassium</b>	High	Normal
<b>Sodium</b>	Normal or low	Normal or Low
<b>Metabolic Acidosis</b>	Present	Absent
<b>Associated Diseases</b>	Primary hypothyroidism, T1DM, vitiligo	Central hypogonadism or hypothyroidism, growth hormone deficiency, DI
<b>Associated Symptoms</b>	Weakness, fatigue, weight loss, hypotension, salt craving, postural dizziness, myalgia, arthralgia GI: N/V, abdominal pain, diarrhea	Weakness, fatigue, weight loss, hypotension, postural dizziness, myalgia, arthralgia, headaches, visual abnormalities
<b>Diagnostic Test</b>	Cosyntropin Stimulation Test High morning plasma ACTH High renin	Insulin tolerance test Cosyntropin Stimulation Test Low or inappropriately normal morning plasma ACTH

Adapted from: Salvatori R. JAMA 2005;294:2481-2488

### Treatment

- acute adrenal crisis – can be life-threatening
  - IV NS 1 L within the first hour followed by continuous IV NS guided by patient requirements; add D5W if hypoglycemic
  - hydrocortisone 100 mg IV stat followed by 50 mg IV q6 h
  - identify and correct precipitating factors
- maintenance
  - hydrocortisone 15-25 mg PO or cortisone acetate 20-35 mg PO total daily dose in 2-3 divided doses, highest dose in the morning
  - prednisolone 3-5 mg once daily or 3-5 mg BID can be used as an alternative to hydrocortisone, especially in patients with reduced compliance
  - Florinef™ (fludrocortisone, synthetic mineralocorticoid) 0.05-0.2 mg PO once daily if mineralocorticoid deficient
  - stress dosing
    - increase dose of steroids 2-3 fold for a few days during moderate-severe illness (e.g. with vomiting, fever)
    - major stress (e.g. surgery, trauma) requires 150-300 mg hydrocortisone IV daily divided into 3 doses
  - medical alert bracelet and instructions for emergency hydrocortisone/dexamethasone IM/SC injection

# Adrenal Medulla

## Catecholamine Metabolism

- catecholamines are synthesized from tyrosine in postganglionic sympathetic nerves (norepinephrine) and chromaffin cells of adrenal medulla (epinephrine)
- broken down into metanephrines and other metabolites (VMA, HVA) and excreted in urine

## Pheochromocytoma/Paraganglioma

### Definition

- paragangliomas are rare neuroendocrine tumours that arise from the extra-adrenal autonomic paraganglia (small organs comprised of neuroendocrine cells that secrete catecholamines)
- pheochromocytomas are catecholamine-secreting tumours derived from chromaffin cells of the adrenal gland

### Epidemiology

- most commonly a single tumour of adrenal medulla
- rare cause of HTN (<0.2% of all hypertensives)

### Etiology and Pathophysiology

- pheochromocytomas and paragangliomas have the greatest genetic inheritance among neuroendocrine tumours
- 30-40% cases are linked to germline mutations, including mutations in the RET, VHL, SDHx, NF1, and SDHAF2 genes
- pheochromocytomas and paragangliomas are divided into clusters: cluster 1 - Pseudohypoxia subtype (FH, VHL/EPAS1-related), cluster 2 - Kinase signaling group (HRAS), cluster 3 - WNT signaling group (CSDE1, UBTF-MAML3 fusion)
- most cases are sporadic; 40% of affected patients have an associated familial disorder. In these patients, the tumours are more likely bilateral adrenal pheochromocytomas/paraganglioma
- hereditary forms present earlier than sporadic cases
- several familial disorders are associated with adrenal pheochromocytoma, all have autosomal dominant inheritance, e.g. multiple endocrine neoplasia type 2 (MEN2) - 50% frequency, von Hippel-Lindau (VHL) syndrome - 10-20% frequency, and less commonly, neurofibromatosis type 1 (NF1) - 0.1-5.7% frequency
- some tumours, via an unknown mechanism, are able to synthesize and release excessive catecholamines

### Clinical Features

- 50% suffer from paroxysmal HTN; others have sustained HTN
- classic triad (not found in most patients): episodic "pounding" headache, palpitations/tachycardia, diaphoresis
- other symptoms: tremor, anxiety, chest or abdominal pain, N/V, visual blurring, weight loss, polyuria, polydipsia
- other signs: orthostatic hypotension, papilledema, hyperglycemia, dilated cardiomyopathy
- symptoms may be triggered by stress, exertion, anesthesia, abdominal pressure, certain foods (especially tyramine containing foods – such as aged/strong cheese and cured meats)

### Investigations

- urine metanephrines
  - increased catecholamine metabolites (metanephrines) and catecholamines
  - plasma metanephrines, if available (most sensitive)
    - cut-off values will depend on assay used
- CT abdomen
  - if negative, whole body CT and meta-iodo-benzoguanidine (MIBG) scintigraphy, Octreoscan, or MRI

### Treatment

- surgical excision of tumour (curative) with careful pre- and postoperative ICU monitoring
- adequate preoperative preparation
  - $\alpha$ -blockade for BP control: doxazosin or phenoxybenzamine (these are the most frequently used alpha blockers) (10-21 d preoperative), IV phentolamine (perioperative if required)
  - $\beta$ -blockade if needed for HR control once  $\alpha$  blocked for a few days
  - metyrosine (catecholamine synthesis inhibitor) + alpha blocker
  - volume restoration with vigorous salt-loading and fluids
- rescreen urine 1-3 mo postoperatively
- all patients are currently offered genetic testing - probability of germline disease increases with young age, multifocal disease, in the setting of paraganglioma

#### ABC of Adrenaline

Adrenaline activates  $\beta$ -receptors, increasing Cyclic AMP

# Disorders of Multiple Endocrine Glands

## Multiple Endocrine Neoplasia

**MEN 1 Affects the 3 Ps**  
Pituitary  
Parathyroid  
Pancreas

- neoplastic syndromes involving multiple endocrine glands
- tumours of neuroectodermal origin
- autosomal dominant inheritance with variable penetrance

**Table 26. MEN Classification**

Type	Tissues Involved	Clinical Manifestations
<b>MEN 1 (chromosome 11)</b>		
<b>3 Ps (Pituitary, parathyroid and pancreas)</b>	Pituitary (30-40%) Anterior pituitary adenoma	Headache, visual field defects, most commonly secrete PRL (prolactinomas are the most common pituitary functional tumour in MEN 1 leading to galactorrhea, erectile dysfunction, decreased libido, amenorrhea), GH (acromegaly), GH+PRL, ACTH (Cushing's), non-functional less common
	Parathyroid (>95%) Primary hyperparathyroidism from hyperplasia or adenomas	Nephrolithiasis, bone abnormalities, MSK complaints, symptoms of hypercalcemia
	Entero-pancreatic endocrine (30-80%) Pancreatic islet cell tumours Gastrinoma Insulinomas Vasoactive intestinal peptide (VIP)-omas Glucagonoma Carcinoid syndrome Non-functional pancreatic neuroendocrine tumours	Epigastric pain (peptic ulcers and esophagitis) Hypoglycemia Secretory diarrhea  Rash (necrolytic migratory erythema), anorexia, anemia, diarrhea, glossitis Flushing, diarrhea, bronchospasm
	Adrenal tumours (~40%)	
<b>MEN 2 (chromosome 10)</b>		
1. MEN 2A (Sipple's Syndrome)	Thyroid (>90%) Medullary thyroid cancer (MTC)	Physical signs are variable and often subtle
	Adrenal medulla (40-50%) Pheochromocytoma (40-50%)	Neck mass or thyroid nodule; non-tender, anterior lymph nodes HTN, palpitations, headache, sweating
	Parathyroid (20-30%) 1 <sup>o</sup> parathyroid hyperplasia	Symptoms of hypercalcemia
	Skin Cutaneous lichen amyloidosis	Scaly skin rash
2. Familial MTC (a variant of MEN 2A)	Thyroid MTC (100%)	MTC without other clinical manifestations of MEN 2A or MEN 2B
3. MEN 2B (also known as MEN3)	Thyroid MTC (>90%)	MTC: most common component, more aggressive and earlier onset than MEN 2A
	Adrenal medulla Pheochromocytoma (>50%)	HTN, palpitations, headache, sweating
	Neurons Mucosal neuroma, intestinal ganglioneuromas (100%)	Chronic constipation; megacolon
	MSK Marfanoid	Marfanoid habitus (no aortic abnormalities)

### Investigations

- MEN 1
  - laboratory
    - offer genetic testing to all patients with a clinical diagnosis of MEN1 and their first-degree relatives
    - gastrinoma: significantly elevated serum gastrin level with a low gastric pH; when gastrin is <10x ULN a secretin stimulation test may be required
    - insulinoma: hypoglycemia with insulin and C-peptide levels that are inappropriately high for the level of glucose
    - glucagonoma: elevated glucagon levels
    - pituitary tumours: assess GH, IGF-1, 24 h urine cortisol, and PRL levels (for over-production), TSH, free T4, 8 am cortisol, LH, FSH, bioavailable testosterone or estradiol (for underproduction due to mass effect of tumour)
    - hyperparathyroidism: serum Ca<sup>2+</sup> and albumin, PTH levels; bone density scan (DEXA)
  - imaging
    - MRI for pituitary tumours, CT or MRI for gastrinoma, CT, MRI, or endoscopic ultrasound for insulinoma, parathyroid scan for parathyroid adenomas

## • MEN 2

- laboratory
  - genetic screening for RET mutations on chromosome 10 is the clinical standard of care in all individuals with a family history of MEN2 and has long-term benefits (early cure and prevention of MTC)
  - calcitonin levels (MTC); 24 h urine and serum metanephrines (pheochromocytoma); serum  $\text{Ca}^{2+}$  and PTH levels (hyperparathyroidism)
  - pentagastrin  $\pm$  calcium stimulation test if calcitonin level is within reference range
  - FNA for thyroid nodules cytology
- imaging
  - neck U/S or CT to identify thyroid nodules and lymphadenopathy
  - CT or MRI of adrenal glands to localize pheochromocytoma
  - metastatic disease generally picked up with cross-sectional imaging

## Treatment

## • MEN 1

- medical
  - proton pump inhibitor (PPI) for acid hypersecretion in gastrinoma
  - cabergoline or other dopamine agonists to suppress PRL secretion and shrink prolactinomas
  - somatostatin analogue for control of symptoms of some of the GI neuroendocrine tumours such as glucagonoma
- surgery for hyperparathyroidism when surgical indications met, functional pancreatic tumours (e.g. insulinoma, glucagonoma, gastrinoma), functioning pituitary tumours (except for prolactinomas where dopamine agonists are used), and nonfunctioning pituitary tumours if associated with mass effect
  - trans-sphenoidal approach is generally preferred for pituitary tumours, pituitary irradiation if surgery is not possible or has failed

## • MEN 2

- prophylactic thyroidectomy recommended in individuals with documented pathogenic RET mutation and an increased risk of aggressive MTC; if incident case, thyroidectomy after diagnosis of MTC
  - rule out presence of pheochromocytoma and hyperparathyroidism prior to thyroidectomy
  - thyroid hormone supplementation following total thyroidectomy
- prostaglandin inhibitors to alleviate diarrhea associated with thyroid cancer
- pheochromocytoma managed with resection
  - $\alpha$ -blocker for at least 10-21 d for pheochromocytoma preoperatively
- hyperparathyroidism managed with resection of parathyroid adenoma
  - hydration, IV bisphosphonates, or denosumab for severe hypercalcemia

**Primary Hyperparathyroidism**

Increased PTH secretion commonly due to parathyroid adenoma, lithium therapy; less often due to parathyroid carcinoma or parathyroid hyperplasia

**Secondary Hyperparathyroidism**

Partial resistance to PTH action leads to parathyroid gland hyperplasia and increased PTH secretion, often in patients with renal failure and osteomalacia (due to low or low-normal serum calcium levels)

**Tertiary Hyperparathyroidism**

Irreversible monoclonal outgrowth of parathyroid glands, usually in long-standing inadequately treated chronic renal failure on dialysis

PH is the most common cause of hypercalcemia in healthy outpatients. PH is most commonly related to a solitary adenoma or, less commonly, multiple gland hyperplasia. Surgical excision is the definitive treatment and is recommended for patients who have symptomatic hypercalcemia, loss in bone density, kidney stones, or renal failure. For asymptomatic disease, medical surveillance may be appropriate with annual serum calcium, creatinine, and bone mineral density (BMD)

For asymptomatic patients, surgery is recommended for those who meet  $\geq 1$  of the following criteria:

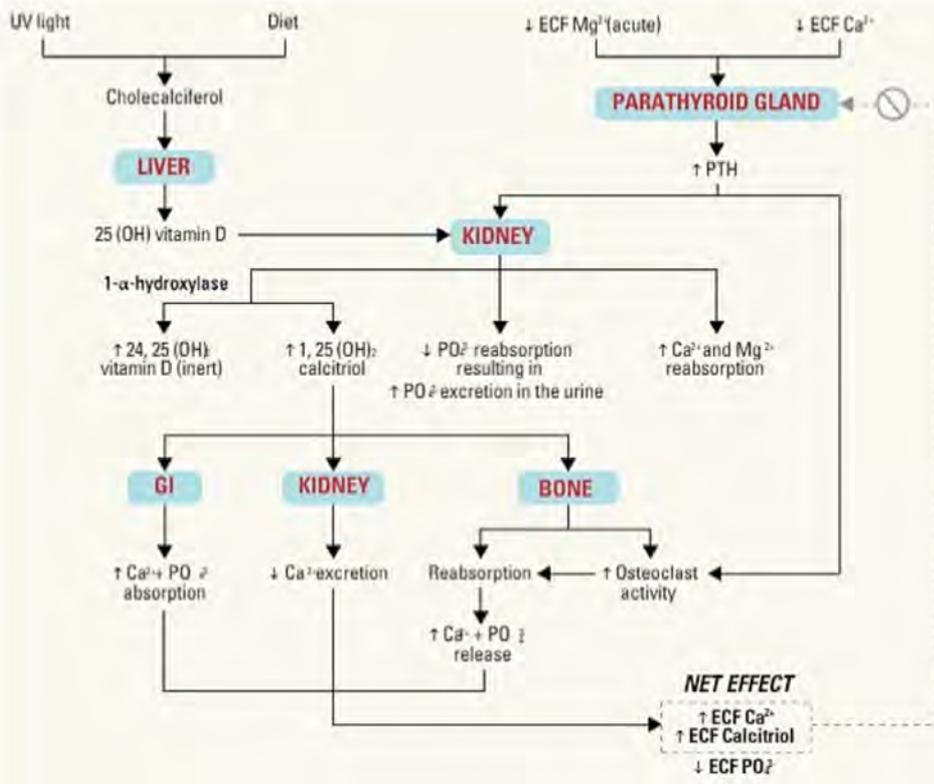

- Serum  $[\text{Ca}^{2+}] > 0.25$  mmol/L (1.0 mg/dL) above the upper limit of normal
- Creatinine clearance  $< 60$  mL/min
- BMD T-score  $< -2.5$  at hip, spine, or distal radius, and/or previous fragility fracture
- Clinical development of a kidney stone or by imaging (x-ray, ultrasound, or CT)
- Age  $< 50$  yr

## Calcium Homeostasis

- normal total serum  $\text{Ca}^{2+}$ : 2.2-2.6 mmol/L
- ionic/free  $\text{Ca}^{2+}$  levels: 1.15-1.31 mmol/L
- serum  $\text{Ca}^{2+}$  is 40% protein bound (mostly albumin), 45% ionized, and 15% complexed with  $\text{PO}_4^{3-}$  and citrate
- regulated mainly by: PTH and vitamin D, whose actions are on three main organs: GI tract, bone, and kidney

Table 27. Major Regulators in Calcium Homeostasis

Major Regulators	Source	Regulation	Net Effect
PTH	Parathyroid glands	Stimulated by low serum $\text{Ca}^{2+}$ and high serum $\text{PO}_4^{3-}$ Inhibited by high serum $\text{Ca}^{2+}$ , high calcitriol, FGF23, and chronic low serum $\text{Mg}^{2+}$	+ $\text{Ca}^{2+}$ + Calcitriol + $\text{PO}_4^{3-}$
Calcitriol (1,25-(OH) $_2$ D $_3$ )	Dietary intake of cholecalciferol (D3) or ergocalciferol (D2) OR Synthesized from cholesterol: UV light on skin makes cholecalciferol (D3). Liver then converts it to calcidiol (25-(OH)D3) and kidneys convert it to calcitriol	Stimulated by: Low serum $\text{PO}_4^{3-}$ High PTH  Inhibited by: High serum $\text{PO}_4^{3-}$ Low PTH Calcitriol (negative feedback) FGF23	+ $\text{Ca}^{2+}$ + $\text{PO}_4^{3-}$
Calcitonin	Thyroid C cells	Stimulated by: Pentagastrin (GI hormone) and high serum $\text{Ca}^{2+}$ ; inhibited by low serum $\text{Ca}^{2+}$	+ $\text{Ca}^{2+}$ (in pharmacologic doses) + $\text{PO}_4^{3-}$
$\text{MgCa}^{2+}$	Major intracellular divalent cation	See <a href="#">Nephrology, NP16</a>	Cofactor for PTH secretion
$\text{PO}_4^{3-}$	Intracellular anion found in all tissues	See <a href="#">Nephrology, NP15</a>	+ $\text{Ca}^{2+}$

**Total Ca<sup>2+</sup> does not reflect ionized Ca<sup>2+</sup> in the following circumstances:**

- Abnormal albumin levels
- Critical illness
- Chronic hepatic failure/renal failure

When albumin is low, ionized calcium assessment should be performed

If ionized calcium is not available, total calcium can be corrected for albumin using this approximation:  
 Corrected Ca<sup>2+</sup>(mmol/L) = measured Ca<sup>2+</sup> + 0.02 (40 - albumin)

- for every decrease in albumin by 10, increase in Ca<sup>2+</sup> by 0.2

**Treatment of Hypercalcemia in Clinical Practice**  
 In clinical practice, treatment is required if the patient has a) symptomatic hypercalcemia or b) extremely high levels of corrected Ca<sup>2+</sup>. Laboratory cutoffs may not always be used

The symptoms and signs of hypercalcemia include: **"Bones, stones, groans, and psychiatric overtones"**

Figure 19. Parathyroid hormone (PTH) regulation

## Hypercalcemia

### Definition

- total corrected serum Ca<sup>2+</sup> > 2.6 mmol/L OR ionized Ca<sup>2+</sup> > 1.35 mmol/L

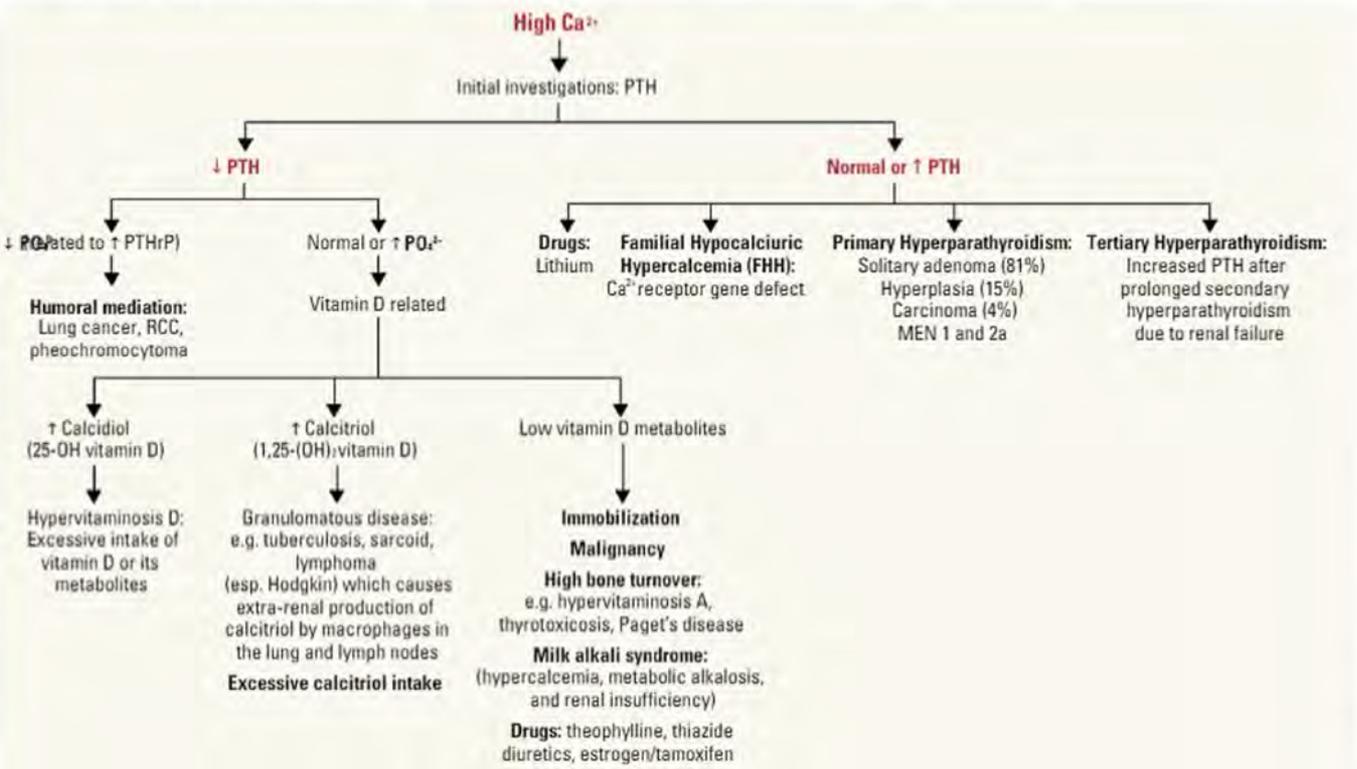

Figure 20. Differential diagnosis of hypercalcemia

**Approach to Hypercalcemia**

1. is the patient hypercalcemic?
2. is the PTH high/normal or low?
3. if PTH is low, is phosphate high/normal or low?
4. if phosphate is high/normal, is the level of vitamin D metabolites high or low?

**Clinical Features**

- symptoms depend on the absolute Ca<sup>2+</sup> value and the rate of its rise (may be asymptomatic)

**Table 28. Symptoms of Hypercalcemia**

Cardiovascular	GI	Renal	Rheumatological	MSK	Psychiatric	Neurologic
HTN	Constipation	Polyuria	Gout	Weakness	>3 mmol/L (12 mg/dL)	Hypotonia
Arrhythmia	Anorexia	(Nephrogenic DI)	Pseudogout	Bone pain	Increased alertness	Hyporeflexia
Short QT	Nausea	Polydipsia	Chondrocalcinosis	(bones)	Anxiety	Myopathy
Deposition of Ca <sup>2+</sup> on valves, coronary arteries, myocardial fibres	Vomiting (groans)	<b>Nephrolithiasis (stones)</b>			Depression	Paresis
	PUD	Renal failure (irreversible)			Cognitive dysfunction	
	Pancreatitis	Dehydration			Organic brain syndromes	
					>4 mmol/L (16 mg/dL)	
					<b>Psychosis (moans)</b>	

\*\* Hypercalcemic crisis (usually >4 mmol/L or 16 mg/dL): primary symptoms include oliguria/anuria and mental status changes including somnolence and eventually coma → this is a medical emergency and should be treated immediately!

**Treatment**

- <3.0 mmol/L: mild, often asymptomatic and does not usually require urgent correction
- 3.0-3.5 mmol/L: may be well tolerated chronically and may not require immediate treatment but may be symptomatic and prompt treatment is usually indicated
- >3.5 mmol/L: severe hypercalcemia requiring urgent correction due to risk of dysrhythmia and coma
- aggressive treatment of acute symptomatic hypercalcemia
- next treat the underlying cause
- mild asymptomatic hypercalcemia: monitor and avoid thiazide, volume depletion, high Ca<sup>2+</sup> diet, lithium, and bed rest

**Table 29. Treatment of Acute Hypercalcemia/Hypercalcemic Crisis**

<b>Increase Urinary Ca<sup>2+</sup> Excretion</b>	<p>FLUIDS, FLUIDS, FLUIDS!</p> <p>Isotonic saline (4-6 L) over 24 h + loop diuretic (e.g. furosemide) but only if hypervolemic (urine output &gt;200 mL/h)</p> <p>Calcitonin:</p> <p>4 IU/kg IM/SC q12 h</p> <p>8 IU/kg IM/SC q6 h</p> <p>Only works for 48 h, can develop tachyphylaxis</p> <p>Rapid onset within 4-6 h</p> <p>Before prescribing calcitonin, remember to ask about fish allergies</p>
<b>Diminish Bone Resorption</b>	<p>Bisphosphonates (treatment of choice)</p> <p>Suggest zoledronic acid 4 mg IV over 15 min or pamidronate 60-90 mg IV over 2 h</p> <p>Inhibits osteoclastic bone resorption, preventing calcium release from bone</p> <p>Effects on calcium levels are typically seen at 24-48 h after administration</p> <p>Calcitonin often given in conjunction with bisphosphonate, given rapid onset of effect</p> <p>Indicated in malignancy-related hypercalcemia (IV pamidronate or zoledronic acid used)</p> <p>If bisphosphonates are contraindicated (i.e. severe renal impairment), denosumab can be administered concurrently with calcitonin</p>
<b>Decrease GI Ca<sup>2+</sup> Absorption</b>	<p>Corticosteroids can be used in hypercalcemia mediated by 1,25 vitamin D. Corticosteroids are potent inhibitors of 1<math>\alpha</math>-hydroxylase and therefore, decrease calcitriol production by activated mononuclear cells (e.g. in lymphoma, granuloma)</p> <p>Effects will be seen in 2-5 d</p>
<b>Dialysis</b>	<p>Treatment of last resort</p> <p>Indication: severe malignancy-associated hypercalcemia and renal insufficiency or heart failure</p>

**Hypocalcemia**

**Definition**

- total corrected serum Ca<sup>2+</sup> <2.2 mmol/L
- mild, asymptomatic: serum Ca<sup>2+</sup> <1.9 mmol/L, ionized Ca<sup>2+</sup> >0.8 mmol/L
- severe: serum Ca<sup>2+</sup> <1.9 mmol/L and/or symptomatic

**The most common cause of hypercalcemia in hospital is malignancy-associated hypercalcemia**

- Usually occurs in the later stages of disease
- Most commonly seen in lung, renal, breast, ovarian, and squamous tumours, as well as lymphoma and multiple myeloma

**Mechanisms:**

- Secretion of PTHrP which mimics PTH action by preventing renal calcium excretion and activating osteoclast-induced bone resorption
- Cytokines in multiple myeloma
- Calcitriol production by lymphoma
- Osteolytic bone metastases direct effect
- Excess PTH in parathyroid cancer

Before prescribing calcitonin, remember to ask about fish allergies

**Differential Diagnosis of Hypercalcemia**

- Primary hyperparathyroidism
- Malignancy: hematologic, humoral, skeletal metastases (>90% from 1 or 2)
- Renal disease: tertiary hyperparathyroidism
- Drugs: calcium carbonate, milk alkali syndrome, thiazide, lithium, theophylline, vitamin A/D intoxication
- Familial hypocalciuric hypercalcemia
- Granulomatous disease: sarcoidosis, tuberculosis, Hodgkin's lymphoma
- Thyroid disease: thyrotoxicosis
- Adrenal disease: adrenal insufficiency, pheochromocytoma
- Immobilization

**Acute Management of Hypercalcemia/Hypercalcemic Crisis**

- Volume expansion (e.g. NS IV 300-500 cc/h): initial therapy
- Calcitonin (SC): transient, partial response
- Bisphosphonate (IV): treatment of choice, adjust dose if CrCl <30 ml/min
- Corticosteroid: most useful in vitamin D toxicity, granulomatous disease, some malignancies
- Saline diuresis + loop diuretic (for volume overload): temporary measure

**Table 30. Clinical Features of Hypocalcemia**

Acute Hypocalcemia	Chronic Hypocalcemia
Paresthesia	CNS: lethargy, seizures, psychosis, basal ganglia calcification, Parkinson's, dystonia, hemiballismus, papilledema, pseudotumour cerebri
Laryngospasm (with stridor)	CVS: prolonged QT interval → Torsades de pointes (ventricular tachycardia)
Hyperreflexia	GI: steatorrhea
Tetany	ENDO: impaired insulin release
Chvostek's sign (tap CN VII)	SKIN: dry, scaling, alopecia, brittle and transversely fissured nails, candidiasis, abnormal dentition
Trousseau's sign (carpal spasm)	OCULAR: cataracts
ECG changes	MSK: generalized muscle weakness and wasting
Delirium	
Psychiatric Sx: emotional instability, anxiety, and depression	
Seizure	

Note: tetany is a hallmark of hypocalcemia – can be mild or severe

Mild: perioral numbness, paresthesia of hands and feet, muscle spasm  
Severe: carpopaedal spasm, laryngospasm, focal/generalized seizures

**Signs and Symptoms of Acute Hypocalcemia**

- Paresthesias: perioral, hands, and feet
- Chvostek's sign: percussion of the facial nerve just anterior to the external auditory meatus elicits ipsilateral spasm of the orbicularis oculi or orbicularis oris muscles
- Trousseau's sign: inflation of a blood pressure cuff above systolic pressure for 3 min elicits carpal spasm and paresthesia

Hypomagnesemia can impair PTH secretion and action

**Watch Out for:**

- Volume depletion via diuresis
- Arrhythmias

**Differential Diagnosis of Tetany**

- Hypocalcemia
- Metabolic alkalosis (with hyperventilation)
- Hypokalemia
- Hypomagnesemia

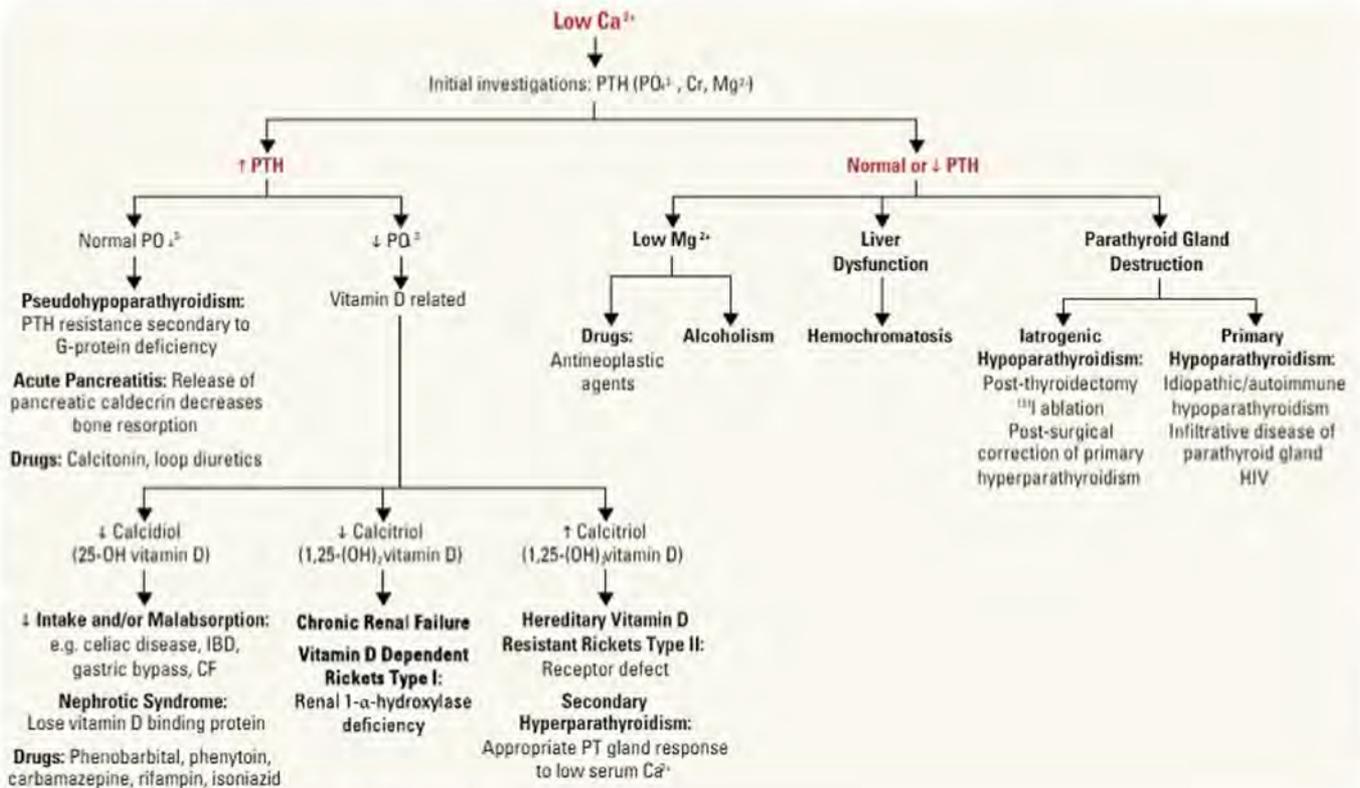

Transient hypoparathyroidism (resulting in hypocalcemia) is common after total thyroidectomy (permanent in <3% of surgeries)

**Approach to Hypocalcemia**

1. is the patient hypocalcemic?
2. is the PTH high or low?
3. if PTH is high, is phosphate low or normal?
4. is the Mg<sup>2+</sup> level low?

**Approach to Treatment**

1. rapidity of treatment depends on severity of symptoms and serum calcium level
  - a) mild, asymptomatic calcium supplementation (i.e. elemental calcium 1 g then 500 mg PO TID)
  - b) severe and/or symptomatic
    - severe hypocalcemia is a medical emergency
    - IV calcium gluconate 1-2 g over 10-20 min followed by slow infusion
    - if positive Chvostek's and Trousseau or seizures, first give IV calcium bolus, i.e. 1 amp IV push, then run Ca<sup>2+</sup> IV drip at 1-2 mg/kg/h
2. vitamin D replacement
  - needed for GI absorption of calcium; must use 1,25 vitamin D if PTH level low (hypoparathyroidism)
3. must treat concurrent hypomagnesemia or calcium will not normalize
4. if underlying cause is hypoparathyroidism, the goal is to raise Ca<sup>2+</sup> to low normal range (2.0-2.1 mmol/L) to prevent symptoms but allow maximum stimulation of PTH secretion

**Figure 21. Etiology and clinical approach to hypocalcemia**

# Metabolic Bone Disease

- see 2022 Clinical Practice Guidelines for the Diagnosis and Management of Osteoporosis for details

## Osteoporosis

### Definition

- a condition characterized by decreased bone mass and microarchitectural deterioration with a consequent increase in bone fragility and susceptibility to fracture
- BMD is measured at hip and lumbar spine, BMD T-score  $\leq -2.5$  is indicative of osteoporosis
- osteopenia (low bone mass): BMD with T-score between  $-1.0$  and  $-2.5$

### ETIOLOGY AND PATHOPHYSIOLOGY

Table 31. Secondary Osteoporosis

Gastrointestinal diseases	Rheumatologic disorders
Gastroctomy	Rheumatoid arthritis
Malabsorption (e.g. Celiac disease, ibd, bariatric surgery)	SLE
Chronic liver disease	Ankylosing spondylitis
Eating disorder	Drugs and chemotherapy
Poor nutrition	Corticosteroid therapy
Bone marrow disorders	Anti-epileptic drugs
Multiple myeloma	Chronic heparin therapy
Lymphoma	Androgen deprivation therapy
Leukemia	Aromatase inhibitors
Endocrinopathies	Renal disease
Cushing's syndrome	Immobilization
Hyperparathyroidism	COPD (due to disease, tobacco, and glucocorticoid use)
Hypothyroidism	
Premature menopause	
Dm	
Hypogonadism	
Malignancy	
Secondary to chemotherapy	
Myelomasevere: carpopaedal spasm, laryngospasm, focal/generalized seizures	

### Clinical Features

- commonly asymptomatic
- height loss due to collapsed vertebrae
- fractures: most commonly in hip, vertebrae, humerus, and wrist (see *Figure 22, E48*)
  - fragility fractures: fracture with fall from standing height or less (does not include fractures of fingers and toes)
  - Dowager's hump: collapse fracture of vertebral bodies in mid-dorsal region
  - x-ray: vertebral compression fractures (described as wedge fractures, require a minimum of 20% height loss), "codfishing" sign (weakening of subchondral plates and expansion of intervertebral discs)
- pain, especially backache, associated with fractures

### Approach to Osteoporosis

1. assess risk factors for osteoporosis on Hx and physical
2. decide if patient requires BMD testing with dual-energy x-ray absorptiometry (DEXA): men and women  $\geq 65$  yr (or younger if presence of risk factors, see *Table 33, E47*)
3. initial investigations
  - all patients with osteoporosis: calcium corrected for albumin, CBC, creatinine, ALP, TSH
  - also consider serum and urine protein electrophoresis if vertebral fractures, celiac workup, and 24 h urinary  $\text{Ca}^{2+}$  excretion to rule out additional secondary causes
  - 25-OH-vitamin D level should only be measured after 3-4 mo of adequate supplementation and should not be repeated if an optimal level  $\geq 75$  nmol/L is achieved
  - lateral thoracic and lumbar x-ray if clinical evidence of vertebral fracture (or in individuals at moderate risk of fracture to help decide if they require medical therapy)
4. assess 10 yr fracture risk by combining BMD result and risk factors
  - 1) WHO Fracture Risk Assessment Tool (FRAX)
  - 2) Canadian Association of Radiologists and Osteoporosis Canada Risk Assessment Tool (CAROC)
    - approach to management guided by 10 yr risk stratification into low, medium, and high-risk
5. for all patients being assessed for osteoporosis, encourage appropriate lifestyle changes (see *Table 34, E47*)

**Corticosteroid Therapy is a Common Cause of Secondary Osteoporosis**  
Individuals receiving  $\geq 7.5$  mg of prednisone daily for over 3 mo should be assessed for bone-sparing therapy  
**Mechanism:** increased resorption + decreased formation + increased urinary calcium loss + decreased intestinal calcium absorption + decreased sex steroid production

### Calcium plus Vitamin D Supplementation and Risk of Fractures

*Osteoporosis Int* 2015;27:367-376

**Purpose:** To review trials of vitamin D and calcium therapy for reducing fracture risk in osteoporosis.  
**Study:** Systematic review searching 2011-2015, inclusive, identified 8 RCTs totaling 30970 participants. RCTs reviewed included healthy adults and ambulatory older adults with medical conditions (excluding cancer). Vitamin D and calcium combination therapy was compared to placebo.  
**Results:** Analysis of RCT data revealed that calcium plus vitamin D supplementation produced a statistically significant reduction in risk of total fractures (0.85; CI: 0.73-0.98) and in hip fractures (0.70; CI: 0.56-0.87). Subgroup analysis was significant for community dwelling or institutionalized patients.  
**Conclusions:** Systematic analysis suggests that vitamin D and calcium therapy significantly decreases fracture risk. This study did not specifically look at individuals with osteoporosis. However, it still supports that vitamin D and calcium should continue to be used as preventive treatment for individuals at increased risk of fractures.

### Vitamin D and Calcium for the Prevention of Fracture: A Systematic Review and Meta-analysis

*JAMA Netw Open* 2019;2:e1917789  
**Purpose:** To investigate if fracture risk is associated with supplementation with vitamin D alone or vitamin D in combination with calcium.  
**Study Selection:** Observational studies with  $\geq 200$  fracture cases and RCTs with  $\geq 500$  participants that reported  $\geq 10$  incident fractures.  
**Results:** Vitamin D supplementation alone was not associated with a reduced risk of any fracture or hip fracture (RR, 1.14; 95% CI, 0.98-1.32). However, combined supplementation with vitamin D (400-800 IU daily) and calcium (1000-1200 mg daily) was associated with a 6% reduction in fracture risk (RR, 0.94; 95% CI, 0.89-0.99) and a 16% reduction of hip fracture risk (RR, 0.84; 95% CI, 0.72-0.97).  
**Conclusion:** Vitamin D alone was not associated with reduced fracture risk but daily supplementation with a combination of vitamin D and calcium was.

### Clinical Signs of Fractures or Osteoporosis

- Height loss  $> 3$  cm (Sn 92%)
- Weight  $< 51$  kg (Sp 97%)
- Kyphosis (Sp 92%)
- Tooth count  $< 20$  (Sp 92%)
- Grip strength
- Armspan-height difference  $> 5$  cm (Sp 76%)
- Wall-occiput distance  $> 4$  cm (Sp 92%)
- Rib-pelvis distance  $\leq 2$  finger breadth (Sn 88%)

**Table 32. Indications for BMD Testing**

Older Adults (age ≥50 yr)	Younger Adults (age <50 yr)
All women and men age ≥65 yr	Fragility fracture:
Menopausal women, and men 50-64 yr with clinical risk factors for fracture:	Prolonged use of glucocorticoids
Fragility fracture after age 40	Use of other high-risk medications (aromatase inhibitors, androgen deprivation therapy, anticonvulsants)
Prolonged glucocorticoid use	Hypogonadism or premature menopause
Other high-risk medication use (aromatase inhibitors, androgen deprivation therapy)	Malabsorption syndrome
Parental hip fracture	Primary hyperparathyroidism
Vertebral fracture or osteopenia identified on x-ray	Other disorders strongly associated with rapid bone loss and/or fracture
Current smoking	
High alcohol intake	
Low body weight (<60 kg) or major weight loss (>10% of weight at age 25 yr)	
Rheumatoid arthritis	
Other disorders strongly associated with osteoporosis: primary hyperparathyroidism, T1DM, osteogenesis imperfecta, uncontrolled hyperthyroidism, hypogonadism or premature menopause (<45 yr), Cushing's disease, chronic malnutrition or malabsorption, chronic liver disease, COPD, and chronic inflammatory conditions (e.g. inflammatory bowel disease)	

**Table 33. Osteoporosis Risk Stratification**

<b>Low-Risk</b> 10 yr fracture risk <10%	Unlikely to benefit from pharmacotherapy; encourage lifestyle changes Reassess risk in 5 yr
<b>Medium-Risk</b> 10 yr fracture risk 10-20%	Discuss patient preference for management and consider additional risk factors Factors that warrant consideration for pharmacotherapy: Additional vertebral fracture(s) identified on vertebral fracture assessment (VFA) or lateral spine x-ray Previous wrist fracture in individuals ≥65 yr or with T-score ≤-2.5 Lumbar spine T-score much lower than femoral neck T-score Rapid bone loss Men receiving androgen-deprivation therapy for prostate cancer Women receiving aromatase-inhibitor therapy for breast cancer Long-term or repeated systemic glucocorticoid use (oral or parenteral) that does not meet the conventional criteria for recent prolonged systemic glucocorticoid use Recurrent falls (defined as falling 2 or more times in the past 12 mo) Other disorders strongly associated with osteoporosis  Repeat BMD and reassess risk every 1-3 yr initially Start pharmacotherapy (need to consider patient preference)
<b>High-Risk</b> 10 yr fracture risk >20%; OR Prior fragility fracture of hip or spine; OR More than one fragility fracture	

**Treatment of Osteoporosis****Table 34. Treatment of Osteoporosis in Women and Men**

Treatment for Both Men and Women	
<b>Lifestyle</b>	Diet: elemental calcium 1000-1200 mg/d; vitamin D 1000 IU/d Exercise: 3x30 min weight-bearing exercises, balance exercise, and aerobic exercise/wk Cessation of smoking, reduce caffeine intake Stop/avoid osteoporosis-inducing medications
<b>Drug Therapy</b>	
<b>Bisphosphonate: inhibitors of osteoclasts</b>	1st line in prevention of hip, nonvertebral, and vertebral fractures (Grade A): alendronate (PO), risedronate (PO), zoledronic acid (IV)
<b>RANKL Inhibitors</b>	Denosumab: 1st line in prevention of hip, nonvertebral, vertebral fractures (Grade A) *Denosumab should not be abruptly stopped/administration delayed. Increased risk of multiple vertebral fractures due to increased bone turnover on discontinuation. Used as an alternative initial treatment in postmenopausal women with osteoporosis who are at high risk for osteoporotic fractures.
<b>Parathyroid Hormone Analogue</b>	Teriparatide: 18-24 mo duration, followed by long-term anti-resorptive therapy with bisphosphonate or RANKL inhibitor
<b>Sclerostin Inhibitors</b>	Romosozumab: 12 mo duration
Treatment Specific to Post-Menopausal Women	
<b>SERM (selective estrogen-receptor modulator): agonistic effect on bone but antagonistic effect on uterus and breast</b>	Raloxifene: 1st line in prevention of vertebral fractures (Grade A) Advantages: prevents osteoporotic fractures (Grade A to B evidence), improves lipid profile, decreased breast cancer risk Disadvantages: increased risk of DVT/PE, stroke mortality, hot flashes, leg cramps
<b>HRT: combined estrogen + progesterone (see gynaecology, 6Y37)</b>	Indicated for vasomotor symptoms of menopause For most women, risks > benefits Combined estrogen/progestin prevents hip, vertebral, total fractures Increased risks of breast cancer, cardiovascular events, and DVT/PE

**Online Clinical Tools****FRAX**

[www.shef.ac.uk/FRAX/tool.aspx](http://www.shef.ac.uk/FRAX/tool.aspx)

**CAROC**

[www.osteoporosis.ca/multimedia/pdf/CAROC.pdf](http://www.osteoporosis.ca/multimedia/pdf/CAROC.pdf)

**Prevention - Hip**

Alendronate	0.61 RR (0.42-0.90)
Risedronate	0.73 RR (0.58-0.92)
Denosumab	0.56 RR (0.35-0.90)
Teriparatide	0.64 RR (0.25-1.68)
Romosozumab	0.44 RR (0.24-0.79)

**Prevention - Nonvertebral**

Alendronate	0.84 RR (0.74-0.94)
Risedronate	0.78 RR (0.68-0.89)
Denosumab	0.80 RR (0.67-0.96)
Teriparatide	0.62 RR (0.47-0.80)
Romosozumab	0.67 RR (0.53-0.86)

**Prevention - Vertebral**

Alendronate	0.57 RR (0.45-0.71)
Risedronate	0.61 RR (0.48-0.78)
Denosumab	0.32 RR (0.22-0.45)
Teriparatide	0.27 RR (0.19-0.38)
Romosozumab	0.33 RR (0.22-0.49)

**Factors Necessary for Mineralization**

- Quantitatively and qualitatively normal osteoid formation
- Normal concentration of calcium and phosphate in ECF
- Adequate bioactivity of ALP
- Normal pH at site of calcification
- Absence of inhibitors of calcification

**Effect of High-Dose Vitamin D Supplementation on Volumetric Bone Density and Bone Strength: A Randomized Clinical Trial**

JAMA 2019;322:736-45

**Purpose:** To investigate the effects of vitamin D supplementation on volumetric BMD and strength.

**Methods:** 311 healthy adults (ages 55-70) without osteoporosis, with baseline concentrations of 25-hydroxyvitamin D of 30-125 nmol/L, were randomized to receive daily doses of 400 IU, 4000 IU, or 10000 IU vitamin D3 for 3 years. For participants with calcium dietary intake <1200 mg/d, supplementation was provided. **Primary Outcome:** Total volumetric BMD at radius and tibia.

**Results:** Compared with the 400 IU group, radial volumetric BMD was significantly lower for the 4000 IU group (-3.9 mg HA/cm<sup>3</sup>; 95% confidence interval [CI], -6.5 to -1.3) and 10000 IU group (-7.5 mg HA/cm<sup>3</sup>; 95% CI, -10.1 to -5.0) with mean % change of -1.2% (400 IU), -2.4% (4000 IU), and -3.5% (10000 IU). Compared with the 400 IU group, tibial volumetric BMD differences were -1.8 mg HA/cm<sup>3</sup> (95% CI, -3.7 to 0.1) (4000 IU) and -4.1 mg HA/cm<sup>3</sup> (95% CI, -6.0 to -2.2) (10000 IU), with mean % change values of -0.4% (400 IU), -1.0% (4000 IU), and -1.7% (10000 IU).

**Conclusion:** In healthy adults, supplementation with daily 4000 IU or 10000 IU vitamin D for 3 years was associated with lower radial BMD compared with 400 IU. 10000 IU was associated with lower tibial BMD. There were no apparent benefits of high-dose vitamin D supplementation for bone health.

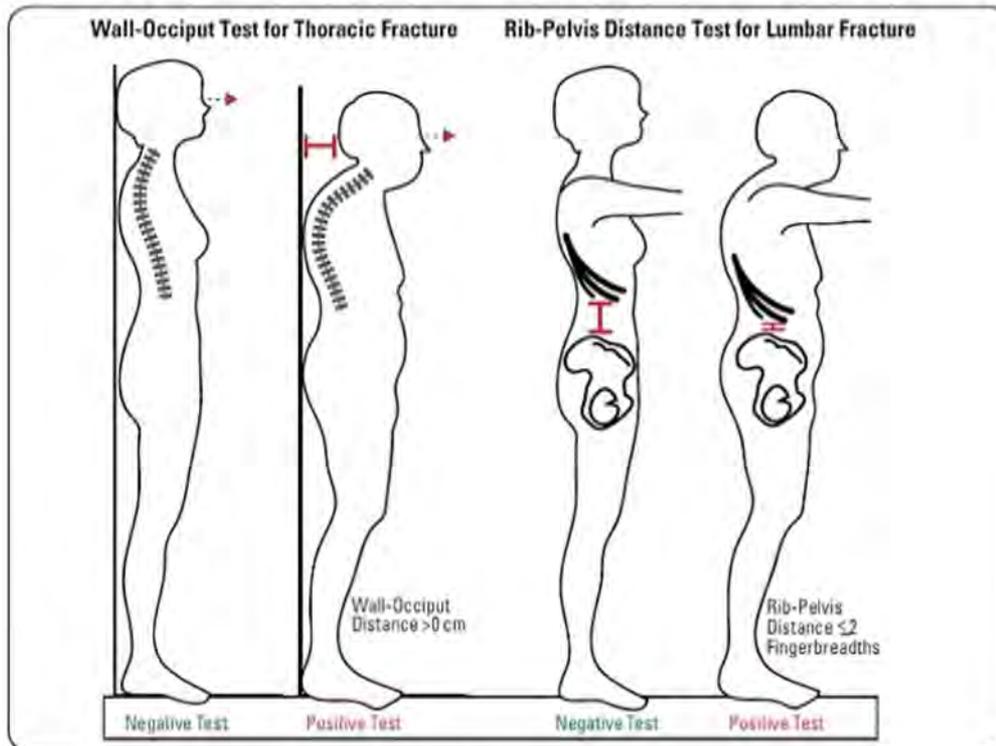

Figure 22. Physical examination test for vertebral fractures

## Osteomalacia and Rickets

### Definition

- osteopenia with disordered calcification leading to a higher proportion of osteoid (unmineralized) tissue prior to epiphyseal closure: rickets (in childhood), osteomalacia (in adulthood)

### Etiology and Pathophysiology

#### Vitamin D Deficiency

- deficient uptake or absorption
  - nutritional deficiency
  - malabsorption: post-gastrectomy, small bowel disease (e.g. celiac sprue), pancreatic insufficiency
- defective 25-hydroxylation
  - liver disease
  - anticonvulsant therapy (phenytoin, carbamazepine, phenobarbital)
- loss of vitamin D binding protein
  - nephrotic syndrome
- decreased 1- $\alpha$ -25 hydroxylation
  - hypoparathyroidism
- renal failure

#### Mineralization Defect

- abnormal matrix
  - osteogenesis imperfecta
- enzyme deficiency
  - hypophosphatasia (inadequate ALP bioactivity)
- presence of calcification inhibitors
  - aluminum, high dose fluoride, anticonvulsants

#### Calcium Deficiency

- deficient uptake or absorption
  - nutritional deficiency
  - malabsorption
- hypercalciuria (in combination with renal phosphate wasting)

#### Hypophosphatemia

- gastrointestinal: poor nutritional intake, chronic diarrhea, excessive phosphate binders
- renal phosphate wasting
  - tumour-induced osteomalacia
  - Fanconi syndrome
  - X-linked/autosomal dominant/recessive hypophosphatemic rickets

**Matrix Abnormalities**

- type IV osteogenesis imperfecta
- fibrogenesis imperfecta ossium
- axial osteomalacia

**Table 35. Clinical Features of Rickets and Osteomalacia**

Rickets	Osteomalacia
Skeletal pain and deformities, bow-legged	Not as severe
Fracture susceptibility	Diffuse skeletal pain
Weakness and hypotonia	Bone tenderness
Disturbed growth	Fractures
Ricketic rosary (prominent costochondral junctions)	Gait disturbances (waddling)
Harrison's groove (indentation of lower ribs)	Proximal muscle weakness
Hypocalcemia	Hypotonia

**Investigations****Table 36. Laboratory Findings in Osteomalacia and Rickets**

Disorder	Serum Phosphate	Serum Calcium	Serum ALP	Other Features
Vitamin D Deficiency	Decreased	Decreased to normal	Increased	Decreased calcitriol
Hypophosphatemia	Decreased	Normal	Increased	
Proximal Renal Tubular Acidosis	Decreased	Normal	Normal	Associated with hyperchloremic metabolic acidosis
Conditions Associated with Abnormal Matrix Formation	Normal	Normal	Normal	

- radiologic findings
  - pseudofractures (AKA Looser zones), fissures, narrow radiolucent lines – thought to be healed stress fractures or the result of erosion by arterial pulsation
  - loss of distinctness of vertebral body trabeculae; concavity of the vertebral bodies
  - changes due to secondary hyperparathyroidism: subperiosteal resorption of the phalanges, bone cysts, resorption of the distal ends of long bones
  - others: bowing of tibia, coxa profundus hip deformity
- bone biopsy: usually not necessary but considered the gold standard for diagnosis

**Treatment**

- definitive treatment depends on the underlying cause
- vitamin D supplementation
- $\text{PO}_4^{3-}$  supplements if low serum  $\text{PO}_4^{3-}$ ,  $\text{Ca}^{2+}$  supplements for isolated calcium deficiency
- bicarbonate if chronic metabolic acidosis

**Renal Osteodystrophy****Definition**

- changes to mineral metabolism and bone structure secondary to CKD
- represents a mixture of four types of bone disease:
  - osteomalacia: low bone turnover combined with increased unmineralized bone (osteoid)
  - adynamic bone disease: low bone turnover due to excessive suppression of parathyroid gland
  - osteitis fibrosa cystica: increased bone turnover due to secondary hyperparathyroidism
  - mixed uremic osteodystrophy: both high and low bone turnover, characterized by marrow fibrosis and increased osteoids
- metastatic calcification secondary to hyperphosphatemia may occur

**Pathophysiology**

- metabolic bone disease secondary to chronic renal failure
- combination of hyperphosphatemia (inhibits 1,25(OH)<sub>2</sub> vitamin D synthesis) and loss of renal mass (reduced 1- $\alpha$ -hydroxylase)

**Clinical Features**

- soft tissue calcifications, necrotic skin lesions if vessels involved
- osteodystrophy, generalized bone pain, and fractures
- pruritus
- neuromuscular irritability and tetany may occur (with low serum calcium)
- radiologic features of osteitis fibrosa cystica, osteomalacia, osteosclerosis, osteoporosis

**Investigations**

- serum  $\text{Ca}^{2+}$  corrected for albumin,  $\text{PO}_4^{3-}$ , PTH, ALP,  $\pm$  imaging (x-ray, BMD),  $\pm$  bone biopsy (gold standard; only done if results inform treatment)

**KDIGO 2017 Clinical Practice Guideline for the Evaluation and Management of Chronic Kidney Disease**

- Kidney Inter Suppl 2012;7(1):1-60
  - Recommendations for Metabolic Bone Disease (MBD) in Chronic Kidney Disease (CKD)
- Screening**
- In CKD patients with evidence of CKD-MBD and/or risk factors for osteoporosis, perform BMD testing to assess fracture risk if results will impact treatment decisions
  - In patients with CKD-MBD, it is reasonable to perform a bone biopsy if knowledge of the type of renal osteodystrophy will impact treatment decisions
- Management**
- Treatment of CKD-MBD should be based on serial assessments of  $\text{PO}_4^{3-}$ ,  $\text{Ca}^{2+}$ , and PTH levels, considered together
  - Suggest lowering elevated  $\text{PO}_4^{3-}$  levels towards the normal range
  - Avoid hyperglycemia in adult patients and maintain serum  $\text{Ca}^{2+}$  in age-appropriate normal range in children

**Treatment**

- prevention
- maintenance of normal serum  $\text{Ca}^{2+}$  and  $\text{PO}_4^{3-}$  by restricting  $\text{PO}_4^{3-}$  intake to 1 g once daily
- $\text{Ca}^{2+}$  supplements;  $\text{PO}_4^{3-}$  binding agents (calcium carbonate, aluminum hydroxide)
- activated vitamin D (calcitriol) with close monitoring to avoid hypercalcemia and metastatic calcification
- bisphosphonates and denosumab are not often used for treatment (can worsen the adynamic components of renal osteodystrophy); bone biopsy may indicate if there are signs of increased bone turnover amenable to bisphosphonates

**Paget's Disease of Bone****Definition**

- a metabolic disease characterized by excessive bone destruction and repair

**Epidemiology**

- 3% of the population, 10% of population >80 y/o
- consider Paget's disease of bone in older adults with elevated ALP but normal GGT

**Etiology and Pathophysiology**

- postulated to be related to a slowly progressing viral infection of osteoclasts, possibly paramyxovirus
- strong familial incidence
- initiated by increased osteoclastic activity leading to increased bone resorption; osteoblastic activity increases in response to produce new bone that is structurally abnormal and fragile

**Differential Diagnosis**

- osteogenic sarcoma
- multiple myeloma
- fibrous dysplasia
- osteitis fibrosa cystica
- metastases

**Clinical Features**

- usually asymptomatic (routine x-ray finding or elevated serum ALP with normal LFTs)
- 3 characteristic findings: osteolytic lesions, cortical thickening, pseudofractures (small fissures which develop in the convex surface of long bone)
- most commonly affects: skull, thoracolumbar spine, pelvis, and long bones of lower extremities
- severe bone pain (e.g. pelvis, femur, tibia)
- skeletal deformities: bowed tibias, kyphosis, frequent fractures
- increased risk of osteosarcoma and giant cell tumours

**Investigations**

- laboratory
  - high serum ALP, normal or high  $\text{Ca}^{2+}$ , normal  $\text{PO}_4^{3-}$
  - normal tests LFTs (prothrombin time/international normalized ratio (PT/INR), activated partial thromboplastin time (aPTT), albumin, bilirubin)
  - elevated procollagen type I N-terminal propeptide (PINP) (bone formation marker)
- imaging
  - plain x-ray of skull and facial bones, abdomen, and tibiae are recommended as initial screening in patients suspected to have Paget's
  - confirmation on x-ray required for diagnosis
    - denser bone with cortical thickening
    - characteristic findings: osteolytic lesions, cortical thickening, and pseudofractures
    - burned-out Paget's disease: when the disease has been present for a long time
  - bone scan to evaluate the extent of disease and identify asymptomatic sites
  - radionuclide bone scintigraphy, in addition to targeted x-ray, are recommended as a means of fully and accurately defining the extent of metabolically active Paget's disease
  - MRI or CT are not recommended for diagnosis, but can be used to assess disease complications, particularly if malignancy is suspected

**Table 37. Paget's Disease-Related Signs**

Signs	Descriptions
Tam o' Shanter	Appearance of advanced Paget's disease of the skull – overall enlargement of cranium, skull falling over the facial bones
Blade of grass	Lucent leading edge in a long bone seen in lytic phase of Paget's
Osteoporosis circumscripta	Radiolucent regions of the skull
Jigsaw pattern bone or mosaic pattern bone	Thickened, disorganized trabeculae lead to areas of sclerosis
Picture frame vertebra	Cortex of vertebral body is thickened
Cotton wool appearance of bone	Results from thickened, disorganized trabeculae that lead to areas of sclerosis
Banana fracture	Horizontal pathological fracture seen in bones deformed by Paget's
Looser zones	Wide, transverse lucencies traversing through a bone
Ivory vertebra	Diffuse and homogenous increase in opacity of a vertebral body

**Complications**

- local
  - fractures; osteoarthritis
  - cranial nerve compression and palsies (e.g. deafness), spinal cord compression
  - osteosarcoma/sarcomatous change in 1-3%
    - Indicated by marked bone pain, new lytic lesions, and suddenly increased ALP
- systemic
  - hypercalcemia and nephrolithiasis
  - high output CHF due to increased vascularity

**Treatment**

- goals: decrease pain, decrease rate of remodelling
- weight-bearing exercise
- adequate calcium and vitamin D intake to prevent development of secondary hyperparathyroidism
- treat medically if symptomatic or asymptomatic with ALP >3x normal or planned surgery
  - bisphosphonates, e.g. zoledronic acid 5 mg IV per yr (preferred) OR alendronate 40 mg PO once daily x 6 mo OR risedronate 30 mg PO once daily x 3 mo
  - calcitonin 50-100 U/d SC if unable to tolerate bisphosphonates
- surgery for fractures, deformity, degenerative changes
- joint replacement surgery and osteotomy are recommended for the treatment of osteoarthritis resistant to medical therapy in patients with Paget's

## Male Reproductive Endocrinology

### Androgen Regulation

- testosterone (from Leydig cells) primarily involved in negative feedback on LH and GnRH, whereas inhibin (from Sertoli cells) suppresses FSH secretion

### Tests of Testicular Function

- testicular size (lower limit = 4 cm x 2.5 cm in adult). Can use orchidometer to measure testicular volume (12-25 mL = adult size)
- LH, FSH, total, bioavailable, and/or free testosterone
- semen analysis
  - semen volume, sperm concentration, morphology, and motility are the most commonly used parameters
- testicular biopsy
  - indicated with normal FSH and azoospermia/oligospermia

### Hypogonadism and Infertility

- see [Urology: U37](#)
- deficiency in gametogenesis or testosterone production

**Etiology**

- causes include primary (testicular failure), secondary (hypothalamic-pituitary failure), and idiopathic

**Diagnosis of Testosterone Deficiency Syndrome (i.e. adult onset primary hypogonadism)**

- requires clinical manifestations of testosterone deficiency (see sidebar) AND documented testosterone levels below the laboratory reference range (confirmed on 2 separate analyses, test needs to be done at 8-9 am when testosterone is usually at its peak)
- rule out secondary causes

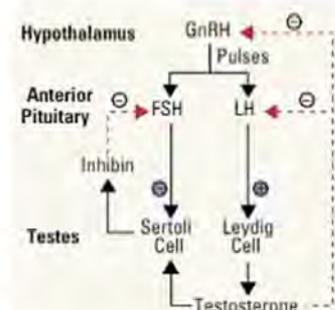

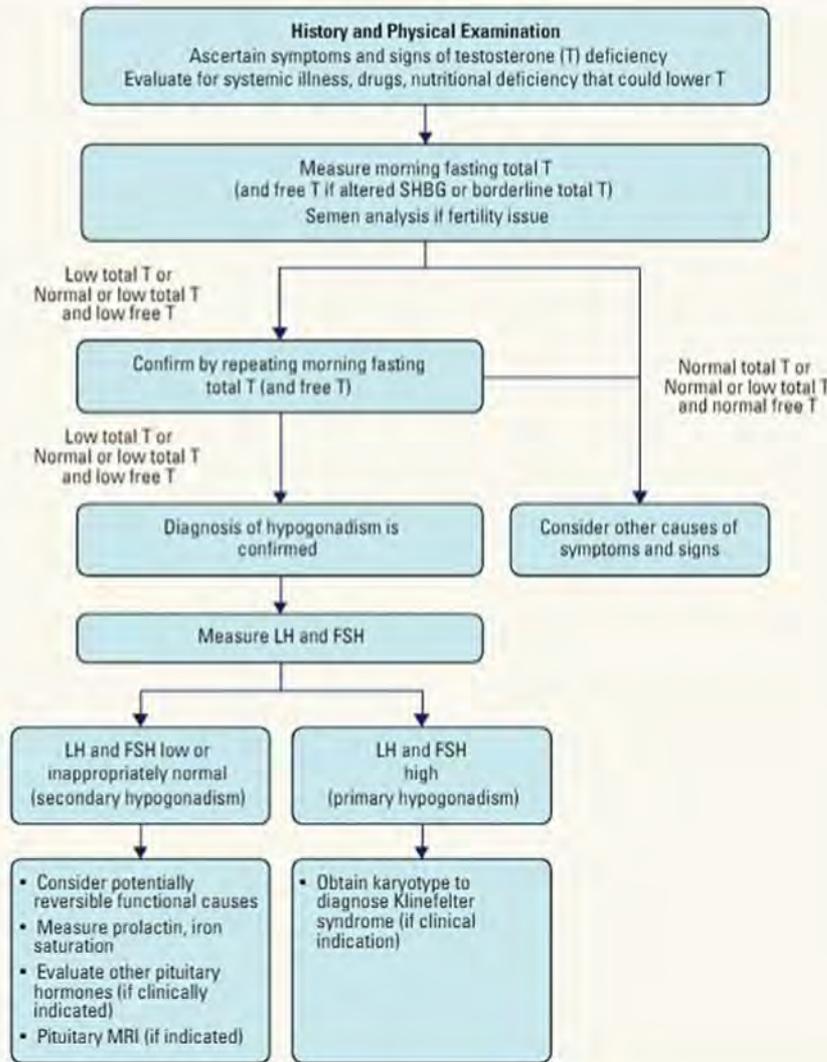

Figure 23. Hypothalamo-pituitary-gonadal axis

#### Two Distinct Features of Primary Hypogonadism

- The decrease in sperm count is affected to a greater extent than the decrease in serum testosterone level
- Likely to be associated with gynecomastia

**Approach to Male Infertility**

**Infertility:** failure of a couple to conceive after 12 mo of regular intercourse without use of contraception in women <35 yr of age; after 6 mo of regular intercourse without use of contraception in women ≥35 yr

**History**

- Partner status regarding infertility
- Length of time for attempt to conceive
- Prior successes with other partners
- Ejaculation problems
- Frequency of intercourse
- Previous Surg, Med Hx, STI Hx
- Hx orchitis? Cryptorchidism?
- Hx toxic exposure?
- Medications
- Alcohol and illicit drug use
- Heat exposure: bath, sauna, whirlpool
- Smoking
- Other: validated questionnaires (e.g. ADAM questionnaire)

**Physical Examination**

- General (height, weight, gynecomastia, masculine)
- Testicular size and consistency
- Varicocele?
- Pituitary disease?
- Thyroid disease?

**Investigations**

- Semen analysis x 2 (sperm count, morphology, motility)
- Scrotal/testicular U/S (look for varicocele)
- Blood work: LH, FSH, testosterone, PRL, thyroid function tests, DNA fragmentation of sperm, karyotype, Y chromosome deletion
- Test female partner (see [Gynaecology, GY23](#))

**Treatment**

- No specific therapy for majority of cases
- Treat specific causes
- Consider: intrauterine insemination, in vitro fertilization (IVF), therapeutic donor insemination, testicular aspiration of sperm, adoption

Figure 24. Diagnostic approach to testosterone deficiency

Table 38. Classification and Features of Hypogonadism

	Hypergonadotropic Hypogonadism (Primary Hypogonadism)	Hypogonadotropic Hypogonadism (Secondary Hypogonadism)
<b>Definition</b>	Primary testicular failure ↑ LH and FSH ↓ testosterone and sperm count	Hypothalamic-pituitary axis failure ↓ LH and FSH (LH sometimes inappropriately normal) ↓ testosterone and sperm count
<b>Etiology</b>	<ul style="list-style-type: none"> <li>• Congenital</li> <li>• Chromosomal defects (Klinefelter, Noonan)</li> <li>• Cryptorchidism</li> <li>• Disorders of sexual development (DSD)</li> <li>• Bilateral anorchia (vanishing testicle syndrome)</li> <li>• Myotonic dystrophy</li> <li>• Mutation of FSH or LH receptor gene</li> <li>• Disorders of androgen synthesis</li> <li>• Germ cell defects</li> <li>• Sertoli cell only syndrome</li> <li>• Leydig cell aplasia/failure</li> <li>• Infection/Inflammation</li> <li>• Orchitis – tuberculosis, lymphoma, mumps, leprosy</li> <li>• Genital tract infection</li> <li>• Physical factors</li> <li>• Trauma, heat, irradiation, testicular torsion, varicocele</li> <li>• Drugs</li> <li>• Cannabis, alcohol, chemotherapy, ketoconazole, glucocorticoid, spironolactone</li> </ul>	<ul style="list-style-type: none"> <li>• Congenital</li> <li>• Kallman’s syndrome</li> <li>• Prader-Willi syndrome</li> <li>• Abnormal subunit of LH or FSH</li> <li>• Infection</li> <li>• Tuberculosis, meningitis</li> <li>• Endocrine</li> <li>• Adrenal androgen excess</li> <li>• Cushing’s syndrome</li> <li>• Hypo or hyperthyroidism</li> <li>• Hypothalamic-pituitary disease (tumour, hyperprolactinemia, hypopituitarism)</li> <li>• Drugs</li> <li>• Alcohol, cannabis, spironolactone, ketoconazole, GnRH agonists, androgen/estrogen/progestin use, chronic narcotic use</li> <li>• Chronic illness</li> <li>• Cirrhosis, chronic renal failure, AIDS</li> <li>• Sarcoidosis, Langerhan’s cell histiocytosis, hemochromatosis</li> <li>• Critical illness</li> <li>• Surgery, MI, head trauma</li> <li>• Obesity</li> <li>• Idiopathic</li> </ul>
<b>Diagnosis</b>	<ul style="list-style-type: none"> <li>• Testicular size and consistency (soft/firm)</li> <li>• Sperm count</li> <li>• LH, FSH, total, and/or bioavailable testosterone</li> <li>• hCG stimulation (mainly used in paediatrics)</li> <li>• Karyotype</li> </ul>	<ul style="list-style-type: none"> <li>• Testicular size and consistency (soft/firm)</li> <li>• Sperm count</li> <li>• LH, FSH, total, and/or bioavailable testosterone</li> <li>• Prolactin levels (and pituitary panel - 14/8 AM cortisol)</li> <li>• Fe, transferrin</li> <li>• MRI of hypothalamic-pituitary region</li> </ul>

**Treatment**

- goal: testosterone replacement (improve libido, muscle mass, strength, body hair growth, bone mass)
  - IM injection, transdermal testosterone patch/gel, oral
  - side effects: acne, fluid retention, erythrocytosis, sleep apnea, benign prostatic hypertrophy, uncertain effects on cardiac events/mortality in older men
  - contraindicated in men with prostate or breast cancer, a palpable prostate nodule, prostate-specific antigen (PSA) >4 ng/mL, elevated hematocrit, untreated severe obstructive sleep apnea (OSA), severe lower urinary tract symptoms (LUTS), uncontrolled CHF, MI, or stroke in last 6 mo, or thrombophilia
  - not suggested in men >65 yr, in men with T2DM with low testosterone concentrations, or in men planning fertility in the near term
  - testosterone therapy only to treat symptoms of hypogonadism, often results in decreased spermatogenesis (and reduced sperm counts) by further suppression of hypothalamic-pituitary-gonadal axis and suppression of endogenous testosterone production
- goal: fertility
  - treat underlying cause
  - GnRH agonist if hypothalamic dysfunction with intact pituitary, administered SC in pulsatile fashion using an external pump
  - hCG ± recombinant follicle stimulating hormone (rFSH) in cases of either hypothalamic or pituitary lesions
  - dopamine agonist (e.g. bromocriptine, cabergoline) if prolactinoma
  - testicular sperm extraction (TESE) or microscopic sperm extraction (MICROTESE) – only if testicular tissues are not functioning

**Other Causes of Male Infertility**

- hereditary disorders: Kartagener syndrome (primary ciliary dyskinesia), cystic fibrosis (absence of the vas deferens)
- anatomy: hypospadias, retrograde ejaculation
- obstruction: vasal occlusion, vasal aplasia, vasectomy, seminal vesicle disease
- sexual dysfunction: erectile dysfunction, premature ejaculation, infrequent coitus
- surgery: transurethral resection of the prostate (TURP), radical prostatectomy, orchiectomy

**DEFECTS IN ANDROGEN ACTION****Etiology**

- complete androgen insensitivity (CAIS)
- partial androgen insensitivity (PAIS)
- 5- $\alpha$ -reductase deficiency
- mixed gonadal dysgenesis
- defects in testosterone synthesis
- infertile male syndrome
- undervirilized fertile male syndrome

**Clinical Features**

- depends on age of onset

**Table 39. Effects of Testosterone Deficiency**

<b>First Trimester <i>in utero</i></b>	Incomplete virilization of external genitalia (ambiguous genitalia) Incomplete development of Wolffian ducts to form male internal genitalia (male pseudohermaphroditism)
<b>Third Trimester <i>in utero</i></b>	Micropenis Cryptorchidism (failure of normal testicular descent)
<b>Prepuberty</b>	Incomplete pubertal maturation (high pitch voice, sparse pubic + axillary hair, absence of facial hair) Eunuchoidal body habitus (greater growth of extremity long bones relative to axial bones) Poor muscle development, reduced peak bone mass
<b>Postpuberty</b>	Decrease in energy, mood, and libido Fine wrinkles in corners of mouth and eyes Decrease in pubic/axillary hair, hematocrit, muscle mass, strength, and BMD

Adapted from: UpToDate, 2010; Cecil's Essentials of Medicine

**Treatment**

- hormone replacement or supplementation
- psychological support
- gonadectomy for cryptorchidism (due to increased risk for testicular cancer)

## Erectile Dysfunction

- see [Urology](#), U33

## Gynecomastia

### Definition

- true gynecomastia refers to benign proliferation of the glandular component of the male breast, resulting in the formation of a concentric, rubbery, firm mass extending from the nipple(s)
- pseudogynecomastia or lipomastia refers to enlargement of soft adipose tissue, especially seen in obese individuals

### Etiology

#### Physiologic

- neonatal (maternal hormone)
- puberty
- elderly

#### Pathologic

- physiologic gynecomastia – trimodal distribution in neonatal, pubertal, and older males
- drugs – spironolactone, cimetidine, ketoconazole, recombinant human GH, hCG, estrogens, antiandrogens, GnRH agonists, 5- $\alpha$ -reductase inhibitors, androgen deprivation therapy (ADT)
- surgical ADT (orchiectomy) for prostate cancer
- starvation and refeeding
- male hypogonadism
- cirrhosis
- treatment of HIV infection – due to fat tissue as part of lipodystrophy
- herbal products – plant-derived oils such as lavender and tea tree oil
- idiopathic
- testicular neoplasms
- CKD
- other rare causes: feminizing adrenal tumours, disorders of sex development, ectopic hCG, familial prepubertal gynecomastia
- hyperthyroidism

### Pathophysiology

- hormonal imbalance due to:
  - increased estrogen activity
    - increased production, or increased availability of estrogen precursors for peripheral conversion to estrogen
  - decreased androgen activity
    - decreased androgen production, binding of androgen to sex hormone binding globulin (SHBG), or androgen receptor blockage

### History

- recent change in breast characteristics
- pain
- trauma to testicles
- mumps
- alcohol and/or drug use
- FHx
- sexual dysfunction

### Physical Exam

- signs of feminization
- breast
  - rule out red flags suggesting breast cancer: unilateral, eccentric, hard or fixed mass, skin dimpling or retraction, and nipple discharge (especially bloody) or crusting
  - gynecomastia occurs concentrically around nipple, is not fixed to underlying tissue
- genito-urinary exam
- stigmata of liver or thyroid disease

### Investigations

- laboratory: serum TSH, PRL, LH, FSH, testosterone, estradiol, LFTs, creatinine, hCG (if hCG is elevated, need to locate the primary tumour); however not all investigations are required for every case of gynecomastia
- CXR and CT of chest/abdomen/pelvis (to locate neoplasm)
- testicular U/S (if primary hypogonadism suspected or mass on physical examination)
- MRI of hypothalamic-pituitary region if secondary hypogonadism or pituitary adenoma suspected

#### Pubertal Gynecomastia

- This benign condition peaks between ages 13-14 and spontaneously regresses in 90% of cases within 2 yr
- Waiting is often the best approach

#### Causes of Gynecomastia

##### DOC TECH

Drugs (especially antiandrogens, i.e. spironolactone)

##### Other

Congenital (Klinefelter syndrome)

Tumour (especially germ cell tumours)

Endocrine (hyperthyroidism)

Chronic disease (cirrhosis, CKD)

#### Drugs Causing Gynecomastia

##### DISCKO

Digoxin

Isoniazid

Spironolactone

Cimetidine

Ketoconazole

Oestrogen/anti-testosterone

#### Occurrence of Gynecomastia

3 Peaks	% Affected
Infancy	60-90
Puberty	4-69
Ages 50-80	24-65

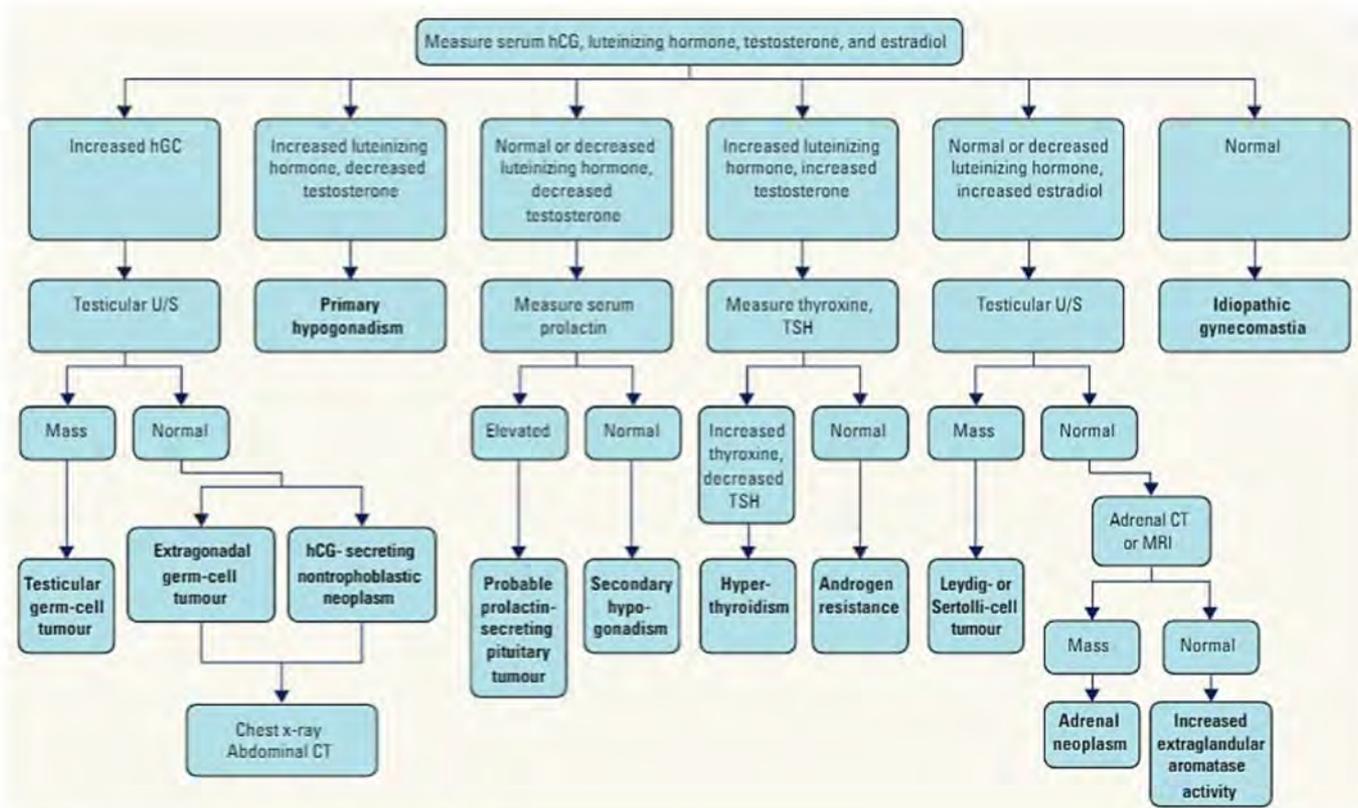

Figure 25. Approach to investigating gynecomastia

#### Treatment

- initial observation for most men with gynecomastia (after stopping offending medications and treating underlying cause)
- medical
  - correct the underlying disorder, discontinue responsible drug
  - androgens for hypogonadism
  - anti-estrogens: tamoxifen has most evidence for benefit
- surgical
  - longstanding (>12 mo, fibrotic), discomfort, or causing psychological distress

## Female Reproductive Endocrinology

- see [Gynaecology, GY23](#)

## Paraneoplastic Syndrome

- clinical syndromes involving non-metastatic systemic effects that accompany malignant disease
- triggered by antibodies against neoplasm cross-reacting with normal tissue or by production of a physiologically active substance by the neoplasm
- commonly present with cancers of lung, breast, ovaries, or lymphatic system

**Table 40. Clinical Features**

Syndrome Class	Symptoms/Syndrome	Associated Malignancies	Mechanism
Endocrine	Cushing's syndrome	Small-cell lung cancer Pancreatic carcinoma Neural tumours Thymoma	Ectopic ACTH and ACTH-mimicking substance secretion
	Syndrome of inappropriate ADH secretion (SIADH)	Small-cell lung cancer CNS malignancies	Antidiuretic hormone secretion
	Hypercalcemia	Lung cancer Breast carcinoma Renal cell carcinoma Multiple myeloma Ovarian carcinoma	PTH-related protein, transforming growth factor alpha (TGF- $\alpha$ ), tumour necrosis factor (TNF) secretion
	Hypoglycemia	Hepatocellular carcinoma Fibrosarcoma Insulinoma	Insulin or insulin-like substance secretion
	Carcinoid	Gastrointestinal neuroendocrine tumours	Serotonin, bradykinin secretion
Neurologic	Lambert-Eaton myasthenic syndrome (LEMS) Muscle weakness in limbs	Small-cell lung cancer	Ab interferes with acetylcholine (ACh) release
	Myasthenia gravis Fluctuating muscle weakness and fatigability	Thymoma	Ab interferes with ACh release
	Paraneoplastic limbic encephalitis Depression, seizures, short-term memory loss	Small-cell lung cancer	Unknown
Renal	Hypokalemic nephropathy	Small-cell lung cancer	Ectopic ACTH and ACTH-like substance secretion
	Nephrotic syndrome	Lymphoma Melanomas	Immunocomplex sedimentation in nephrons
GI	Watery diarrhea	MTC VIPoma	Calcitonin, prostaglandin secretion VIP secretion
Hematologic	Erythrocytosis	Renal cell carcinoma Hepatocellular carcinoma	Erythropoietin (EPO) production
Rheumatologic	SLE	Lymphomas Lung cancer Breast carcinoma Gonadal carcinoma	Anti-nuclear Ab production
	Scleroderma	Breast carcinoma Lung cancer Uterine cancer	Anti-nuclear Ab production

### Investigations

- CBC, electrolytes, creatinine, LFTs, ALP, erythrocyte sedimentation rate (ESR), CRP, serum/urine electrophoresis
- serum autoantibodies, lumbar puncture
- imaging: skeletal survey, CT, MRI, positron emission tomography (PET) scan
- $\pm$  endoscopy

### Treatment

- treat underlying tumour: surgery, radiation, chemotherapy
- treat immune-mediated disorder: intravenous immunoglobulin (IVIG), steroids, immunosuppressive drugs, plasmapheresis (reserved for patients with identifiable antibodies in serum)

# Common Medications

## Diabetes Medications

Drug Class	Mechanism of Action	Generic Drug Name	Canada Name	US Name (if different)	Dosing	Indications	Contraindications	Side Effects	Comments
<b>Biguanide</b>	Sensitizes peripheral tissues to insulin → increases glucose uptake Decreases hepatic glucose production by stimulation of hepatic AMP-activated protein kinase (AMPK)	metformin	Glucophage® Glumetza®		500 mg once daily titrated to 2000 mg/d maximum (split BID unless extended release)	T2DM Improves both fasting and postprandial hyperglycemia Also → TG	<b>ABSOLUTE:</b> Moderate to severe liver dysfunction Moderate renal dysfunction GFR <30 mL/min Cardiac dysfunction	GI upset (abdominal discomfort, bloating, diarrhea) Vitamin B <sub>12</sub> deficiency	▲ A1c 1.0-1.5% Weight neutral Negligible risk of hypoglycemia as monotherapy
<b>Insulin Secretagogue</b>	Stimulates insulin release from β cells by causing K <sup>+</sup> channel closure → depolarization → Ca <sup>2+</sup> mediated insulin release Use in nonobese T2DM	sulfonylureas: glyburide  glimepiride	Diabeta® Euglucon®  Diamicron® Diamicron® MR  Amaryl®	Micronase® Glynase PreTab®	2.5-5.0 mg/d titrated to >5 mg BID Max: 20 mg/d  40-160 mg BID 30-120 mg once daily  1-8 mg once daily	T2DM, taken with meals	<b>ABSOLUTE:</b> Moderate to severe liver dysfunction <b>RELATIVE (glyburide and glimepiride):</b> Adjust dose in mild to moderate kidney dysfunction and avoid in severe kidney dysfunction Avoid glyburide in the elderly <b>INTERACTIONS:</b> Do not combine with a non-sulfonylurea insulin secretagogue or preprandial insulin	Hypoglycemia Weight gain	▲ A1c 0.8%  Gliclazide lowest incidence of hypoglycemia
<b>Meglitinides</b>	Stimulates insulin release from β cells by causing K <sup>+</sup> channel closure → depolarization → Ca <sup>2+</sup> mediated insulin release	non-sulfonylureas: repaglinide  nateglinide	GlucNorm®  Starlix®	Prandin®	0.5-4 mg TID  60-120 mg TID	Short t <sub>1/2</sub> of 1 h causes brief but rapid ↑ in insulin, therefore effective for postprandial control	<b>ABSOLUTE:</b> Severe liver dysfunction <b>INTERACTIONS:</b> Do not combine with a sulfonylurea or preprandial insulin	Hypoglycemia (less than sulfonylurea) Weight gain	▲ A1c 0.7% for repaglinide and 0.5-1.0% for nateglinide Costly Must be dosed with meals
<b>Insulin Sensitizers (thiazolidinedione)</b>	Sensitizes peripheral tissues to insulin → increases glucose uptake Decreases FFA release from adipose Binds to nuclear receptor peroxisome proliferator-activated receptor gamma (PPAR-γ)	rosiglitazone  pioglitazone	Avandia®  Actos®		2-8 mg once daily  15-45 mg once daily	T2DM – not as initial therapy	<b>ABSOLUTE:</b> New York Heart Association (NYHA) > class II CHF, bladder cancer <b>INTERACTIONS:</b> Do not combine with insulin	Peripheral edema CHF Anemia Fluid retention and CHF Increased risk of cardiac events with rosiglitazone (requires written informed consent when prescribing) Increased risk of bladder cancer with pioglitazone Fractures Mild increase in LDL	▲ A1c 0.8% Delayed maximum efficacy (6-12 wk)  NOTE: This class of medication is rarely used anymore due to side effects and concerns about potential increased cardiovascular (CV) mortality
<b>α-Glucosidase Inhibitor</b>	▲ carbohydrate GI absorption by inhibiting brush border α-glucosidase	acarbose	Glucobay®	Precose®	25 mg once daily titrated to 100 mg TID	▲ postprandial hyperglycemia	<b>ABSOLUTE:</b> Inflammatory bowel disease Severe liver dysfunction	Flatulence Abdominal cramps Diarrhea	▲ A1c 0.6% Not recommended as initial therapy in patients with HbA1c >8.5%
<b>Dipeptidyl Peptidase-IV (DPP-IV) Inhibitor</b>	Inhibits degradation of endogenous antihyperglycemic incretin hormones Incretin hormones stimulate insulin secretion, inhibit glucagon release, and delay gastric emptying	sitagliptin  saxagliptin  linagliptin	Januvia®  Onglyza®  Trajenta®		100 mg once daily  2.5-5 mg once daily  5 mg once daily		<b>ABSOLUTE (sitagliptin):</b> T2DM DKA  <b>RELATIVE (sitagliptin and saxagliptin):</b> Use with dose reduction in kidney dysfunction	Nasopharyngitis Upper respiratory tract infection (URTI) Headache Pancreatitis Stevens Johnson syndrome Bullous pemphigoid	▲ A1c 0.7% Weight neutral Expensive Negligible risk of hypoglycemia as monotherapy

## Diabetes Medications

Drug Class	Mechanism of Action	Generic Drug Name	Canada Name	US Name (if different)	Dosing	Indications	Contraindications	Side Effects	Comments
Glucagon-Like Peptide (GLP)-1 Analogue	Binds to GLP-1 receptor to promote insulin release Insulinotropic effect suppressed as plasma glucose <4 mmol/L Slows gastric emptying, suppresses inappropriately elevated glucagon levels Causes $\beta$ -cell regeneration and differentiation <i>in vitro</i>	exenatide	Byetta <sup>®</sup>		5-10 $\mu$ g SC BID 1 h before meals		<b>ABSOLUTE:</b> T1DM DKA Acute pancreatitis Hx Multiple endocrine neoplasia syndrome type 2 <b>MTC</b> <b>RELATIVE:</b> Gastroparesis End stage renal disease (ESRD) Personal or family history of MTC	N/V, diarrhea Dizziness, headache Muscle weakness Anti-exenatide antibodies Pancreatitis	$\uparrow$ A1c 1.0% Weight loss Negligible risk of hypoglycemia as monotherapy  Added CV mortality and CV outcomes benefit in patients with known CVD
		liraglutide	Victoza <sup>®</sup>		0.6-1.8 mg once daily SC				
		semaglutide	Rybelsus PO/ Ozempic SC <sup>®</sup>		3-14 mg once daily PO,				
		dulaglutide	Trulicity <sup>®</sup>		0.25-1 mg once weekly SC 0.75-1.5 mg/ wk SC				
Sodium-glucose linked transporter 2 (SGLT2) Inhibitor	Enhances urinary glucose excretion by inhibiting glucose reabsorption in the proximal renal tubule	canagliflozin	Invokana <sup>®</sup>		100 - 300 mg once daily before first meal of the day		<b>ABSOLUTE:</b> Severe renal impairment ESRD Patients on dialysis	UTI, genital infections Hypotension caution with concomitant loop diuretic use Caution with renal dysfunction Hyperlipidemia (raises LDL and HDL) Dapagliflozin not to be used in patients with active or history of bladder cancer Rare DKA (may occur with no hyperglycemia)	$\uparrow$ A1c 0.7-1.0% Negligible risk of hypoglycemia as monotherapy  Cause weight loss  Added CV mortality, CV outcomes benefit in patients with known prior CVD  Renal protection
		dapagliflozin	Forxiga <sup>®</sup>		5 - 10 mg once daily in the morning with or without food				
		empagliflozin	Jardiance <sup>®</sup>		10 - 25 mg once daily in the morning with or without food				

## Dyslipidemia Medications

Drug Class	Mechanism of Action	Generic Drug Name	Canada Name	US Name (if different)	Dosing	Indications	Contraindications	Side Effects
HMG-CoA Reductase Inhibitor (statins)	Inhibits cholesterol biosynthesis, $\uparrow$ LDL synthesis, $\uparrow$ LDL clearance, modest $\uparrow$ HDL, limited $\uparrow$ VLDL	atorvastatin fluvastatin lovastatin pravastatin rosuvastatin simvastatin	Lipitor <sup>®</sup> Lescol <sup>®</sup> Mevacor <sup>®</sup> Pravachol <sup>®</sup> Crestor <sup>®</sup> Zocor <sup>®</sup>		10-80 mg/d 20-80 mg/d 20-80 mg/d 10-40 mg/d 5-40 mg/d 10-80 mg/d	1st line monotherapy Used for $\uparrow$ LDL, $\uparrow$ TG	Active liver disease	$\uparrow$ liver enzymes Myositis ( $\uparrow$ risk if combined with fibrates) Rhabdomyolysis
Fibrates	Activate PPAR $\alpha$ , upregulate lipoprotein lipase + apo A1, $\uparrow$ VLDL, $\uparrow$ TG, modest $\uparrow$ LDL, modest $\uparrow$ HDL	bezafibrate fenofibrate gemfibrozil	Bezalip <sup>®</sup> Lipidil <sup>®</sup> Lipid <sup>®</sup>		400 mg/d 48-200 mg/d 600-1200 mg/d	Used for $\uparrow$ TG, hyperchylomicronemia	Hepatic disease Renal disease	GI upset Skin rashes $\uparrow$ risk of gallstone formation $\uparrow$ risk of rhabdomyolysis when combined with statins
Niacin	Inhibits secretion of hepatic VLDL via lipoprotein lipase (LPL) pathway $\rightarrow$ decreased VLDL and LDL; decreased clearance of HDL	nicotinic acid	Niaspan <sup>®</sup> generic niacin	Niacor <sup>®</sup>	0.5-2 g/d	Used for severe hypertriglyceridemia not controlled by fibrate	Hypersensitivity Hepatic dysfunction Active peptic ulcer disease (PUD) Hyperuricemia Severe hypotension	Generalized flushing Abnormal liver enzymes Pruritus IGT Watch glucose control with overt DM
Bile Acid Sequestrants	Resins that bind bile acids in intestinal lumen and prevent absorption thereby $\uparrow$ LDL	cholestyramine colestipol	Questran <sup>®</sup> Colestid <sup>®</sup>		2-24 g/d 5-30 g/d	Used for $\uparrow$ LDL Use as adjunct with statins or fibrates	Complete biliary obstruction TG >3.5 mmol/L	Constipation, nausea Flatulence Bloating Rise in TG Binds other medications
Cholesterol Absorption Inhibitors	Inhibits cholesterol absorption at the small intestine brush border	ezetimibe	Ezetrol <sup>®</sup>	Zetia <sup>®</sup>	10 mg/d	Used for $\uparrow$ LDL	Hypersensitivity Hepatic dysfunction (when used with statin) Do not combine with fibrates or bile acid resins	Fatigue Pharyngitis Sinusitis Abdominal pain Diarrhea Arthralgia

## Dyslipidemia Medications

Drug Class	Mechanism of Action	Generic Drug Name	Canada Name	US Name (if different)	Dosing	Indications	Contraindications	Side Effects
Anti-PCSK9	Inhibits degradation of the LDL receptor by PCSK9 enzyme LDL clearance	evolocumab	Repatha®		140 mg q2 wk or 420 mg once monthly	Add-on to maximally tolerated statin therapy in heterozygous familial hypercholesterolemia (FH) (evolocumab, alirocumab) and homozygous FH (evolocumab) Consider in patients with atherosclerotic CVD and LDL-C not at target despite maximally tolerated statin + ezetimibe	Hypersensitivity No studies regarding use in severe hepatic or renal impairment	Nasopharyngitis, URTI, influenza Sinusitis Back pain Myalgia Arthralgia Nausea
		alirocumab	Praluent®		75 mg q2 wk or 300 mg once monthly			

## Thyroid Medications

Drug Class	Mechanism of Action	Generic Drug Name	Canada Name	US Name (if different)	Dosing	Indications	Contraindications	Side Effects
Antithyroid Agent (thionamides)	Decreases thyroid hormone production by inhibiting iodine and peroxidase from interacting with thyroglobulin to form T <sub>4</sub> and T <sub>3</sub> PTU also interferes with conversion of T <sub>4</sub> to T <sub>3</sub>	propylthiouracil (PTU)	Propyl-Thyracil®		Start 100 mg PO TID, then adjust accordingly Thyroid storm: start 150-300 mg PO QID, then adjust accordingly	Hyperthyroidism, thyroid storm	Hypersensitivity PTU recommended in 1st trimester, MMI during 2nd and 3rd trimester Lactation: safe with PTU <300 mg/d and MMI <20-30 mg/d	N/V Rash Drug-induced hepatitis Agranulocytosis Hepatitis with PTU Cholestasis with MMI Vasculitis
		methimazole (MMI)	Tapazole®		Start 5-20 mg PO once daily, then adjust accordingly Up to 60 mg once daily may be required			
Thyroid Hormone	Synthetic form of thyroxine (T <sub>4</sub> )	levothyroxine l-thyroxine	Synthroid® Eltroxin®	Levoxyl®	0.05-2.0 mg/d, usually 1.6x weight (kg) is dose in micrograms In elderly patients start at 0.025 mg/d	Hypothyroidism Post thyroidectomy	Recent MI, thyrotoxicosis	If wrong dosing: symptoms of hypothyroidism or hyperthyroidism Skin rash from dye in pill
Antithyroid Agent Radiopharmaceutical	Radioactive isotope of iodine that is incorporated into the thyroid gland irradiating the area and destroying local glandular tissue	sodium iodide I-131	Iodotope®		Dose corrected for 24 h radioactive iodine uptake Hyperthyroidism 4-12 millicuries (mCi) Thyroid Ca 50-150 mCi	Hyperthyroidism Thyroid malignancy	Hypersensitivity Concurrent antithyroid medication Pregnancy, lactation	N/V Bone marrow suppression Sialadenitis Thyroiditis

## Metabolic Bone Disease Medications

Drug Class	Mechanism of Action	Generic Drug Name	Canada Name	US Name (if different)	Dosing	Indications	Contraindications	Side Effects
<b>Bisphosphonates</b>	Inhibits osteoclast-mediated bone resorption	alendronate	Fosamax®		Osteoporosis: 5-10 mg once daily 70 mg once weekly Paget's: 40 mg once daily for 6 mo	Prevention of postmenopausal osteoporosis Treatment of osteoporosis Glucocorticoid-induced osteoporosis Paget's disease	Esophageal stricture or achalasia (oral) Unable to stand or sit upright for >30 min (oral) Hypersensitivity Hypocalcemia Renal insufficiency (CrCl <35 mL/min) History or atypical femoral fracture or osteonecrosis of the jaw	GI Musculoskeletal (MSK) pain Headache Osteonecrosis of the jaw Atypical femur fractures
		risedronate	Actonel®		Osteoporosis: 5 mg once daily 35 mg once weekly 150 mg once monthly Paget's: 30 mg once daily for 2 mo	Treatment and prevention of postmenopausal osteoporosis Treatment and prevention of glucocorticoid-induced osteoporosis Paget's disease	Renal insufficiency (CrCl <30 mL/min)	
		pamidronate	Aredia®		Hypercalcemia of malignancy: 60-90 mg IV over 2-24 h Wait at least 7 d before considering retreatment	Hypercalcemia of malignancy Paget's disease Osteolytic bone metastases of breast cancer Osteolytic lesions of multiple myeloma	Renal insufficiency (CrCl <30 mL/min)	
		zoledronate	Zometa® Aclasta®	Reclast®	5 mg IV once yearly 5 mg IV	Treatment of osteoporosis Hypercalcemia of malignancy Treatment and prevention of skeletal complications related to cancer	Renal insufficiency (CrCl <35 mL/min)	
<b>Selective Estrogen Receptor Modulators</b>	Decreases resorption of bone through binding to estrogen receptors	raloxifene	Evista®		60 mg once daily	Treatment and prevention of postmenopausal osteoporosis (2nd line)	Lactation Pregnancy Active or past history of DVT, PE, or retinal vein thrombosis	Hot flashes Leg cramps Increased risk of fatal stroke, venous thromboembolism
<b>Anti-RANKL Monoclonal Ab</b>	Inhibits RANKL (osteoclast differentiating factor) → inhibits osteoclast formation and decreases bone resorption	denosumab	Prolia™	Xgeva™	60 mg SC q6 mo	Treatment for postmenopausal women at high-risk of fracture Prevent skeletal-related events in patients with bone metastasis from solid tumours Also approved for glucocorticoid-induced osteoporosis, and for men	Hypocalcemia Vitamin D insufficiency	Fatigue/headache/ GI injection site reaction Hypocalcemia Atypical femur fractures Osteonecrosis of the jaw
<b>PTH analog</b>	Stimulates new bone formation by preferential stimulation of osteoblastic activity over osteoclastic activity	teriparatide	Forteo®		20 µg SC once daily x 18-24 mo	Treatment for postmenopausal women with osteoporosis who are at high-risk for fracture Treatment for men with primary or hypogonadal osteoporosis who are at high-risk for fracture Also approved for glucocorticoid-induced osteoporosis	Paget's disease Prior external beam or implant radiation therapy involving the skeleton Bone metastases Metabolic bone diseases other than osteoporosis	Orthostatic hypotension Hypercalcemia Dizziness Leg cramps
<b>Calcium</b>	Inhibits PTH secretion				1200 mg/d (including diet) Divided in 3 doses	Osteopenia Osteoporosis Prevention of metabolic bone disease	Caution with renal stones	Vomiting Constipation Dry mouth
<b>Anti-sclerostin Monoclonal Ab</b>	Binds to and inhibits sclerostin (inhibitor of Wnt β-Catenin pathway) → increased bone formation and reduced bone resorption	Romosozumab	Evenity®		210 mg SC qMonth x 12 mo	Treatment of osteoporosis in postmenopausal women at high risk for fracture (defined as history of osteoporotic fracture or multiple risk factors for fracture)	Hypocalcemia Hypersensitivity	Headache, joint pain, pain at injection site May increase risk of MI/stroke/CV death Osteonecrosis of jaw Atypical femur fractures

## Metabolic Bone Disease Medications

Drug Class	Mechanism of Action	Generic Drug Name	Canada Name	US Name (if different)	Dosing	Indications	Contraindications	Side Effects
Vitamin D	Regulation of calcium and phosphate homeostasis	cholecalciferol (vitamin D <sub>3</sub> )			800-2000 IU/d (higher doses required in insufficiency or deficiency)	Osteopenia Osteoporosis Prevention of metabolic bone disease	Caution in patients on digoxin (risk of hypercalcemia which may precipitate arrhythmia)	Hypercalcemia Headache N/V Constipation
		ergocalciferol (vitamin D <sub>2</sub> )	Drisdol® Erdol®		50000 IU/wk	Osteoporosis in patients with liver dysfunction, refractory rickets, hypoparathyroidism	Hypercalcemia Malabsorption syndrome Decreased renal function	
		calcitriol (1,25(OH) <sub>2</sub> -D)	Recaltrol®  Calcijex®		Start 0.25 µg/d Titrated up by 0.25 µg/d at 4-8 wk intervals to 0.5-1 µg/d  Start 0.25 µg/d Titrated up by 0.25 µg/d at 2-4 wk intervals to 0.5-2 µg/d	Hypocalcemia and osteodystrophy in patients with chronic renal failure on dialysis Hypoparathyroidism	Hypercalcemia Vitamin D toxicity	

## Adrenal Medications

Drug Class	Mineralocorticoid Activity	Generic Drug Name	Potency Relative to Cortisol	Equivalent Dose (mg)	Duration of Action (t <sub>1/2</sub> in h)	Dosing	Comments
Hydrocortisone	Yes	cortel solu-Cortel	1.0	20	8	<u>Adrenal Crisis:</u> 50-100 mg IV bolus, then 50-100 mg q8 h (continuous infusion x 24-48 h) PO once stable (50 mg q8 h x 48 h, then taper over 14 d) <u>Chronic AI:</u> 15-20 mg PO BID-TID (2/3 AM, 1/3 PM)	In high doses, mineralocorticoid side effects may emerge (salt + water retention, ECF volume expansion, HTN, low K+ metabolic alkalosis)
Cortisone Acetate	Yes	cortisone acetate	0.8	25	oral = 8 IM = 18+	<u>Adrenal Crisis:</u> 75-300 mg/d PO/IM divided q12-24 h <u>Chronic AI:</u> 25 mg/d divided BID-TID	Pro-drug which is converted to active form as hydrocortisone High doses can result in mineralocorticoid side effects (see above)
<b>Mineralocorticoid</b>							
Fludrocortisone	100%	—	—			<u>Chronic:</u> 0.1 mg daily	Replaces aldosterone in primary adrenal insufficiency
Prednisone	Yes	prednisone	4	5	16-36	<u>Adrenal Crisis:</u> 15-60 mg/d PO once daily or divided BID/QID <u>Chronic AI:</u> 5 mg daily	Pro-drug which is converted to active form as prednisolone
Dexamethasone	No	dexamethasone	30	0.75	36-54	<u>Adrenal Crisis:</u> 4 mg IV; repeat q2-6 h if necessary	

## Landmark Endocrinology Trials

Trial Name	Reference	Clinical Trial Details
<b>DIABETES</b>		
<b>GLP-1 Agonists</b>		
LEADER	NEJM 2016;375:311-22	<p><b>Title:</b> Liraglutide and Cardiovascular Outcomes in Type 2 Diabetes</p> <p><b>Purpose:</b> To investigate the cardiovascular effects of liraglutide (GLP1 analogue) when added to standard care in patients with T2DM.</p> <p><b>Methods:</b> 9340 patients with T2DM at high cardiovascular risk were randomly assigned to receive liraglutide or placebo.</p> <p><b>Results:</b> The primary outcome (first occurrence of death from cardiovascular causes, nonfatal MI, or nonfatal stroke) was observed in significantly less patients on liraglutide (13.0%) than placebo (14.9%) (hazard ratio, 0.87; 95% confidence interval, 0.78-0.97; <math>P &lt; 0.001</math> for noninferiority; <math>P = 0.01</math> for superiority).</p> <p><b>Conclusion:</b> In patients with T2DM, liraglutide reduced the rate of first occurrence of death from cardiovascular causes, nonfatal MI, or nonfatal stroke.</p>
REWIND	Lancet 2019;394:121-30	<p><b>Title:</b> Dulaglutide and Cardiovascular Outcomes in T2DM (REWIND): A Double-Blind, Randomized Placebo-Controlled Trial</p> <p><b>Purpose:</b> To assess the effects of adding the GLP-1 receptor agonist dulaglutide to existing antihyperglycemic regimens on major cardiovascular events in patients with T2DM.</p> <p><b>Methods:</b> 9901 patients with T2DM <math>\geq 50</math> years old with previous CVD or cardiovascular risk factors were randomly assigned to receive dulaglutide (1.5 mg weekly) or placebo. Primary composite outcome was first occurrence of non-fatal MI, non-fatal stroke, or death from cardiovascular causes.</p> <p><b>Results:</b> During median follow-up of 5.4 years, the primary composite outcome occurred in 12.0% of patients on dulaglutide vs. 13.4% of patients on placebo (hazard ratio (HR), 0.88; 95% CI 0.79-0.99; <math>P = 0.026</math>). There was no significant difference in all-cause mortality between groups (10.8% in the dulaglutide group vs. 12% in the placebo group; HR, 0.90; 95% CI, 0.80-1.01; <math>P = 0.067</math>).</p> <p><b>Conclusion:</b> In middle-aged and older adults with T2DM with previous CVD or cardiovascular risk factors, dulaglutide could be considered for managing glycemic control.</p>
<b>SGLT2 Inhibitors</b>		
EMPA-REG OUTCOME	NEJM 2015;373:2117-28	<p><b>Title:</b> Empagliflozin, Cardiovascular Outcomes, and Mortality in Type 2 Diabetes</p> <p><b>Purpose:</b> To investigate the effects of empagliflozin on cardiovascular morbidity and mortality in patients with T2DM at high cardiovascular risk.</p> <p><b>Methods:</b> 7020 patients were randomly assigned to receive empagliflozin (10 mg or 25 mg) or placebo daily.</p> <p><b>Results:</b> Risk of hospitalization from heart failure, death from any cause, or cardiovascular causes was significantly lower in the pooled empagliflozin group as compared to placebo. There were no significant differences in the rates of MI or stroke. There were increased rates of genital infection with empagliflozin.</p> <p><b>Conclusion:</b> Empagliflozin reduced rates of death from any cause and death from CVD in patients with T2DM at high risk for cardiovascular events.</p>
CANVAS	NEJM 2017;377:644-57	<p><b>Title:</b> Canagliflozin and Cardiovascular and Renal Events in Type 2 Diabetes</p> <p><b>Purpose:</b> To assess the effects of canagliflozin on cardiovascular, renal, and safety outcomes in patients with T2DM.</p> <p><b>Methods:</b> 10142 patients with T2DM at high cardiovascular risk were randomly assigned to receive canagliflozin or placebo. Primary outcome was a composite of death from cardiovascular causes, nonfatal MI, or nonfatal stroke.</p> <p><b>Results:</b> Canagliflozin was associated with significantly lower rates of the primary outcome as compared to placebo (26.9 vs. 31.5 participants per 1000 patient-years; hazard ratio (HR), 0.86; 95% CI, 0.75-0.97; <math>P = 0.001</math> for noninferiority; <math>P = 0.02</math> for superiority). However, canagliflozin was associated with a greater risk of amputation (6.3 vs. 3.4 participants per 1000 patient-years; HR, 1.97; 95% CI, 1.41-2.75).</p> <p><b>Conclusion:</b> Canagliflozin lowered the risk of cardiovascular events but increased the risk of amputation in patients with T2DM at high cardiovascular risk.</p>
DECLARE-TIMI 58	NEJM 2019;380:347-57	<p><b>Title:</b> Dapagliflozin and Cardiovascular Outcomes in Type 2 Diabetes</p> <p><b>Purpose:</b> To assess the safety and efficacy of the SGLT2i dapagliflozin in patients with T2DM who had or were at risk for atherosclerotic CVD.</p> <p><b>Methods:</b> 17160 patients were randomly assigned to receive 10 mg dapagliflozin daily or placebo. Primary composite safety outcome was MACE (major adverse cardiovascular events), defined by cardiovascular death, MI, or ischemic stroke. The primary efficacy outcomes were MACE and a composite of cardiovascular death or hospitalization for heart failure.</p> <p><b>Results:</b> For the primary safety outcome, dapagliflozin was noninferior to placebo (<math>P = 0.001</math> for noninferiority). In the efficacy analyses, dapagliflozin was associated with a lower rate of cardiovascular death or hospitalization for heart failure (4.9% vs. 5.8%; hazard ratio, 0.83; 95% CI, 0.73-0.95; <math>P = 0.005</math>), but it did not significantly lower rates of MACE (8.8% vs. 9.4%; hazard ratio, 0.93; 95% CI, 0.84-1.03; <math>P = 0.17</math>).</p> <p><b>Conclusion:</b> Dapagliflozin was noninferior to placebo with respect to MACE but was associated with lower rates of cardiovascular death or hospitalization for heart failure in patients with T2DM who had or were at risk for atherosclerotic CVD.</p>
<b>SGLT2 Inhibitors - Renal</b>		
CREDESCENCE	NEJM 2019;380:2295-2306	<p><b>Title:</b> Canagliflozin and Renal Outcomes in Type 2 Diabetes and Nephropathy</p> <p><b>Purpose:</b> To investigate if an SGLT2i improves renal outcomes in patients with T2DM.</p> <p><b>Methods:</b> 4401 patients with T2DM and chronic kidney disease (CKD) were randomly assigned to receive either 100 mg canagliflozin (oral SGLT2i) daily or placebo.</p> <p><b>Results:</b> Trial was stopped early after median follow-up of 2.6 yr. Canagliflozin significantly lowered the relative risk of the primary composite outcome (end-stage kidney disease, doubling of serum creatinine, or death from renal or cardiovascular causes) by 30% (hazard ratio, 0.70; 95% confidence interval, 0.59-0.82; <math>P = 0.00001</math>).</p> <p><b>Conclusion:</b> Canagliflozin therapy resulted in a lower risk of kidney failure and cardiovascular events in patients with T2DM and CKD.</p>
DAPA-CKD	NEJM 2020;383:1436-46	<p><b>Title:</b> Dapagliflozin in Patients with Chronic Kidney Disease</p> <p><b>Purpose:</b> To assess the effects of SGLT2is in patients with CKD with or without T2DM.</p> <p><b>Methods:</b> 4304 patients with estimated GFR (eGFR) <math>\sim 25</math> to 75 mL/min/1.73m<sup>2</sup> and urinary ACR <math>\sim 200</math> to 5000 were randomly assigned to receive dapagliflozin (10 mg/d) or placebo.</p> <p><b>Results:</b> Over a median of 2.4 yr, dapagliflozin was associated with significantly lower rates of the primary composite outcome (sustained decline in eGFR <math>\geq 50\%</math>, end-stage kidney disease, or death from renal or cardiovascular outcomes) as compared to placebo (9.2% vs. 14.5%; hazard ratio, 0.61; 95% CI, 0.51-0.72; <math>P &lt; 0.001</math>). Effects were similar in patients with and without T2DM.</p> <p><b>Conclusion:</b> Dapagliflozin therapy resulted in a lower risk of kidney failure and cardiovascular events in patients with CDK, with or without T2DM.</p>

<b>SGLT2 Inhibitors - Cardiac</b>		
DAPA-HF	NEJM 2019;381:1995-2008	<p><b>Title:</b> Dapagliflozin in Patients with Heart Failure and Reduced Ejection Fraction</p> <p><b>Purpose:</b> To assess the effects of SGLT2is in patients with heart failure and reduced ejection fraction, with or without T2DM.</p> <p><b>Methods:</b> 4744 patients with New York Heart Association class II, III, or IV heart failure and ejection fraction <math>\leq 40\%</math> were randomly assigned to receive dapagliflozin (10 mg/d) or placebo, in addition to recommended therapy.</p> <p><b>Results:</b> Over a median of 18.2 months, dapagliflozin was associated with significantly lower rates of the primary composite outcome (worsening heart failure or cardiovascular death) as compared to placebo (16.3% vs. 21.2%; hazard ratio, 0.74; 95% CI, 0.65-0.85; <math>P &lt; 0.001</math>). Effects were similar in patients with and without T2DM.</p> <p><b>Conclusion:</b> Dapagliflozin therapy resulted in a lower risk of worsening heart failure or cardiovascular death in patients with heart failure and reduced ejection fraction, with or without T2DM.</p>
EMPEROR-Reduced	NEJM 2020;383:1413-24	<p><b>Title:</b> Cardiovascular and Renal Outcomes with Empagliflozin in Heart Failure</p> <p><b>Purpose:</b> To assess the effects of SGLT2is in patients with heart failure, including those with a markedly reduced ejection fraction.</p> <p><b>Methods:</b> 3730 patients with New York Heart Association class II, III, or IV heart failure and ejection fraction <math>\leq 40\%</math> were randomly assigned to receive empagliflozin (10 mg/d) or placebo, in addition to recommended therapy.</p> <p><b>Results:</b> Over a median of 16 months, empagliflozin was associated with significantly lower rates of the primary composite outcome (hospitalization for worsening heart failure or cardiovascular death) as compared to placebo (19.4% vs. 24.7%; hazard ratio, 0.75; 95% CI, 0.65-0.86; <math>P &lt; 0.001</math>). Effects were similar in patients with and without T2DM. Empagliflozin was also associated with a slower annual rate of decline in estimated GFR (<math>-0.55</math> vs. <math>-2.28</math> ml/min/1.73m<sup>2</sup>/yr; <math>P &lt; 0.001</math>).</p> <p><b>Conclusion:</b> Empagliflozin therapy resulted in a lower risk of hospitalization for worsening heart failure or cardiovascular death in patients receiving recommended therapy for heart failure, with or without T2DM.</p>
<b>A1c Targets</b>		
ADVANCE	NEJM 2008;358:2560-72	<p><b>Title:</b> Intensive Blood Glucose Control and Vascular Outcomes in Patients with Type 2 Diabetes</p> <p><b>Purpose:</b> To investigate the effects of intensive glucose control on vascular outcomes in patients with T2DM.</p> <p><b>Methods:</b> 11140 patients with T2DM received intensive glucose control with modified release gliclazide (and other drugs necessary to reach target HbA1c <math>\leq 6.5\%</math>) or standard glucose control (target HbA1c defined by local guidelines).</p> <p><b>Results:</b> Intensive glucose control reduced the incidence of nephropathy (4.1% vs. 5.2%; hazard ratio, 0.79; 95% confidence interval [CI], 0.66-0.93; <math>P &lt; 0.006</math>), but did not significantly reduce major macrovascular events or death from any cause. Severe hypoglycemia was more common in the intensive control group (2.7% vs. 1.5%; 1.86 CI [1.42 to 2.40]; <math>P &lt; 0.001</math>).</p> <p><b>Conclusion:</b> Intensive glucose control targeting HbA1c <math>\leq 6.5\%</math> significantly reduces the incidence of nephropathy but not major macrovascular events or death.</p>
ACCORD	NEJM 2008;358:2545-59	<p><b>Title:</b> Effects of Intensive Glucose Lowering in Type 2 Diabetes</p> <p><b>Purpose:</b> To investigate if intensive glucose control targeting normal HbA1c levels reduces cardiovascular events in patients with T2DM with established CVD or CVD risk factors.</p> <p><b>Methods:</b> 10251 patients (mean age 62.2) were randomly assigned to receive intensive therapy targeting a HbA1c level of <math>&lt; 6.0\%</math> or standard therapy targeting 7.0-7.9%.</p> <p><b>Results:</b> The intensive therapy arm was stopped early due to evidence of increased mortality. There was no difference in cardiovascular events or death from cardiovascular events. There were increased rates of hypoglycemia, fluid retention, and weight gain <math>&gt; 10</math> kg in the intensive therapy group.</p> <p><b>Conclusion:</b> Intensive glucose lowering therapy in T2DM does not improve clinical outcomes and increases mortality with more adverse events.</p>
VADT	NEJM 2009;129-39	<p><b>Title:</b> Glucose Control And Vascular Complications In Veterans With Type 2 Diabetes</p> <p><b>Purpose:</b> To investigate effects of intensive glucose control on cardiovascular events in patients with long-standing T2DM.</p> <p><b>Methods:</b> 1791 military veterans who had suboptimal responses to therapy for T2DM were randomly assigned to intensive control (absolute reduction in HbA1c by 1.5% relative to standard) or standard glucose control.</p> <p><b>Results:</b> Median HbA1c was 6.9% in the intensive-therapy group and 8.4% in the standard-therapy. Risk of major cardiovascular events, microvascular complications, or death from any cause were not significantly different between groups. Adverse events, predominantly hypoglycemia, were more common in the intensive control group.</p> <p><b>Conclusion:</b> Rates of major cardiovascular events, death, or microvascular complications were not reduced by intensive glucose control in patients with poorly controlled T2DM.</p>
<b>Treating Diabetes</b>		
4T Trial	NEJM 2009;361:1736-1747	<p><b>Title:</b> Three Year Efficacy of Complex Insulin Regimens in T2DM: 4T Trial Study: Randomized unblinded trial with 3 yr of follow-up.</p> <p><b>Population:</b> 708 patients with T2DM, not on insulin or thiazolidinedione therapy on maximal metformin and sulfonylurea therapy.</p> <p><b>Intervention:</b> Thrice-daily prandial insulin aspart, vs. twice-daily biphasic insulin aspart, vs. once-daily basal insulin detemir. Sulfonylurea therapy was replaced with a secondary insulin regime specific to each arm if there was persistent hyperglycemia.</p> <p><b>Primary Outcome:</b> Three yr HbA1c.</p> <p><b>Results:</b> Significant difference in rates of patient withdrawal from the study: 5.1% biphasic, 11.7% prandial, 8.5% basal regimens (<math>P = 0.04</math>). There were no significant differences in median HbA1c levels between all three arms from yr 1-3. A smaller proportion of patients reached HbA1c <math>&lt; 6.5\%</math> or <math>&lt; 7.0\%</math> in the biphasic arm. The basal arm had the least weight gain and the least weight circumference increase, but the highest rate of secondary insulin requirement. The basal arm had fewest severe hypoglycemic events per patient year, while the biphasic had the most serious adverse effects.</p> <p><b>Conclusion:</b> Basal insulin regimen provides the best glycemic control over a 3 yr study, with better HbA1c control, fewer hypoglycemic events, and less weight gain.</p>
The ACCORD Trial – Blood Pressure Control	NEJM 2010;362:1575-1585	<p><b>Title:</b> Effects of Intensive Blood Pressure Control in T2DM: The ACCORD Trial</p> <p><b>Study:</b> RCT, unblinded with 4.7 yr of mean follow-up.</p> <p><b>Population:</b> 4733 patients with T2DM, risk factors for cardiovascular (CV) disease, systolic blood pressure (sBP) between 130-180 mmHg.</p> <p><b>Intervention:</b> sBP control <math>&lt; 120</math> mmHg (intensive) or 140 mmHg (standard).</p> <p><b>Primary Outcomes:</b> Major CV event (composite nonfatal MI, nonfatal stroke, or CV-related death).</p> <p><b>Results:</b> Mean number of medications at 1 yr for intensive therapy was 3.4 (95% CI 3.4-3.5) vs. 2.1 (95% CI 2.1-2.2) for standard therapy. There was a significant increase in all serious adverse events in the intensive treatment arm (3.3% vs. 1.27%, <math>P &lt; 0.001</math>); especially bradycardia or arrhythmia (0.5% vs. 0.13%, <math>P = 0.02</math>) and hyperkalemia (0.4% vs. 0.04%, <math>P = 0.01</math>). There was no significant difference in primary outcomes in the two study arms, or all-cause mortality. There was a significant reduction in any stroke (0.32%/yr vs. 0.53%/yr, <math>P = 0.01</math>) and nonfatal stroke incidences (0.30%/yr vs. 0.47%/yr, <math>P = 0.03</math>) in the intensive therapy arm.</p> <p><b>Conclusion:</b> Intensive BP lowering to <math>&lt; 120</math> mmHg vs. 140 mmHg in patients with T2DM and CV risk factors does not reduce major CV event risk except for stroke events.</p>

Trial Name	Reference	Clinical Trial Details
The ACCORD Trial – Combination Lipid Therapy	NEJM 2010;362:1563-1574	<b>Title:</b> Effects of Combination Lipid Therapy in T2DM: The ACCORD Trial <b>Study:</b> RCT, double-blinded trial with 4.7 yr of mean follow-up. <b>Population:</b> 5518 patients with T2DM. <b>Intervention:</b> Statin with or without fibrate therapy. <b>Primary Outcome:</b> Major CV event (composite nonfatal MI, nonfatal stroke, or CV-related death). <b>Results:</b> No significant differences in primary outcome between the two arms. No difference in all MI, all stroke, or all-cause mortality between study arms. <b>Conclusions:</b> The addition of fibrate therapy to statin therapy in patients with T2DM does not reduce major CV event risk.
DCCT	NEJM 1993;329:977-986	<b>Title:</b> The Effect of Intensive Treatment of Diabetes on the Development and Progression of Long-term Complications in Insulin-dependent Diabetes Mellitus <b>Purpose:</b> To investigate whether intensive treatment to maintain normal blood glucose reduces the frequency and severity of microvascular complications in T1DM. <b>Methods:</b> 1441 patients with T1DM received intensive therapy ( $\geq 3$ daily insulin injections or insulin pump, BG monitoring QID with strict targets) or conventional therapy (1-2 insulin injections daily, BG monitoring daily). <b>Results:</b> Intensive treatment of T1DM significantly reduced the risk for the development and progression of retinopathy in primary- and secondary-intervention cohorts, respectively. Intensive therapy also reduced the occurrence of microalbuminuria, albuminuria, and clinical neuropathy. Intensive therapy was associated with an increase in the occurrence of severe hypoglycemia. <b>Conclusion:</b> Intensive treatment significantly reduces the development and progression of microvascular complications in T1DM.
EDIC	NEJM 2005;353:2644-53	<b>Title:</b> Intensive Diabetes Treatment and Cardiovascular Disease in Patients with Type 1 Diabetes <b>Purpose:</b> To investigate whether intensive vs. conventional therapy during the DCCT trial influenced the long-term incidence of CVD. <b>Methods:</b> The DCCT trial randomly assigned 1441 patients with T1DM to intensive or conventional therapy for a mean of 6.5 years from 1983-1993. 93% were followed until 2005 (EDIC) for cardiovascular events. <b>Results:</b> During the mean 17-year follow-up, intensive treatment reduced the risk of any cardiovascular event by 42% (95% confidence interval [CI], 9-63%; $P=0.02$ ) and of nonfatal MI, stroke, or death from CVD by 57% (CI, 12-79%; $P=0.02$ ). <b>Conclusion:</b> Long-term risk of CVD in patients with T1DM is reduced by intensive therapy.
UKPDS 33	Lancet 1998;352:837-53	<b>Title:</b> Intensive Blood-Glucose Control With Sulphonylureas or Insulin Compared With Conventional Treatment and Risk of Complications in Patients With Type 2 Diabetes (UKPDS 33) <b>Purpose:</b> To investigate the effects of intensive blood-glucose control with sulphonylurea or insulin vs. conventional treatment on the risk of complications in T2DM. <b>Methods:</b> 3867 patients with newly diagnosed T2DM were received intensive treatment with a sulphonylurea or insulin (target FPG $< 6$ mmol/L) vs. conventional treatment with diet alone (target FPG $< 15$ mmol/L without hyperglycemic symptoms). <b>Results:</b> Patients allocated to intensive treatment had lower median HbA1c levels ( $P<0.0001$ ), and their risk was reduced by 12% for any diabetes-related endpoint (95% confidence interval [CI], 1-21, $P=0.029$ ), by 10% for any diabetes-related death (CI, -11-27, $P=0.34$ ), and by 6% for all-cause mortality (CI, -10-20, $P=0.44$ ). Intensive therapy induced more hypoglycemic episodes and weight gain. <b>Conclusion:</b> In T2DM, sulphonylurea or insulin-mediated intensive glucose control reduced microvascular but not macrovascular complications.
UKPDS 34	Lancet 1998;352:854-65	<b>Title:</b> Effect of Intensive Blood-Glucose Control With Metformin On Complications In Overweight Patients With Type 2 Diabetes (UKPDS 34) <b>Purpose:</b> To investigate the effects of intensive glucose control with metformin on rates of microvascular and macrovascular complications in overweight patients with T2DM. <b>Methods:</b> 753 patients were randomised to receive conventional management with diet alone or intensive blood-glucose control regimen with metformin targeting FPG $< 6$ mmol/L. <b>Results:</b> Patients allocated metformin had reduced HbA1c (7.4% vs. 8.0%), and risk reductions of 32% for any diabetes-related endpoint ( $P=0.002$ ), 42% for diabetes-related death ( $P=0.017$ ), and 36% for all-cause mortality ( $P=0.011$ ). Among various intensive blood-glucose control regimens, metformin was superior to sulphonylureas or insulin for any diabetes-related endpoint ( $P=0.0034$ ), all-cause mortality ( $P=0.021$ ), and stroke ( $P=0.032$ ). <b>Discussion:</b> Metformin decreases risk of diabetes-related endpoints in overweight patients with less weight gain and hypoglycemia than insulin and sulphonylureas. Consider for first line therapy.
UKPDS Extension	NEJM 2008;359:1577-89	<b>Title:</b> 10-Year Follow-Up of Intensive Glucose Control in Type 2 Diabetes <b>Purpose:</b> Post-trial monitoring of UKPDS to determine whether improved glucose control persisted and if there were long-term effects on macrovascular outcomes. <b>Methods:</b> 3277 patients were assessed through annual UKPDS clinics or annual questionnaires for up to 10 yr. <b>Results:</b> After 1 yr, between-group differences in HbA1c were lost. Relative risk reductions in the sulphonylurea-insulin group persisted for any diabetes-related end point (9%, $P=0.04$ ) and microvascular disease (24%, $P=0.001$ ), in addition to the emergence of risk reductions for MI (15%, $P=0.01$ ) and death from any cause (13%, $P=0.007$ ). Risk reductions persisted in the metformin group for any diabetes-related end point (21%, $P=0.01$ ), MI (33%, $P=0.005$ ), and death from any cause (27%, $P=0.002$ ). <b>Conclusion:</b> Glycemic differences were lost early, but sustained reductions in microvascular risk and emergent risk reductions for MI and death were evident during 10 years of post-trial follow-up.
<b>Diabetes Prevention</b>		
DPP Research Group: Lifestyle	NEJM 2002;346:393-403	<b>Title:</b> Reduction in the Incidence of Type 2 Diabetes with Lifestyle Intervention or Metformin <b>Purpose:</b> To investigate whether lifestyle interventions or metformin could prevent or delay the development of T2DM. <b>Methods:</b> 3234 nondiabetic persons with elevated fasting and post-load plasma glucose were randomly assigned to placebo, metformin (850 mg BID), or a lifestyle-modification program (min 7% weight loss and 150 min of physical activity/wk). <b>Results:</b> Lifestyle interventions and metformin reduced the incidence of T2DM by 58% (95% confidence interval [CI], 48-66%) and 31% (CI, 17-43%), respectively, as compared with placebo. Lifestyle interventions were significantly more effective than metformin. <b>Conclusion:</b> Metformin and lifestyle modifications reduced the incidence of diabetes in high-risk individuals but lifestyle modifications were more effective.
Look AHEAD	NEJM 2013;369:145-54	<b>Title:</b> Cardiovascular Effects of Intensive Lifestyle Intervention in Type 2 Diabetes <b>Purpose:</b> To investigate if an intensive lifestyle intervention for weight loss would decrease cardiovascular morbidity and mortality among overweight or obese patients with T2DM. <b>Methods:</b> 5145 patients were randomly assigned to receive weight loss lifestyle interventions (decreased caloric intake and increased physical activity) or diabetes support and education (control). <b>Results:</b> Trial was stopped early on the basis of futility. As compared to control, lifestyle interventions reduced weight, HbA1c and cardiovascular risk factors, but the incidence of the primary composite outcome (death from cardiovascular causes, nonfatal myocardial infarction, nonfatal stroke, or hospitalization for angina) was not significantly different between the groups. <b>Conclusion:</b> Rate of cardiovascular events in overweight or obese adults with T2DM were not reduced by an intensive lifestyle intervention focusing on weight loss.

Trial Name	Reference	Clinical Trial Details
<b>Multifactorial Diabetes Treatment</b>		
Steno-2	NEJM 2008;358:580-91	<p><b>Title:</b> Effect of a Multifactorial Intervention on Mortality in Type 2 Diabetes</p> <p><b>Purpose:</b> To investigate if intensified multifactorial interventions would influence rates of death in patients with T2DM and microalbuminuria.</p> <p><b>Methods:</b> 160 patients received either conventional multifactorial treatment or intensified, target-driven therapy involving a combination of medications and focused behaviour modification.</p> <p><b>Results:</b> A lower risk of death from any cause, death from cardiovascular causes, cardiovascular events, and progression to end-stage renal disease was seen in intensive therapy, and fewer patients in this group required retinal photocoagulation.</p> <p><b>Conclusion:</b> Vascular complications and death rates were significantly improved by multifactorial interventions in at-risk patients with T2DM.</p>
<b>LIPIDS</b>		
IMPROVE-IT	NEJM 2015;372:2387-97	<p><b>Title:</b> Ezetimibe Added to Statin Therapy after Acute Coronary Syndromes</p> <p><b>Purpose:</b> To assess whether the addition of ezetimibe to statin therapy can further reduce the rate of cardiovascular events.</p> <p><b>Methods:</b> 18144 patients who had been hospitalized within the previous 10 days for acute coronary syndrome (ACS) with LDL cholesterol = 1.3 to 2.6 mmol/L (if on lipid lowering therapy) or 1.3 to 3.2 mmol/L (if not on lipid lowering therapy) were randomly assigned to receive a combination of either simvastatin (40 mg) and ezetimibe (10 mg) (simvastatin-ezetimibe) or simvastatin (40 mg) and placebo (monotherapy).</p> <p><b>Results:</b> Median time-weighted average LDL cholesterol was significantly lower in the simvastatin-ezetimibe group as compared to monotherapy (1.4 vs. 1.8 mmol/L; P&lt;0.001). At 7 yr, the simvastatin-ezetimibe group was associated with significantly lower Kaplan-Meier event rates of the primary composite outcome (cardiovascular death, nonfatal MI, unstable angina, coronary revascularization, or nonfatal stroke) (32.7% vs. 34.7%; hazard ratio, 0.936; 95% CI, 0.89-0.99; P=0.016).</p> <p><b>Conclusion:</b> Ezetimibe, when added to statin therapy, resulted in lower LDL cholesterol and improved cardiovascular outcomes. Additional benefit was conferred by lowering LDL cholesterol below previous targets.</p>
FOURIER	NEJM 2017;376:1713-22	<p><b>Title:</b> Evolocumab and Clinical Outcomes in Patients with Cardiovascular Disease</p> <p><b>Purpose:</b> To assess if the PCSK9 inhibitor evolocumab prevents cardiovascular events.</p> <p><b>Methods:</b> 27564 patients with atherosclerotic CVD and LDL cholesterol <math>\geq</math>1.8 mmol/L who were on statin therapy were randomly assigned to receive evolocumab (140 mg every 2 weeks or 420 mg monthly) or matching placebo.</p> <p><b>Results:</b> At 48 weeks, evolocumab was associated with a least-squares mean percentage reduction in LDL cholesterol of 59% relative to placebo, from a median baseline of 2.4 mmol/L to 0.78 mmol/L (P&lt;0.001). Patients in the evolocumab group experienced significantly lower rates of the primary composite outcome (cardiovascular death, MI, stroke, hospitalization for unstable angina, or coronary revascularization) as compared to placebo (9.8% vs. 11.3%, respectively; hazard ratio, 0.85; 95% CI, 0.79-0.92; P&lt;0.001).</p> <p><b>Conclusion:</b> Evolocumab lowers LDL cholesterol and reduces the risk of cardiovascular events in patients with atherosclerotic CVD.</p>
ODYSSEY OUTCOMES	NEJM 2018;379:2097-107	<p><b>Title:</b> Alirocumab and Cardiovascular Outcomes after Acute Coronary Syndrome</p> <p><b>Purpose:</b> To determine if the PCSK9 inhibitor alirocumab improves cardiovascular outcomes following acute coronary syndromes (ACS) in patients on high-intensity statin therapy.</p> <p><b>Methods:</b> 18924 patients on high-intensity statin therapy who experienced ACS 1-12 months prior with LDL cholesterol <math>\geq</math> 1.8 mmol/L and non-HDL-C <math>\geq</math> 2.6 mmol/L or ApoB <math>\geq</math> 80 mg/dL were randomly assigned to receive SC alirocumab (75 mg) or matching placebo every two weeks.</p> <p><b>Results:</b> At median follow-up of 2.8 months, the composite primary outcome (death from coronary heart disease, non-fatal MI, ischemic stroke, or hospitalization for unstable angina) occurred in 9.5% and 11.1% of patients on alirocumab and placebo, respectively (hazard ratio, 0.85; 95% CI 0.78-0.93; P&lt;0.001). Alirocumab was associated with greater absolute benefit with respect to the primary outcome in patients with higher baseline LDL cholesterol.</p> <p><b>Conclusion:</b> Alirocumab reduces the risk of recurrent ischemic cardiovascular events in patients who had a previous ACS on high-intensity statin therapy.</p>
REDUCE-IT	NEJM 2019;380:11-22	<p><b>Title:</b> Cardiovascular Risk Reduction with Icosapent Ethyl for Hypertriglyceridemia</p> <p><b>Purpose:</b> To assess the effects of icosapent ethyl on the rate of ischemic events.</p> <p><b>Methods:</b> 8179 patients with established CVD or diabetes and other risk factors, who were on statin therapy with fasting TG 1.52-5.63 mmol/L and LDL cholesterol 1.06-2.59 mmol/L were randomly assigned to receive icosapent ethyl (2 g BID) or placebo.</p> <p><b>Results:</b> At median follow-up of 4.9 yr, the primary composite end point (cardiovascular death, nonfatal MI, nonfatal stroke, coronary revascularization, or unstable angina) occurred in significantly less patients in the icosapent ethyl group as compared to placebo (17.2% vs. 22.0%, respectively; hazard ratio, 0.75; 95% CI, 0.68-0.83; P&lt;0.001). Icosapent ethyl was associated with significantly higher rates of hospitalization for atrial fibrillation or flutter as compared to placebo (3.1% vs. 2.1%; P=0.004).</p> <p><b>Conclusion:</b> Icosapent ethyl therapy was associated with a significantly lower risk of ischemic events in patients with elevated TGs despite the use of statins.</p>
4S	Lancet 1994;344:1383-1389	<p><b>Title:</b> Randomised Trial of Cholesterol Lowering In 4444 Patients With Coronary Heart Disease: The Scandinavian Simvastatin Survival Study (4S)</p> <p><b>Purpose:</b> To investigate if cholesterol lowering with simvastatin alters mortality and morbidity in patients with coronary heart disease (CHD).</p> <p><b>Methods:</b> 4444 patients with CHD and serum cholesterol 5.5-8.0 mmol/L on a lipid-lowering diet received simvastatin or placebo.</p> <p><b>Results:</b> In the simvastatin group, mean changes in total cholesterol, LDL, and HDL of -25%, -35%, and +8%, respectively, were observed with few adverse effects. The relative risk of coronary events in the simvastatin group was 0.66 (95% confidence interval [CI], 0.59-0.75, P&lt;0.00001) and relative risk of death was 0.70 (CI, 0.58-0.85, P=0.0003).</p> <p><b>Conclusion:</b> In CHD patients, long-term treatment with simvastatin safely improves survival.</p>
HPS	Lancet 2002;360:7-22	<p><b>Title:</b> MRC/BHF Heart Protection Study Of Cholesterol Lowering With Simvastatin In 20536 High-Risk Individuals: A Randomised Placebo-Controlled Trial</p> <p><b>Purpose:</b> To investigate the effects of reducing LDL cholesterol on the development of vascular disease.</p> <p><b>Methods:</b> 20536 adults with coronary disease, other occlusive arterial disease, or diabetes received 40 mg simvastatin daily or placebo.</p> <p><b>Results:</b> As compared to placebo, simvastatin significantly reduced all-cause mortality (12.9% vs. 14.7%; P=0.0003), mainly due to an 18% reduction in the coronary death rate (5.7% vs. 6.9%; P=0.0005). There were significant reductions in the first event rate for non-fatal MI or coronary death (8.7% vs. 11.8%; P&lt;0.0001), for non-fatal or fatal stroke (4.3% vs. 5.7%; P&lt;0.0001), and for coronary or non-coronary revascularisation (9.1% vs. 11.7%; P&lt;0.0001).</p> <p><b>Conclusion:</b> Adding simvastatin treatment safely protects against vascular disease in a variety of high-risk patients.</p>
FIELD	Lancet 2005;366:1849-61	<p><b>Title:</b> Effects of Long-Term Fenofibrate Therapy on Cardiovascular Events In 9795 People With Type 2 Diabetes Mellitus (The FIELD Study): Randomised Controlled Trial</p> <p><b>Purpose:</b> To assess the effect of fenofibrate on cardiovascular events in patients with T2DM at high risk for CVD.</p> <p><b>Methods:</b> 9795 patients with T2DM not taking statin therapy were randomly assigned to micronized fenofibrate 200 mg daily or placebo.</p> <p><b>Results:</b> Fenofibrate significantly reduced the relative risk of non-fatal MI (hazard ratio [HR], 0.76, 95% confidence interval [CI], 0.62-0.94; P=0.010) and total cardiovascular events (HR, 0.89; CI, 0.80-0.99; P=0.035), but there was no significant difference in the risk of coronary events or CHD mortality between groups.</p> <p><b>Conclusion:</b> Fenofibrate did not significantly reduce the risk of coronary events, but rates of total cardiovascular events (mainly non-fatal MIs and revascularizations) were reduced.</p>

Trial Name	Reference	Clinical Trial Details
TNT	NEJM 2005;352:1425-35	<b>Title:</b> Intensive Lipid Lowering With Atorvastatin in Patients With Stable Coronary Disease <b>Purpose:</b> To assess the efficacy and safety of reducing LDL to <2.6 mmol/L in patients with stable coronary heart disease (CHD). <b>Methods:</b> 10001 patients with CHD and LDL<3.4 mmol/L were randomly assigned to receive either 10 mg or 80 mg of atorvastatin daily. <b>Results:</b> Mean LDL was 2.0 mmol/L and 2.6 mmol/L during treatment with 80 mg and 10 mg of atorvastatin, respectively. Major cardiovascular events occurred in 8.7% receiving 80 mg vs. 10.9% receiving 10 mg, indicating a 22% relative risk reduction (hazard ratio, 0.78; 95% confidence interval, 0.69-0.89; P<0.001). <b>Conclusion:</b> In patients with stable CHD, intensive lipid-lowering treatment with 80 mg atorvastatin daily has greater clinical efficacy than 10 mg of atorvastatin daily.
Jupiter	NEJM 2008;359:2195-207	<b>Title:</b> Rosuvastatin to Prevent Vascular Events in Men and Women with Elevated C-Reactive Protein <b>Purpose:</b> To investigate if statins reduce cardiovascular events in patients with elevated CRP but without hyperlipidemia. <b>Methods:</b> 17802 healthy men and women with LDL<130 mg/dL and CRP>2.0 mg/L were randomly assigned to receive rosuvastatin 20 mg daily or placebo. <b>Results:</b> Rosuvastatin reduced LDL and CRP levels by 50% and 37%, respectively. In the rosuvastatin and placebo groups, the rates of the primary outcomes (MI, stroke, arterial revascularization, hospitalization for unstable angina, or death from CVD) were 0.77 and 1.36 per 100 person-years of follow-up, respectively (P<0.00001). <b>Conclusion:</b> Statins reduce the incidence of major cardiovascular events in healthy people without hyperlipidemia but with an elevated CRP.

## Acronyms

ABG	arterial blood gas	DS	double strength	LDL-C	low density lipoprotein cholesterol	PTSD	post-traumatic stress disorder
ACR	albumin:creatinine ratio	EC	emergency contraception	LMWH	low molecular weight heparin	PUD	peptic ulcer disease
ACEI	angiotensin converting enzyme inhibitors	ER	extended release	LSIL	low-grade squamous intraepithelial lesion	PUFA	polyunsaturated fatty acids
AIN	anal intraepithelial neoplasia	F/U	follow-up	LV	left ventricle	PVD	peripheral vascular disease
AKI	acute kidney injury	FAP	familial adenomatous polyposis	LVH	left ventricle hypertrophy	PVR	post-void residual
AMC	another medical condition	FBG	fasting blood glucose	MCV	mean corpuscular volume	QHS	quaque hora somni (i.e. every night at bedtime)
AR	absolute reduction	FHT	family health team	MDI	metered-dose inhaler	R&M	routine and microscopic
ARB	angiotensin receptor blockers	FOBT	fecal occult blood test	MMSE	mini mental status examination	RA	rheumatoid arthritis
BPH	benign prostatic hyperplasia	FP	family physician	MOCA	Montreal cognitive assessment	RN	registered nurse
BPPV	benign paroxysmal positional vertigo	FRS	Framingham Risk Score	MS	multiple sclerosis	ROM	range of motion
BRBPR	bright red blood per rectum	GAD	generalized anxiety disorder	MSM	men who have sex with men	RR	relative risk
CA	cancer	GERD	gastroesophageal reflux disease	MUFA	monounsaturated fatty acids	RSV	respiratory syncytial virus
CABG	coronary artery bypass graft	gFOBT	guaiac fecal occult blood test	NE	norepinephrine	SAH	subarachnoid hemorrhage
CAM	complementary and alternative medicine	GP	general practitioner	NHP	natural health product	SDRI	serotonin dopamine reuptake inhibitor
CANRISK	Canadian Diabetes Risk Questionnaire	HAART	highly active anti-retroviral therapy	NNT	number needed to treat	SIDS	sudden infant death syndrome
CBT	cognitive behavioural therapy	HDL	high density lipoprotein	NNH	number needed to harm	SNRI	serotonin norepinephrine reuptake inhibitor
CCB	calcium channel blockers	HDL-C	high density lipoprotein cholesterol	NP	nurse practitioner	SOB	shortness of breath
CCS	Canadian Cancer Society	HEENT	head, ears, eyes, nose, and throat	NPH	human insulin isophane	SR	sustained release
CF	cystic fibrosis	HF	heart failure	NRT	nicotine replacement therapy	SSRI	selective serotonin reuptake inhibitor
CHEP	Canadian Hypertension Education Program	HNPCC	hereditary non-polyposis colon cancer	NTD	neural tube defects	STI	sexually transmitted infection
CK	creatinine kinase	hs-CRP	high sensitivity C-reactive protein	NTG	nitroglycerin	TC	total cholesterol
CNS	central nervous system	HSIL	high-grade squamous intraepithelial lesion	NYHA	New York Heart Association	TCA	tricyclic antidepressant
CPAP	continuous positive airway pressure	HPV	human papillomavirus	O&P	ova and parasites	TDEE	total daily energy expenditure
CRC	colorectal cancer	HRT	hormone replacement therapy	OA	osteoarthritis	TG	triglyceride
CrCl	creatinine clearance	IBD	inflammatory bowel disease	OD	omne in die (i.e. once daily)	TIA	transient ischemic attack
CRP	C-reactive protein	IBS	irritable bowel syndrome	OGTT	oral glucose tolerance test	TM	tympenic membrane
CSEP	Canadian Society for Exercise Physiology	ICS	inhaled corticosteroids	OSA	obstructive sleep apnea	TMJ	temporomandibular joint
CV	cardiovascular	IFG	impaired fasting glucose	PCOS	polycystic ovarian syndrome	TUIP	transurethral incision of the prostate
CVA	costovertebral angle	IGT	impaired glucose tolerance	PCSK9	proprotein convertase subtilisin kexin 9	TURP	transurethral resection of the prostate
CVD	cardiovascular disease	IHD	ischemic heart disease	PFT	pulmonary function test	UC	ulcerative colitis
DASH	Dietary Approaches to Stop Hypertension	INH	isoniazid	PHE	periodic health examination	URTI	upper respiratory tract infection
DHP	dihydropyridine	IPV	interpersonal therapy	PID	pelvic inflammatory disease	VAIN	vaginal intraepithelial neoplasia
DKA	diabetic ketoacidosis	IUB	intravenous pyelogram	PMS	premenstrual syndrome	VIN	vulvar intraepithelial neoplasia
DMPA	depot medroxyprogesterone	KUB	kidneys, ureter, bladder x-ray	PND	paroxysmal nocturnal dyspnea	VBI	vertebrobasilar insufficiency
DRE	digital rectal exam	LDCT	low dose computed tomography	PPD	purified protein derivative	WC	waist circumference
		LDL	low density lipoprotein	PSA	prostate specific antigen	WSIB	Workplace Safety and Insurance Board

## Four Principles of Family Medicine

### College of Family Physicians of Canada

1. the family physician is a skilled clinician
  - works with patients to understand their illness experience and collaborate on shared management plans
  - uses expert generalist knowledge to develop a comprehensive approach to management of undifferentiated disease, multimorbidity, and chronic disease
2. family medicine is a community-based discipline
  - responds/adapts to changing needs and circumstances of the community, with emphasis on injury/disease prevention and health promotion
  - sees patients across their lifespan, with a variety of diseases, in a variety of clinical contexts, collaboratively with a network of multidisciplinary community healthcare providers
3. the family physician is a resource to a defined practice population
  - engages in self-directed, lifelong learning to ensure relevance of practice in maintaining patient health
  - advocates for public policy to promote health, resource stewardship, and continuity and coordination of care
4. the patient-physician relationship is central to the role of the family physician
  - commits to the whole person, not just the disease, in the context of the patient's family and wider social environment
  - promotes continuity of patient care, respecting patient privacy and the physician-patient relationship

### Experts in Generalism

Generalism is a professional philosophy of care, distinguished by a commitment to holistic, integrated, person-centred care, the broadest scope of practice, and collaboration with the larger health care team in order to respond to patient and community health needs. Family physicians are the quintessential experts in generalism with an emphasis on patient- and family-centred care, community adaptiveness, undifferentiated problems, management of uncertainty, prevention and health promotion, multimorbidity/chronic disease, and longitudinal aspects of health and illness

# Periodic Health Examination

- Canadian Task Force on Preventive Health Care was established in 1976 to develop and disseminate clinical practice guidelines for primary and preventive care, and provides:
  - recommendations based on systematic analysis of scientific evidence
  - periodic preventive health visits are recommended instead of annual physical examinations (sometimes called "yearly physicals")

## Purpose of the Periodic Health Examination

- primary prevention: identify risk factors for common diseases; counsel patients on health-promoting practices (e.g. vaccinations)
- secondary prevention: early detection of disease to allow prompt treatment and to prevent disease progression (e.g. screening programs)

## Classification of Recommendations (GRADE)

### Strength of Recommendation

- strong: confidence that desirable effects outweigh undesirable effects (strong recommendation for an intervention) or that the undesirable effects outweigh desirable effects (strong recommendation against an intervention)
  - implies that most individuals will be best served by the recommended course of action
- conditional: desirable effects probably outweigh the undesirable effects (conditional recommendation for an intervention) or undesirable effects probably outweigh the desirable effects (conditional recommendation against an intervention)
  - implies that most people would want the recommended course of action but that many would not
  - different choices will be appropriate for different individuals, patients require support in reaching a management decision consistent with his/her values and preferences

### Quality of Evidence

- high: high level of confidence that true effect lies close to the estimate of the effect
- moderate: true effect likely to be close to the estimate of the effect, but there is a possibility that it is substantially different
- low or very low: true effect may be substantially different from the estimate of the effect

**Table 1. Periodic Health Exam**

	General Population	Special Population
<b>Discussion</b>	Dental hygiene (community fluoridation, brushing, flossing) (A) Noise control and hearing protection (A) Screen for poverty Counsel on smoking cessation and provide nicotine replacement therapy (A), referral to smoking cessation program (B) Dietary advice on leafy green vegetables and fruits (B) Seat belt use (B) Moderate physical activity (B) Avoid sun exposure and wear protective clothing (B) Problem drinking screening and counselling (B) Counselling to protect against STIs (B) Nutritional counselling, dietary advice on fat, and cholesterol (B) Dietary advice on calcium and vitamin D requirements (B)	<b>Paediatrics:</b> home visits for high-risk families (A), injury prevention (poison control, smoke detectors, non-flammable sleepwear, hot water thermostat settings) (B), inquiry into developmental milestones (B)  <b>Adolescents:</b> counsel on sexual activity and contraceptive methods (B), counsel to prevent smoking initiation and substance use (B)  <b>Perimenopausal Women (&gt;50):</b> assess for risk factors for: osteoporosis and fracture (A), counsel on osteoporosis, counsel on risks/benefits of hormone replacement therapy (B)  <b>Adults &gt;65:</b> follow up on caregiver concern of cognitive impairment (A), multidisciplinary post-fall assessment (A)
<b>Physical</b>	BP measurement, using techniques described in CHEP guidelines (A) Measure height, weight, and calculate BMI for adults ≥18 (B)	<b>Paediatrics:</b> repeated examinations of hips, eyes, and hearing (especially in first year of life) (A), serial height, weight, and head circumference (B), visual acuity testing after age 2 (B)  <b>Adults &gt;65:</b> hearing impairment (inquiry, whispered voice test, audioscope) (B)  <b>First-Degree Relative with Melanoma:</b> full body skin exam (B)

Classification of recommendation in brackets: A – high quality of evidence; B – moderate quality of evidence. For up-to-date guidelines, see: [www.canadiantaskforce.ca](http://www.canadiantaskforce.ca).

Guidelines [Internet]. Ottawa (ON): The Canadian Task Force on Preventive Health Care; c2019 [cited 2021]. Available from: <https://canadiantaskforce.ca/guidelines/>  
Zaltzman A, Dubey V, Iglar K. Update to the Preventive Care Checklist Form ©, CFP. 2020 Apr 1;66(4):270-2.

### Adult Periodic Health Exam

Male and female evidence-based preventive care checklist forms are available online at <http://www.cfp.ca>, most recently updated in 2018, re-endorsed in 2019.

### Choosing Wisely Canada

<http://www.choosingwiselycanada.org/>  
A campaign to help clinicians and patients engage in conversations about unnecessary tests and treatments and make smart and effective choices to ensure high quality care

### Folic Acid Supplementation in Pregnancy (Joint SOGC-Motherisk Clinical Guideline May 2015)

- To prevent neural tube defects in all women capable of becoming pregnant
- Low-risk women (no personal health risks, planned pregnancy): diet of folate-rich foods and a daily oral multivitamin supplement containing 0.4-1.0 mg folic acid for at least 2-3 mo before conception, throughout pregnancy, and 4-6 wk postpartum or as long as breast-feeding continues
- High-risk women (health risks including epilepsy, insulin-dependent diabetes, BMI >35, family history of NTD, high-risk ethnic group): diet of folate-rich foods and daily supplementation with multivitamins with 5 mg folic acid at least 3 mo prior to conception until 12 wk post-conception
- From wk 12 post-conception until postpartum period (4-6 wk or as long as breastfeeding continues): 0.4-1.0 mg of folic acid supplementation is sufficient
- Women with additional lifestyle issues (poor compliance with medications, no consistent birth control, taking possible teratogenic substances): higher folic acid dose of 5 mg and counselling about prevention of birth defects

Table 1. Periodic Health Exam

	General Population	Special Population
<b>Tests</b>	See recommendations below for age and gender specific screening for diabetes, dyslipidemia, HTN, and cancer screening (colon, prostate, cervical, lung, and breast) One-time screening ultrasound for abdominal aortic aneurysm in men aged 65–80 yr (B)	<b>Paediatrics:</b> routine hemoglobin for high-risk infants (B), blood lead screening of high-risk infants (B)  <b>TB High-Risk Groups:</b> Mantoux skin testing (A)  <b>STI High-Risk Groups:</b> voluntary HIV antibody screening (A), gonorrhea screening (A), chlamydia screening in women (B), syphilis screening (A)  <b>Syphilis High-Risk Groups:</b> VDRL test (A)
<b>Therapy</b>	Folic acid supplementation for women of child-bearing age (A) Pharmacologic treatment of HTN (refer to CHEP Guidelines) (A) Varicella vaccine for children ages 1–12 and susceptible adolescents/adults (A) Rubella vaccine for all non-pregnant women of child-bearing age unless there is proof of immunity via immunization records or serology (B) Tetanus vaccine: routine booster q10 yr if had 1 <sup>st</sup> series (A) Pertussis vaccine: adults >65 should receive one booster given as Tdap–Adecel <sup>®</sup> or Boostrix <sup>®</sup> (A) Herpes zoster vaccine for adults ≥50	<b>Paediatrics:</b> routine immunizations (A)  <b>Influenza High-Risk Groups:</b> outreach strategies for vaccination (A), annual immunization (B), now recommended for all  <b>HPV High-Risk Groups:</b> vaccination for males and females from age 9 with no upper age limit, if ongoing risk  <b>TB High-Risk Groups:</b> INH prophylaxis for household contacts or skin test converters (B), INH prophylaxis for high-risk sub-groups (B)  <b>Immunocompromised/Ages ≥65/COPD/Asthma/CHF/Asplenia/Liver Disease/Renal Failure/DM:</b> pneumococcal vaccine (Pneumovax <sup>®</sup> 23) for all ≥65 or high-risk, add Prevnar <sup>®</sup> 13 if ≥65 and high-risk (A)

Classification of recommendation in brackets: A – high quality of evidence; B – moderate quality of evidence. For up-to-date guidelines, see: [www.canadiantaskforce.ca](http://www.canadiantaskforce.ca).

## Breast Cancer Screening Guidelines

### 2018 Canadian Task Force on Preventive Care Recommendations

- for women ages 50–74, recommend screening with mammography every 2–3 yr; the decision to undergo screening is conditional on the relative value that a woman places on possible benefits and harms from screening (conditional recommendation; very low certainty evidence)
- for women ages 40–49, recommend not screening with mammography; the decision to undergo screening is conditional on the relative value a woman places on possible benefits and harms from screening (conditional recommendation; low certainty evidence)
- recommend not performing clinical breast examinations to screen for breast cancer (conditional recommendation; no evidence)
- recommend not advising women to practice breast self-examination to screen for breast cancer (conditional recommendation; low certainty evidence)
- recommend not using MRI, tomosynthesis, or U/S to screen for breast cancer in women not at increased risk (strong recommendation; no evidence)
- for more information on benign breast lesions and breast cancer, see [General Surgery and Thoracic Surgery, GS65](#)

## Lung Cancer Screening Guidelines

### 2016 Canadian Task Force on Preventive Health Care Recommendations

- for adults ages 55–74 with ≥30 pack-yr smoking history who currently smoke or quit ≤15 yr ago, recommend annual screening with LDCT up to three consecutive times; screening should ONLY be carried out in health care settings with expertise in early diagnosis and treatment of lung cancer (weak recommendation; low quality evidence)
- for all other adults, regardless of age, smoking history, or other risk factors, recommend not screening for lung cancer with LDCT (strong recommendation; very low quality evidence)
- recommend that chest x-ray not be used to screen for lung cancer, with or without sputum cytology (strong recommendation; low quality evidence)

## Colorectal Cancer Screening Guidelines

### 2016 Canadian Task Force on Preventive Health Care Recommendations

- recommend screening adults ages 60-74 for CRC with FOBT (either gFOBT or FIT) q2 yr OR flexible sigmoidoscopy q10 yr (strong recommendation; moderate quality evidence)
- recommend screening adults ages 50-59 for CRC with FOBT (either gFOBT or FIT) q2 yr OR flexible sigmoidoscopy q10 yr (weak recommendation; moderate quality evidence)
- recommend not screening adults ages  $\geq 75$  for CRC (weak recommendation; low quality evidence)
- recommend not using colonoscopy as a screening test for CRC (weak recommendation; low quality evidence)

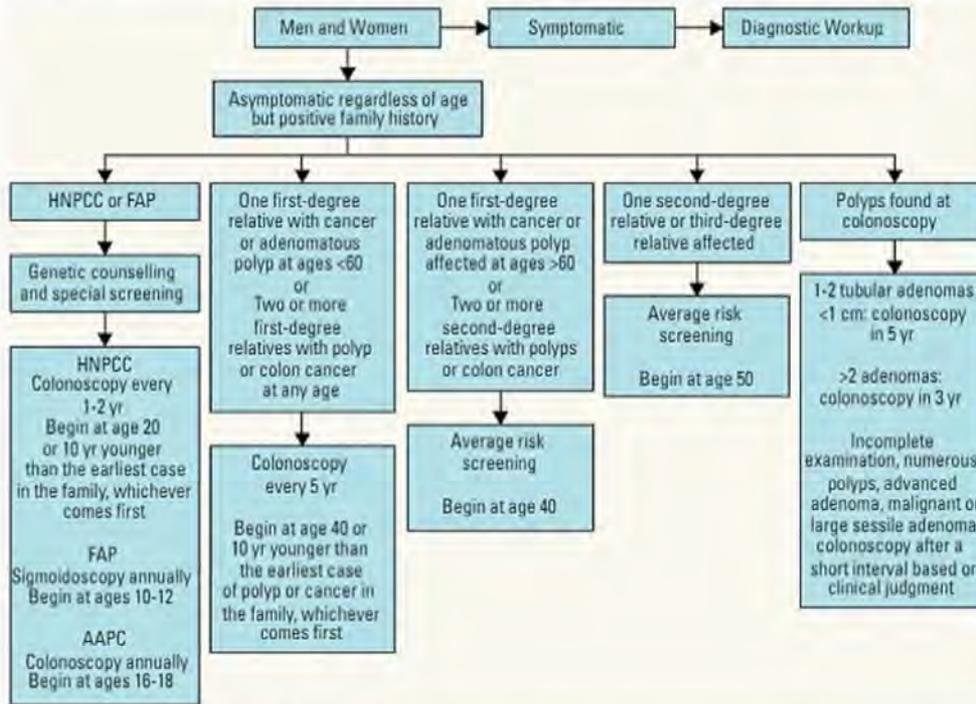

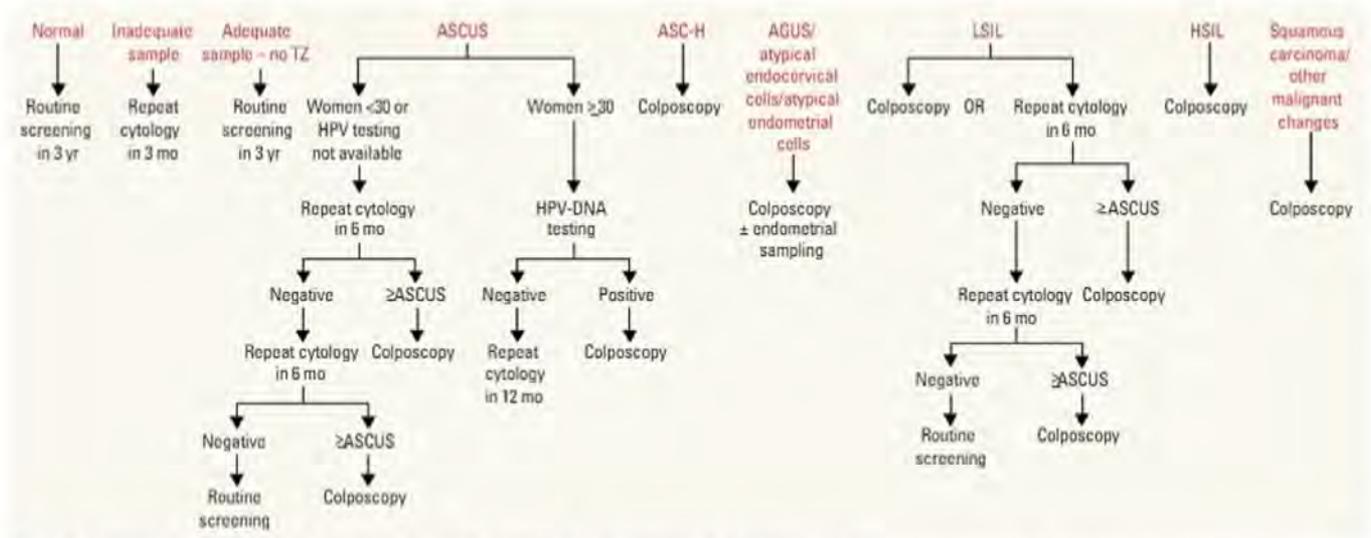

Figure 1. Approach to higher risk screening

AAPC = attenuated adenomatous polyposis; FAP = familial adenomatous polyposis; HNPCC = hereditary nonpolyposis colorectal cancer; 1st degree relatives: parents, siblings, children; 2nd degree relatives: grandparents, aunts, uncles; 3rd degree relatives: great grandparents or cousins. Figure printed with permission from *Can J Gastroenterol* 2004;18:93-99. Also see: BC Guidelines [Internet]. Victoria (BC): Guidelines and Protocols Advisory Committee. Colorectal Screening for Cancer Prevention in Asymptomatic Patients; 2013 Mar 1 [revised 2016 Jun 22; cited 2021 May 27]. Available from: <https://www2.gov.bc.ca/gov/content/health/practitioner-professional-resources/bc-guidelines/colorectal-cancer-screening>

## Cervical Cancer Screening Guidelines

### 2013 Canadian Task Force for Preventive Care Guidelines Recommendations

- for women ages 30-69, recommend Papanicolaou (Pap) smear or liquid-based cytology for cervical cancer q3 yr (strong recommendation; high quality evidence)
- for women ages 25-29, recommend Pap smear or liquid based cytology for cervical cancer q3 yr (weak recommendation; moderate quality evidence)
- for women ages  $\geq 70$  who have not been adequately screened, recommend continued screening until 3 negative test results have been obtained (weak recommendation; low quality evidence)
- for women ages  $\geq 70$  who have been adequately screened (i.e. 3 successive negative Pap tests in the last 10 yr), recommend that routine screening may cease
- for more information on cervical cancer (see *Gynaecology*, GY48)
- note: provincial/territorial guidelines vary, e.g. Ontario guidelines:
  - women ages  $\geq 21$  (recommended ages  $\geq 25$ ) who are or have ever been sexually active, recommend screening q3 yr (if cytology normal); women who are not sexually active by this age should delay cervical cancer screening until sexually active
  - a woman may discontinue screening at age 70 if she has an adequate and negative cytology screening history in the previous 10 yr (i.e. three or more negative cytology tests)

**Figure 2. Decision-making chart for cervical cancer screening (not applicable to adolescents)**  
 AGUS = atypical glandular cells of unknown significance; ASCUS = abnormal squamous cells of unknown significance; ASC-H = abnormal squamous cells cannot rule out HSIL; HSIL = high grade squamous intraepithelial lesion; LSIL = low grade squamous intraepithelial lesion; TZ = transitional zone  
 Adapted from: Ontario Cervical Screening Cytology Guidelines. May 2012

## Prostate Cancer Screening Guidelines

### 2014 Canadian Task Force for Preventive Care Guidelines Recommendations

- for men ages 55-69, recommend not screening for prostate cancer with the PSA test (weak recommendation; moderate quality evidence); clinicians should discuss the risks and benefits of screening and its potential consequences with each man in the context of his preferences
- for men ages ≤55, recommend not screening for prostate cancer with the PSA test (strong recommendation; low quality evidence)
- for men ages ≥70, recommend not screening for prostate cancer with the PSA test (strong recommendation; low quality evidence)

### Basis of Recommendation

- the potential small benefit from PSA screening is outweighed by the potential significant harms of the screening and associated follow-up treatment
  - for men ages ≤55 or ≥70, there is no evidence that screening with the PSA test reduces mortality, whereas there is evidence of harms
  - for men ages 55-69, there is inconsistent evidence of a small potential benefit of screening and evidence of harms

## Health Promotion and Counselling

- health promotion is the most effective preventive strategy
- initial steps should include to respectfully explore the values and purposes of the patient's habits or behaviours
- it is helpful to be guided by a patient's present stage of change when having discussions around healthy behaviours
- for more information, see [www.motivationalinterviewing.org](http://www.motivationalinterviewing.org)

### Motivational Strategies for Behavioural Change

**Table 2. Motivational Strategies for Behavioural Change**

Patient's Stage of Change	Physician's Aim	Physician's Plan
Pre-Contemplation	Encourage patient to consider the possibility of change Assess readiness for change Increase patient's awareness of the problem and its risks	Raise issue in a sensitive manner Offer (not impose) a neutral exchange of information to avoid resistance
Contemplation	Understand patient's ambivalence and encourage change Build confidence and gain commitment to change	Offer opportunity to discuss pros and cons of change using reflective listening
Preparation	Explore options and choose course most appropriate for the patient Identify high-risk situations and develop strategies to prevent relapse Continue to strengthen confidence and commitment	Offer realistic options for change and opportunity to discuss inevitable difficulties
Action	Help patients design rewards for success Develop strategies to prevent relapse Support and reinforce convictions towards long-term change	Offer positive reinforcement and explore ways of coping with obstacles Encourage self-rewards to positively reinforce change
Maintenance	Help patient maintain motivation Review identified high-risk situations and strategies for preventing relapse Increase self-belief in ongoing change	Discuss progress and signs of impending relapse
Relapse	Help patient view relapse as a learning experience Provide support appropriate to re-entry into the change cycle at the patient's present level of readiness, post-relapse	Offer a non-judgmental discussion about circumstances surrounding relapse and how to avoid relapse in the future Reassess patient's readiness to change

Adapted from: Hurd P. Motivating Change. Nurs Stand 2001;16:45-52, 54-55

## Nutrition

### General Population

- Canada's Food Guide is appropriate for individuals ages  $\geq 2$  yr
- counsel on variety, portion size, and plate layout
- guideline 1: nutritious foods are the foundation for healthy eating. Vegetables, fruits, whole grains, and proteins should be consumed regularly. Among protein foods, consume plant-based more often (e.g. legumes, nuts, seeds, tofu, fortified soy beverage). Foods with mostly unsaturated fat should replace those that contain mostly saturated fat. Water should be beverage of choice
  - nutritious foods to consume regularly can be fresh, frozen, canned, or dried
  - consider cultural preferences and food traditions. Traditional food improves diet quality among Indigenous peoples
- guideline 2: processed or prepared foods and beverages that contribute to excess sodium, free sugars, or saturated fat undermine healthy eating, and should not be consumed regularly
- guideline 3: food skills are needed to navigate the complex food environment and support healthy eating. Cooking and food preparation using nutritious foods should be promoted. Food labels should be promoted as a tool to help make informed choices

### Canadian Cancer Society

- #### Recommendations for Vitamin D Use
- Based on CCS research on Vitamin D and the prevention of colorectal and breast cancers
  - In consultation with their healthcare provider, the Society recommends that:
    - Adults living in Canada should consider taking Vitamin D supplementation of 1000 IU/d during the fall and winter
    - Adults at higher risk of having lower Vitamin D levels should consider taking Vitamin D supplementation of 1000 IU/d all year round. This includes people: who are older, with dark skin, who do not go outside often, and who wear clothing that covers most of their skin
    - Babies who are exclusively breast-fed: 400 IU/d

### Energy Content of Food

- Carbohydrates: 4 kcal/g
- Protein: 4 kcal/g
- Fat: 9 kcal/g
- Ethanol: 7 kcal/g

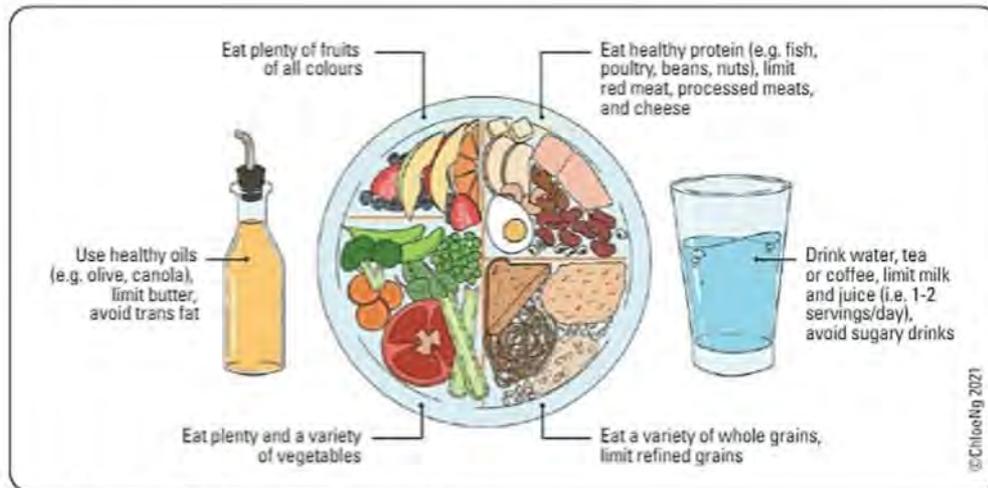

### Calculating Total Daily Energy Expenditure

- Roughly 35 kcal/kg/d
- Varies by age, weight, height, sex, and activity level
- Average 2000-2100 kcal/d for women, 2700-2900 kcal/d for men

### Handy Serving Size Comparisons

- 85 g meat, fish, poultry → palm of hand
- 250 ml dairy (milk/yogurt) → size of fist
- 1 serving of bread/grains → one slice, palm of hand
- 125 g rice/pasta → one hand cupped
- 250 g of fruit/vegetables → two cupped hands
- 28 g cheese → full length of thumb
- 5 g oil/butter → tip of thumb
- 28-57 g nuts/chips/snacks → palm covered

**Osteoporosis Canada  
Recommendations for Calcium and  
Vitamin D Daily Requirements**

- Vitamin D: 400-1000 IU for individuals 19-50 yr, 800-2000 IU for individuals ≥50 yr or younger adults at high-risk (osteoporosis, multiple fractures, inadequate vitamin D absorption)
- Calcium: 1000 mg daily from all sources for individuals 19-50 yr and pregnant/lactating women; 1200 mg daily for individuals >50 yr (recommended to obtain calcium from diet whenever possible vs. supplementation)

**Cardiovascular Disease Prevention**

Table 3. Dietary Guidelines for Reducing Risk of Cardiovascular Disease

	Recommendations
<b>Carbohydrates</b>	Complex carbs (legumes, whole grains) should be favoured over simple carbs (white flour/rice, table sugar) Eliminate sugar-sweetened beverages in favour of water
<b>Fruits and Vegetables</b>	Consume a higher proportion of whole, fresh fruits and vegetables Consume leafy green vegetables and berries at least 3 times/wk Consume starchy vegetables (white potatoes, corn, green peas) in moderation
<b>Fats</b>	Consume mono- and polyunsaturated fats in moderation (non-tropical vegetable fats, liquid fats) Minimize trans fat intake (processed/snack foods) Limit saturated fats (processed foods, red meat, cheese, whole milk, butter) Olive and canola oil are recommended over butter/margarine/coconut oil Skim or 1% milk is recommended over whole milk
<b>Protein</b>	Consume fish with higher levels of omega-3 fatty acids (salmon, tuna, mackerel) Moderate consumption of lean poultry, seafood, and nuts Limit red meat Minimize consumption of processed meats (deli/cold cuts, sausage, bacon)
<b>Salt</b>	≤2000 mg/d
<b>Alcohol</b>	≤3 drinks/d on most days for men, max 15/wk ≤2 drinks/d on most days for women, max 10/wk
<b>Dietary Approaches</b>	<p><b>Mediterranean diet:</b> High intake of leafy green vegetables, fruits, whole grains, nuts, legumes, extra virgin olive oil Moderate intake of fish, lean meats, low fat dairy, poultry Low intake of red meats and sweets If choosing to consume alcohol, low-risk drinking guidelines suggest limiting to 3 drinks/d (men) and 2 drinks/d (women)</p> <p><b>DASH diet:</b> High in vegetables/fruits, no or low-fat dairy, whole grains, poultry, fish, beans, seeds, and nuts Low in sodium, sweets, added sugars, sugar-sweetened beverages, fats, and red meats Lower in saturated fat, trans fat, and cholesterol High in potassium, magnesium, calcium, protein, and fibre</p> <p><b>Vegetarian diet:</b> Substitute meat/seafood/poultry with soy products, legumes, nuts, and whole grains</p>

Dietary approaches to stop hypertension (DASH), available from: [http://www.nhlbi.nih.gov/health/public/heart/hbp/dash/dash\\_brief.pdf](http://www.nhlbi.nih.gov/health/public/heart/hbp/dash/dash_brief.pdf)

# Obesity

## Definition

- prevalent, complex, progressive, and relapsing chronic disease that is characterized by abnormal/excessive body fat (adiposity)
- impairs health, increases risk of long-term medical complications, and reduces lifespan

## Epidemiology

- in Canada, the prevalence of obesity has tripled and severe obesity has more than quadrupled since 1985
- obesity remains higher in populations which face multiple socioeconomic barriers such as geographic isolation, poverty, and lack of access to nutritious (and more expensive) food
- for example, First Nations living on reserve had higher rates of obesity (30-51%) than non-Indigenous populations (12-31%)
- close to 1/3 of Canadians ages 5-17 yr were identified as having a BMI classified as overweight or obese
- screen time ≥2 h/d (total screen time, television time, and computer time) is likely associated with an increased risk of children having a BMI classified as overweight or obese

## 2015 Canadian Task Force on Preventive Health Care Recommendations

- for apparently healthy adults ≥18 yr, it is recommended to measure height, weight, and calculate BMI at appropriate primary care visits
  - BMI = weight (kg)/height<sup>2</sup> (m<sup>2</sup>) = weight (lbs)/height<sup>2</sup> (in<sup>2</sup>) x 703
  - note: this recommendation does not apply to people with eating disorders or who are pregnant
- for those with increased BMI (25.0-34.9 kg/m<sup>2</sup>), WC should be measured regularly to identify patients with increased visceral adiposity and related health risks
- for apparently healthy children and youth ages 0-17 yr, it is recommended to monitor growth at all appropriate primary care visits using the 2014 WHO Growth Charts for Canada (strong recommendation; very low quality evidence). This recommendation does not apply to children and youth with eating disorders, or who are underweight, overweight, or obese

**Table 4. Classification of Weight by Body Mass Index and Associated Disease Risks in Adults**

	BMI (kg/m <sup>2</sup> )	Risk of Developing Health Problems
Underweight	<18.5	Increased
Normal	18.5-24.9	Least
Overweight	25.0-29.9	Increased
Obesity Class I	30.0-34.9	High
Obesity Class II	35.0-39.9	Very high
Obesity Class III (Extreme Obesity)	≥40.0	Extremely high

Body Mass Index (BMI) Nomogram. Government of Canada: Health Canada, available from: <https://www.canada.ca/en/health-canada/services/food-nutrition/healthy-eating/healthy-weights/canadian-guidelines-body-weight-classification-adults/body-mass-index-nomogram.html>

## Management

### Canadian Adult Obesity Clinical Practice Guidelines (Obesity Canada, 2020)

- recognize that people with obesity experience weight bias and stigma, which contributes to increased complications and mortality independent of weight or BMI
- **Step 1** - Ask: recognize obesity as a chronic disease and obtain patient permission to discuss and help treat this disease in an unbiased manner
- **Step 2** - Assess: assess the patient using appropriate measures (i.e. height, weight, WC, and BMI calculation) and identifying root causes (e.g. biological factors, individual life experiences, psychological factors), complications, and barriers to treatment
- **Step 3** - Advise: discuss treatment options and work with the patient to create individualized care plans that address root causes of obesity and supports behaviour change
  - nutrition:
    - all individuals can benefit from adopting a healthy, well-balanced diet
    - weight loss requires long-term reduction in caloric intake, encouraged by a personalized eating pattern that meets the patient's values, preferences, and nutritional needs
    - medical nutrition therapy should not be used in isolation (may promote compensatory mechanisms that promote positive caloric intake by increasing hunger), but instead should be used in combination with other interventions (e.g. psychological, pharmacological, surgical)
  - physical activity:
    - consider aerobic physical activity (30-60 min of moderate to vigorous intensity most d/wk) for adults who wish to achieve small amounts of body weight and fat loss, reduce abdominal visceral fat, maintain weight loss, and/or increase cardiorespiratory fitness
    - resistance training may promote weight maintenance, increased muscle mass, fat-free mass, and mobility in adults with overweight/obesity
    - regular physical activity can improve cardiometabolic risk factors and improve health-related quality of life
  - psychological and behavioural interventions:
    - multicomponent psychological intervention (behaviour modification, cognitive therapy, and values-based strategies to alter diet/activity) should be incorporated into care plans for weight loss

### Treatment for Overweight and Obesity in Adult Populations: A Systematic Review and Meta-analysis

CMAJ Open 2014;2:E306-317

**Purpose:** To evaluate the effectiveness of behavioural and pharmacological treatments for overweight and obese adults.

**Methods:** Review of RCTs of primary-care-relevant behavioural (diet, exercise, lifestyle) and pharmacological (orlistat, metformin) treatments with or without behavioural interventions in overweight or obese adults with 12 mo follow-up from baseline for weight outcomes or harms. Secondary health outcomes (TC, LDL, FBG, incidence of T2DM, SBP and dbp) were also studied.

**Results:** 68 RCTs were included and showed that intervention participants had greater weight loss (-3.02 kg, 95% CI -3.52 to -2.52), waist circumference reduction (-2.78 cm, 95% CI -3.34 to -2.22) and BMI reduction (-1.11 kg/m<sup>2</sup>, 95% CI -1.39 to -0.84). Relative risk for weight loss of ≥5% body weight was 1.77 (95% CI 1.58 to 1.99; NNT 5, 95% CI 4-7). Relative risk for loss of ≥10% body weight was 1.91 (95% CI 1.69 to 2.16; NNT 9, 95% CI 7-12). Incidence of T2DM was lower among pre-diabetic intervention participants (RR 0.62, 95% CI 0.50 to 0.77; NNT 17, 95% CI 13-29).

**Conclusion:** Behavioural and pharmacological treatments for overweight and obese adults may lead to clinically important reductions in weight and incidence of T2DM in pre-diabetic populations.

### Adverse Medical Consequences of Obesity

- T2DM
- Dyslipidemia
- CAD
- Osteoarthritis
- Stroke
- OSA
- HTN
- Certain cancers
- Gallbladder disease
- CHF
- Low back pain
- Non-alcoholic stotohepatitis
- Increased total mortality
- Pregnancy complications

### Associations with Low BMI

- Osteoporosis
- Eating disorders
- Under-nutrition
- Pregnancy complications

### Pharmacotherapy for Obesity

- There are currently 3 prescription medications available in Canada that are approved for use in adult patients with BMI ≥30 kg/m<sup>2</sup> or BMI ≥27 kg/m<sup>2</sup> and ≥1 weight-related condition (e.g. HTN, T2DM, dyslipidemia)
- Note: these medications should be used alongside a reduced-calorie diet and increased physical activity
- **Contrave**<sup>®</sup> (maltrexone and bupropion): controls hunger and cravings
- **Saxenda**<sup>®</sup> (liraglutide): decreases appetite and, therefore, food intake
- **Xenical**<sup>®</sup> (orlistat): reduces dietary fat absorption by 30% through inhibition of pancreatic and gastric lipases

- pharmacotherapy:
  - ♦ liraglutide, naltrexone-bupropion combination, or orlistat (see sidebar *Pharmacotherapy for Obesity, FM9*)
  - ♦ can be used for patients with BMI  $\geq 30$  kg/m<sup>2</sup> or  $\geq 27$  kg/m<sup>2</sup> with adiposity-related complications, in combination with medical nutrition therapy, physical activity, and psychological interventions
  - ♦ can be used to maintain weight loss achieved by behaviour changes and to prevent weight regain
- bariatric surgery:
  - ♦ consider for patients with BMI  $\geq 40$  kg/m<sup>2</sup> or BMI  $\geq 35$  kg/m<sup>2</sup> with  $\geq 1$  adiposity-related disease (e.g. T2DM)
  - ♦ consider for weight loss and/or to control adiposity-related diseases where optimal medical and behavioural management has been insufficient to produce significant weight loss
  - ♦ choice of bariatric procedure should be decided according to the patient's needs, in collaboration with an experienced interprofessional team (suggest against adjustable gastric banding and single anastomosis gastric bypass, due to unacceptable complications and long-term failure)
- **Step 4** - Agree: agree on goals of therapy with the patient, focusing on the patient's values to ensure realistic expectations and sustainable behaviour change and health outcomes
- **Step 5** - Assist: follow up and reassess the patient regularly to assist with drivers/barriers and advocate for improved obesity care

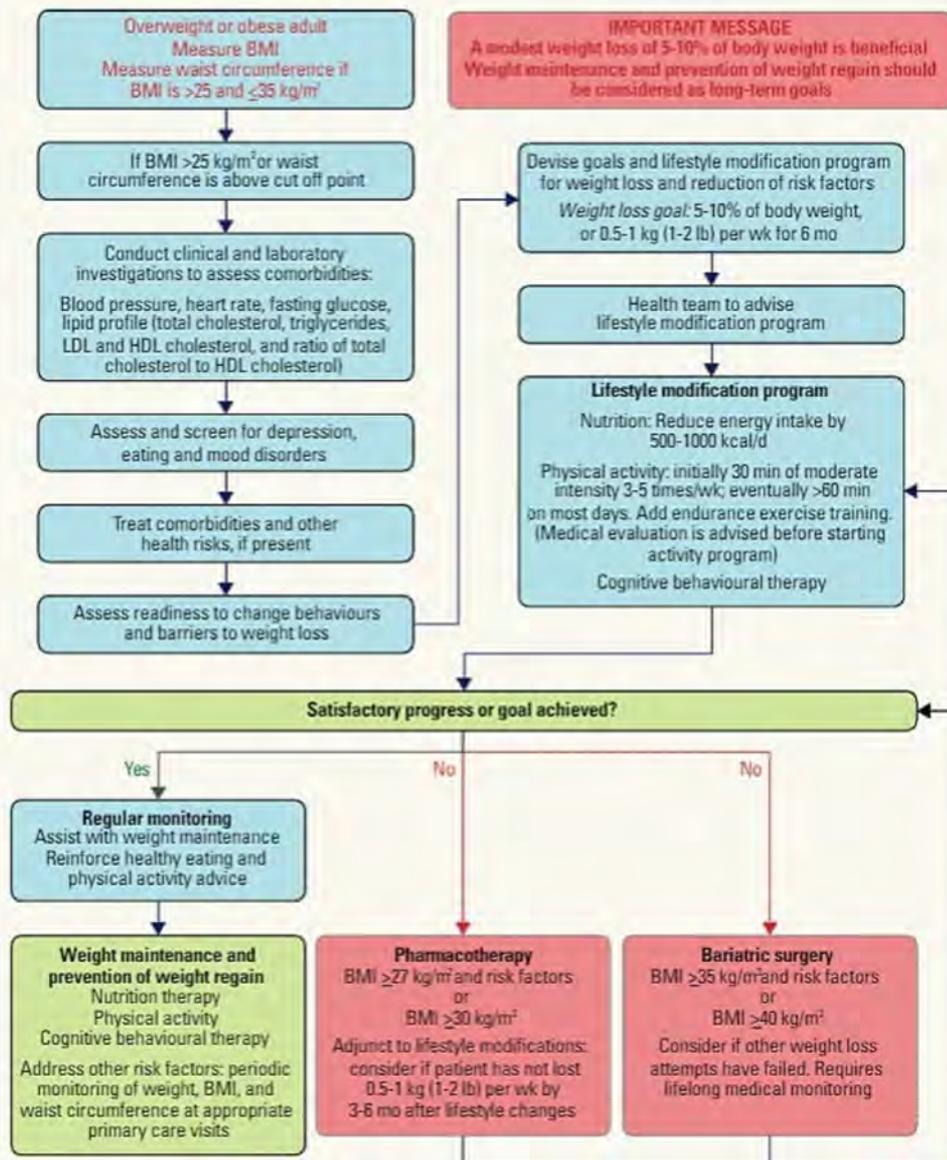

**Effects of Popular Diets without Specific Calorie Targets on Weight Loss Outcomes: Systematic Review of Findings from Clinical Trials**  
Nutrients 2017;9:4822

**Purpose:** To assess the short-term ( $\leq 6$  mo) and long-term ( $> 6$  mo) weight loss outcomes for current popular diets in overweight and obese adults.  
**Methods:** A systematic review was conducted. All diets in the 2016 U.S. News & World Report Rankings for "Best Weight-Loss Diets" were examined. From the potential 38 diets, eligible studies included trials with a sample size  $\geq 15$  per group, interventional clinical trials, intervention periods  $\geq 12$  wk, BMI  $\geq 25$  mg/m<sup>2</sup>, participants ages  $\geq 18$  yr and objective measures of pre- and post-intervention.  
**Results:** Sixteen articles were included in the review. Diets included the Atkins, DASH, Glycemic-Index, Mediterranean, Ornish, Paleolithic, and Zone diets. The Atkins diet showed the most clinically significant reduction in weight loss in both the short-term and long-term.  
**Conclusion:** Other diets had limited evidence supporting their effectiveness in producing clinically significant short-term and long-term weight loss. Future studies are needed to compare and evaluate the efficacy of these other diets.

**Effect of Intermittent Energy and Carbohydrate Restriction vs. Daily Energy Restriction on Weight Loss and Metabolic Disease Risk Markers in Overweight Women**  
Br J Nutr 2013;110:1534-1547

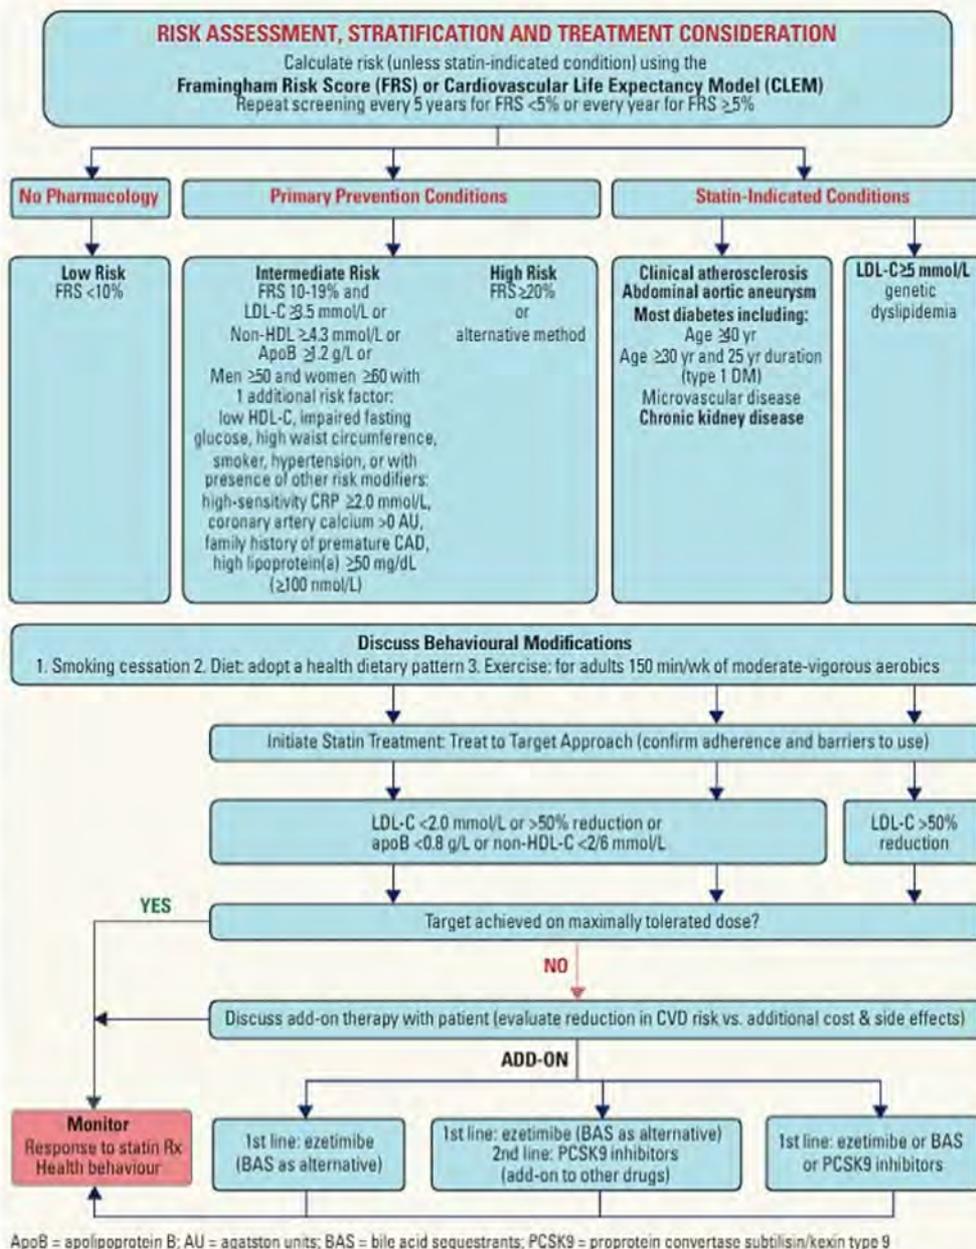

**Purpose:** To determine if intermittent energy and carbohydrate restriction (IECR) may result in greater improvements in insulin sensitivity and weight control than daily energy restriction (DER).  
**Methods:** Two IECR regimens were tested, including one which allowed ad libitum protein and fat (IECR + PF). Overweight women (n=115) ages 20-69 with a family history of breast cancer were randomised to an overall 25% energy restriction, or a 25% DER, or an IECR + PF for a 3 mo weight-loss period and 1 mo of weight maintenance (IECR or IECR + PF for 1 d/wk).  
**Results:** Insulin resistance reduced with the IECR diets and the IECR + PF diet. Reductions with the IECR diets were significantly greater compared with the DER diet. Both IECR groups had greater reductions in body fat compared with the DER group. During the weight maintenance phase, 1 day of IECR or IECR + PF per week maintained the reductions in insulin resistance and weight.  
**Conclusion:** In the short term, IECR is superior to DER with respect to improved insulin sensitivity and body fat reduction.

**Figure 4. 2006 Canadian clinical practice guidelines on the management and prevention of obesity in adults and children**

Adapted from: Lau DCW, et al. 2006 Canadian clinical practice guidelines on the management and prevention of obesity in adults and children (summary). CMAJ 2007;176:51-513

# Dyslipidemia

**Figure 5. Approach to primary prevention of CVD (2021 Canadian Cardiovascular Society Guidelines)**  
 Pearson GJ, Thanassoulis G, Anderson T, et al. 2021 Canadian Cardiovascular Society Guidelines for the Management of Dyslipidemia for the Prevention of Cardiovascular Disease in the Adult. Can J Cardiol. 2021 Aug;37(8):1129-1150.

• see [Endocrinology, E3](#)

**Definition**

• abnormal elevation of plasma cholesterol or TG levels

**Assessment**

- screen with full lipid profile every 1-3 yr in males and females ≥40 yr or who are menopausal, or at any age for adults with additional dyslipidemia risk factors (see Clinical Pearl), and in the late postpartum period for women who have had a pregnancy-related complication (e.g. hypertensive disorders of pregnancy, gestational diabetes, preterm birth, stillbirth, low birthweight infant, placental abruption)
- history and physical examination
- measure standard lipid panel (TC, LDL-C, HDL-C, TG, calculated HDL-C), glucose, and eGFR (optional: apolipoprotein B (ApoB), urine ACR)
- screen for secondary causes: hypothyroidism, CKD, DM, nephrotic syndrome, liver disease

**Signs of Hyperlipidemia**

- Atheromata: plaques in the intimal layer of arterial walls
- Xanthelasmata: a sharply demarcated yellowish deposit of cholesterol underneath the skin, usually on or around the eyelid
- Tendinous xanthoma: lipid deposit in tendon (especially Achilles)
- Eruptive xanthoma: hypertriglyceridemia-induced reddish yellow, pruritic, and painful papular or nodular rash
- Lipemia retinalis: characterized by creamy, white-coloured retinal blood vessels, occurs only with extreme hypertriglyceridemia
- Corneal arcus (arcus senilis): lipid deposit in cornea

To calculate FRS go to <https://www.framinghamheartstudy.org/fhs-risk-functions/cardiovascular-disease-10-year-risk/>

**Risk Factors for Screening for Dyslipidemia**

- Men and women ages ≥40 (or postmenopausal)
- Increased incidence in Indigenous individuals or individuals of South Asian ancestry
- Current cigarette smoking
- T2DM
- Arterial HTN
- Family history of premature CVD (men <55 yr, women <65 yr in 1st-degree relative)
- Family history of dyslipidemia
- Erectile dysfunction
- Chronic kidney disease (CKD)
- Inflammatory disease (lupus, RA, psoriatic arthritis, IBD)
- HIV infection
- COPD
- Clinical evidence of atherosclerosis or abdominal aortic aneurysms
- Stigmata of dyslipidemia (arcus cornea, xanthelasma, or xanthoma)
- Obesity (BMI ≥30 kg/m<sup>2</sup>)
- Hypertensive diseases of pregnancy

**Non-Fasting Lipids vs. Fasting Lipids**

- Non-fasting (TC and non-HDL cholesterol) can be used for Framingham Risk Assessment and hold same prognostic value as fasting lipids
- In fasted vs. non-fasted samples, HDL-C and TC vary by <2%, LDL-C varies by <10% and TG varies by <20%
- Recently, non-fasting LDL-C has the same prognostic value as fasting LDL-C

Ontario Association of Medical Laboratories Guidelines for Lipid Testing in Adults 2013. Accessed from: <https://oaml.com/wp-content/uploads/2016/05/OAMLGuidelineforAdultLipidTestingFinal2013.pdf>

LDL cannot be calculated when TG ≥4.5 mmol/L

- risk category
  - estimate using the FRS for assessing 10 yr risk of developing CAD
    - FRS is calculated based on gender, age, HDL-C, TC, sBP, smoking, DM
    - family history of premature CVD (<55 in 1st degree male relative or <65 in 1st degree female relative) doubles FRS
    - to be completed for men and women ages 40-75 every 3-5 yr
    - CV age is calculated as patient's age minus the difference between his or her estimated remaining life expectancy (adjusted for coronary and stroke risk) and the average remaining life expectancy of Canadians of the same age and sex
- used to increase adherence to therapy and reaffirm positive effect of following therapy
  - treatment decisions focus on LDL-C level and/or FRS risk; the alternate primary targets are apolipoprotein B and non-HDL-C
  - if moderate risk and LDL-C <3.5, treatment decision thresholds shifted to apolipoprotein B >1.2 g/L or non-HDL-C >4.3 mmol/L
  - other targets include: TC:HDL-C ratio, apolipoprotein B:apolipoprotein AI ratio, high-sensitivity CRP (used more for risk stratification of CAD), non-HDL-C, and serum TG levels

### Management

- intensity and type of treatment is guided by "risk category" assigned (see *Figure 5, FM11*)
- use decision-making aids such as <http://chd.bestsciencemedicine.com/calc2.html>
- 1. Health behaviour interventions (can decrease LDL-C by up to 10%)
  - smoking cessation: likely the most important for preventing CAD
  - dietary modification: reduce saturated fat, red meat, refined sugar, alcohol; consume nuts, fruits/vegetables, poultry, fish
  - physical activity: at least 150 min of moderate to vigorous intensity aerobic exercise per wk, in bouts of  $\geq 10$  min to reduce CVD risk (see *Table 5, FM13*)
  - employ consistent lifestyle modifications for at least 3 mo before considering drug therapy; high-risk patients should start treatment immediately with concurrent health behaviour interventions
- 2. Pharmacologic therapy (can decrease LDL-C by up to 40%)
  - for a comparison of dyslipidemia medications, see *Endocrinology, E6*
  - 1st line monotherapy: statins (HMG-CoA reductase inhibitors)
    - risks: myopathy (myalgia, rhabdomyolysis)
    - if severe side effects: ezetimibe (cholesterol absorption inhibitor) can be used for 19% reduction in LDL-C
    - post-acute coronary syndrome: cholesterol absorption inhibitors (e.g. ezetimibe) in addition to simvastatin reduced mortality, attained lipid targets <1.8, and improved outcomes in high-risk individuals
- lower evidence for other agents: bile acid sequestrants, niacin, fibrates, PCSK9 inhibitors
- monitoring
  - ALT, CK, Cr at baseline then 6 wk later for signs of transaminitis or myositis; tolerate rise in CK up to 10 times upper limit of normal vs. 2-3 times if symptomatic, or serum Cr rise of  $\leq 25\%$
  - no routine repeated measures of ALT and CK necessary in asymptomatic patients using statin therapy
  - if adequate response is achieved, evaluate fasting lipids every 6-12 mo

### Isolated Hypertriglyceridemia

- does not increase cardiovascular risk
- normal HDL-C and TC, elevated TG
- mild  $\geq 2.2$  mmol/L ( $\geq 200$  mg/dL); marked  $\geq 5.6$  mmol/L ( $\geq 500$  mg/dL)
- principal therapy is lifestyle modification
  - weight loss, exercise, avoidance of smoking and alcohol, effective blood glucose control in those with DM, increased omega-3 fatty acid intake
  - severe hypertriglyceridemia (typically  $>10$  mmol/L) is associated with an increased risk of acute pancreatitis
- drug therapy (lowers risk for pancreatitis, not CAD)
  - nicotinic acid
  - fibrates

#### Safety of Statins: An Update

Therapeutic Advances in Drug Safety 2012;3:133-144  
Trials have shown that statin therapy slightly increases the incidence of T2DM and hemorrhagic stroke; however, the absolute risk is small. Relative to the reduction in coronary events, their clinical significance is not great enough to recommend against statin use.

Use with caution when prescribing combined statin and fibrate therapy as there has been concern regarding the safety of certain combinations (potential increased risk of myalgias, CK elevations, myopathy and/or rhabdomyolysis)

#### Clinical Definition of Metabolic Syndrome

Central obesity  
Men – WC  $\geq 94$  cm  
Women – WC  $\geq 80$  cm

Plus any TWO of the following four factors:

Risk Factor	Defining Level
TG level	$\geq 1.7$ mmol/L (150 mg/dL)
HDL-C level:	
Men	$<1.0$ mmol/L (40 mg/dL)
Women	$<1.3$ mmol/L (50 mg/dL)
BP	$>130/85$ mm Hg or taking BP medications
Fasting glucose level	$\geq 5.6$ mmol/L (100 mg/dL)

#### Statin-Related Adverse Events: A Meta-Analysis

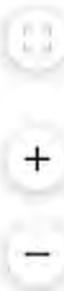

Clin Ther 2006;28:26-35

**Purpose:** To synthesize adverse event data with statin use based on RCT data.

**Methods:** Meta-analysis of RCTs focused on adverse effects of statins. Eligible patients were those taking statin monotherapy for primary or secondary prevention of CVD, compared to placebo. Adverse events including elevated liver enzymes or myopathy (myalgias, elevated CK, rhabdomyolysis) were the main outcomes.

**Results:** Statin therapy increased the risk of any adverse event by 39% (OR 1.4; 95% CI 1.09-1.80;  $P=0.008$ ) compared with placebo. Treating 1000 patients with a statin would cause 5 adverse events. Serious events (CK  $>10$  times the upper limit of normal or rhabdomyolysis) are infrequent (NNH 3400) and rhabdomyolysis, although serious, is rare (NNH 7428).

**Conclusion:** Statin therapy was associated with greater odds of adverse events compared with placebo but with substantial clinical benefit. Similar rates of serious adverse events were observed between statin and placebo.

## Exercise

**Table 5. Canadian 24 Hour Movement Guidelines (2020 CSEP Guidelines)**

Age Category	Physical Activity Guidelines	Example Activities	Sleep/Sit Guidelines
Infant (<1)	Active several times daily in a variety of ways Accumulate >30 min/d of tummy time while awake	Interactive floor-based play including tummy time, reaching for toys, crawling	<b>Sleep:</b> 14-17 h/d (0-3 mo), 12-16 h/d (4-11 mo) of good quality sleep including naps, with consistent bed and wake up times <b>Sit:</b> not restrained (i.e. in a stroller) for >1 h, screen time not recommended, engage in reading/storytelling while sedentary
Toddler (1-2)	Accumulate >180 min of physical activity at any intensity spread throughout the day including energetic play	Moving around the home Climbing stairs Exploring environment Brisk walking, running, dancing	<b>Sleep:</b> 11-14 h/d of good quality sleep including naps, with consistent bed and wake up times <b>Sit:</b> not restrained (i.e. in a stroller) for >1 h, sedentary screen time not recommended if <2 yr (<1 h screen time for those ages 2 yr), engage in reading/storytelling while sedentary
Preschool (2-4)	Accumulate >180 min in a variety of activities at any intensity, including ≥60 min of energetic play throughout the day	Moving around the home Climbing stairs Exploring environment Brisk walking, running, dancing	<b>Sleep:</b> 10-13 h/d of good quality sleep which may include a nap <b>Sit:</b> not restrained (i.e. in a stroller) for >1 h, sedentary screen time <1 h (less is better), engage in reading/storytelling while sedentary
Children (5-11) and Youth (12-17)	Accumulate >60 min/d of moderate to vigorous aerobic physical activity Muscle/bone strengthening exercises 3 d/wk A variety of structured/unstructured light physical activities for several h/d	Moderate: bike riding, playground playing Vigorous: running, swimming	<b>Sleep:</b> 9-11 h/d (5-13 yr), 8-10 h/d (14-17 yr) uninterrupted, with consistent bed and wake up times <b>Sit:</b> no more than 2 h/d of recreational screen time, limit sitting for extended periods
Adults (18-64)	Accumulate 150 min/wk of moderate to vigorous intensity aerobic physical activity, in bouts of ≥10 min Muscle/bone strengthening activities using major muscle groups, ≥2 d/wk	Moderate: brisk walking, bike riding Vigorous: jogging, cross country skiing	<b>Sleep:</b> 7-9 h/d of good quality sleep, with consistent bed and wake up times <b>Sit:</b> limit sedentary time to 8 h or less; no more than 3 h/d of recreational screen time, break up long periods of sitting as often as possible
Older Adults (≥65)	Same as Adults above Physical activities that challenge balance	Same as Adults above Those with poor mobility should perform physical activities to enhance balance and prevent falls	Same as Adults above

### Epidemiology

- 25% of the population exercises regularly, 50% occasionally, 25% is sedentary

### Management

- assess current level of fitness, motivation, and access to exercise
- encourage warm up and cool down periods to allow transition between rest and activity and to avoid injuries
- exercise with caution for patients with CAD, DM (risk of hypoglycemia), exercise-induced asthma
- patients with known CAD should have cardiac assessment prior to commencing exercise
- benefits of exercise
  - reduces risk of premature death, heart disease, stroke, HTN, certain types of cancer, T2DM, osteoporosis, and overweight/obesity
  - leads to improved fitness, strength, mobility, functional independence, and mental health (morale and self-esteem)

## Smoking Cessation

### Epidemiology

- smoking is the single most preventable cause of premature illness and death
- 70% of smokers see a physician each year
- 2012 Canadian Tobacco Use Monitoring Survey on population ages ≥15
  - 16% are current smokers (lowest since 1985)
  - highest prevalence in those ages 20-24 (20%)
  - 11% of youth ages 15-19 smoke (decreased from 25% in 2000); more males (18%) smoke than females (14%); number of cigarettes consumed per day is also decreasing (15.0 per day in 2012 vs. 16.2 per day in 2001)

### Doses, Durations, and Modes of Delivery of Nicotine Replacement Therapy for Smoking Cessation

Cochrane DB Syst Rev 2019;4:CD013308

**Purpose:** NRT helps with smoking cessation but it is unclear what NRT routines and dosages are most helpful. The aim was to establish efficacy of different forms, deliveries, dosages, and duration of treatment.

**Methods:** Meta-analysis including RCTs of people motivated to quit smoking, comparing one type of NRT vs. another.

**Results:** High-certainty evidence that combination NRT (fast-acting form + patch) results in higher long-term quit rates than single form. Moderate-certainty evidence dosages ≥21/22 mg are equally effective. Five studies comparing 4 mg gum to 2 mg gum found a benefit of the higher dose. Nine studies tested the effect of using NRT prior to quit day (preloading) in comparison to using it from quit day onward; there was moderate-certainty evidence of a favourable effect of preloading on abstinence.

**Conclusions:** There is high-certainty evidence that using combination NRT vs. single form NRT can increase the chances of successfully stopping smoking. Higher dosed patches and gum seemed to result in higher long term quit rates with moderate quality evidence.

**Management**

- general approach
  - identify tobacco users; elicit smoking habits, previous quit attempts, and results
  - be curious about how the patient relates to smoking. Ask: what purpose does smoking serve in their life at the moment?
  - 2012 Canadian Action Network for the Advancement, Dissemination and Adoption of Practice-informed Tobacco Treatment (CAN-ADAPTT) Guidelines
    - tobacco use status should be updated for all patients regularly
    - health care providers should clearly advise patients to quit
    - health care providers should assess patient willingness to quit and offer assistance to those who express interest
    - health care providers should conduct regular follow-up to assess response and monitor the patient's mental health status/other addictions while quitting smoking
- medication dosage should be monitored and adjusted as necessary
  - every smoker should be offered treatment
- educate patient to watch for withdrawal symptoms: low mood, insomnia, irritability, anxiety, difficulty concentrating, restlessness, decreased heart rate, increased appetite
- combining counselling/behavioural therapies and smoking cessation medication is more effective than either alone
  - ≥4 counselling sessions, >10 min each, with 6-12 mo follow-up yields better results
  - 14% abstinent with counselling vs. 10% without counselling
  - approach depends on patient's stage of change (see *Motivational Strategies for Behavioural Change, FM7*)
- willing to quit
  - provision of social support, community resources (self-help, group, helpline, web-based strategies)
  - pregnant patients: counselling is recommended as first line treatment
    - NRT should be made available to pregnant women who are unable to quit using non-pharmacologic methods
    - intermittent NRT use (lozenges, gum) is preferred over continuous dosing of the patch
    - no strong evidence that either major positive or negative outcomes were associated with gestational use of bupropion or varenicline; consider using only if benefits outweigh risks
- pharmacologic therapy
  1. NRT
    - 19.7% abstinent at 12 mo with NRT vs. 11.5% for placebo
    - no difference in achieving abstinence for different forms of NRT
    - reduces cravings and withdrawal symptoms without other harmful substances contained in cigarettes
    - cost of NRT is comparable, and often lower than cigarettes
    - use with caution: immediately post-MI, worsening angina, arrhythmia
    - advise no smoking while using NRT
    - public reimbursement for smoking cessation treatment varies across Canada – see <https://www.helpthemquit.ca/treatment/costs-coverage> for more details
  2. Antidepressants (mechanism of action appears to be independent of antidepressant effect)
    - bupropion SR (Zyban™)
      - 21% abstinent at 12 mo vs. 8% for placebo
      - bupropion has similar effectiveness to NRT
  3. Varenicline (Champix™)
    - partial nicotinic receptor agonist (to reduce cravings) and partial competitive nicotinic receptor antagonist (to reduce response to smoked nicotine)
    - more effective than bupropion (23% abstinent from 9-52 wk with varenicline vs. 16% with bupropion vs. 9% with placebo)
    - significant side effects (including nausea, headache, drowsiness, unusual dreams, neuropsychiatric symptoms) may lower patient compliance

**Antidepressants for Smoking Cessation**

Cochrane DB Syst Rev 2020;4:CD0000031

**Purpose:** To assess evidence for the efficacy, safety, and tolerability of medications with antidepressant properties in assisting long-term tobacco smoking cessation.

**Methods:** Meta-analysis of RCTs comparing antidepressant medications to placebo or alternative pharmacotherapy, or the same medication used in a different way for smoking cessation. Safety analyses with any follow-up length was also conducted

**Results:** Compared to placebo, bupropion was associated with increased long-term smoking cessation rates (RR 1.64, 95% CI 1.52 to 1.77), higher risk of reported psychiatric adverse events (RR 1.25, 95% CI 1.15 to 1.37), and higher dropout rate due to adverse events of the drug (RR 1.37, 95% CI 1.21 to 1.56). Bupropion resulted in inferior cessation rates to varenicline (RR 0.71, 95% CI 0.64 to 0.79), however no difference in efficacy between bupropion and NRT was found. Additionally, nortriptyline aided smoking cessation when compared with placebo (RR 2.03, 95% CI 1.48 to 2.78). There was insufficient evidence to establish whether combination bupropion and NRT resulted in superior quit rates to NRT alone, or whether combination bupropion and varenicline resulted in superior quit rates to varenicline alone.

**Conclusion:** Evidence suggests that bupropion may be helpful and as successful as NRT and nortriptyline in helping people to quit smoking, but that it is less effective than varenicline.

**The 5 A's for Patients Willing to Quit**

- Ask if the patient currently smokes and is willing to discuss cessation
- Advise the patient to quit
- Assess willingness to quit
- Assist in quit attempt(s)
- Arrange follow-up

**The 2-3 Pattern of Smoking Cessation**

- Onset of withdrawal is 2-3 h after last cigarette
- Peak withdrawal is at 2-3 d
- Expect improvement of withdrawal symptoms at 2-3 wk
- Resolution of withdrawal at 2-3 mo
- Highest relapse rate within 2-3 mo

**Assist Patient in Developing Quit Plan**

**STAR**

- Set quit date
- Tell family and friends (for support)
- Anticipate challenges (e.g. withdrawal)
- Remove tobacco-related products (e.g. ashtrays/lighters)

**Table 6. Types of Nicotine Replacement Therapy**

Type	Dosage	Comment	Side Effects
Nicotine Gum (OTC)	2 mg if <25 cig/d 4 mg if >25 cig/d 1 piece q1-2 h for 1-3 mo (max 24 pieces/d)	Chew until "peppery" taste then "park" between gum and cheek to facilitate absorption Continue to chew/park intermittently for 30 min	Mouth soreness Hiccups Dyspepsia Jaw ache (Most are transient)
Nicotine Patch (OTC)	Use for 8 wk 21 mg/d x 6 wk 14 mg/d x 2 wk 7 mg/d x 2 wk	Start with lower dose if <10 cig/d Change patch q24 h and alternate sides	Skin irritation Insomnia Palpitations Anxiety
Nicotine Inhaler (OTC)	6-16 cartridges/d up to 12 wk	Nicotine inhaled through mouth, absorbed in mouth and throat (not in lungs)	Local irritation Cough
Nicotine Nasal Spray (Rx)		Newer form of NRT	Local irritation Cough

**Table 7. Pharmacologic Treatments for Smoking Cessation**

Drug	Mechanism	Dosage	Prescribing*	Contraindications
<b>Bupropion</b>	Inhibits re-uptake of dopamine and/or NE Side effects: insomnia, dry mouth	1. 150 mg qAM x 3 d 2. Then 150 mg BID x 7-12 wk 3. For maintenance consider 150 mg BID for up to 6 mo	1. Decide on a quit date 2. Continue to smoke for first 1-2 wk of treatment and then completely stop (therapeutic levels reached in 1 wk)	Seizure disorder Eating disorder MAOI use in the past 14 d Simultaneous use of bupropion (Wellbutrin®) for depression
<b>Varenicline</b>	Partial nicotinic receptor agonist, and partial competitive antagonist of nicotinic receptor Side effects: nausea, vomiting, constipation, headache, dream disorder, insomnia, increased risk of psychosis, depression, suicidal ideation	1. 0.5 mg qAM x 3 d 2. Then 0.5 mg BID x 4 d 3. Continue 1 mg BID x 12 wk ± additional 12 wk as maintenance	1. Decide on a quit date 2. Continue to smoke for first wk of treatment and then completely stop	Caution with pre-existing psychiatric condition

\*Bupropion and varenicline may be used in combination with NRT

**Physician Advice for Smoking Cessation**

Cochrane DB Syst Rev 2013;5:CD000165

**Purpose:** To assess the effectiveness of physician advice in promoting smoking cessation, compare minimal physician interventions with more intensive interventions, assess the effectiveness of various aids in smoking cessation, and determine the effect of anti-smoking advice on mortality.

**Methods:** Systematic review of RCTs of smoking cessation advice from a medical practitioner. Abstinence was assessed ≥6 mo after advice was first provided.

**Results:** 42 trials with over 31,000 smokers were identified. Most common setting for advice delivery was primary care. A significant increase in quitting rates was noted with advice vs. no advice (RR 1.66, 95% CI 1.42-1.94), which was further increased when the intervention was considered more intensive (RR 1.84, 95% CI 1.60-2.13; n.s.). Intensive advice showed a small, non-significant advantage vs. minimal advice when directly compared (RR 1.37, 95% CI 1.20-1.56). A small benefit with follow-up visits was also noted. No statistically significant difference in mortality at 20 yr follow-up was found.

**Conclusion:** Simple advice can increase smoking cessation rates by 1-3% on top of the unassisted quit rate. More intensive advice and providing follow-up support may further increase quit rates.

- unwilling to quit
  - motivational intervention (5 Rs)
    1. Relevance to patient
      - relevance to patient's disease status or risk, family or social situation (e.g. having children in the home), health concerns, age, gender
    2. Risks of smoking
      - short-term: SOB, asthma exacerbation, impotence, infertility, pregnancy complications, heartburn, URTI
      - long-term: MI, stroke, COPD, lung cancer, other cancers
      - environmental: higher risk in spouse/children for lung cancer, SIDS, asthma, respiratory infections
    3. Rewards: (benefits)
      - improved health, save money, food tastes better, good example for children
    4. Roadblocks: (obstacles)
      - fear of withdrawal, weight gain, failure, lack of support
    5. Repetition
      - reassure unsuccessful patients that most people try many times before successfully quitting (average number of attempts before success is 7)
- recent quitter
  - highest relapse rate within 3 mo of quitting
    - minimal practice: congratulate success, encourage ongoing abstinence, review benefits and risks
    - prescriptive interventions: address problem(s) of weight gain, negative mood, withdrawal, lack of support

**Alcohol Use**

- see Psychiatry, PS28

**Definition**

- alcohol use disorder diagnostic categories occur along a continuum

**Epidemiology**

- 10-15% of patients in family practice misuse alcohol
- 20-50% of hospital admissions, 10% of premature deaths, 30% of suicides, and 50% of fatal traffic accidents in Canada are alcohol-related
- more likely to miss diagnosis in women, elderly, and patients with high socioeconomic status

**Assessment**

- screen for alcohol dependence with CAGE questionnaire
  - if CAGE is positive, further explore for the possibility of alcohol misuse or dependence
- assess drinking profile
  - setting, time, place, occasion, with whom
  - impact on family, work, social life
  - quantity-frequency history
    - how many drinks per day?
    - how many days per week?
    - maximum number of drinks on any one day in the past month?
- if identified positive for alcohol use disorder:
  - screen for other drug use
  - identify any medical/psychiatric complications (e.g. delirium tremens or withdrawal seizures)
  - ask about drinking and driving
  - ask about past recovery attempts and assess current readiness to change

**Standard Drink Equivalents**

- One standard drink = 13.64 g of pure alcohol
- Beer/Cider/Cooler (5% alcohol) = 12 oz
- Malt liquor (7% alcohol) = 8-9 oz
- Wine (12-17% alcohol) = 5 oz
- Fortified wine = 3 oz
- Hard liquor (40%) = 1.5 oz

**CAGE Questionnaire**

Have you ever felt you needed to Cut down on your drinking?  
Have people Annoyed you by criticizing your drinking?  
Have you ever felt Guilty about drinking?  
Have you ever felt you needed a drink first thing in the morning (Eye-opener) to steady your nerves or to get rid of a hangover?  
Two "yes" responses is considered positive

### Investigations

- GGT and MCV for baseline and follow-up monitoring
- AST, ALT (usually AST:ALT approaches 2:1 in persons with alcohol use disorder)
- CBC (anemia, thrombocytopenia), INR (decreased clotting factor production by the liver)

### Management

- intervention should be consistent with patient's motivation for change
- individualized counselling and regular follow-up is crucial
- 10% of patients in alcohol withdrawal will have seizures or delirium tremens
- Alcoholics Anonymous/12-step program
  - outpatient/day programs for those with chronic, resistant alcohol use disorder
  - family treatment (Al-Anon, Alateen, screen for spousal/child abuse)
- refer to specialist or inpatient program if:
  - dangerous or highly unstable home environment
  - severe medical/psychiatric concern
  - addiction to drug that may require in-patient detoxification
  - refractory to other treatment programs
- pharmacologic
  - diazepam for withdrawal
  - disulfiram (Antabuse®): impairs metabolism of alcohol by blocking conversion of acetaldehyde to acetic acid, leading to flushing, headache, N/V, hypotension if alcohol is ingested (available in U.S., but no longer available in Canada)
  - naltrexone: competitive opioid antagonist that reduces cravings and pleasurable effects of drinking
    - may trigger withdrawal in opioid-dependent patients
  - acamprosate: glutamate receptor modulator that also reduces craving
- see [Psychiatry, PS29](#)

### Prognosis

- relapse is common and should not be viewed as failure
- monitor regularly for signs of relapse
- 25-30% of persons with alcohol use disorder exhibit spontaneous improvement over 1 yr
- 60-70% of individuals with jobs and families have improved quality of life 1 yr post-treatment

## Common Presenting Problems

### Abdominal Pain

- see [Gastroenterology, G4](#), [General Surgery and Thoracic Surgery, GS4](#), and [Emergency Medicine, ER18](#)

### Epidemiology

- 20% of individuals have experienced abdominal pain within the last 6-12 mo
- 90% resolve in 2-3 wk
- only 10% are referred to specialists, of those <10% admitted to hospital

### Etiology

- most common diagnosis in family medicine at 28% is "nonspecific abdominal pain," which has no identifiable cause and is usually self-limited
- GI disorders (e.g. PUD, pancreatitis, IBD, appendicitis, gastroenteritis, IBS, diverticular disease, biliary tract disease)
- urinary tract disorders (e.g. UTI, renal calculi)
- gynecological disorders (e.g. PID, ectopic pregnancy, endometriosis)
- cardiovascular disorders (e.g. CAD, AAA, ischemic bowel)
- other: DKA, porphyria, hypercalcemia, medications (e.g. NSAIDs), alcohol, toxic ingestion, foreign body, psychogenic

### Pathophysiology

- type of pain
  - somatic pain: sharp, localized pain
  - visceral pain: dull, generalized pain
- location of pain
  - epigastric (foregut): distal esophagus, stomach, proximal duodenum, biliary tree, pancreas, liver
    - right upper quadrant (RUQ): biliary, hepatic, colonic, pulmonary, renal
    - left upper quadrant (LUQ): cardiac, gastric, pancreatic, renal, vascular
  - periumbilical (midgut): distal duodenum to proximal 2/3 of transverse colon
  - hypogastric (hindgut): distal 1/3 of transverse colon to rectosigmoid region
    - right lower quadrant (RLQ): colonic, appendix, gynecological, renal
    - left lower quadrant (LLQ): colonic, gynecological, renal
  - any location: aneurysm, dissection, ischemia, varicella zoster virus, muscle strain, hernia, bowel obstruction, peritonitis, porphyria, DKA

**Figure 6. Continuum of alcohol use**  
Butt P, Gliksmann L, Beirness D, et al. Alcohol and health in Canada: A summary of evidence and guidelines for low-risk drinking. Ottawa, ON: Canadian Centre on Substance Abuse, 2011.

### Some Adverse Medical Consequences of Problem Drinking

- **GI:** gastritis, dyspepsia, pancreatitis, liver disease, bleeds, diarrhea, oral/esophageal cancer
- **Cardiac:** HTN, alcoholic cardiomyopathy
- **Neurologic:** Wernicke-Korsakoff syndrome, peripheral neuropathy
- **Hematologic:** anemia, coagulopathies
- **Other:** trauma, insomnia, family violence, anxiety/depression, social/family dysfunction, sexual dysfunction, fetal damage

If pain precedes nausea/vomiting, cause of abdominal pain is more likely to require surgery

### Abdominal Pain Red Flags

- Severe pain
- Signs of shock
- Peritoneal signs
- Abdominal distention
- Pain out of proportion to clinical findings
- New onset pain, change in pain, or altered bowel habits in elderly
- Weight loss
- Blood per rectum/melena
- Anemia
- Supraclavicular nodes
- Family history of serious bowel disease

In patients >50, keep a high index of suspicion for AAA – its presentation may mimic renal colic or diverticulitis

### Investigations

- guided by findings on history and physical
- possible blood work: CBC, electrolytes, BUN, Cr, amylase, lipase, AST, ALT, ALP, bilirubin, glucose, INR/PTT, toxicology screen,  $\beta$ -hCG
- imaging
  - CXR (for free air under the diaphragm) in setting of perforation in surgical abdomen
  - abdominal x-ray, KUB (consider: gas pattern, free air, kidney stones, constipation)
  - U/S (renal stones, gallbladder disease, gynaecological problems, liver disease, pancreatitis, diverticular disease, appendicitis)
  - CT-scan (AAA, appendicitis), non-contrast helical CT-scan (first choice for renal stones)
- other tests
  - urinalysis
  - endoscopy (for peptic ulcers, gastritis, tumours, etc.)
  - *H. pylori* testing (urea breath test, serology, biopsy)

## Allergic Rhinitis

- see [Otolaryngology, OT24](#)

### Definition

- inflammation of the nasal mucosa that is triggered by an allergic reaction
- classification
  - seasonal
    - symptoms during a specific time of the year
    - common allergens: trees, grass, and weed pollens, airborne moulds
  - perennial
    - symptoms throughout the year with variation in severity
    - common allergens: dust mites, animal dander, moulds
- persistent allergic rhinitis may lead to chronic rhinosinusitis

### Epidemiology

- affects approximately 40% of children and 20-30% of adults
- prevalence has increased in developed countries, particularly in the past two decades
- associated with asthma, eczema, sinusitis, and otitis media

### Etiology

- increased IgE levels to certain allergens  $\rightarrow$  excessive degranulation of mast cells  $\rightarrow$  release of inflammatory mediators (e.g. histamine) and cytokines  $\rightarrow$  local inflammatory reaction

### Assessment

- identify allergens
- take an environmental/occupational history
- ask about related conditions (e.g. atopic dermatitis, asthma, sinusitis, and family history)

### Management

- conservative
  - minimize exposure to allergens
    - most important aspect of management, often sufficient (may take months)
  - maintain hygiene, saline nasal rinses
- pharmacologic agents
  - oral second-generation antihistamines – first-line therapy for mild symptoms
    - e.g. cetirizine (Reactine<sup>®</sup>), fexofenadine (Allegra<sup>®</sup>), loratadine (Claritin<sup>®</sup>)
  - intranasal corticosteroids for moderate/severe or persistent symptoms (expect >1 mo of consistent use to see results)
  - intranasal decongestants (use must be limited to <5 d to avoid rhinitis medicamentosa)
- allergy skin testing
  - for patients with chronic rhinitis whose symptoms are not controlled by conservative and pharmacological therapy
  - may identify allergens to include in immunotherapy treatment
- immunotherapy (allergy shots)
  - reserved for severe cases unresponsive to pharmacologic agents
  - consists of periodic (usually weekly) subcutaneous injections of custom prepared solutions of one or more antigens to which the patient is allergic

#### Differential Diagnosis

- Acute viral infection
- Vasomotor rhinitis
- Deviated septum
- Nasal polyps
- Acute/chronic sinusitis
- Drug-induced rhinitis

#### Rhinitis Medicamentosa

Rebound nasal congestion. Occurs with prolonged use (>5-7 d) of vasoconstrictive intranasal medications. Patient may become dependent, requiring more frequent dosing to achieve the same decongestant effect

## Amenorrhea

- see [Gynaecology](#), GY7
- absence of menses due to dysfunction of the hypothalamus, pituitary, ovaries, uterus, and/or vagina. Classified as either primary (absence of menarche by age 15 or thereafter) or secondary (absence of menses >3 mo in women who previously had regular menstrual cycles)

## Anxiety

- see [Psychiatry](#), PS15

### Epidemiology

- 25-30% of patients in primary care settings have psychiatric disorders
- many are undiagnosed or untreated; hence the need for good screening
- high rate of coexistence of anxiety disorders and depression

### Screening

- screening tools such as the Generalized Anxiety Disorder 7-item (GAD-7) tool
- screening questions
  - do you tend to be an anxious or nervous person?
  - have you felt unusually worried about things recently?
  - has this worrying affected your life? How?

### Assessment

- identify associated symptoms on history and physical to rule out organic medical causes (e.g. hyperthyroidism, cardiopulmonary disorder, traumatic brain injury)
- risk factors: past history of anxiety, stressful life event, trauma, social isolation, female, LGBTQ2S+, comorbid psychiatric diagnosis (e.g. depression), family history of anxiety or depression
- assess substance misuse, suicidal ideation/self-harm
- to differentiate anxiety disorders, consider symptoms and their duration
- use the GAD-7 tool to assess and monitor levels of anxiety
- ask patients about experiences that may impact current situation and intersectionality

### Differential Diagnosis of Anxiety Disorders

- Panic disorder
- GAD
- Social anxiety disorder (previously social phobia)
- Agoraphobia
- Specific phobia
- Selective mutism
- Separation anxiety disorder
- Other: general medical condition, AMC, mood disorder, psychotic disorder, OCD, PTSD

### Symptoms of GAD

#### AND I C REST

- Anxious, nervous, or worried
  - No control over the worry
  - Duration >6 mo
  - Irritability
  - Concentration impairment
  - Restlessness
  - Energy decreased
  - Sleep impairment
  - Tension in muscles
- Can Fam Physician 2005;51:1340-42

### Rule Out

- Cardiac (post MI, arrhythmias)
- Endocrine (hyperthyroidism, diabetes, pheochromocytoma)
- Respiratory (asthma, COPD)
- Somatoform disorders
- Psychotic disorders
- Mood disorders (depression, bipolar)
- Personality disorder (OCPD)
- Drugs (amphetamines, thyroid preparations, caffeine, OTC for colds/decongestants, alcohol/benzodiazepine withdrawal)

### Differential Diagnosis of Wheezing

- Allergies, anaphylaxis
- Asthma, reactive airway disease
- GERD
- Infections (bronchitis, pneumonia)
- Obstructive sleep apnea
- COPD
- Less common: congestive heart disease, foreign body, malignancy, cystic fibrosis, vocal cord dysfunction

### Self-Management Asthma and COPD Education and Written Action Plan

- Education is a key component in management of asthma and COPD
  - Guided self-management combining education, regular medical review, self-assessment, and written action plans have been shown to reduce hospitalizations, ED visits, and missed days at work or school
- Sample action plans available online: <https://cts-sct.ca/>

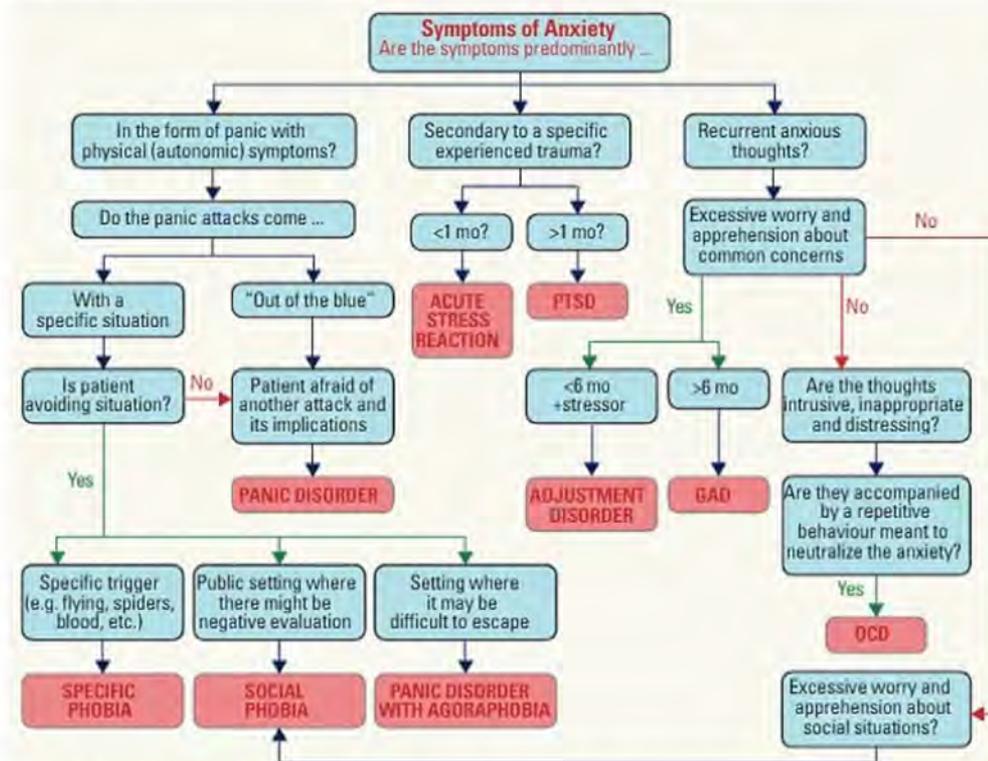

Figure 7. Differentiating anxiety disorders using the DSM-V diagnostic criteria

Adapted from: Evans M, Bradwejn J, Dunn L. Anxiety Review Panel. Guidelines for the treatment of anxiety disorders in primary care. Toronto: Queen's Printer of Ontario, 2000.41

**Management**

- patient education: emphasize prevalence, good recovery rate of anxiety conditions
- with consent, explore lifestyle habits: exercise, caffeine, alcohol intake, etc. and collaboratively develop a person-centered plan (e.g. reduce caffeine at a particular pace)
- psychological: psychotherapy including CBT, exposure therapy, relaxation techniques, and mindfulness strategies
- pharmacotherapy: see [Psychiatry, PS59](#)
- offer self-help materials, connect with community resources (e.g. support groups), and provide support to family and caregivers

**Asthma/COPD**

- see [Respirology, R7](#)

**Definition**

- asthma
  - chronic, reversible airway inflammation characterized by periodic attacks of wheezing, dyspnea, chest tightness, and coughing
  - airways are hyper-responsive to triggers/antigens leading to acute obstructive symptoms including bronchoconstriction, mucous plugs, and increased inflammation
  - cannot be diagnosed at first presentation
  - PFTs can be done starting at age 6 or when child is able to follow testing instructions
  - peak flow meters are useful in the office and at home for monitoring
- COPD
  - group of chronic, progressive, non-reversible lung diseases characterized by limited air flow with variable degrees of air sac enlargement and lung tissue destruction
  - emphysema and chronic bronchitis are the most common forms

**Table 8. Differentiating COPD from Asthma**

	<b>COPD</b>	<b>Asthma</b>
<b>Age of Onset</b>	Usually in 6th decade	Any age (but 50% of cases are diagnosed in children ages <10)
<b>Role of Smoking</b>	>10 pack yr	Not causal, known trigger
<b>Reversibility of Airflow Obstruction</b>	Airflow obstruction is chronic and persistent	Airflow obstruction is episodic and usually reversible with therapy
<b>Evolution</b>	Slow, progressive worsening (with periodic exacerbations)	Stable, episodic, <50% will outgrow
<b>History of Allergy</b>	Infrequent	>50% patients
<b>Precipitators</b>	Environmental irritants (air pollution), cigarette smoking, $\alpha$ -1 antitrypsin deficiency, viral infection, occupational exposure (firefighters, dusty jobs)	Environmental irritants (dust, pollen), animal fur, cold air, exercise, URTIs, cigarette smoke, use of $\beta$ -blockers/ASA
<b>Symptoms/Signs</b>	Chronic cough, sputum, and/or dyspnea	Wheeze (hallmark symptom), dyspnea, chest tightness, prolonged expiration, cough which is worse in the cold, at night, and in the early AM
<b>Diffusion Capacity</b>	Decreased (more so in pure emphysema)	Normal (for pure asthma)
<b>Hypoxemia</b>	Chronic in advanced stages	Not usually present
<b>Spirometry</b>	May have improvement with bronchodilators but not universally seen	Marked improvement with bronchodilators or steroids
<b>Chest X-Ray</b>	Often normal Increased bronchial markings (chronic bronchitis) and chronic hyperinflation (emphysema) often co-exist, bullae	Often normal or episodic hyperinflation Hyperinflation during asthma attack
<b>Management</b>	<b>All: Smoking Cessation</b> <b>Mild</b> Step 1: SABA as needed (salbutamol) Step 2: SABA as needed + LAAC (i.e. tiotropium) or + LABA (e.g. salmeterol) <b>Moderate</b> Step 3: SABA/SAMA + LABA or SABA + LABA or LAAC; consider inhaled vs. oral steroids <b>Severe</b> Step 4: Pneumococcal vaccination, annual influenza immunization	Ongoing patient education, and environmental control SABA taken prn as rescue medication + maintenance meds Maintenance medications <b>Mild</b> Step 1: Low-dose ICS Step 2: Medium/high-dose ICS or low-dose ICS plus either LABA, LTRA modifier <b>Moderate</b> Step 3: Medium/high-dose ICS + either LABA, LT modifier <b>Severe</b> Step 4: As above + immunotherapy $\pm$ oral glucocorticosteroids + pneumococcal vaccination, annual influenza immunization

ICS = inhaled corticosteroids; LAAC = long-acting anticholinergic; LABA = long-acting  $\beta$ -agonist; LT modifier = leukotriene modifier; SABA = short-acting  $\beta$ -agonist, SAMA = short acting muscarinic antagonist

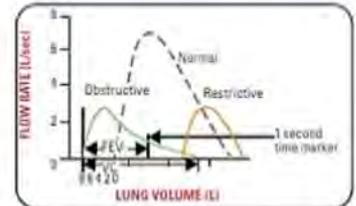

**Signs of Poorly Controlled Asthma**

- $\beta$ 2-agonist use >4x/wk
- Asthma-related absence from work/school
- Exercise induced asthma
- Night-time symptoms >1x/wk

**What Colour is Your Inhaler?**

Name	Body/Cap Colour
<b><math>\beta</math>2-Agonists</b>	
salbutamol - Ventolin <sup>®</sup>	Light blue/teal
salmeterol - Serevent <sup>®</sup>	Teal/light teal
terbutaline - Bricanyl <sup>®</sup>	Blue/white
<b>ICS</b>	
fluticasone - Flovent <sup>®</sup>	Orange/peach
budesonide - Pulmicort <sup>®</sup>	White/brown
<b>Combined Long-Acting <math>\beta</math>2-Agonist + ICS</b>	
fluticasone/salmeterol - Advair <sup>®</sup>	Purple discus
budesonide/formoterol - Symbicort <sup>®</sup>	Red/white
fluticasone/vilanterol - Breo <sup>®</sup>	Grey/blue
<b>Anticholinergics</b>	
umeclidinium - Incruse <sup>®</sup>	White/green
ipratropium - Atrovent <sup>®</sup>	Clear/green
tiotropium - Spiriva <sup>®</sup>	White/turquoise

**Figure 8. Expiratory flow volume curves (obstructive, normal, and restrictive disease)** See [Respirology, R4](#)  
Adapted from: Weinberger SE. Principles of pulmonary medicine, 5th ed. With permission from Elsevier. © 2008

**More About Inhalers**

- Aerosols (puffers = MDI, MDI + spacer) MDIs should be used with spacers to:
  - Reduce side effects
  - Improve amount inhaled
  - Increase efficiency of use
- DPI (discuss, turbuhaler, and diskhaler) require deep and fast breathing (may not be ideal for children)
- Nebulizers can be used to convert liquid medications into a fine mist: recommended for use if contraindications to MDIs
- Currently there is large push in clinical practice to transition away from the use of MDI inhalers and to move towards using DPI inhalers to reduce the impact of aerosol treatments on the environment - Evohaler MDIs had 20–30 times larger carbon footprints than the Accuhaler and Elipta DPIs (Thorax 2020 Jan;75(1):82-84.)

When prescribing salbutamol, watch out for signs of hypokalemia: lethargy, irritability, paresthesias, myalgias, weakness, palpitations, N/V, polyuria

## Benign Prostatic Hyperplasia

- see [Urology](#), U7

### Definition

- hyperplasia of the stroma and epithelium in the periurethral transition zone

### History and Physical

- include current/past health, surgeries, trauma, current medications including OTC
- specific urinary symptoms
- physical exam must include DRE for size, symmetry, nodularity, and texture of prostate (prostate is symmetrically enlarged, smooth, and rubbery in BPH)

### Investigations

- urinalysis to exclude UTI and for microscopic hematuria (common sign)
- serum PSA: protein produced by prostatic tissue
  - PSA to screen/test for BPH is no longer used due to the high false positive rate, and is instead used as a marker to guide treatment once diagnosis has been made
  - PSA testing is inappropriate in men with a life expectancy less than 10 yr or patients with prostatitis, UTI
  - increased PSA in a younger man is more often due to cancer than other causes
  - abnormal DRE or PSA should trigger further assessment
  - discuss test with men at increased risk of prostate cancer (FHx, Black men) or who are concerned about development of prostate cancer
  - decision to test PSA in an asymptomatic man (see *Prostate Cancer Screening, VM6*)
- other tests
  - Cr, BUN, PVR volume by U/S, urodynamic studies, renal U/S, patient voiding diary
- tests NOT recommended as part of routine initial evaluation include:
  - cystoscopy, cytology, prostate U/S or biopsy, IVP, urodynamic studies

**Table 9. Symptoms and Complications of BPH**

Obstructive Symptoms	Irritative Symptoms	Late Complications
Hesitancy (difficulty starting urine flow)	Urgency	Hydronephrosis
Diminution in size and force of urinary stream	Frequency	Loss of renal concentrating ability
Stream interruption (double voiding)	Nocturia	Systemic acidosis
Urinary retention (bladder does not feel completely empty)	Urge incontinence	Renal failure
Post-void dribbling	Dysuria	
Overflow incontinence		
Nocturia		

### Management

- referral to urologist if moderate/severe symptoms
- conservative: for patients with mild symptoms or moderate/severe symptoms considered by the patient to be non-bothersome
  - fluid restriction (avoid alcohol and caffeine)
  - avoidance/monitoring of certain medications (e.g. antihistamines, diuretics, antidepressants, decongestants)
  - pelvic floor/Kegel exercises; consider referral to pelvic physiotherapist
  - bladder retraining (scheduled voiding)
- pharmacological: for moderate/severe symptoms
  - $\alpha$ -receptor antagonists (e.g. terazosin (Hytrin<sup>®</sup>), doxazosin (Cardura<sup>®</sup>), tamsulosin (Flomax<sup>®</sup>), alfuzosin (Xatral<sup>®</sup>))
    - relax smooth muscle around the prostate and bladder neck
  - 5- $\alpha$  reductase inhibitors (e.g. finasteride (Proscar<sup>®</sup>))
    - only for patients with demonstrated prostatic enlargement due to BPH
    - inhibit the enzyme responsible for conversion of testosterone to dihydrotestosterone (DHT) thus reducing growth of prostate
  - antimuscarinic and  $\beta$ -3 agonists
    - recommended for storage symptoms, but avoid in patients with bladder outlet obstruction and/or elevated PVR
  - long-acting phosphodiesterase inhibitor
    - recommended in patients with erectile dysfunction
  - desmopressin
    - recommended for nocturia as a result of nocturnal polyuria (watch for hyponatremia in older adults)
- surgical
  - TURP, TUIP (for prostate <30 g)
  - absolute indications: failed medical therapy, intractable urinary retention, benign prostatic obstruction leading to renal insufficiency
  - complications: impotence, incontinence, ejaculatory difficulties (retrograde ejaculation), decreased libido

## Bronchitis (Acute)

### Definition

- acute infection of the tracheobronchial tree causing inflammation leading to bronchial edema and mucus formation

### Epidemiology

- 5th most common diagnosis in family medicine, and most common is URTI

### Etiology

- 80% viral: rhinovirus, coronavirus, adenovirus, influenza, parainfluenza, and RSV
- 20% bacterial: *M. pneumoniae*, *C. pneumoniae*, and *S. pneumoniae*

### Investigations

- acute bronchitis is typically a clinical diagnosis
- sputum culture/Gram stain is not useful
- CXR if suspecting pneumonia (cough >3 wk, abnormal vital signs, localized chest findings) or HF
- PFT with methacholine challenge if suspecting asthma

### Management

- primary prevention: frequent hand washing, smoking cessation, avoid irritant exposure
- symptomatic relief: rest, fluids (3-4 L/d when febrile), humidity, analgesics, and antitussives as required
- bronchodilators may offer improvement of symptoms (e.g. salbutamol)
- current literature does not support routine antibiotic treatment for the management of acute bronchitis because it is most likely to be caused by a viral infection
  - antibiotics may be useful if elderly, comorbidities, suspected pneumonia, or if the patient is toxic (see *Antimicrobial Quick Reference, FM54*)
  - antibiotics in children show no benefit

#### Differential Diagnosis of Bronchitis

- URTI
- Asthma
- Acute exacerbation of chronic bronchitis
- Sinusitis
- Pneumonia
- Bronchiolitis
- Pertussis
- Environmental/occupational exposures
- Post-nasal drip
- Others: GERD, CHF, cancer, aspiration syndromes, CF, foreign body

#### How to Tell if Viral or Bacterial?

Bacterial infections tend to give a higher fever, excessive amounts of purulent sputum production, and may be associated with concomitant COPD

## Chest Pain

- see [Cardiology and Cardiac Surgery, C5](#) and [Emergency Medicine, ER21](#)

### Differential Diagnosis

Table 10. Differential Diagnosis of Chest Pain

Diagnosis	Clinical Findings	LR+	LR-
Acute MI	Chest pain radiates to both arms	7.1	0.67
	Third heart sound on auscultation	3.2	0.88
	Hypotension	3.1	0.96
Chest Wall Pain	>2 of: localized muscle tension, stinging pain, pain reproducible by palpation, absence of cough	3.0	0.47
GERD	Burning retrosternal pain, acid regurgitation, sour or bitter taste in the mouth; 1 wk trial of high-dose proton pump inhibitor relieves symptoms	3.1	0.30
Panic Disorder/Anxiety State	Single question: In the past 4 wk, have you had an anxiety attack (suddenly feeling fear or panic)?	4.2	0.09
Pericarditis	Clinical triad of pleuritic chest pain (increases with inspiration or when reclining, and is lessened by leaning forward), pericardial friction rub, and electrocardiographic changes (diffuse ST segment elevation and PR interval depression without T wave inversion)	N/A	N/A
Pneumonia	Egophony	8.6	0.96
	Dullness to percussion	4.3	0.79
	Fever	2.1	0.71
	Clinical impression	2.0	0.24
Heart Failure	Pulmonary edema on chest radiography	11.0	0.48
	Clinical impression/judgment	9.9	0.65
	History of heart failure	5.8	0.45
	History of acute myocardial infarction	3.1	0.69
Pulmonary Embolism	High pretest probability based on Wells criteria	6.8	1.8
	Moderate pretest probability based on Wells criteria	1.3	0.7
	Low pretest probability based on Wells criteria	0.1	7.6
Acute Thoracic Aortic Dissection	Acute chest or back pain and a pulse differential in the upper extremities	5.3	N/A

Adapted from: McConaghy J, Rupal S. Outpatient diagnosis of acute chest pain in adults. *Am Fam Physician*. 2013 Feb 1; 87(3): 177-182

#### Risk Factors for CAD

- Major**
- Smoking
  - Diabetes
  - HTN
  - Hyperlipidemia
  - Family history of early CAD in first degree relative (males <55 yr, females <65 yr)
  - Untreated obstructive sleep apnea
  - CKD
- Minor**
- Obesity
  - Sedentary lifestyle
  - Age

#### Red Flags

- Severe pain
- Pain for >20 min
- New onset pain at rest
- Severe SOB
- Loss of consciousness
- Hypotension
- Tachycardia
- Bradycardia
- Cyanosis

#### MI in Elderly Women

Elderly women can often present with dizziness, back pain, lightheadedness, or weakness in the absence of chest pain

#### MI in Diabetics

May present with dyspnea, syncope, and fatigue in the absence of chest pain

**Investigations**

- ECG, CXR, and others if indicated (cardiac enzymes, d-dimers, LFTs, etc.)
- refer to ED if suspecting serious etiology (e.g. aortic dissection, MI)

**Management of Common Causes of Chest Pain**

- angina/ischemic heart disease
  - NTG: wait 5 min between sprays and if no effect after 3 sprays, send to ED
- MI
  - ASA (160-325 mg, chewed stat), clopidogrel (Plavix<sup>®</sup>) or ticagrelor (Brilinta<sup>®</sup>), LMWH (enoxaparin), morphine, oxygen, NTG
  - ± reperfusion therapy with fibrinolytics (e.g. tissue plasminogen activator (tPA), reteplase (rPA), tenecteplase (TNK), or streptokinase (SK)) if within 12 h (ideally <30 min) or time from first medical contact to percutaneous intervention (catheter lab) if <30 min
  - start β-blocker (e.g. metoprolol starting dose 25 mg PO q6h or BID, titrating to HR goal of 55-60 bpm)
- endocarditis: antibiotic choice is based on whether patient has a native or prosthetic heart valve as well as culture and sensitivity results
- GERD: antacids, H2-blockers, PPIs, patient education
- costochondritis: NSAIDs

**Common Cold (Acute Rhinitis)**

- see *Infectious Diseases, Pneumonia, ID7 and Influenza, ID9*

**Definition**

- viral URTI with inflammation

**Epidemiology**

- most common diagnosis in family medicine, peaks in winter months
- incidence: adults = 2-4/yr, children = 6-10/yr
- organisms
  - mainly rhinoviruses (30-35% of all colds)
  - others: coronavirus, adenovirus, RSV, influenza, parainfluenza, coxsackie virus
- incubation: 1-5 d
- transmission: person-person contact via secretions on skin/objects and by aerosol droplets

**Risk Factors**

- psychological stress, excessive fatigue, allergic nasopharyngeal disorders, smoking, sick contacts

**Clinical Features**

- symptoms
  - local: nasal congestion, clear to mucopurulent secretions, sneezing, sore throat, conjunctivitis, cough
  - general: malaise, headache, myalgias, mild fever
- signs
  - erythematous nasal/oropharyngeal mucosa, enlarged lymph nodes
  - normal chest exam
- complications
  - secondary bacterial infection: otitis media, sinusitis, bronchitis, pneumonia
  - asthma/COPD exacerbation

**Differential Diagnosis**

- allergic rhinitis, pharyngitis, influenza, laryngitis, croup, sinusitis, bacterial infections

**Management**

- patient education
  - symptoms peak at 1-3 d and usually subside within 1 wk
  - cough may persist for days to weeks after other symptoms disappear
  - no antibiotics indicated because of viral etiology
  - secondary bacterial infection can present within 3-10 d after onset of cold symptoms
- prevention
  - frequent hand washing, avoidance of hand to mucous membrane contact, use of surface disinfectant
  - yearly influenza vaccination
- symptomatic relief
  - rest, hydration, gargling warm salt water, steam, nasal irrigation (spray/pot)
  - analgesics and antipyretics: acetaminophen, ibuprofen
  - cough suppression: dextromethorphan or codeine if necessary (children <6 yr of age should not use any cough/cold medications)
  - decongestants, antihistamines
- patients with asthma will require increased use of bronchodilators and inhaled steroids

**Ruling Out Coronary Artery Disease in Primary Care**

C MAJ 2010;182(12):1295-1300

Components of the prediction rule used to determine the presence or absence of CAD in patients with chest pain in primary care:

- Age/sex (female ≥65, male ≥55): 1 pt
  - Known clinical vascular disease (coronary artery disease, occlusive vascular disease, or cerebrovascular disease): 1 pt
  - Pain worse during exercise: 1 pt
  - Pain not reproducible by palpation: 1 pt
  - Patient assumes pain is of cardiac origin: 1 pt
- Positive result: 3-5 pts; negative result: <2 pts (sensitivity: 87.1%, specificity: 80%)

**Influenza vs. Colds: A Guide to Symptoms**

Features	Flu	Cold
Onset of illness	Sudden	Slow
Fever	High fever	None
Exhaustion level	Severe	Mild
Cough	Dry severe or hacking	±
Throat	Fine	Sore
Nose	Dry and clear	Runny
Head	Achy	Headache-free
Appetite	Decreased	Normal
Muscles	Achy	Fine
Chills	Yes	No

**Echinacea for Preventing and Treating the Common Cold**

Cochrane DB Syst Rev 2014;2:CD000530

**Purpose:** To assess whether echinacea preparations are effective and safe for the prevention and treatment of the common cold.

**Methods:** Meta-analysis of RCTs comparing mono-preparations of echinacea with placebo. Primary efficacy outcome was number of individuals with at least one cold in prevention trials and duration of colds in treatment trials. Primary safety and acceptability outcome was number of participants dropping out due to adverse events.

**Results:** 24 double-blind trials with 4631 participants were included. No prevention study comparisons comparing echinacea and placebo found a statistically significant difference in terms of number of patients with at least one cold episode, though a relative risk reduction of 10% to 20% was identified. Of treatment trials reporting on duration of colds, only 1 study of 7 showed a significant effect favouring echinacea over placebo. No significant differences were found between echinacea and placebo groups in number of dropouts due to adverse events, though prevention trials showed a trend towards higher dropout numbers due to adverse events in treatment groups.

**Conclusions:** Echinacea products have not been shown to provide benefits for treating colds, although it is possible there is a weak benefit from some echinacea products. Individual prophylaxis trials consistently show positive (if non-significant) trends, although potential effects are of questionable clinical relevance.

## Concussion/Mild Traumatic Brain Injury

- see [Neurosurgery](#), NS37 and [Emergency Medicine](#), ER9
- a useful tool for the assessment of individuals and athletes with concussion is the Sport Concussion Assessment Tool, 5th edition (SCAT5), Br J Sports Med 2017;0:1-8
- Parachute Canada concussion guidelines including return to play/return to sports: <https://parachute.ca/en/injury-topic/concussion/>

## Contraception

- see [Gynaecology](#), GY15

### Emergency Contraception

- hormonal emergency contraception (EC) (Yuzpe® or Plan B®, usually 2 doses taken 12 h apart) or post-coital copper IUD (intrauterine device) insertion
- hormonal EC is effective if taken within 72 h of unprotected intercourse (reduces chance of pregnancy by 75-85%), most effective if taken within 24 h, does not affect an established pregnancy
- copper IUDs inserted within 5 d of unprotected intercourse are significantly more effective than hormonal EC (reduces chance of pregnancy by ~99%)
- pregnancy test should be performed if no menstrual bleeding within 21 d of either treatment
- advance provision of hormonal EC increases the use of EC without decreasing the use of regular contraception
- pharmacists across Canada can dispense Plan B® OTC

## Cough

### History and Physical

- duration (chronic  $\geq 8$  wk), onset, frequency, quality (dry vs. productive), sputum characteristics, provoking/relieving factors, recent changes
- associated symptoms: fever, dyspnea, hemoptysis, wheezing, chest pain, orthopnea, PND, rhinitis, reflux, post-nasal drip
- constitutional symptoms: fever, chills, fatigue, night sweats
- risk factors: smoking, environmental allergies, occupation, exposure, family history of lung CA or other CA, TB status, recent travel
- medications (e.g. ACEI,  $\beta$ -blockers), allergies
- PMHx: lung (asthma, COPD, CF), heart (HF, MI, arrhythmias), chronic illness, GI (reflux)
- vitals including O<sub>2</sub> saturation, respiratory exam, HEENT, and precordial exam

### Investigations

- guided by findings on history and physical
  - CXR, PFTs, upper GI series, sputum culture test for acid-fast bacilli (if TB is suspected)

## Dementia (Major Neurocognitive Disorder)

- see [Psychiatry](#), PS24

### Epidemiology

- 15% of Canadians  $\geq 65$  yr are living with dementia; risk for dementia doubles every 5 yr after age 65
- prevalence of depression in dementia is 20-60%; major depression decreases as dementia severity increases; vascular and mixed dementias have a higher prevalence of depression
- leading types of dementia: Alzheimer's (40-50%), mixed (20-25%), Lewy-Body (5-15%), vascular (5-10%), frontotemporal (5-10%)

### Investigations

- history, physical exam, MMSE, MOCA (best screening test), Dementia Quick Screen (see sidebar)
- investigations are completed to exclude reversible causes of dementia and should be selected based on the clinical circumstances
- CBC, liver enzymes, TSH, renal function tests, serum electrolytes, serum calcium, serum glucose, vitamin B<sub>12</sub>, folate, VDRL, HIV, head CT

### Management

- treat and prevent reversible causes
- provide orientation cues (e.g. calendars, clocks) and optimize vision and hearing
- family education, counselling, and supports (alternative levels of care)
- pharmacologic therapy: N-methyl-d-aspartate receptor antagonists and cholinesterase inhibitors slow rate of cognitive decline; low-dose antipsychotics and antidepressants can be used to treat behavioural and emotional symptoms
- 20% of patients develop clinical depression, most commonly seen in vascular dementia

### Differential Diagnosis

#### Common Causes

- Upper airway cough syndrome (post-nasal drip)
- Asthma/COPD
- GERD
- Non-asthmatic eosinophilic bronchitis
- Other Causes
  - ACEI
  - Aspiration
  - Bronchiectasis
  - Cystic fibrosis
  - Chronic interstitial lung disease
  - CHF
  - Lung/laryngeal cancer
  - Pertussis
  - Psychogenic
  - Restrictive lung disease
  - TB, atypical mycobacterium, and other chronic lung infections

### Dementia Quick Screen = Mini Cog + Animal Naming

- 3 simple tests, takes about 2 min
- Use when suspecting mild cognitive impairment or when patient is at high-risk
- Mini Cog = 3 words recalled + clock drawing
  - Clock Drawing – including numbers and hands so time shows 10 min past 11 (normal = correct number/hand placing or only minor spacing problems)
  - 0 word recall = impairment
  - 1-2 words and clock drawing abnormal = impairment
  - 3 words recalled = normal
  - Naming animals in 1 min (normal = >15 in one min)
- Interpretation: If all 3 results within normal range, cognitive impairment unlikely
- Return for further evaluation if:
  - <15 animals named
  - 0-1 words recalled
  - Clock drawing abnormal

## Depression

- see [Psychiatry, PS12](#)

### Etiology

- often presents as non-specific complaints (e.g. sleep disturbance, chronic fatigue, pain); can be associated with triggers (e.g. major life events)
- depression is a clinical diagnosis and tests are done in order to rule out other causes of symptoms
- 2/3 of patients may not receive appropriate treatment for their depression
- early diagnosis and treatment improve outcomes

### Screening Questions

- Canadian Task Force on Preventive Health Care (2013) recommends not routinely screening for depression
- if screening indicated, use the Patient Health Questionnaire-2 (PHQ-2)
  - "Over the past 2 wk, how often have you been bothered by any of the following problems":
    - little interest or pleasure in doing things?
    - feeling down, depressed, or hopeless
- the PHQ-2 is scored out of 6, with a score of 3 or more considered positive
  - those who screen positive should be evaluated with the PHQ-9 to determine whether they meet criteria for depression
- PHQ-9 tool is useful to diagnose and monitor depression; use Geriatric Depression Scale (GDS) for the geriatric population
- screen all patients presenting with depression for suicidal ideation and behaviour, a positive screen should prompt additional questioning

### Assessment

- risk factors: see [Psychiatry, PS12](#)
- personal or family history of depression
- medications and potential substance misuse concerns
- high-risk for suicide/homicide
  - fill out Form 1 (in Ontario): application by physician to hospitalize a patient against his/her will for psychiatric assessment (up to 72 h)
- functional impairment (e.g. work, relationships)
- at least 5 out of 9 criteria including at least one of anhedonia or depressed mood  $\geq 2$  wk for actual diagnosis to be met (see Memory Aid)
- validated depression rating scales: Beck's Depression Inventory, Zung's self-rating depression scale, Children's Depression Inventory, Geriatric Depression Scale, Personal Health Questionnaire Depression Scale (PHQ-9)
- routine medical workup (physical exam, CBC, TSH, ferritin, folate, B12, electrolytes, urinalysis, glucose, etc.)

### Treatment

- goal: full remission of symptoms and return to baseline psychosocial function
- phases of treatment
  - acute phase (8-12 wk): relieve symptoms and improve quality of life, counsel patients on risks (e.g. sexual side effects, discontinuation syndrome)
  - maintenance phase (6-12 mo after symptom resolution): prevent relapse/recurrence, must stress importance of continuing medication treatment for full duration to patients
- treatment options are pharmacotherapy, psychotherapy, or a combination of both
  - combination therapy is synergistic and most effective (see EBM in sidebar)
- treatment of youth (ages 10-21)
  - for mild depression, a period of active support and monitoring before initiating treatment is recommended
  - fluoxetine is first line among SSRIs (most evidence)
    - monitor closely for adverse effects such as suicidal ideation and behaviour
  - psychotherapy
    - CBT or IPT alone can be used for mild depression
    - psychotherapy plus medication is recommended for moderate to severe depression
- treatment should continue for at least 6 mo
  - ongoing management should include assessment in key domains (school, home, social setting)
  - reassessment and referral is recommended if there is no improvement after 6-8 wk of treatment
  - consider referral for adolescents with moderate/severe depression and coexisting psychosis and/or substance misuse

### Must Ask About/Rule Out

- Suicidal/homicidal ideation
- Psychosis
- Substance use/misuse/withdrawal
- Anxiety
- Bipolar/manic/hypomanic episodes
- Bereavement
- Intimate partner violence
- Post-partum depression
- Organic cause

### Differential Diagnosis

- Other psychiatric disorders (e.g. anxiety, personality, bipolar, adjustment disorder, schizoaffective, seasonal affective disorder, substance misuse/withdrawal)
- Cancer (50% of patients with tumours, especially of brain, lung, and pancreas, develop symptoms of depression before the diagnosis of cancer is made)
- Chronic fatigue syndrome
- Early dementia
- Endocrine (e.g. hyper/hypothyroidism, DM, adrenal disorders)
- Infections (mononucleosis)
- Liver failure, renal failure
- Medication side effects ( $\beta$ -blockers, benzodiazepines, glucocorticoids, interferon)
- Menopause
- Neurological (Parkinson's disease, MS)
- Vitamin deficiency (pernicious anemia, pellagra)

### Combined Pharmacotherapy and Psychological Treatment for Depression: A Systematic Review

*Arch Gen Psychiatry* 2004;61:714-719

**Purpose:** To examine the relationship between adherence and efficacy of antidepressant medications plus psychological treatment vs. medications alone in the management of depressive disorders.

**Methods:** Systematic review of RCTs comparing antidepressant medications alone vs. combination therapy with psychological intervention included. Efficacy and adherence to therapy were the main outcomes.

**Results:** 16 trials with 1842 patients were included. Patients receiving combination therapy showed significantly greater improvements than those receiving medications alone (OR 1.86, 95% CI 1.38-2.52); dropout and non-responder proportions did not differ in distribution between the two groups (OR 0.86, 0.60-1.24). A significant advantage with combination therapy was noted in studies with follow-up longer than 12 wk (OR 2.21, 1.22-4.03), accompanied by significant reduction in dropout and non-responder proportions.

**Conclusion:** Combination therapy with psychological treatment and medication is associated with greater improvement rates than medication alone, and may decrease dropout rates with longer therapies.

Table 11. Common Medications

Class	Examples	Action	Side Effects	Notes
SSRI	paroxetine (Paxil <sup>®</sup> ) fluoxetine (Prozac <sup>®</sup> ) sertraline (Zoloft <sup>®</sup> ) citalopram (Celexa <sup>®</sup> ) fluvoxamine (Luvox <sup>®</sup> ) escitalopram (Cipralex <sup>®</sup> ) vortioxetine (Trintellix <sup>®</sup> )	Block serotonin reuptake	Sexual dysfunction (impotence, decreased libido, delayed ejaculation, anorgasmia), headache, GI upset, weight loss, tremors, insomnia, fatigue, increase QT interval (baseline ECG is suggested)	First line therapy for youth is fluoxetine; paroxetine is not recommended for youth (controversial)
SNRI	venlafaxine (Effexor <sup>®</sup> ) duloxetine (Cymbalta <sup>®</sup> ) desvenlafaxine (Pristiq <sup>®</sup> )	Block serotonin and norepinephrine reuptake	Insomnia, tremors, tachycardia, sweating	
SDRI	bupropion (Wellbutrin <sup>®</sup> )	Block dopamine and NE reuptake	Headache, insomnia, nightmares, seizures, less sexual dysfunction than SSRIs	Often chosen for lack of sexual side effects, can be used for augmentation of anti-depressant effects with other classes of medication
TCA	amitriptyline (Elavil <sup>®</sup> )	Block serotonin and NE reuptake	Sexual dysfunction, weight gain, tremors, tachycardia, sweating	Narrow therapeutic window, lethal in overdose

### Prognosis

- up to 40% resolve spontaneously within 6-12 mo
- risks of recurrence: 50% after 1 episode, 70% after 2 episodes, 90% after 3 episodes

## Diabetes Mellitus

- see [Endocrinology, E7](#)
- see 2018 Clinical Practice Guidelines from Diabetes Canada, available from: <http://guidelines.diabetes.ca/cpg>
- see Diabetes Mellitus Patient Care Flow Sheet from Canadian Diabetes Association, available from: <https://guidelines.diabetes.ca/docs/cpg/Appendix-3.pdf>

### Definition

- metabolic disorder characterized by the presence of hyperglycemia due to defective insulin secretion, defective insulin action, or both

### Classification and Diagnosis

- see [Endocrinology, E7](#)

### Epidemiology

- major health concern, affecting up to 10% of Canadians
- incidence of T2DM is rising due to increasing obesity, sedentary lifestyle, and age of the population
- leading cause of new-onset blindness and renal dysfunction
- Canadian adults with DM are twice as likely to die prematurely compared to persons without DM
- 1 in 5 Indigenous people in Canada has diabetes

### Risk Factors

- T1DM
  - personal or family history of autoimmune disease
- T2DM
  - first degree relative with DM
  - ages  $\geq 40$  yr
  - obesity (especially abdominal), HTN, hyperlipidemia, CAD, vascular disease
  - prior gestational diabetes mellitus, macrosomic baby ( $>4$  kg)
  - PCOS
  - history of IGT or IFG
  - presence of complications associated with DM
  - presence of associated diseases: PCOS, acanthosis nigricans, psychiatric disorders, HIV
  - medications: glucocorticoids, atypical antipsychotics, HAART
- both
  - member of a high-risk population (e.g. Indigenous peoples, Hispanic, Asian, or African descent)

### Screening

- T2DM
  - FBG or HbA1c in everyone  $\geq 40$  q3 yr, or at high-risk using the CANRISK calculator
  - more frequent and/or earlier testing if presence of  $\geq 1$  risk factor (see above)
- gestational diabetes mellitus (see [Obstetrics, OB29](#))
  - all pregnant women between 24-28 wk gestation

### A1C Interpretation

- advantages:
  - convenient (measure any time of day)

Criteria for Depression  
( $\geq 5/9$  with at least one of anhedonia or depressed mood for  $\geq 2$  wk)

#### M-SIGECAPS

M	Depressed Mood
S	Increased/decreased Sleep
I	Decreased Interest
G	Guilt
E	Decreased Energy
C	Decreased Concentration
A	Increased/decreased Appetite and weight
P	Psychomotor agitation/retardation
S	Suicidal ideation

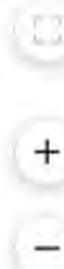

#### DM Related Symptoms

- **Hyperglycemia:** polyphagia, polydipsia, polyuria, weight change, blurry vision, yeast infections
- **Diabetic Ketoacidosis (DKA):** fruity breath, anorexia, N/V, fatigue, abdominal pain, Kussmaul breathing, dehydration
- **Hypoglycemia:** hunger, anxiety, tremors, palpitations, sweating, headache, fatigue, confusion, seizures, coma

#### Long-Term Complications of DM

- **Microvascular:** nephropathy, retinopathy, neuropathy
- **Macrovascular:** CAD, CVD, PVD

- single sample
- predicts microvascular complications
- better predictor of CVD than fasting plasma glucose (FPG) or two hour plasma glucose in a 75 g OGTT
- slow day-to-day variability
- reflects long-term glucose concentration
- disadvantages:
  - cost
  - misleading in various medical conditions (e.g. hemoglobinopathies, iron deficiency, hemolytic anemia, severe hepatic or renal disease)
  - altered by ethnicity and aging
  - standardized, validated assay required
  - not for diagnostic use in children and adolescents (as the sole diagnostic test), pregnant women as part of routine screening for gestational diabetes, those with CF, or those with suspected T1DM

**Goals of Therapy**

- see [Endocrinology, E9](#) and Clinical Pearl (SMART Goals)

**Assessment and Monitoring**

**Table 12. Assessment and Monitoring**

	Initial Assessment	q2-4mo	Annually
<b>History</b>	Symptoms of hyperglycemia, ketoacidosis, hypoglycemia Past medical history Functional inquiry Family history Risk factors Medications Sexual function Lifestyle	DM-directed history DM-directed history Screen for awareness and frequency of hypoglycemia and DKA Glucose monitoring Use of insulin and oral agents Smoking cessation	DM-directed history Screen for awareness and frequency of hypoglycemia and DKA Glucose monitoring Use of insulin and oral agents Sexual function Lifestyle counselling Screen for depression
<b>Physical Exam</b>	General: height, weight, BMI, BP, WC Head and neck: funduscopy, thyroid exam Cardiovascular exam: signs of PVD, pulses, bruits Abdominal exam (e.g. for organomegaly) Hand/foot/skin exam Neurological exam	Wt, BP, BMI, WC	Foot exam for sensation (using a 10 g monofilament), ulcers or infection Remainder of exam as per PHE
<b>Investigations</b>	FBG, HbA1c, fasting lipids, Cr, urine albumin:creatinine ratio Baseline ECG; repeat testing q2 yr for those at high-risk	HbA1c q3 mo FBG as needed	Fasting lipid profile Annual random urine ACR and Cr
<b>Management</b>	Nutritional and physical education Consider referral to DM education program if available Monitoring blood glucose: explain methods and frequency Medication counselling: oral hypoglycemic agents and/or insulin, method of administration, dosage adjustments Pneumococcal vaccination Ophthalmology consult (T1DM within 5 yr T2DM at diagnosis)	Assess progress towards long-term complications Adjust treatment plan if necessary	Calibrate home glucose monitor Arrange annual retinopathy screening Influenza vaccination annually

**Nonpharmacologic Management**

- diet
  - can reduce HbA1c by 1-2%
  - moderate weight loss (5%) improves glycemic control and CVD risk factors
  - all diabetics should see a registered dietician for nutrition counselling
  - decrease combined saturated fats and trans fatty acids to <10% of calories
  - avoid simple sugars, choose low glycemic index foods, ensure regularity in timing and spacing of meals
- physical activity and exercise
  - at least 150 min of aerobic exercise plus 2 sessions of resistance training per wk is recommended
  - encourage 30-45 min of moderate exercise 4-7 d/wk
  - promote cardiovascular fitness: increases insulin sensitivity, lowers BP, and improves lipid profile
  - if using insulin, may require alterations of diet, insulin regimen, injection sites, and self-monitoring

**Self-Monitoring of Blood Glucose**

- T1DM: 3 or more self-tests/d is associated with a 1% reduction in HbA1c
- T2DM: recommendations vary based on treatment regimen (e.g. insulin dependent requires more frequent monitoring – refer to 2020 Diabetes Canada Clinical Practice Guidelines)
- if FBG >14 mmol/L, perform ketone testing to rule out DKA
- if bedtime level is <7 mmol/L, have bedtime snack to reduce risk of nocturnal hypoglycemia

**SMART Diabetes Quick Reference Guide**

- A A1C: Optimal Glycemic Control (Usually <7%)
- B BP: Optimal Blood Pressure Control (≤130/80)
- C Cholesterol: LDL-C <2 if treating
- D Drugs: Consider ACEI/ARB, Statin, and ASA
- E Exercise/Eating
- S Smoking Cessation

**Calculate Total Insulin Required**

T1DM: 0.5-0.7 units/kg/d  
T2DM: 0.3 units/kg/d  
More information on insulin prescription, available at:  
1) [https://guidelines.diabetes.ca/CDACPG/media/documents/hcp-resources/insulin\\_Prescription\\_Fillable\\_EN\\_02\\_21.pdf](https://guidelines.diabetes.ca/CDACPG/media/documents/hcp-resources/insulin_Prescription_Fillable_EN_02_21.pdf)  
2) <https://guidelines.diabetes.ca/docs/resources/in-hospital-management-clinical-order-set-fillable.pdf>

**Dietary Advice for Treatment of T2DM in Adults**  
CDSR 2007.3:CD004097

**Purpose:** To assess the effects of type and frequency of different dietary advice strategies for adults with T2DM.  
**Methods:** Systematic review of RCTs with follow-up of 6 mo or longer, where dietary advice was the main intervention.  
**Results:** 36 RCTs with 1467 participants were included, all measuring weight and glycemic control measures, and some reporting mortality, blood pressure, serum cholesterol and triglycerides, and maximal exercise capacity and compliance. No data was available for efficacy of dietary advice in terms of dietary changes. Adoption of regular exercise was found to promote HbA1c glycemic control in type 2 diabetic patients.  
**Conclusion:** No high-quality data is available for the efficacy of dietary treatment of T2DM, though exercise has been shown to improve HbA1c at 6 and 12 mo follow-up in patients.

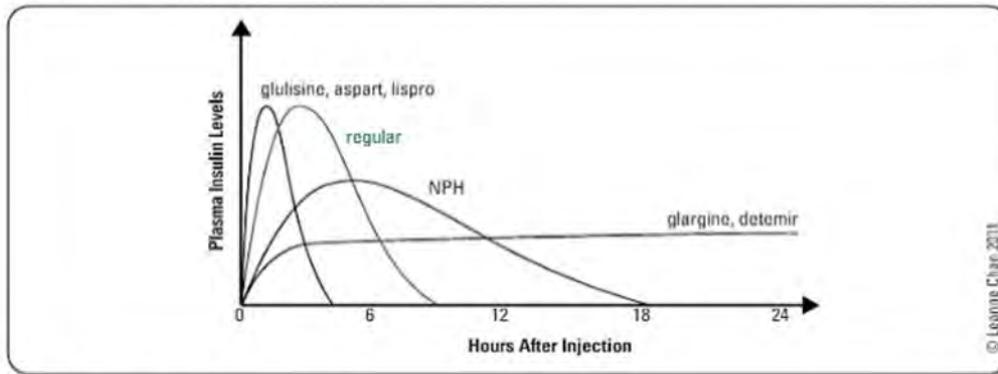

Figure 9. Types of insulin preparation

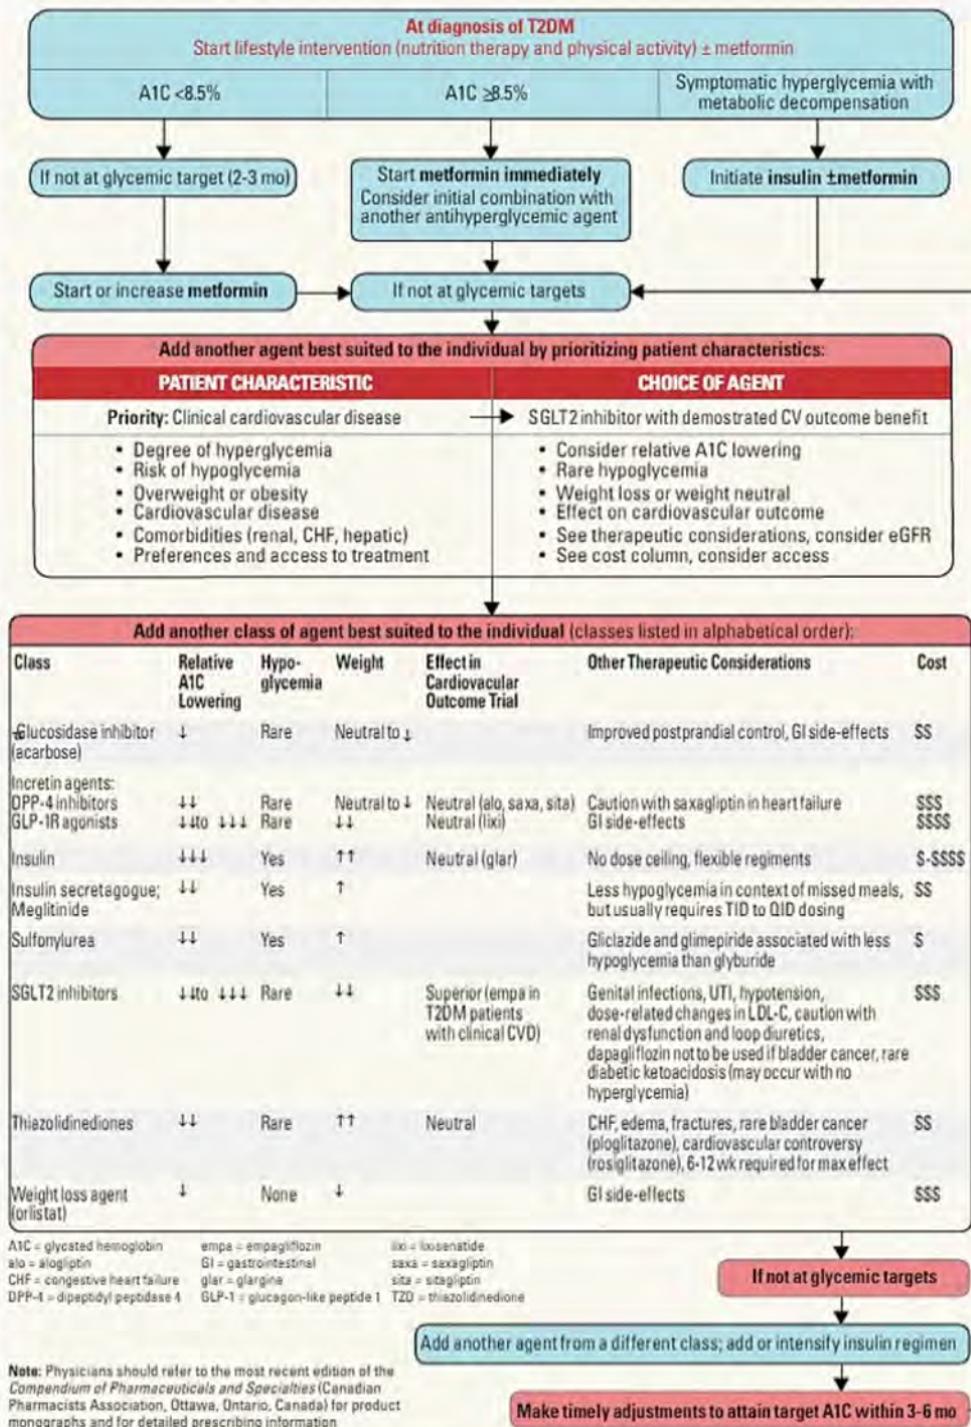

Figure 10. Management of hyperglycemia in T2DM

With permission of: Diabetes Canada Clinical Practice Guidelines Expert Committee. Diabetes Canada 2018 Clinical Practice Guidelines for the Prevention and Management of Diabetes in Canada. Can J Diabetes 2018;42(Suppl 1):S1-S325.

**Pharmacologic Agents (T2DM)**

- oral
  - biguanide: metformin (Glucophage\*)
  - thiazolidinedione: troglitazone (Rezulin\*), rosiglitazone (Avandia\*)
  - α-glucosidase inhibitor: acarbose (Precose\*)
  - non-sulfonylurea insulin secretagogues: nateglinide (Starlix\*), repaglinide (Gluconorm\*)
  - sulfonylureas: glyburide (DiaBeta\*), glimepiride (Amaryl\*), gliclazide (Diamicon\*)
  - DPP-4 inhibitor: sitagliptin (Januvia\*), linagliptin (Trajenta\*)
  - SGLT2 inhibitors: canagliflozin (Invokana\*), dapagliflozin (Farxiga\*), empagliflozin (Jardiance\*)
- injectable
  - GLP-1 analogue: liraglutide (Victoza\*), semaglutide (Ozempic\*)

**Other Medications Used in DM**

- ACEI or ARB in those with any of:
  - clinical macrovascular disease
  - ages ≥55
  - ages <55 and microvascular complications
- statin in those with any of:
  - clinical macrovascular disease
  - ages ≥40
  - ages <40 and any of the following:
    - ♦ diabetes duration >15 yr and ages >30 yr
    - ♦ microvascular complications
    - ♦ other cardiovascular risk factors
- low dose ASA (81-325 mg)
  - for secondary prevention in people with established CVD (NOT to be used routinely for primary prevention)

**Rosiglitazone Revisited: An Updated VertiMeta-Analysis of Risk for Myocardial Infarction and Cardiovascular Mortality**

Arch Intern Med 2010;170:1191-1201

**Purpose:** To evaluate the effectiveness of rosiglitazone on myocardial infarctions (MIs) and mortality.

**Methods:** Systematic review of RCTs of rosiglitazone, lasting at least 24 wk in duration, and reporting cardiovascular (CV) adverse events. Main outcomes were MIs, CV-related mortality, and all-cause mortality.

**Results:** Rosiglitazone significantly increased MI risk (OR 1.28, 95% CI 1.02-1.63, P=0.04) but not CV mortality (OR 1.03, 0.78-1.36, P=0.86).

**Conclusion:** Rosiglitazone continues to demonstrate increased risk of MIs, though it is not associated with increased risk of CV or all-cause mortality.

**Differential Diagnosis of Vertigo**

	BPPV	Labyrinthitis	Meniere's	Acoustic Neuroma
Onset	Sudden	Sudden	Gradual	Insidious
Duration	Seconds	Days	Min-h	Chronic
Hearing Loss	-	+	+	+
Tinnitus	-	+	+	+
Neuro Sx	-	-	-	-

**Dizziness**

- see Otolaryngology, OT6

**Epidemiology**

- 70% of affected patients see general practitioners initially, 4% are referred to specialists
- frequency is proportional to age; commonest concern of ambulatory patients ages >75

**Differential Diagnosis**

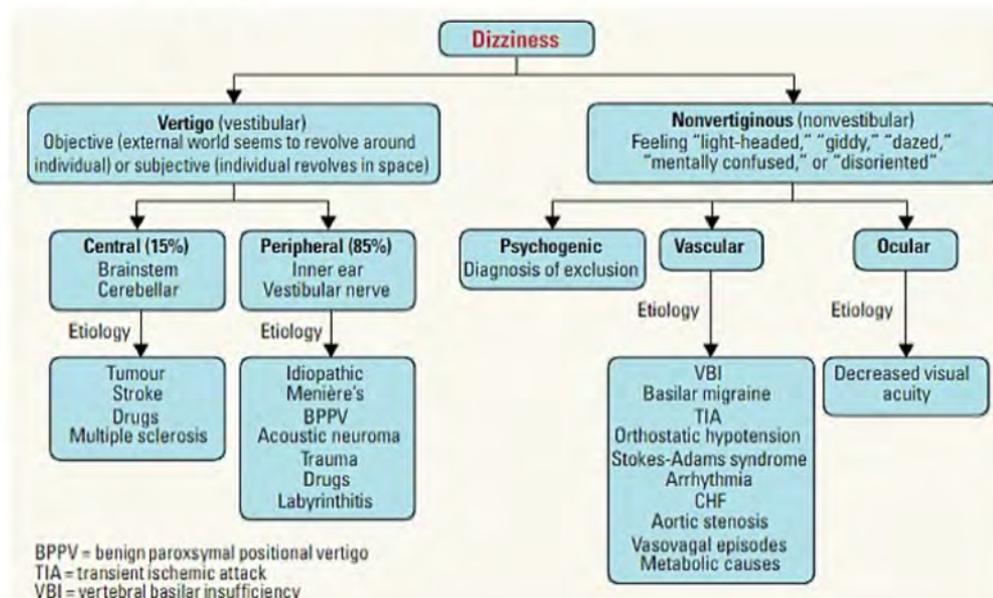

Figure 11. Differential diagnosis of dizziness

**History**

- clarify type of dizziness: vertigo, pre-syncope, disequilibrium, light-headedness
- duration
- exacerbations
  - worse with head movement or eye closure (vestibular)
  - no change with head movement and eye closure (non-vestibular)
  - worse with exercise (cardiac/pulmonary causes)

- associated symptoms
  - neurologic (central)
    - transient diplopia, dysphagia, dysarthria, ataxia (TIA, VBI, migraine)
    - persistent headache, alterations in level of consciousness, sensory and/or motor deficits (CNS)
  - audiologic (peripheral)
    - hearing loss, tinnitus, otalgia, aural fullness
  - others
    - N/V (peripheral vestibular disorders)
    - breathlessness, palpitations (hyperventilation, cardiac problem)
- general medical history
  - HTN, DM, heart disease, fainting spells, seizures, cerebrovascular disease, migraines
  - ototoxic drugs: aminoglycosides (gentamicin, streptomycin, tobramycin), erythromycin, ASA, antimalarials
  - hypotension (secondary to diuresis): furosemide, caffeine, alcohol
  - depression/anxiety: can present with light-headedness

### Physical Exam/Investigations

- syncopal
  - cardiac (orthostatic changes in vitals), peripheral vascular, and neurologic exams
  - blood work, ECG, 24 h Holter, treadmill stress test, loop ECG, tilt table testing, carotid, vertebral doppler, and EEG
- vertiginous
  - ENT and neurologic exams (head impulse, nystagmus, test of skew, HINTS exam)
  - Dix-Hallpike, consider audiometry, and MRI if indicated
- non-syncopal, non-vertiginous
  - assess gait, vision, and test for neuropathy
  - cardiac and neurologic exams (cerebellar and cranial nerve function)
  - 3 min hyperventilation trial (patient is coached to hyperventilate until patient becomes dizzy to identify if symptoms are reproducible and confirm that hyperventilation is the etiology of the symptoms), ECG, EEG
  - Romberg test: test for disequilibrium (patient sways towards the side of vestibular dysfunction)

### Treatment

- guided by history, physical exam, and investigations
- include education, lifestyle modification, physical maneuvers (e.g. Epley or Dr. Carol Foster's technique for BPPV), symptomatic management (e.g. antiemetics), pharmacotherapy, and surgery
- refer when significant central disease is suspected, when vertigo of peripheral origin is persistent (lasting >2-4 wk), or if atypical presentation

## Domestic Violence/Elder Abuse

### INTIMATE PARTNER VIOLENCE

#### Definition

- includes physical, sexual, emotional, psychological, and financial abuse

#### Epidemiology

- lifetime prevalence of intimate partner violence against women is between 25-30%
- similar prevalence of intimate partner violence against men, who may be less likely to report due to social stigma
- women who experience abuse have increased rates of injury, death, and health consequences including 50-70% increase in gynecological, central nervous system, and stress-related problems
- remember that men can also be victims of abuse
- occurs in all socioeconomic, educational, and cultural groups with increased incidence in pregnancy, disabled women, transgender and non-binary individuals, bisexuality, and 18-24 age group
- 25-50% chance of child abuse or neglect in families where partner abuse occurs; children exposed to violence in the home are more likely to experience or perpetrate violence later in life (Cycle of Violence)
- physician recognition rates as low as 5%

#### Presentation

- multiple visits with vague, ill-defined complaints such as: headaches, gastrointestinal symptoms, insomnia, chronic pain, hyperventilation
- may also present with injuries inconsistent with history

#### Management

- maintain a high index of suspicion
  - asking about abuse is the strongest predictor of disclosure
  - consider asking if patient feels safe at home or in their relationships; several screening tools (see sidebar) exist to identify victims of partner violence

#### Dix-Hallpike Test

- Have the patient seated with legs extended and head at 45° rotation
- Rapidly shift patient to supine position with head fully supported in slight extension (for 45 s)
- Observe for rotatory nystagmus and ask about sensation of vertigo

#### Screening Instruments for Domestic Violence

Note: It is important to be mindful that the clinical relevance of the following screening tools may vary. Additionally, should they be relevant, one must take care to reduce distress and maintain patients' trust during these difficult conversations. Helpful strategies include interviewing the patient alone in a safe environment. Consider starting the discussion with "It is important to ask about people's close relationships", or "Do you feel safe in your current relationships? While domestic violence may seem likely, the patient may not report it during the first encounter. Remember to screen for comorbid depression, anxiety, and substance misuse in suspected victims of domestic violence."

#### A) Woman Abuse Screening Tool (WAST)-SHORT

1. In general how would you describe your relationship?
  - a. A lot of tension
  - b. Some tension
  - c. No tension
2. Do you and your partner work out arguments with . . . ?
  - a. Great difficulty
  - b. Some difficulty
  - c. No difficulty

Endorsing either question 1 ("a lot of tension") or question 2 ("great difficulty") makes intimate partner violence exposure likely

#### B) HITS

How often does your partner:

1. Physically hurt you?
2. Insult you?
3. Threaten you with harm?
4. Scream or curse at you?

Each question on HITS to be answered on a 5 point scale ranging from 1 (= never) to 5 (= frequently)  
A total score of 10 or greater is significant

Activate Windows

Go to Settings to activate Windows

- make sure to determine the victim's level of immediate and long-term danger and ask if there are weapons in the house
- ensure patient safety
  - victim most at risk for homicide when attempting to leave home or following separation
  - safety planning includes ensuring that there is access to an exit in the home, establishing a safe place to go, and having emergency items prepared should the patient need to leave quickly (including money, clothes, keys, medications, and important documents)
- provide community resources
  - shelter or helpline number with legal advocacy and counselling services
  - involve social workers or domestic violence advocates with the patient's consent
- appointment for follow-up to assess whether condition is better or worse
- reassure patient is not to blame and that the assault is a crime
- goal is to convey support
  - reporting suspected or known child abuse is mandatory
  - spousal abuse is a criminal act, but not reportable without the person's permission
- DOCUMENT all evidence of abuse-related visits for medico-legal purposes; aim to provide verbatim quotations, when possible

### ELDER ABUSE

- see [Geriatric Medicine, GM6](#)

## Dyspepsia

- see [Gastroenterology, GI0](#)

### Definition and Clinical Features

- defined as epigastric pain or discomfort
- can be associated with fullness, belching, bloating, heartburn, food intolerance, N/V

### Epidemiology

- annual incidence 1-2%, prevalence 20-40%

### Etiology

- common: functional, PUD, GERD, gastritis
- others: cholelithiasis, irritable bowel syndrome, esophageal or gastric cancer, pancreatitis, pancreatic cancer, Zollinger-Ellison syndrome, and abdominal angina

### History

- symptoms may not be useful in finding cause
- associated with eating, anorexia, N/V, alcohol, NSAID use
- red flags: vomiting, bleeding/anemia, abdominal mass, dysphagia (V BAD)

### Investigations

- for new onset dyspepsia:
  - <60 yr without high-risk features, test for *H. pylori* using the urea breath test or serology
  - ≥60 yr should undergo upper endoscopy to rule out organic pathology

### Management

- lifestyle modifications: decrease caffeine and alcohol intake, avoid citrus food, smaller and more frequent meals, avoid supine position right after meals, smoking cessation
- pharmacologic treatment
  - gastric acid suppression: H2 blockers, PPIs; both are effective for PUD and GERD
  - TCAs or prokinetics: e.g. metoclopramide; effective for functional dyspepsia
- *H. pylori* eradication
  - do not keep patients on PPI without at least 1 trial off the medication per year (<https://choosingwiselycanada.org/perspective/ppi-toolkit/>)
- for non-responders, upper endoscopy should be considered. If endoscopy is negative, defined as functional dyspepsia

#### Dyspepsia Red Flags

- Weight loss
- Dysphagia
- Persistent vomiting
- GI bleeding (hematemesis, hematochezia, melena)
- Onset ages >50

#### *H. pylori* Eradication

Bismuth Quadruple Therapy (PBMT) or Concomitant NonBismuth Quadruple Therapy (PAMC) for 14 days

#### PBMT:

- 1) PPI standard dose BID
- 2) Bismuth subsalicylate 524 mg QID
- 3) Metronidazole 500 mg QID
- 4) Tetracycline 500 mg QID

#### PAMC:

- 1) PPI standard dose BID
- 2) Clarithromycin 500 mg BID
- 3) Amoxicillin 1000 mg BID
- 4) Metronidazole 500 mg BID

## Dyspnea

• see [Respirology, R3](#) and [Emergency Medicine, ER26](#)

### Definition

- uncomfortable, abnormal awareness of breathing, a subjective sensation of shortness of breath, or difficulty breathing
- when discussing dyspnea with patients, consider using language that is easy for patients to understand such as speaking about “feeling breathless” or “having trouble catching your breath”

### History and Physical Exam

- history
  - associated symptoms (cough, sputum, hemoptysis, wheezing, chest pain, palpitations, dizziness, edema)
  - constitutional symptoms (night sweats, fever, weight loss)
  - history of asthma, allergies, eczema, ASA/NSAID sensitivity, nasal polyps
  - smoking, recreational drugs, medications
  - occupational exposure, environmental exposure (e.g. pets, allergens, smoke)
  - travel and birth place (considering areas with increased prevalence of tuberculosis)
  - family history of atopy
  - previous CXR or PFTs
- physical exam: vitals, respiratory, precordial, HEENT, signs of anemia/liver failure/heart failure

### Investigations

- CXR, ECG
- PFTs, ABG acutely if indicated

### Management

- dependent on cause
- send to ED if acute presentation with moderate symptoms
- call ambulance if in severe respiratory distress

## Dysuria

• see [Urology, U10](#)

### Definition

- the sensation of pain, burning, or discomfort when urinating

### Epidemiology

- more common in women than men
- approximately 25% of women report one episode of acute dysuria per yr
- most common in women ages 25-54 and in those who are sexually active
- in men, prevalence of dysuria increases with age

### Etiology

- infectious
  - most common cause
  - presents as cystitis, urethritis, pyelonephritis, vaginitis, cervicitis, epididymo-orchitis, or prostatitis
- non-infectious
  - hormonal conditions (hypoestrogenism), obstruction (BPH, urethral strictures), allergic reactions, radiation, drugs/chemicals, foreign bodies, trauma, neoplasm, kidney stones, inflammatory diseases, endometriosis, psychogenic

### Differential Diagnosis of Dyspnea

- Pulmonary**
  - COPD
  - Asthma
  - Restrictive lung disease
  - Pneumothorax
  - Congenital lung disease
  - PE
  - Malignancy
- Cardiac**
  - HF
  - CAD
  - MI (recent or past) cardiomyopathy
  - Valvular dysfunction
  - Pericarditis
  - Arrhythmia
  - Hypertrophy
- Mixed/Other**
  - Deconditioning
  - Psychological and/or physical trauma
  - Pain
  - Neuromuscular
  - Metabolic condition
  - Anemia
  - Functional: anxiety, panic attack, hyperventilation

### UTI Clinical Decision Aid

Arch Intern Med 2007;67:2201-2206

- Dysuria
  - +Leukocytes (on urine dipstick)
  - +Nitrites (on urine dipstick)
- If 2 or more criteria met, then treat without culture, otherwise culture required prior to treatment.

### Risk Factors for Complicated UTI

- Male
- Pregnancy
- Recent urinary tract instrumentation
- Functional or anatomic abnormality of the urinary tract
- Chronic renal disease
- DM
- Immunosuppression
- Indwelling catheter

### Cranberries for Preventing Urinary Tract Infections

Cochrane DB Syst Rev 2012;10:CD001321

**Purpose:** To assess the effectiveness of cranberry products in preventing UTIs in susceptible populations.

**Methods:** All randomized controlled trials (RCTs) or quasi-RCTs of cranberry products for the prevention of UTIs were assessed and a meta-analysis of 24 RCTs (n=4473) conducted.

**Results:** Cranberry products did not significantly reduce the incidence of symptomatic UTIs at 12 mo (RR 0.86, 95% CI 0.71-1.04) compared with placebo control.

**Conclusion:** Cranberry products do not have a significant benefit in the prevention of symptomatic UTIs over a 12 mo period.

**Table 13. Etiology, Signs, and Symptoms of Common Causes of Dysuria**

Infection	Etiology	Signs and Symptoms
UTI/Cystitis	KEEPS bacteria ( <i>Klebsiella</i> , <i>E. coli</i> , <i>Enterobacter</i> , <i>Proteus mirabilis</i> , <i>Pseudomonas</i> , <i>S. saprophyticus</i> )	Internal dysuria throughout micturition, frequency, urgency, incontinence, hematuria, nocturia, back pain, suprapubic discomfort, low grade fever (rare)
Urethritis	<i>C. trachomatis</i> , <i>N. gonorrhoeae</i> , <i>Trichomonas</i> , <i>Candida</i> , herpes	Initial dysuria, urethral/vaginal discharge, history of STI
Vaginitis	<i>Candida</i> , <i>Gardnerella</i> , <i>Trichomonas</i> , <i>C. trachomatis</i> , atrophic, herpes, lichen sclerosus	External dysuria/pain, vaginal discharge, irritation, dyspareunia, abnormal vaginal bleeding
Prostatitis	<i>E. coli</i> , <i>C. trachomatis</i> , <i>S. saprophyticus</i> , <i>Proteus mirabilis</i> , <i>Enterobacter</i> , <i>Klebsiella</i> , <i>Pseudomonas</i>	Dysuria, fever, chills, urgency, frequency, tender prostate, rectal pain
Pyelonephritis	<i>E. coli</i> , <i>S. saprophyticus</i> , <i>Proteus mirabilis</i> , <i>Enterobacter</i> , <i>Klebsiella</i> , <i>Pseudomonas</i>	Internal dysuria, fever, chills, flank pain radiating to groin, CVA tenderness, N/V

**Investigations**

- if history and physical are consistent with an uncomplicated UTI, treat empirically with no further investigations
- urinalysis/dipstick: positive for nitrites and leukocytes
- urine R&M: pyuria, bacteriuria, hematuria
- urine C&S
- CBC and differential if suspecting pyelonephritis
- if vaginal/urethral discharge present: wet mount, Gram stain, KOH test, vaginal pH, culture for yeast and trichomonas, endocervical/urethral swab or urine PCR for *N. gonorrhoeae* and *C. trachomatis*
- radiologic studies and other diagnostic tests if atypical presentation
- see [Paediatrics](#), P69 for UTI

**Management**

- hospitalize if septic or critically ill, and consider hospitalization if persistently high fever, persistent pain, severe weakness, or inability to maintain hydration or tolerate oral feeds
- first-line treatment of uncomplicated UTI is TMP/SMX (cotrimoxazole) 160/800 mg BID x 3 d or nitrofurantoin 100 mg BID x 5 d
- UTI/cystitis
  - pregnant women with bacteriuria (2-7%) must be treated (first line: amoxicillin, nitrofurantoin, cephalixin) even if asymptomatic due to increased risk of pyelonephritis, preterm labour, low birth weight, and perinatal mortality. Need to follow with monthly urine cultures and repeat if still infected
  - patients with recurrent UTIs (>3/yr) should be considered for prophylactic antibiotics
  - if complicated UTI, patients require longer courses of broader spectrum antibiotics
- urethritis
  - positive swab or PCR for chlamydia or gonorrhea must be reported to Public Health
  - all patients should return 4-7 d after completion of therapy for clinical evaluation

**Epistaxis**

- see [Otolaryngology](#), O127

**Erectile Dysfunction**

- see [Urology](#), U33

**Definition**

- >3 mo of consistent or recurrent inability to attain and/or maintain sufficient penile erection for sexual performance

**Epidemiology**

- ~20% of men age 40; ~50% of men age 70

**Etiology**

- organic: vascular (90%) (arterial insufficiency, atherosclerosis), endocrine (low testosterone, DM), anatomic (structural abnormality, e.g. Peyronie's), neurologic (postoperative, DM), medications (clonidine, antihypertensives, SSRIs, tricyclic antidepressants, cimetidine, 5- $\alpha$ -reductase inhibitors)
- psychogenic (10%)

**Prevention of UTIs**

- Maintain good hydration
- Avoid feminine hygiene sprays and scented douches
- Empty bladder immediately before and after intercourse
- Vaginal estrogen therapy for peri- and post-menopausal women with recurrent UTIs

**Differential Diagnosis of Erectile Dysfunction**

**PENIS**

- Psychogenic
- Endocrine (T2DM, testosterone)
- Neurogenic (T2DM, postoperative)
- Insufficiency of blood (atherosclerosis)
- Substances

**Table 14. Differentiation Between Organic and Psychogenic ED**

Characteristic	Organic	Psychogenic
Onset	Gradual	Acute
Circumstances	Global	Situational
Course	Constant	Varying
Non-Coital Erection	Poor	Rigid
Morning Erection	Absent	Present
Psychosexual Problem	Secondary	Long history
Partner Problem	Secondary	At onset
Anxiety and Fear	Secondary	Primary

Walsh PC, Campbell MF, Retik AB. Campbell's Urology, 8th ed. W.B. Saunders, 2002. Table 46-4

**History**

- comprehensive sexual, medical, and psychosocial history
  - review medication and substance use
- time course
  - last satisfactory erection
  - gradual or sudden onset
  - attempts at sexual activity
- quantify
  - presence of morning or night time erections
  - stiffness (scale of 1-10)
  - ability to initiate and maintain an erection with sexual stimulation
  - erection stiffness during sex (scale of 1-10)
- qualify
  - partner or situation specific
  - loss of erection before penetration or climax
  - degree of concentration required to maintain an erection
  - percentage of sexual attempts satisfactory to patient and/or their partner
  - significant bends in penis or pain with erection
  - difficulty with specific positions
  - impact on quality of life and relationship

**Investigations**

- hypothalamic-pituitary-gonadal axis evaluation: testosterone (free + total), prolactin, LH
- risk factor evaluation: fasting glucose, HbA1c, lipid profile
- others: TSH, CBC, urinalysis
- specialized testing
  - psychological and/or psychiatric consultation
  - in-depth psychosexual and relationship evaluation
  - nocturnal penile tumescence and rigidity (NPTTR) assessment
  - vascular diagnostics (e.g. doppler studies, angiography)

**Management**

**Table 15. Management of Erectile Dysfunction**

Nonpharmacologic	Pharmacologic	Surgical
Lifestyle changes (alcohol, smoking, exercise)	Oral agents	Implants
Relationship/sexual counselling	Suppository	Vascular repair
Vacuum devices	Male urethral suppository for erection (MUSE)	Realignment
	Injections	

- pharmacologic treatment
  - phosphodiesterase type 5 inhibitors
  - testosterone (currently only indicated in patients presenting with hypogonadism and testosterone deficiency (note: breast/prostate cancer are absolute contraindications))
  - $\alpha$ -adrenergic blockers (e.g. yohimbine); currently limited data for use in erectile dysfunction

**Table 16. Phosphodiesterase Type 5 Inhibitors**

Examples	Dosing (1 dose/d)	Specifics	Side Effects	Contraindications
sildenafil (Viagra®)	25-100 mg/dose	Take 0.5-4 h prior to intercourse May last 24 h	Flushing, headache, indigestion	Not to be used in patients taking nitrates
tadalafil (Cialis®)	5-20 mg/dose	Effects may last 36 h	As above	As above
vardeafil (Levitra®)	2.5-20 mg/dose	Take 1 h prior to intercourse	As above	As above

**The Effect of Lifestyle Modification and Cardiovascular Risk Factor Reduction on Erectile Dysfunction**

Arch Intern Med 2011;171:1797-1803

**Purpose:** To evaluate the effectiveness of lifestyle interventions and pharmacotherapy for cardiovascular (CV) risk factors on severity of erectile dysfunction (ED).

**Methods:** Meta-analysis of RCTs with a follow-up of a minimum of 6 wk, evaluating lifestyle intervention vs. pharmacotherapy for CV risk factor reduction. Main outcome measure was weighted mean differences in the International Index of Erectile Dysfunction (IIEF-5) score.

**Results:** 6 RCTs with a total of 740 participants were included. Lifestyle modifications and pharmacotherapy for CV risk factor reduction were both associated with significant improvements in sexual function based on IIEF-5 scores (weighted mean difference (WMD) 2.66, 95% CI 1.86-3.47). Excluding statin trials, lifestyle modification interventions were associated with a statistically significant improvement in sexual function (WMD 2.40, 1.19-3.61).

**Conclusion:** Lifestyle modifications and pharmacotherapy for CV risk reduction are effective in improving male sexual function.

**Reasons for Referral to Urology**

- Significant penile anatomic disease
- Younger patient with a history of pelvic or perineal trauma
- Cases requiring vascular or neurosurgical intervention
- Complicated endocrinopathies
- Complicated psychiatric or psychosocial problems
- Patient or physician desire for further evaluation

## Fatigue

### Definition

- can describe difficulty or inability to initiate activity, maintain activity, or difficulty with concentration/memory
- presentation may vary and the patient's specific complaint should be clarified, e.g. excessive sleepiness, muscle weakness, decreased exercise tolerance, mood concerns

### Epidemiology

- 25% of office visits to family physicians
  - peaks in ages 20-40
  - F:M=3-4:1
- 50% have associated psychological complaints/problems, especially if <6 mo duration

### Differential Diagnosis

**Table 17. Differential Diagnosis of Fatigue: PS VINDICATE**

<b>P</b>	<b>Psychogenic</b>	<b>Depression, life stresses, anxiety disorder, chronic fatigue syndrome, fibromyalgia</b>
	Physiologic	Pregnancy, caregiving demands (young children, elderly)
<b>S</b>	<b>Sleep disturbance</b>	<b>OSA, sleep disorder, poor sleep hygiene, BPH, shift work, pain</b>
	Sedentary	Unhealthy/sedentary lifestyle
<b>V</b>	<b>Vascular</b>	<b>Stroke</b>
<b>I</b>	<b>Infectious</b>	<b>Viral (e.g. mononucleosis, hepatitis, HIV), bacterial (e.g. TB), fungal, parasitic</b>
<b>N</b>	<b>Neoplastic</b>	<b>Any malignancy</b>
	Nutrition	<b>Anemia (Fe<sup>2+</sup> deficiency, B12 deficiency)</b>
	Neurogenic	Myasthenia gravis, multiple sclerosis, Parkinson's disease
<b>D</b>	<b>Drugs</b>	<b>β-blockers, antihistamines, anticholinergics, benzodiazepines, antiepileptics, antidepressants</b>
<b>I</b>	<b>Idiopathic</b>	
<b>C</b>	<b>Chronic illnesses</b>	<b>HF, lung diseases (e.g. COPD, sarcoidosis), renal failure, chronic liver disease</b>
<b>A</b>	<b>Autoimmune</b>	<b>SLE, RA, mixed connective tissue disease, polymyalgia rheumatica</b>
<b>T</b>	<b>Toxin</b>	<b>Substance misuse (e.g. alcohol), heavy metal</b>
<b>E</b>	<b>Endocrine</b>	<b>Hypothyroidism, DM, Cushing's syndrome, adrenal insufficiency, pregnancy</b>

Common causes are in bold

### Investigations

- psychosocial causes are common, so usually minimal investigation is warranted
- physical causes of fatigue usually have associated symptoms/signs that can be elicited from a focused history and physical exam
- investigations are guided by history and physical exam and may include:
  - CBC and differential, electrolytes, BUN, Cr, ESR, glucose, TSH, ferritin, vitamin B12, serum protein electrophoresis, Bence-Jones protein, albumin, AST, ALT, ALP, bilirubin, calcium, phosphate, ANA, β-hCG
  - urinalysis, CXR, ECG
  - additional tests: serologies (Lyme disease, hepatitis B and C screen, HIV, ANA) and Mantoux skin tests

### Treatment

- treat underlying cause
- if etiology cannot be identified (1/3 of patients)
  - validation and follow-up, especially with fatigue of psychogenic etiology
  - supportive counselling, behavioural, or group therapy
  - encourage patient to stay physically active to maximize function, and consider using motivational interviewing techniques to create person-centred approaches
  - review all medications, OTC, and herbal remedies for drug-drug interactions and side effects
  - prognosis: after 1 yr, 40% are no longer fatigued

## CHRONIC FATIGUE SYNDROME

### Diagnosis (IOM, 2015)

- diagnosis requires the following three symptoms:
  1. a substantial reduction or impairment in the ability to engage in pre-illness levels of activity that is:
    - lasting >6 mo
    - accompanied by fatigue of new onset, not alleviated by rest, and not caused by excessive exertion
  2. post-exertional malaise\*
    - worsening of symptoms after physical, mental or emotional exertion that would not have caused a problem before the illness

- 3. unrefreshing sleep\*
  - even after a full night of sleep despite the absence of specific objective sleep alterations

AND

- at least one of the two following manifestations is also required:
  - cognitive impairment\*
  - orthostatic intolerance

\*The frequency and severity of these symptoms need to be evaluated

**Epidemiology**

- F>M, more common in White individuals than other groups, majority in their 30s
- found in <5% of patients presenting with fatigue

**Etiology**

- unknown, likely multifactorial
- may include infectious agents, immunological factors, neurohormonal factors, and/or nutritional deficiency

**Investigations**

- no specific diagnostic laboratory tests

**Treatment**

- promote sleep hygiene
- provide support and education that most patients improve over time
- non-pharmacological
  - regular physical activity, optimal diet, psychotherapy, family therapy, support groups
  - consider using motivational interviewing techniques to create person-centred approaches
- pharmacological
  - to relieve symptoms: e.g. antidepressants, anxiolytics, NSAIDs, antimicrobials (if indicated based on investigations), anti-allergy therapy, antihypertensive therapy

**Exercise Therapy for Chronic Fatigue**

Cochrane DB Syst Rev 2019;10:CD003200

**Purpose:** To determine the effects of exercise therapy for adults with chronic fatigue syndrome (CFS) compared with any other intervention or control.

**Methods:** Meta-analysis of RCTs involving adults with CFS as a primary diagnosis who were able to participate in exercise therapy. Studies compared exercise therapy to passive control, psychological therapies, adaptive pacing therapy, or pharmacological therapy.

**Results:** Eight RCTs with 1518 participants were included. Exercise therapy lasted 12 to 26 wk. Moderate quality evidence showed exercise therapy was more effective in reducing fatigue vs. passive or no treatment, and was also associated with a positive effect on daily physical functioning and sleep. It also slightly improved physical functioning, depression, and sleep compared to adaptive pacing.

**Conclusion:** Exercise therapy may have a positive effect on fatigue in adults with CFS compared to usual care or passive therapies.

**Fever**

- see Paediatrics, P58

**Definition**

- oral temperature >37.2°C (AM), 37.7°C (PM)
- fever in children <2 yr must be a rectal temperature for accuracy
- TM not accurate for measurement until child is >5 yr

**Table 18. Differential Diagnosis of Fever**

Infection	Cancer	Medications		Other
Bacterial	Leukemia	Allopurinol	Nifedipine	Inflammatory Bowel
Viral	Lymphoma	Captopril	Phenytoin	Disease
TB	Other Malignancies	Cimetidine	Diuretics	Collagen Vascular Disease
		Heparin	Barbiturates	DVT
		INH	Antihistamines	
		Meperidine		

**History**

- fever
  - peak temperature, type of thermometer, site of temperature measurement, duration
  - time of day
  - response to antipyretics
- systemic symptoms
  - weight loss, fatigue, rash, arthralgia, night sweats
- symptoms of possible source
  - URTI: cough, coryza, ear pain (consider influenza, COVID-19)
  - UTI/pyelonephritis: dysuria, foul-smelling urine, incontinence, frequency, hematuria, flank pain
  - pneumonia: cough, pleuritic chest pain
  - meningitis: headache, confusion, stiff neck, rash
  - osteomyelitis: bone pain
  - skin: purulent discharge
  - PID: discharge, dyspareunia, lower abdominal pain
  - gastroenteritis: abdominal pain, diarrhea, blood per rectum, vomit
  - medications
  - PE/DVT: swollen legs, pain in calf, SOB, pleuritic chest pain
  - history of cancer/family history of cancer
- infectious contacts
  - travel history, camping, daycare, contact with TB, foodborne, animals

**Possible Investigations**

- CBC and differential, blood culture, urine culture, urinalysis
  - viral swab including influenza, COVID-19
- stool O&P, Gram stain, culture
- CXR, Mantoux skin test, sputum culture
- lumbar puncture

**Management**

- increase fluid intake
- general: sponge bath, light clothing
- acetaminophen/ibuprofen as needed
- treat underlying cause

**Headache****Definitions**

- primary headaches
  - see [Neurology, N46](#)
  - primary headaches are the most common headaches seen in family medicine including tension headaches, migraines, and cluster headaches
  - secondary causes should be ruled out prior to diagnosing a patient with a primary headache
- secondary headaches
  - caused by underlying organic disease
  - account for <10% of all headaches, may be life-threatening

**Etiology of Secondary Headaches**

- drug: drug withdrawal, medication overuse, drug side effect, and carbon monoxide
- infectious: meningitis, encephalitis, abscess
- vascular: aneurysm, stroke, subarachnoid hemorrhage, HTN, and temporal arteritis
- endocrine: thyroid disease, pheochromocytoma
- neoplastic: tumour
- trauma: TMJ injury, c-spine injury, head injury, subdural hematoma, and subarachnoid hemorrhage
- other: serious ophthalmological and otolaryngological causes

**Investigations**

- indicated only when red flags are present and may include:
  - CBC for suspected systemic or intracranial infection
  - ESR or CRP for suspected temporal arteritis
  - neuroimaging (CT or MRI) to rule out intracranial pathology
  - CSF analysis for suspected intracranial hemorrhage, infection

**Management**

- based on underlying disorder
- analgesics may provide symptomatic relief
  - see [Neurology, N46](#)

**Hearing Impairment**

- see [Otolaryngology, O17](#)

**Definition**

- hearing impairment: a raised hearing threshold measured as decibels of hearing loss relative to the normal population at specific frequencies
- hearing disability: hearing impairment that interferes with performing daily tasks

**Classification**

- conductive (external sound does not reach the middle ear)
- sensorineural (involving the inner ear, cochlea, or auditory nerve)
- mixed

**Epidemiology**

- prevalence increases with age (6% of 35-44 yr, 43% of 65-84 yr)
- 90% of age-related hearing loss (presbycusis) is sensorineural
- hearing loss detectable by audiology is present in greater than 1/3 of people >65 yr

**Assessment**

- infants: universal newborn hearing screening program
- elderly

**Acupuncture for Migraine Prophylaxis**

Cochrane DB Syst Rev 2016;6:CD001218

**Purpose:** To investigate whether acupuncture is more effective than no prophylactic treatment, routine care only, or sham acupuncture, and whether it is as effective as prophylactic pharmacological treatment, in terms of reducing headache frequency in adults with episodic migraine.

**Methods:** Meta-analysis of RCTs with a minimum of an 8 wk duration, comparing acupuncture intervention with a no-acupuncture control (no prophylaxis, routine care, sham, or pharmacological prophylaxis).

**Results:** 22 trials with 4995 participants were included. Acupuncture was associated with moderate headache frequency reduction compared to no acupuncture (standardized mean difference (SMD) -0.56, 95% CI -0.65 to -0.48), and a reduction of >50% in headache frequency for 41% and 17% of participants receiving acupuncture and no acupuncture, respectively (pooled risk ratio (RR) 2.40, 2.08 to 2.76; NNT 4, 3 to 6). Acupuncture showed a small but statistically significant reduction over sham both post-treatment (SMD -0.18, -0.28 to -0.08) and post-follow-up (SMD -0.19, -0.30 to -0.09), with >50% headache frequency reduction being achieved in 50% vs. 41% of those receiving acupuncture and sham, respectively (pooled RR 1.23, 1.11 to 1.36; NNT 11, 7 to 20); these numbers were 53% and 42%, respectively, post-follow-up (pooled RR 1.25, 1.13 to 1.39; NNT 10, 6 to 18). Number of participants dropping out and reporting adverse effects did not differ significantly between acupuncture and sham groups. Compared to pharmacological prophylaxis, a significant reduction in migraine frequency was noted with drugs (SMD -0.25, -0.39 to -0.10), but the significance was not maintained at follow-up. After 6 mo, headache frequency was halved in 59% of patients receiving acupuncture and 54% receiving prophylactic drugs (pooled RR 1.11, 0.97 to 1.26). Those receiving acupuncture were less likely to drop out due to adverse effects or to report adverse events than those receiving drugs.

**Conclusion:** Adding acupuncture to symptomatic treatment of attacks reduces frequency of headaches. Acupuncture is more effective than sham, and is similarly effective to pharmacological interventions for migraine prophylaxis.

**Migraine Screen****POUND**

Pu Isatole quality

Over 4-72 h

Unilateral

Nausea and vomiting

Disabling intensity

If ≥4 present then a diagnosis is likely (Positive likelihood ratio = 24)

- screening tests
  - whispered-voice test
    - ♦ examiner stands 0.6 meters (arm's length) behind the patient, whispers a combination of 6 letters/numbers, and asks the patient to repeat the sequence. Test 1 ear at a time while masking the non-test ear simultaneously
  - tuning fork test (to distinguish conductive from sensorineural hearing loss)
- diagnostic tests (formal audiologic assessment)
  - pure tone, air, and bone conduction testing
  - speech audiometry
  - impedance audiometry

**Management**

- counsel about noise control and hearing protection programs (grade A evidence)
  - treat patients with unexplained unilateral sensorineural hearing loss urgently with steroids
  - consider blood sugar, CBC and differential, TSH, syphilis testing for unexplained sensorineural hearing loss
  - consider a CT/MRI for patients with progressive asymmetric sensorineural hearing loss to exclude vestibular schwannoma (acoustic neuroma)
- refer patients who
  - have an unknown etiology to an ENT specialist
  - experience sudden sensorineural hearing loss to an ENT specialist for ongoing care
- treatment: hearing amplification (e.g. hearing aids), assistive listening devices, and cochlear implants can dramatically improve quality of life

**Hypertension**

Hypertension guidelines are reviewed and updated annually, for up-to-date recommendations, please see <http://guidelines.hypertension.ca/>

**Definitions**

- HTN
  - BP  $\geq 140/90$  mmHg (office Blood Pressure Measurement (OBPM));  $\geq 135/85$  mmHg (ambulatory blood pressure monitoring (ABPM)/automated office blood pressure (AOBP))
- isolated systolic HTN
  - sBP  $\geq 140$  mmHg and dBP  $< 90$  mmHg
  - associated with progressive reduction in vascular compliance
  - usually begins in 5th decade
- hypertensive urgency
  - sBP  $> 210$  mmHg or dBP  $> 120$  mmHg with minimal or no target-organ damage
- hypertensive emergency
  - severe HTN (dBP  $> 120$  mmHg) + acute target-organ damage
  - accelerated HTN
    - ♦ significant recent increase in BP over previous hypertensive levels associated with evidence of vascular damage on fundoscopy, but without papilledema
  - malignant HTN
    - ♦ sufficient elevation in BP to cause papilledema and other manifestations of vascular damage (retinal hemorrhages, bulging discs, mental status changes, increasing creatinine)
- white coat HTN
  - high clinic BP with normal home BP and 24 h ambulatory BP, caused by anxiety in clinic
- masked HTN
  - normal clinic BP with high BP in home and/or ambulatory setting, often provoked by anxiety, job stress, exercise

**Epidemiology**

- 22% of Canadian adults suffer from HTN (prevalence is 52% in the 60-70 age group)
- lifetime risk of developing HTN is approximately 90%
- 64% of Canadians who have HTN are treated and controlled, while 17% are unaware that they have HTN
- 3rd leading risk factor associated with death
  - risk factor for CAD, HF, cerebrovascular disease, renal failure, PVD

**Etiology**

- essential HTN (90%, undetermined cause)
- secondary HTN (10%, known cause)

**Predisposing Factors**

- family history
- obesity (especially abdominal)
- alcohol consumption
- stress
- sedentary lifestyle

**Headache Red Flags**

**SNOOP**

Systemic symptoms of illness

- Fever
- Anticoagulation
- Pregnancy
- Cancer

Neurologic signs/symptoms

- Impaired mental status
- Neck stiffness
- Seizures
- Focal neurological deficits

Onset

- Sudden and severe
- New headache after age 50

Other associated conditions

- Following head trauma
- Awakens patient from sleep
- Jaw claudication
- Scalp tenderness
- Worse with exercise, sexual activity, or Valsalva

Prior headache history

- Different pattern
- Rapidly progressing in severity/frequency

**Does This Patient Have Hearing Impairment?**

JAMA 2006;295:416-428

**Purpose:** To evaluate bedside clinical maneuvers used to evaluate the presence of hearing impairment.

**Methods:** Systematic review of original studies examining the accuracy or precision of screening questions and tests.

**Results:** 24 studies were included.

**Conclusions:** Elderly patients acknowledging a hearing impairment require audiometry, while those who indicate they do not have hearing impairment should be screened with a whispered-voice test. A normal whispered-voice test requires no further workup, and those unable to perceive the whisper require audiometry. Weber and Rinne tests are not suitable for general hearing impairment screening.

- Symptoms of HTN are usually not present (this is why it is called the "silent killer")
- Patients may have an occipital headache upon awakening or organ-specific complaints if advanced disease

**Renovascular HTN Suspected if Patient Presenting with 2 or more of:**

- Sudden onset or worsening of HTN and ages  $> 55$  or  $< 30$
- Presence of abdominal bruit
- HTN resistant to 3 or more drugs
- Rise in Cr of 30% or more associated with use of an ACEI or ARB
- Other atherosclerotic vascular disease, particularly in patients who smoke or have dyslipidemia
- Recurrent pulmonary edema associated with hypertensive surges

- smoking
- male
- ages >30
- excessive salt intake/fatty diet
- Black ancestry
- dyslipidemia

**Table 19. Causes of Secondary HTN**

	Common Cause		
<b>Renal</b>	Renovascular HTN Renal parenchymal disease, glomerulonephritis, pyelonephritis, polycystic kidney		
<b>Endocrine</b>	1° hyperaldosteronism Pheochromocytoma Cushing's syndrome Hyperthyroidism/hyperparathyroidism Hypercalcemia of any cause		
<b>Vascular</b>	Coarctation of the aorta Renal artery stenosis		
<b>Other</b>	Obstructive sleep apnea		
<b>Drug-Induced</b>	Estrogens/OCP MAOIs Cocaine	Steroids Lithium Amphetamines	NSAIDs Decongestants Alcohol

**Suspect Hyperaldosteronism when**

- HTN refractory to treatment with ≥3 drugs
- Spontaneous hypokalemia
- Profound diuretic-induced hypokalemia (<3.0 mmol/L)
- Incidental adrenal adenomas

**Hypertensive Emergencies**

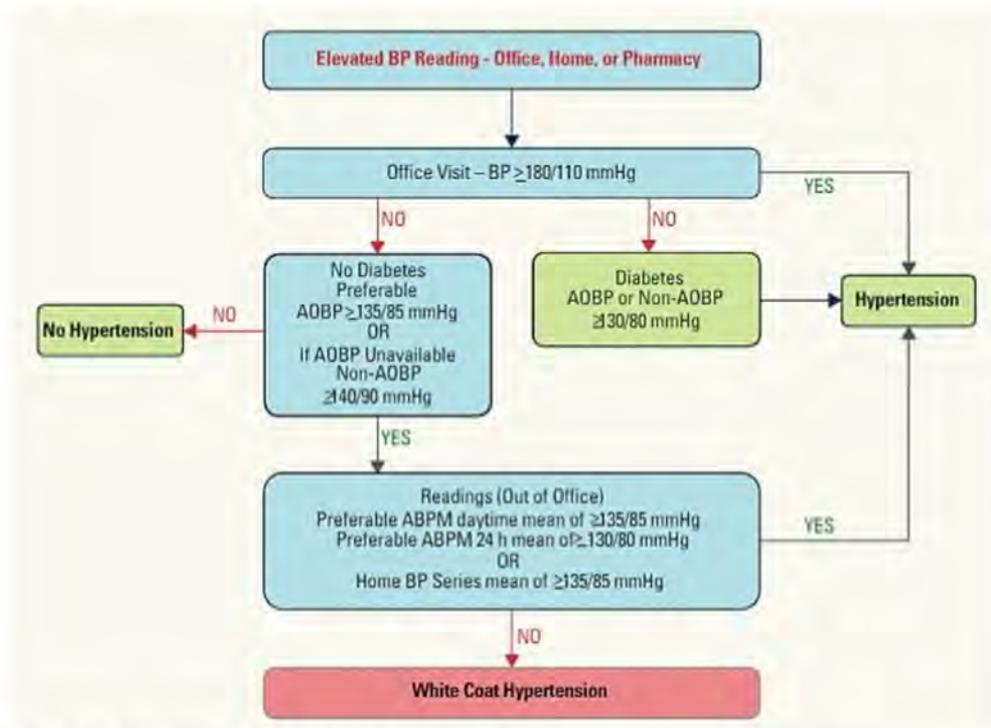

- **Malignant HTN**
- **Cerebrovascular**
  - Hypertensive encephalopathy
  - Stroke
  - Intracerebral hemorrhage
  - SAH
- **Cardiac**
  - Acute aortic dissection
  - Acute refractory LV failure
  - Myocardial infarction/ischemia
  - Acute pulmonary edema
- **Renal failure**

**Investigations**

- for all patients with HTN:
  - electrolytes, Cr, fasting glucose and/or HbA1c, lipid profile, 12-lead ECG, urinalysis
  - self-measurement of BP at home is encouraged (recommended devices listed at [www.hypertension.ca](http://www.hypertension.ca))
- for specific patient etiology:
  - DM or chronic kidney disease: urinary protein excretion
  - if suspected renovascular HTN: renal ultrasound, captopril renal scan (if GFR >60 mL/min), MRA/CTA (if normal renal function)
  - if suspected endocrine cause: plasma aldosterone, plasma renin (aldosterone-to-renin ratio)
    - measured from morning samples taken from patients in sitting position after resting 15 min
    - discontinue aldosterone antagonists, ARBs, β-blockers, and clonidine prior to testing
  - if suspected pheochromocytoma: 24 h urine for metanephrines and creatinine
  - if suspected LV dysfunction: echocardiogram
  - if clinically indicated or with refractory hypertension: sleep study

**Diagnosis**

- all Canadian adults should have BP assessed at all appropriate clinical visits, oscillometric preferred to manual

**Figure 12. Diagnostic algorithm for hypertension in adults**

**Treatment**

- hypertension means high pressure/strain. Without increasing a patient's potential distress, consider what may be causing their high pressure or strain. It may be important to support a patient in reducing sources of stress and worry
- treat to target BP: <140/90 mmHg, <130/80 mmHg if DM
- optimum management of HTN requires assessment of overall cardiac risk
- explore adherence to lifestyle modification and pharmacotherapy at each visit
- lifestyle modification (in all HTN patients – may be sufficient treatment in patients with stage 1 HTN (140-159/90-99 mmHg))
  - diet
    - follow Canada's Guide to Healthy Eating (see *Nutrition, FM7*) and Dietary Approaches to Stop Hypertension (DASH)
    - limit daily salt intake to 5 g (2000 mg of sodium)
    - potassium/magnesium/calcium supplementations are NOT recommended for HTN, but an increase in dietary potassium may help
  - moderate intensity dynamic exercise: 30-60 min, 4-7x/wk; higher intensity exercise is not more effective
  - smoking cessation
  - low-risk alcohol consumption (see *Alcohol Use, FM15*)
  - work towards a healthy BMI (18.5-24.9 kg/m<sup>2</sup>) and waist circumference (<102 cm for men, <88 cm for women)
  - individualized approaches to reduce stress
- pharmacological
  - indications for therapy (caution with elderly patients):
    - dBP ≥90 mmHg with target organ damage or independent cardiovascular risk factors
    - dBP ≥100 mmHg or sBP ≥160 mmHg without target organ damage or cardiovascular risk factors
    - sBP ≥140 with target organ damage
    - sBP >130 for high-risk populations (Framingham Risk >20%, ages >50)
  - first-line antihypertensives (consider a single pill combination therapy)
  - combination therapy principles:
    - if there is an inadequate response to therapy, consider adding another first line antihypertensive
    - avoid combining a non-DHP CCB with a β-blocker or an ACEI with an ARB
    - monitor potassium and creatinine when administering an ACEI/ARB with a potassium-sparing diuretic

**Table 20. Considerations in the Individualization of Pharmacological Therapy in Adults**

Condition or Risk Factor	Recommended Drugs	Alternative Drugs	Not Recommended/Notes
Isolated Diastolic HTN with or without Systolic HTN	Monotherapy or single pill combination (SPC) Recommended monotherapy choices include thiazide/thiazide-like diuretics (with longer-acting diuretics preferred), β-blockers, ACEI, ARBs, or long-acting CCBs. Recommended SPC choices include combinations of an ACEI with CCB, ARB with CCB, or ACEI/ARB with a diuretic. (Consider ASA and statins in selected patients)	Combinations of first-line drugs	Not recommended for monotherapy: α-blockers, β-blocker in those ≥60 yr, ACEI in Black people Hypokalemia should be avoided in those prescribed diuretics. ACEI, ARBs and direct renin inhibitors are potential teratogens, and caution is required if prescribing to women with childbearing potential. Combination of an ACEI with an ARB is not recommended
Isolated Systolic HTN without other compelling indications	Thiazide diuretic, ARB, or long acting dihydropyridine CCB	Combinations of first-line drugs	Same as above
CAD	ACEI or ARB; β-blockers or CCB for patients with stable angina	When combination therapy for high-risk patients, ACEI/DHP CCB is preferred	Avoid short-acting nifedipine. Combination of an ACEI with an ARB is specifically not recommended. Exercise caution when lowering sBP to target if dBP is ≤60 mmHg, especially in patients with LVH
Recent MI	β-blocker and ACEI (ARB if cannot tolerate ACEI)	Long-acting CCB if β-blocker contraindicated or not effective	Non-dihydropyridine CCBs should not be used with concomitant HF
Left Ventricular Hypertrophy	ACEI, ARB, thiazide/thiazide-like diuretics, or long-acting CCB	Combination of additional agents	Hydralazine and minoxidil can increase LVH, thus not recommended
Cerebrovascular Disease (stroke/TIA)	ACEI and thiazide/thiazide-like diuretic combination	Combination of additional agents	Treatment of HTN should not be routinely undertaken in acute stroke unless extreme BP elevation. ACEI and ARB combination after a stroke is not recommended

2020 Hypertension Highlights, Hypertension Canada. <https://hypertension.ca/wp-content/uploads/2018/07/Hypertension-Guidelines-English-2019-Web.pdf>

**Impact of Health Behaviour on Blood Pressure**

Intervention	sBP (mmHg)	dBP (mmHg)
Diet and weight control	-6.0	-4.8
Reduced salt/sodium intake	-5.4	-2.8
Reduced alcohol intake (heavy drinkers)	-3.4	-3.4
DASH diet	-11.4	-5.5
Physical activity	-3.1	-1.8
Relaxation therapies	-3.7	-3.5

CHBP (Canadian Hypertension Education Program) Guidelines 2014. Available from: [https://www.onlinemj.ca/article/S0828-282X\(14\)00070-1/fulltext](https://www.onlinemj.ca/article/S0828-282X(14)00070-1/fulltext)

**β-blocker**

Not recommended as first line for patients of ages ≥60

**ACEI**

Not recommended as monotherapy in people of African descent

**Calcium Channel Blockers**

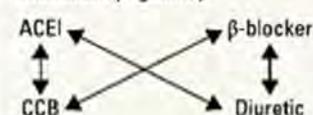

**Dihydropyridine CCBs**

- Amlodipine
- Nifedipine
- Felodipine

**Non-dihydropyridine CCBs**

- Diltiazem
- Verapamil

**How to Combine Antihypertensive Medications (in general)**

**Table 20. Considerations in the Individualization of Pharmacological Therapy in Adults**

Condition or Risk Factor	Recommended Drugs	Alternative Drugs	Not Recommended/Notes
<b>Heart Failure</b>	ACEI (ARB if ACEI intolerant) and $\beta$ -blockers Aldosterone antagonists (mineralocorticoid receptor antagonists) may be added for patients with a recent cardiovascular hospitalization, acute MI, elevated BNP or NT-proBNP level, or NYHA Class II to IV symptoms	ARB in addition to ACEI Hydralazine/isosorbide dinitrate combination if ARB or ACEI not tolerated/contraindicated  Thiazide/thiazide-like or loop diuretics are recommended as additive therapy. DHP CCB can also be used  A combined ARB/neprilysin inhibitor is recommended (in place of an ACEI or ARB) in symptomatic patients with HTN and HFrEF on standard guideline-based therapies	Titrate doses of ACEI and ARBs to those used in clinical trials Carefully monitor potassium and renal function if combining any of ACEI, ARB and/or aldosterone antagonist
<b>Dyslipidemia</b>	Does not affect initial treatment recommendations	Combination of additional agents	
<b>DM with Albuminuria (ACR &gt;2.0 mg/mmol renal disease, CVD or additional CV risk factors)</b>	ACEI or ARB	Addition of a dihydropyridine CCB is preferred over a thiazide/ thiazide-like diuretic	A loop diuretic could be considered in hypertensive chronic kidney disease patients with extracellular fluid volume overload
<b>DM without Albuminuria (criteria listed above)</b>	ACEI, ARB, DHP CCB, or thiazide/ thiazide-like diuretics	Combination of first-line drugs If combination with ACEI is being considered, a dihydropyridine CCB is preferable to a thiazide/thiazide like diuretic	Normal urine microalbumin to creatinine ratio <2.0 mg/mmol
<b>Non-Diabetic Chronic Kidney Disease with Proteinuria (urinary protein &gt;500 mg/24 h or ACR &gt;30 mg/mmol)</b>	ACEI (ARB if ACEI intolerant), if there is proteinuria Diuretics as additive therapy	Combinations of additional agents	Patients on an ACEI or ARB should have careful monitoring of renal function and potassium. ACEI and ARB combinations are not recommended in patients without proteinuria
<b>Renovascular Disease</b>	Does not affect initial treatment recommendations Atherosclerotic renal artery stenosis should be primarily managed medically, while revascularization should be considered for renal fibromuscular dysplasia	Combinations of additional agents	Caution in using ACEI or ARB if bilateral renal artery stenosis or unilateral disease with solitary kidney Renal artery angioplasty and stenting could be considered for patients with renal artery stenosis and complicated, uncontrolled HTN

2020 Hypertension Highlights, Hypertension Canada. <https://hypertension.ca/wp-content/uploads/2018/07/Hypertension-Guidelines-English-2018-Web.pdf>

**Systematic Review for 2017 ACC/AHA Guidelines for Prevention, Detection, Evaluation, and Management of High Blood Pressure in Adults**  
Hypertension 2018;71:e116-135

**Purpose:** Determine evidence for self-measured BP without other augmentation for clinical outcomes and BP control. Determine optimal target for BP lowering during antihypertensive therapy in adults. Determine benefits and harms of different classes of antihypertensive drugs.

**Methods:** Systematic review and meta-analysis using PubMed and EMBASE.

**Results:** There is a modest but significant improvement in sBP in RCTs of self-measured BP vs. usual care at 6 but not 12 mo; may be a helpful adjunct to routine office care. sBP lowering to a target of <130 mmHg may reduce risk of several important outcomes including MI, stroke, heart failure, and major CV events. No class of medications (i.e. ACEI, ARBs, CCBs, or  $\beta$ -blockers) was significantly better than thiazides and thiazide-like diuretics as a first-line therapy for any outcome.

**Conclusion:** Self-measured BP is a useful adjunct in BP control. Target sBP <130. Thiazides, CCBs,  $\beta$  blockers, ARBs, ACEI are to be used as first-line therapy with patient factors guiding choice.

**Table 21. Common Antihypertensive Medications in Pregnancy and Lactation**

Pregnancy			Lactation
First line oral drugs	Second line oral drugs	Medications to avoid	Oral drugs
Labetalol	Clonidine	ACEIs*	Labetalol
Methyldopa	Hydralazine	ARBs*	Methyldopa
Long-acting oral nifedipine	Thiazide diuretics		Long-acting oral nifedipine
Other $\beta$ -blockers (acebutolol, metoprolol, pindolol, and propranolol)			Enalapril Captopril

\* Fetotoxicity of renal system

**Follow-Up**

- assess and encourage adherence to pharmacological and non-pharmacological therapy at every visit
- lifestyle modification q3-6 mo
- pharmacological
  - follow-up q1-2 mo until BP under target for 2 consecutive visits, q3-6 mo once at target BP
  - follow-up frequently for patients with symptomatic/severe HTN, antihypertensive drug intolerance, target organ damage
- referral is indicated for cases of refractory HTN, suspected secondary causes, or worsening renal failure
- hospitalization is indicated for malignant HTN

## Joint Pain

- see [Rheumatology](#), RH4

### History

- number of joints involved: monoarticular, oligoarticular, polyarticular
- inflammatory vs. non-inflammatory
- pattern of joints involved: symmetrical vs. asymmetrical, large vs. small joints, axial skeleton
- onset: acute vs. chronic (>6 wk)
- morning stiffness (duration) vs. worse at end of day with activity
- PMHx
  - trauma, infection, medications (steroids, diuretics)
  - comorbidities: DM, renal insufficiency (gout), psoriatic arthritis, myeloma, osteoporosis, and OA
  - FHx of arthritis, autoimmune disease
- ROS: constitutional symptoms (neoplasm, septic arthropathy), myalgia, skin/eye/nail/hand changes, and GI/GU changes

### Physical Exam

- vitals
- specific joint exams to affected areas
- systemic features (skin, nails, eyes, hands)

### Investigations (Guided by the History and Physical Exam)

- general: CBC and differential, electrolytes, creatinine
- acute phase reactants: ESR, CRP
- complement (C3, C4)
- urinalysis to detect disease complications (proteinuria, active sediment)
- serology (tailored to clinical suspicion, see [Rheumatology](#), RH4)
  - antinuclear antibody (ANA), negative ANA helps to exclude SLE, positive ANA in subset of RA
  - anti-double stranded DNA (anti-dsDNA), perform anti-dsDNA and anti-smith (anti-Sm) for SLE if positive ANA
  - human leukocyte antigen B27 (HLA-B27), more consistent with reactive arthritis than RA
  - anti-histidyl tRNA synthetase autoantibodies (anti-Jo1), positive in dermatomyositis and polymyositis
  - anti-Sm
  - anti-La antibodies (anti-La), positive in Sjögren's disease
  - anti-Sjögren's-syndrome-related antigen A (anti-SSA/Ro), positive in Sjögren's disease
  - rheumatoid factor (Rf), positive in RA and other conditions including Sjögren's disease
  - anti-cyclic citrullinated peptide (anti-CCP), positive in RA
- synovial fluid analysis (cell count and differential, culture, Gram stain, microscopy)
- radiology (plain film, CT, MRI, U/S, bone densitometry, bone scan)

### Treatment

- tailor therapy depending on the specific cause; consider referral to rheumatologist
- non-pharmacological: patient education, lifestyle modification, assisted devices, physiotherapy, occupational therapy
- pharmacological: analgesia (acetaminophen, NSAIDs), anti-inflammatory (disease-modifying anti-rheumatic drugs (DMARDs), steroids, antibiotics
  - if osteoarthritis, consider steroid injections, hyaluronic acid injections

## Low Back Pain

- see [Orthopaedic Surgery](#), OR28
- Clinically Organized Relevant Exam (CORE) Back Tool: <https://cep.health/clinical-products/low-back-pain/>

### Definition

- acute: <6 wk
- subacute: 6-12 wk
- chronic: >12 wk

### Epidemiology

- 5th most common reason for visiting a physician
- lifetime prevalence: 90%, peak prevalence: ages 45-60
- largest WSB category and most common cause of chronic disability for individuals <45 y/o
- 90% resolve in 6 wk, <5% become chronic

### Signs and Symptoms of Inflammatory Arthritis

#### WARM(S) Joints

- Worse with rest, better with activity
- Awakening in the latter half of the night
- Redness around joint
- Morning stiffness (>30 min)
- Soft tissue swelling, erythema

### Systemic Features

- Fever (SLE, infection)
- Rash (SLE, psoriatic arthritis)
- Nail abnormalities (psoriatic, reactive arthritis)
- Uveitis (psoriatic, reactive arthritis, ankylosing spondylitis)
- Myalgias (fibromyalgia, myopathy)
- Weakness (polymyositis, neuropathy)
- GI symptoms (scleroderma, IBD)
- GU symptoms (reactive arthritis, gonococemia)

**Etiology**

- source of pain can be local, radicular, referred, or related to a psychiatric illness
- 98% are mechanical causes (worse with movement, better with rest)
  - soft tissue: sprain (ligament), strain (muscle)
  - spine: facet joint/disc degeneration, disc herniation, spinal stenosis (e.g. spondylosis), spondylolisthesis, compression fracture
  - other: pregnancy
- 2% are non-mechanical causes
  - surgical emergencies
    - ♦ cauda equina syndrome (areflexia, lower extremity weakness, saddle anesthesia, fecal incontinence, urinary retention)
- abdominal aortic aneurysm (pulsatile abdominal mass)
  - medical conditions
- neoplastic: primary, metastatic, multiple myeloma
- infectious: osteomyelitis, TB
- metabolic: osteoporosis, osteomalacia, Paget's disease
- rheumatologic: ankylosing spondylitis, polymyalgia rheumatica
- referred pain: perforated ulcer, pancreatitis, pyelonephritis, ectopic pregnancy, herpes zoster

**Physical Exam**

- inspection: curvature, posture, gait
- palpation: bony deformities/tenderness, paraspinal muscle bulk/tenderness, trigger points
  - percussion of spine to elicit pain due to fracture or infection
- range of motion and peripheral pulses
- neurologic exam for L4/L5/S1 helps determine level of spinal involvement (power, reflexes, sensation)
- special tests
  - straight leg raise (positive if pain at <70° and aggravated by ankle dorsiflexion), positive test is indicative of sciatica
  - crossed straight leg raise (raising of uninvolved leg elicits pain in leg with sciatica), more specific than straight leg raise
  - femoral stretch test (patient prone, knee flexed, examiner extends hip) to diagnose L4 radiculopathy

**Investigations**

- plain films not recommended in initial evaluation
- if infection/cancer suspected: CBC, ESR
- if neurologic deficits worsening or infection/cancer suspected: consider CT or MRI

**Table 22. Approach to Non-Traumatic Low Back Pain**

	Back Dominant (Pain greatest above gluteal fold)		Leg Dominant (Pain greatest below gluteal fold)	
	Pattern 1	Pattern 2	Pattern 3	Pattern 4
<b>History</b>	Worse with flexion Constant/intermittent	Worse with extension Never worse with flexion Always intermittent	Pain changes with back movement/position Currently/previously constant	Worse with activity Improves with rest and posture change Intermittent/short duration
<b>Physical Exam</b>	Normal neurological exam Fast responder Improves with extension Slow responder No change or worsens with extension	Normal neurological exam ± improves with flexion Worse with extension	Leg pain can improve but not disappear Positive straight leg raise ± conduction loss Fast responder Improves with specific back position Slow responder Not better with position changes	No irritative findings ± conduction loss
<b>Likely Pathology</b>	Disc pain	Facet joint pain	Compressed nerve pain: sciatica	Symptomatic spinal stenosis: neurogenic claudication
<b>Initial Management</b>	Scheduled extension Lumbar roll Night lumbar roll Medication as required: acetaminophen + NSAIDs	Scheduled flexion Limited extension Night lumbar roll Medication as required: acetaminophen + NSAIDs	Prone extension Supine "2" lie Lumbar roll Night lumbar roll Medication as required: acetaminophen + NSAIDs, may consider if 1st line not sufficient	Abdominal exercises Night lumbar roll Sustained flexion Pelvic tilt Medication as required: acetaminophen + NSAIDs

Adapted from: American Academy of Orthopaedic Surgeons. Acute care: nontraumatic low back pain. Orthopaedic Knowledge Update: Spine 2 2001:153-166  
 Adapted from: Centre for Effective Practice. Clinically Organized Relevant Exam (CORE) Back Tool. 2016

**A Summary of the Guideline for the Evidence-Informed Primary Care Management of Low Back Pain**  
*This evidence-informed guideline is for non-specific, non-malignant low back pain in adults only*

**Red Flags** help identify rare, but potentially serious conditions. They include:

- Features of Cauda Equina Syndrome including sudden or progressive onset of loss of bladder/bowel control, saddle anesthesia (**EMERGENCY**)
- Severe worsening pain, especially at night or when lying down (**URGENT**)
- Significant trauma (**URGENT**)
- Weight loss, history of cancer, fever (**URGENT**)
- Use of steroids or intravenous drugs (**URGENT**)
- Patient with first episode of severe back pain >50 y/o, especially >65 y/o (**SOON**)
- Widespread neurological signs (**SOON**)

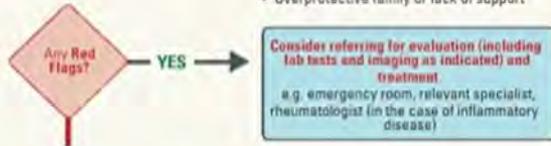

**EMERGENCY** — referral within hours  
**URGENT** — referral within 24-48 h  
**SOON** — referral within weeks

**Conduct a full assessment including:**

- History taking
- Physical and neurological exam
- Evaluation of **Red Flags**
- Psychosocial risk factors/**Yellow Flags**

**Yellow Flags** indicate psychosocial barriers to recovery. They include:

- Belief that pain and activity are harmful
- 'Sickness behaviours' (like extended rest)
- Low or negative mood, social withdrawal
- Treatment expectations that do not fit best practice
- Problems with claim and compensation
- History of back pain, time off, other claims
- Problems at work, poor job satisfaction
- Heavy work, unsociable hours (shift work)
- Overprotective family or lack of support

**ACUTE and SUBACUTE**  
*(within 12 wk of pain onset)*

- Educate patient that low back pain typically resolves within a few weeks (70% in 2 wk; 90% in 6 wk)
- Prescribe self-care strategies including alternating cold and heat, continuation of usual activities as tolerated
- Encourage early return to work
- Recommend physical activity and/or exercise
- Consider analgesics in this order:
  - Acetaminophen
  - NSAIDs (consider PPI)
  - Short course muscle relaxants
  - Short-acting opioids (rarely, for severe pain)
- Spinal traction, TENS not recommended

1-6 WK

Reassess (including **Red Flags**) if patient is not returning to normal function or symptoms are worsening

- Consider Referral**
- Physical therapist
  - Chiropractor
  - Osteopathic physician
  - Physician specializing in musculoskeletal medicine
  - Spinal surgeon (for unresolving radicular symptoms)
  - Multidisciplinary pain program (if not returning to work)

**CHRONIC**  
*(more than 12 wk since pain onset)*

- Prescribe physical or therapeutic exercise
- Analgesic Options
  - Acetaminophen
  - NSAIDs (consider PPI)
  - Low dose tricyclic antidepressants
  - Short term cyclobenzaprine for flare-ups
- Referral Options
  - Community-based active rehabilitation program
  - Community-based self management/cognitive behavioural therapy program
- Additional Options
  - Progressive muscle relaxation
  - Acupuncture
  - Massage therapy, TENS as adjunct to active therapy
  - Aqua therapy and yoga
- MODERATE TO SEVERE PAIN
  - Opioids (for appropriate patients: refer to the Canadian National Opioid Guideline endorsed by the College of Physicians and Surgeons of Alberta at <http://nationalpaincentre.mcmaster.ca/opioid>)
  - Referral Options
    - Multidisciplinary chronic pain program
    - Epidural steroids (for short-term relief of radicular pain)
    - Prolotherapy, facet joint injections, and surgery in carefully selected patients

**Message for Low Back Pain**  
 Cochrane DB Syst Rev 2015:4

**Purpose:** To evaluate the effect of massage therapy for non-specific low back pain.  
**Methods:** Meta-analysis of randomized or quasi-randomized trials evaluating use of any massage modality (hands or mechanical device) as a treatment for non-specific low back pain.  
**Results:** 13 RCTs were identified, comparing massage therapy to other active or sham treatments. Massage was superior for pain and function on both short- and long-term follow-ups relative to sham treatment. It was similar to exercises, and superior to joint mobilization, relaxation therapy, physical therapy, acupuncture and self-care education. Benefits lasted at least 1 yr post-treatment. Acupuncture massage was associated with better results than classic (Swedish) massage, and Thai massage produced similar results to the classic massage.  
**Conclusions:** Massage may be beneficial for subacute and chronic non-specific low back pain, especially in combination with exercise and education.

**Association of Spinal Manipulative Therapy with Clinical Benefit and Harm for Acute Low Back Pain**  
 JAMA 2017;317:1451-1460

**Purpose:** To systematically review studies about the effectiveness and harms of Spinal Manipulative Therapy (SMT) for acute (<6 wk) low back pain.  
**Methods:** Systematic review and meta-analysis including RCTs and observational studies. Evidence assessed using GRADE criteria. Outcomes such as pain, function, or any harms were measured during 6 wk of SMT.  
**Results:** 15 RCTs provided moderate-quality evidence that SMT has a statistically significant association with improvements in pain (pooled mean improvement in the 100 mm visual analog pain scale, -9.95 (95% CI, -15.6 to -4.3)). 12 RCTs (1381 patients) produced moderate-quality evidence that SMT has a statistically significant association with improvements in function (pooled mean effect size, -0.39 (95% CI, -0.71 to -0.07)). No RCT reported any serious adverse event. Minor transient adverse events such as increased pain, muscle stiffness, and headache were reported 50-67% of the time in large case series of patients treated with SMT.  
**Conclusion:** SMT in acute low back pain was associated with modest improvements in pain and function at up to 6 wk, with transient minor musculoskeletal harms. However, heterogeneity in study results was large.

Edmonton, AB: Toward Optimized Practice. Appendix 1 – Summary, p. 43-44. Available from: <https://actt.albertadoctors.org/CPGs/Pages/Low-Back-Pain.aspx>. Copyright 2015, Toward Optimized Practice.

**Menopause/Hormone Therapy**

• see Gynaecology, GY36

**Definition**

• 12 mo of amenorrhea following the final menstrual period

**Epidemiology**

• mean age of menopause is 51.4 yr

**Clinical Features**

- associated with estrogen deprivation
- urogenital tract: atrophy, vaginal dryness/itching, urinary frequency/urgency/incontinence, bleeding
- vascular: vasomotor instability (e.g. hot flashes), increased risk of heart disease
- bones: bone loss, joint/muscle/back pain, fractures, loss of height
- brain: depression, irritability, mood swings, memory loss

### Management

- person-specific support and offering of health education about menopause (if desired)
- <https://www.menopauseandyou.ca>
- non-pharmacological management: encourage physical exercise, smoking cessation, and a balanced diet with adequate intake/supplementation of calcium (1200 mg/d) and vitamin D (1000 IU/d)
- pharmacological management:
  - hormone therapy (HT)
    - initiation of HT requires a thorough discussion of short- and long-term benefits and risks
    - prescribe for moderate to severe symptoms for no longer than 5 yr; routine use is not recommended
    - regimens: cyclic or continuous estrogen-progestin, estrogen only (if no uterus, patch/gel/cream/ring/vaginal tablet)
    - advantages: decreases risk of osteoporotic fractures, colorectal cancer
    - disadvantages: increases risk of breast cancer, coronary heart disease, stroke, DVT, and PE
  - venlafaxine, SSRIs, or gabapentin to ease vasomotor instability

## Osteoarthritis

- see [Rheumatology](#), RH5

### Definition

- progressive deterioration of articular cartilage and surrounding joint structures caused by genetic, metabolic, biochemical, and biomechanical factors with secondary components of inflammation

### Epidemiology

- most common form of arthritis seen in primary care
- prevalence is 10-12% and increases with age
- results in long-term disability in 2-3% of patients with OA
- almost everyone >65 yr shows signs of OA on x-ray, but only 33% of these individuals will be symptomatic

### Clinical Features

- joint pain with activity, improved with rest, morning stiffness or gelling <30 min
- deformity, bony enlargement, crepitus, limitation of movement, periarticular muscle atrophy
- usually affects distal joints of hands, spine, hips, and knees

### Investigations

- no laboratory tests for the diagnosis of OA
- hallmark radiographic features: joint space narrowing, subchondral sclerosis, subchondral cysts, osteophytes

### Management

- goals: relieve pain, preserve joint motion and function, prevent further injury
- conservative
  - patient education, weight loss, low-impact exercise (through occupational therapy/physiotherapy), assistive devices (e.g. canes, orthotics)
- pharmacological
  - consider comorbidities such as PUD, HTN, IHD, hepatic disease, and renal disease
  - medications do not alter natural course of OA
  - 1st line: acetaminophen up to 4 g/d (OA is not an inflammatory disorder)
  - 2nd line: NSAIDs (cyclooxygenase-2 (COX2) selective) in low doses for short durations
  - 3rd line: duloxetine, combination analgesics (e.g. acetaminophen and codeine)
  - other pharmacological adjuncts:
    - intra-articular corticosteroid or hyaluronic acid injections
    - topical NSAIDs (diclofenac)
    - capsaicin cream
    - oral glucosamine (evidence remains inconclusive)
- surgery
  - consider if persistent significant pain and functional impairment despite optimal pharmacotherapy (e.g. debridement, osteotomy, total joint arthroplasty)

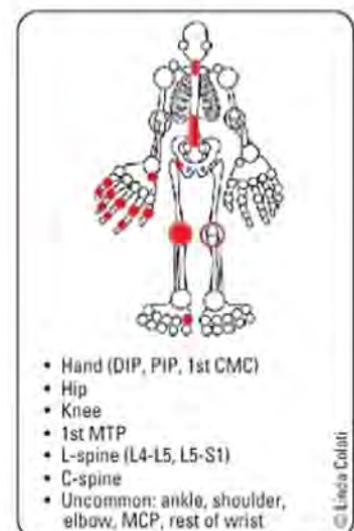

Figure 14. Common sites of involvement in OA

CMC = carpometacarpal joint

DIP = distal interphalangeal joint

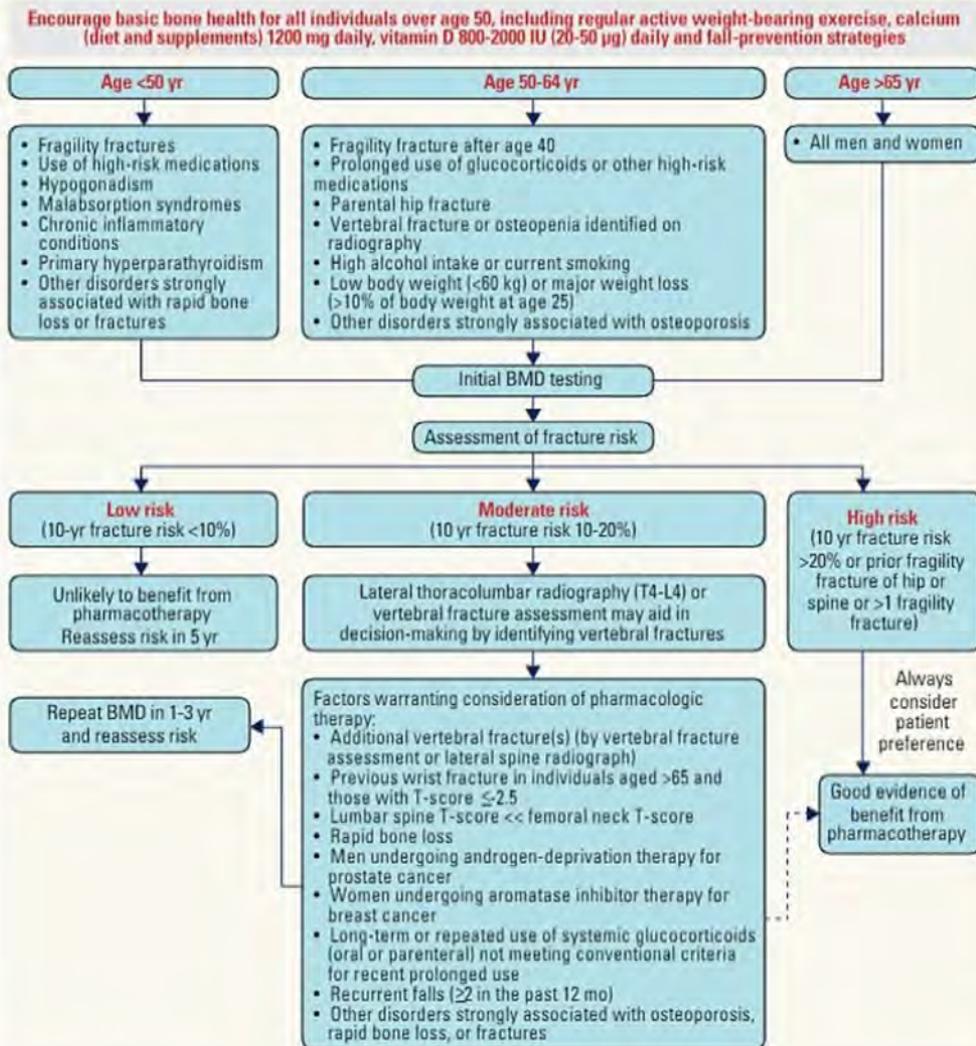

MCP = metacarpophalangeal joint

MTP = metatarsophalangeal joint

PIP = proximal interphalangeal joint

# Osteoporosis

- see [Endocrinology, E46](#)
- for current guidelines and tools see [www.osteoporosis.ca](http://www.osteoporosis.ca)

**Figure 15. 2010 Clinical practice guidelines for the diagnosis and management of osteoporosis in Canada** (Integrated management model) Adapted from: CMAJ 2010;182:1864-1873

## Definition

- age-related disease characterized by decreased bone mass and increased susceptibility to fractures

## Epidemiology

- in Canada, affects 1 in 4 women and 1 in 8 men

## Clinical Presentation

- asymptomatic for many years
- fragility or osteoporotic fractures

## Approach to Clinical Assessment

- identify risk factors on history and physical examination
- history
  - prior falls, fragility fractures, parental hip fractures, and gait or balance issues
  - glucocorticoid use
  - smoking and alcohol intake ( $\geq 3$  units/d)
  - rheumatoid arthritis
- physical examination
  - height annually (prospective loss  $>2$  cm or historical loss  $>6$  cm) and weight (weight loss  $>10\%$  since age 25)
  - rib-to-pelvis distance  $\leq 2$  fingers' breadth

### Disorders Strongly Associated with Osteoporosis Include:

Primary hyperparathyroidism, T1DM, osteogenesis imperfecta, uncontrolled hyperthyroidism, hypogonadism or premature menopause (<45 yr), Cushing's disease, chronic malnutrition or malabsorption, chronic liver disease, COPD, and chronic inflammatory conditions (e.g. IBD)

### 10 Yr Fracture Risk Assessment

FRAX (WHO Fracture Risk Assessment Tool) and CAROC (Canadian Association of Radiologists and Osteoporosis Canada) have been validated in the Canadian Population

FRAX and CAROC are available online from: <https://osteoporosis.ca/tools/>

### How Much Calcium Do We Need?

Age	Amount/day
4-8	1000 mg
9-18	1300 mg
19-50	1000 mg
>50	1200 mg

### Calcium Content of Common Foods

- 1 cup milk = 300 mg
- ¾ cup yogurt = 332 mg
- ½ can salmon with bones = 240 mg
- ½ cup cooked broccoli = 33 mg
- 1 medium orange = 50 mg

### Vitamin D Content in Food

- Milk fortified with vitamin D3 contains 100 IU per 250 mL glass
- Foods such as margarine, eggs, chicken livers, salmon, sardines, herring, mackerel, swordfish, and fish oils (halibut and cod liver oils) all contain small amounts; supplementation is necessary to obtain adequate levels as dietary intake has minimal impact
- Most multivitamins provide 400 IU of vitamin D3
- Recommended daily intake of vitamin D:
  - adults 19-50 years old, including women who are pregnant or breastfeeding: 400-1000 IU daily
  - individuals over 50 years, or younger people who have risk factors (osteoporosis, multiple fractures, or conditions affecting the absorption of vitamin D): 800-2000 IU daily

- occiput-to-wall distance >5 cm
- assess fall risk by ability to get up from chair without support with arms, and walking several steps and return

### Investigations

- CBC, Cr, corrected Ca<sup>2+</sup>, ALP, TSH, 25-hydroxyvitamin D (after 3-4 mo of adequate supplementation), and serum protein electrophoresis if there are vertebral fractures

### Indications for Bone Mineral Density Testing and Management

- see [Endocrinology, E47](#)

## Rash

- see [Dermatology, D16](#)

## Sexually Transmitted Infections

- see [Gynaecology, GY28](#)

### Definition

- diverse group of infections caused by multiple microbial pathogens
- transmitted by either secretions or fluids from mucosal surfaces

### Epidemiology

- high incidence rates worldwide
- Canadian prevalence in clinical practice
  - common: chlamydia (most common), gonorrhea (2nd most common), HPV, genital herpes
  - less common: hepatitis B, HIV, syphilis, trichomoniasis
  - rare: chancroid, granuloma inguinale, lymphogranuloma venereum
- non-sexually transmitted genital tract infections: vulvovaginal candidiasis (VVC), bacterial vaginosis (BV)
- three most common infections associated with vaginal discharge in adult women are BV, VVC, and trichomoniasis

### History

- sexual history
  - age of first intercourse, gender of sexual partners (past and present), sexual activity (oral, anal, vaginal intercourse, use of sex toys), contraception use, sexual activity during travel
  - total number of partners in the past year/month/week and duration of involvement with each
- STI history
  - STI awareness, previous STIs and testing (including Pap tests), partner communication/history regarding STIs
  - local symptoms such as burning, itching, discharge, sores, vesicles, testicular pain, dysuria, abdominal pain
  - systemic symptoms such as fever, lymphadenopathy, arthralgia

### Investigations/Screening

- individuals at increased risk should be screened for hepatitis B, HIV, and syphilis
- Pap test q3 yr for anyone with a cervix aged 25 to 69 who has ever been sexually active
- annual screening for all sexually active people under 30 for gonorrhea and chlamydia

### Management

- primary prevention is vastly more effective than treating STIs and their sequelae
- offer hepatitis B vaccine if not immune
- offer Gardasil<sup>®</sup> to females and males aged 9-14 yr
- discuss STI risk factors (e.g. decreasing the number of sexual partners)
- direct advice to ALWAYS use barrier contraception or to abstain from intercourse
- condoms are not 100% effective against HPV or HSV
- a person with an STI is not considered treated until the management of his/her partner(s) is ensured (contact tracing by Public Health)
- patients diagnosed with bacterial STI or trichomonas infection should abstain from sexual activity until treatment completion and for 7 d after treatment for both partners, or until test of cure completed
- mandatory reporting: chlamydia, gonorrhea, hepatitis B, HIV, syphilis, chancroid

When an STI is detected in a child, evaluation for sexual abuse is mandatory

#### STI Risk Factors

- Sexually active males and females <25 yr old
- Unprotected sex, sexual contact with a known case of STI, previous STI
- New sexual partner or >2 sexual partners in the past 12 mo
- Street involved, homeless, and/or substance misuse

#### Sexual History 5 P's

- Partners (numbers, gender)
- Practices (vaginal, oral, anal insertive/receptive)
- Protection
- Past history of STIs
- Pregnancy prevention

#### Efficacy of Human Papillomavirus Vaccines – A Systematic Quantitative Review

Int J Gynecol Cancer 2009;19:1166-1176

**Purpose:** To evaluate two vaccines for human papillomavirus (HPV) in terms of efficacy, safety and immunogenicity.

**Methods:** Systematic review of RCTs involving women between the ages of 9 and 26 yr, randomly assigned to receive vaccination with HPV L1 virus-like particle in either quadrivalent (HPV 6, 11, 16, 18), bivalent (HPV 16, 18), or univalent (HPV 16) form or placebo. Main outcomes were prevention of cytologically and/or histologically proven lesions (including LSIL, HSIL, VIN, VAIN, AIN, adenocarcinoma *in situ* of the cervix, or cancer of the cervix associated with HPV infection).

**Results:** Six studies involving 47236 women were included. Bivalent and quadrivalent vaccines reduced the rate of lesions in the cervix, vulva, vagina, and anogenital region with efficacy of 93% (95% CI 87-96%) and 62% (95% CI 27-70), respectively. More symptoms were found in the bivalent vaccine group (35%, 5-73%) compared to control groups.

**Conclusion:** Prophylactic vaccination can prevent HPV infection in women ages 9-26 not previously infected with HPV subtypes covered by the vaccines.

Table 23. Diagnosis and Treatment of Common STIs

	Signs and Symptoms	Investigations	Treatment	Complications
<b>Gonococcal Urethritis/Cervicitis (<i>Neisseria gonorrhoeae</i>)</b>	M: urethral discharge, unexplained pyuria, dysuria, irritation, testicular swelling, symptoms of epididymitis  F: mucopurulent endocervical discharge, vaginal bleeding, dysuria, pelvic pain, dyspareunia  M and F: often asymptomatic, can involve rectal symptoms in cases of unprotected anal sex	M: first-void urine NAAT, urethral swab for Gram stain and culture  F: vaginal swab or urine NAAT, endocervical swab for Gram stain and culture, vaginal swab for wet mount (to rule out trichomonas)  M and F: urine NAAT, rectal/pharyngeal swabs if indicated	Ceftriaxone 250 mg IM single dose* Test of cure: cultures 3-7 d post-treatment for pharyngeal infections, ongoing signs or symptoms, treatment failure, or pregnancy Repeat screening in all patients 6 mo post-treatment	M: urethral strictures, epididymitis, infertility  F: PID, infertility, ectopic pregnancy, perinatal infection, chronic pelvic pain  M and F: arthritis, increased risk of acquiring and transmitting HIV
<b>Non-Gonococcal Urethritis/Cervicitis (Usually <i>Chlamydia trachomatis</i>**)</b>	~70% asymptomatic If symptoms appear (usually 2-6 wk after infection) then similar to gonococcal symptoms (see above)	Same as above	Azithromycin 1 g PO single dose + gonococcal urethritis/cervicitis prescription* Same follow-up as above	Same as above
<b>Human Papillomavirus (genital warts, cervical dysplasia)</b>	Most are asymptomatic M: cauliflower lesions (condylomata acuminata) on skin/mucosa of penile or anal area  F: cauliflower lesions and/or pre-neoplastic/neoplastic lesions on cervix/vagina/vulva	None needed if simple condylomata Potential biopsy of suspicious lesions  F: screening for cervical dysplasia through regular Pap smears	For condylomata: cryotherapy, electrocautery, laser excision, topical therapy (patient-applied or office-based) For cervical dysplasia: colposcopy and possible excision, dependent on grade of lesion	M and F: anal cancer MSM and F who have receptive anal sex: rectal cancer  F: cervical/vaginal/vulvar cancer
<b>Genital Herpes (HSV-1 and -2)</b>	1 <sup>st</sup> episode: painful vesiculoulcerative genital lesions ± fever, tender lymphadenopathy, protracted course Recurrent episodes: less extensive lesions, shorter course may have "trigger factors"	Swab of vesicular content for culture or NAAT	1 <sup>st</sup> Episode Acyclovir 200 mg PO 5x/d x 5-10 d or Famciclovir 250 mg PO TID x 5 d or Valacyclovir 1000 mg PO BID x 10 d  Recurrent Episode Acyclovir 200 mg PO 5x/d x 5 d or 800 mg PO TID x 2 d or Famciclovir 125 mg PO BID x 5 d or Valacyclovir 500 mg PO BID x 3 d or 1000 mg PO once daily x 3 d	Genital pain, urethritis, cervicitis, aseptic meningitis, increased risk of acquiring and transmitting HIV
<b>Infectious Syphilis (<i>Treponema pallidum</i>)</b>	1 <sup>st</sup> : chancre (painless sore), regional lymphadenopathy 2 <sup>nd</sup> : rash and flu-like symptoms, meningitis, headache, uveitis, retinitis, condylome lata, mucous lesions, alopecia Latent Phase: asymptomatic 3 <sup>rd</sup> : neurologic, cardiovascular, and tissue complications	Specimen collection from 1 <sup>st</sup> and 2 <sup>nd</sup> lesions, screen high-risk individuals with serologic syphilis testing (VDRL), universal screening of pregnant women	Benzathine penicillin G 2.4 million units IM single dose Notify partners (last 3-12 mo) Continuous follow-up and testing until patients are seronegative	Chronic neurologic and cardiovascular sequelae, increased risk of acquiring and transmitting HIV

F = females; M = males

\*N.B. If urethritis/cervicitis is suspected, always treat for both gonococcal and non-gonococcal types (i.e. ceftriaxone AND azithromycin)

\*\*Most common reportable STI in Canada

## Sinusitis

- see [Otolaryngology, OT25](#)

### Definition

- acute or chronic inflammation of the sinuses, often also involving the nasal cavities

### Etiology

- viral etiology is more common
- viral: rhinovirus, influenza, parainfluenza
- bacterial: *S. pneumoniae*, *H. influenzae*, *M. catarrhalis*

### Clinical Presentation

- often presents with PODS symptoms (see [Figure 16, FM48](#))

### Management of Acute Sinusitis

- for symptom relief: oral analgesics (acetaminophen, NSAIDs), nasal saline rinse, short-term use of topical or oral decongestants
- antihistamines are ineffective
- mild to moderate acute bacterial sinusitis: intranasal corticosteroids
- severe acute bacterial sinusitis: antibiotics and intranasal corticosteroids
  - first-line antibiotic is amoxicillin, and second line may include amoxicillin-clavulanic acid or a fluoroquinolone
  - ENT referral if: anatomic defect (e.g. deviated septum, polyp, adenoid hypertrophy), failure of second-line therapy, or ≥4 episodes/yr, refer urgently for the red flags listed in the side box

#### Red Flags for Urgent Referral

- Altered mental status
- Headache
- Systemic toxicity
- Swelling of the orbit or change in visual acuity or extraocular muscles
- Hard neurological findings
- Signs of meningeal irritation
- Suspected intracranial complications (meningitis, intracranial abscess, cavernous sinus thrombosis)
- Involvement of associated structures (peri-orbital cellulitis, Pott's puffy tumour)

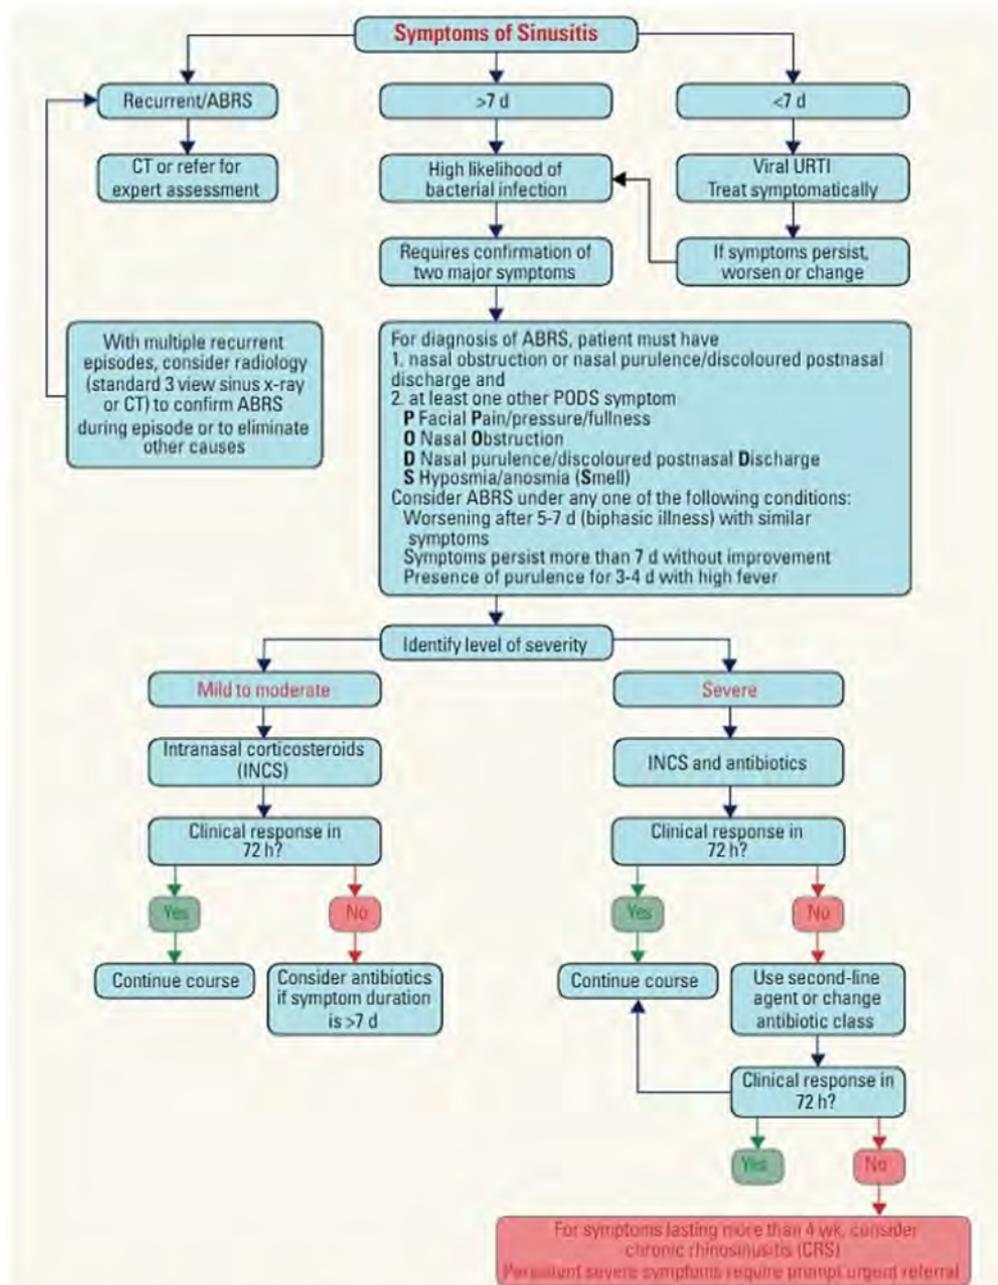

Figure 16. Diagnosis and management of sinusitis

ABRS = acute bacterial rhinosinusitis.

Adapted from: Desrosiers M, et al. Allergy Asthma Clin Immunol 2011;7:doi:10.1186/1710-1492-7-2

## Sleep Disorders

- see [Respirology](#), R29 and [Neurology](#), N48

### Definition and Clinical Presentation

- most often characterized by one of three complaints: insomnia, parasomnias, excessive daytime sleepiness
- insomnia: difficulty falling asleep, difficulty maintaining sleep, early morning waking, non-refreshing sleep
- parasomnias: night terrors, nightmares, restless leg syndrome, somnambulism (performing complex behaviour during sleep with eyes open but without memory of event)
- excessive daytime sleepiness: abnormal fatigue or tiredness extending into waking hours

### Epidemiology

- 1/3 of patients in primary care setting have occasional sleep problems, 10% have chronic sleep problems

### Etiology

- primary sleep disorders
  - primary insomnia, narcolepsy, OSA, restless leg syndrome, periodic limb movements of sleep
- secondary causes
  - medical: COPD, asthma, CHF, hyperthyroidism, chronic pain, BPH, menopause, GERD, PUD, pregnancy, neurological disorders
  - drugs: alcohol, caffeine, nicotine, nicotine replacement therapy,  $\beta$ -agonists, antidepressants, steroids, decongestants, amphetamine, cocaine, modafinil, acetylcholinesterase inhibitors, dopamine agonists, and others
  - psychiatric: mood and anxiety disorders
  - lifestyle factors: shift work, jet lag

### Investigations

- complete sleep diary every morning for 1-2 wk, see <https://app.consensusleepdiary.com/#/>
  - record bedtime, sleep latency, total sleep time, awakenings, quality of sleep
- rule out specific medical problems (e.g. CBC and differential, TSH)
- refer for sleep study, nocturnal polysomnogram, or daytime multiple sleep latency test if suspicion of sleep apnea or periodic leg movements of sleep

### Management of Specific Problems

- **primary insomnia**
  - person reacts to insomnia with fear or anxiety around bedtime or with a change in sleep hygiene, which can progress to a chronic disorder (psychophysiological insomnia)
  - consider asking the patient if they have questions or fears about sleep that you might be able to address
  - treat any suspected medical or psychiatric cause
  - exercise regularly, avoid heavy exercise within 3 h of bedtime
  - first-line treatment (CBT)
    - sleep hygiene: avoid alcohol, caffeine, nicotine; comfortable sleep environment; regular sleep schedule; no napping
    - relaxation therapy: deep breathing, meditation, biofeedback
    - stimulus control therapy: re-association of bed/bedroom with sleep, re-establishment of a consistent sleep-wake schedule, reduce activities that cue staying awake
    - sleep restriction therapy: total time in bed should closely match the total sleep time of the patient
    - address inappropriate beliefs and attitudes that perpetuate dysfunctional sleep
  - pharmacologic treatment (used to supplement CBT; short-term prescription of <14 d with appropriate follow-up in 7-14 d):
    - short-acting benzodiazepines (e.g. lorazepam) are used to:
      - break the cycle of chronic insomnia
      - manage an exacerbation of previously controlled insomnia
    - non-benzodiazepines: zopiclone, zolpidem, melatonin, sedating antidepressants (e.g. amitriptyline, trazodone)
    - if no progress or limited improvement on pharmacotherapy, consider referral to sleep medicine program
- **snoring**
  - results from soft tissue vibration at the back of the nose and throat due to turbulent airflow through narrowed air passages
  - physical exam: obesity, nasal polyps, septal deviation, hypertrophy of the nasal turbinates, enlarged uvula and tonsils
  - investigations (only if severely symptomatic): nocturnal polysomnography and airway assessment (CT/MRI)
  - treatment
    - sleep on side (position therapy), weight loss
    - nasal dilators, tongue-retaining devices, mandibular advancement devices
  - at risk of developing OSA
- **obstructive sleep apnea**
  - apnea (no breathing for  $\geq 10$  s) resulting from partial or complete upper airway obstruction due to collapse of the base of the tongue, soft palate with uvula, and epiglottis; respiratory effort is present
  - leads to a distinctive snoring, choking, awakening-type pattern as the body rouses itself to open the airway
  - apneic episodes can last from 20-180 s and occur 100-600 episodes/night
  - diagnosis is based on nocturnal polysomnography: >15 apneic/hypopneic episodes/h of sleep
  - consequences
    - daytime somnolence, non-restorative sleep
    - poor social and work performance
    - mood changes: anxiety, irritability, depression
    - sexual dysfunction: poor libido, impotence
    - morning headache (due to hypercapnia)
    - HTN (2x increased risk), CAD (3x increased risk), stroke (4x increased risk), arrhythmias
    - OSA is an independent risk factor for CAD

#### Risk Factors for Obstructive Sleep Apnea

- 2% of women, 4% of men between ages 30-60
- Obesity (due to upper airway narrowing). BMI >28 kg/m<sup>2</sup> present in 60-90% of cases
- Children (commonly due to large tonsils and adenoids)
- Aging (due to decreased muscle tone)
- Persistent URTIs, allergies, nasal tumours, hypothyroidism (due to macroglossia), neuromuscular disease
- Family history

- ♦ pulmonary HTN, right ventricular dysfunction, cor pulmonale (due to chronic hypoxemia)
- ♦ memory loss, decreased concentration, confusion
- investigations
  - ♦ evaluate BP, inspect nose, and oropharynx (enlarged adenoids or tonsils)
  - ♦ blood gas not helpful, TSH if clinically indicated
  - ♦ nocturnal polysomnography
- treatment
  - ♦ modifiable factors: avoid sleeping supine; weight loss; avoid alcohol, sedatives, opioids; inhaled steroids if nasal swelling present; dental appliances to modify mandibular position
  - ♦ primary treatment of OSA is CPAP: maintains patent airway in 95% of OSA cases
  - ♦ surgery: somnoplasty, uvulopalatopharyngoplasty (UPPP), tonsillectomy, and adenoidectomy (in children)
  - ♦ report patient to Ministry of Transportation if OSA is not controlled by CPAP

## Sore Throat (Pharyngitis)

### Definition

- inflammation of the oropharynx
- may be caused by a wide range of infectious organisms, most of which produce a self-limited infection with no significant sequelae

### Etiology

- viral: adenovirus, rhinovirus, influenza virus, RSV, Epstein-Barr virus (EBV), coxsackie virus, herpes simplex virus, cytomegalovirus (CMV), HIV
- bacterial:  $\beta$ -hemolytic *Streptococcus*, *Neisseria gonorrhoeae*, *Chlamydia pneumoniae*, *Mycoplasma pneumoniae*, *Corynebacterium diphtheriae*, *Fusobacterium necrophorum*

### Epidemiology

- viral
  - most common cause (90% in adults is viral), occurs year round
- bacterial
  - Group A  $\beta$ -hemolytic *Streptococcus* (GABHS)
    - ♦ most common bacterial cause
    - ♦ occurs most often in winter months
    - ♦ 5-15% of adult cases and up to 50% of all paediatric cases of acute pharyngitis
    - ♦ most prevalent between 5-17 y/o

### Clinical Presentation

- viral
  - pharyngitis, conjunctivitis, rhinorrhea, hoarseness, cough
  - nonspecific flu-like symptoms such as fever, malaise, and myalgia
  - often mimics bacterial infection
  - common viral infections
    - ♦ EBV (infectious mononucleosis)
      - pharyngitis, tonsillar exudate, fever, lymphadenopathy, fatigue, rash
    - ♦ coxsackie virus (hand, foot, and mouth disease)
      - primarily late summer, early fall
      - sudden onset of fever, pharyngitis, headache, abdominal pain, and vomiting
      - appearance of small vesicles that rupture and ulcerate on soft palate, tonsils, pharynx
      - ulcers are pale grey and several mm in diameter, have surrounding erythema, and may appear on hands and feet
    - ♦ herpes simplex virus
      - like coxsackie virus, but ulcers are fewer and larger
      - pharyngitis, tonsillar exudate, fever, lymphadenopathy, fatigue, rash
- bacterial
  - symptoms: pharyngitis, fever, malaise, headache, abdominal pain, absence of cough
  - signs: fever, tonsillar or pharyngeal erythema/exudate, swollen/tender anterior cervical nodes, halitosis
  - complications:
    - ♦ suppurative: abscess, sinusitis, otitis media, cervical adenitis, pneumonia
    - ♦ non-suppurative: acute rheumatic fever, acute glomerulonephritis

### Red Flags in Patients with "Sore Throat"

- Persistence of symptoms longer than 1 wk without improvement
- Respiratory difficulty (particularly stridor, croup, etc.)
- Difficulty in handling secretions (peritonsillar abscess)
- Difficulty in swallowing (Ludwig's angina)
- Severe pain in the absence of erythema (supraglottitis/epiglottitis)
- Palpable mass (neoplasm)
- Blood in the pharynx or ear (trauma)

**Table 24. Modified Centor Score: Approach to Diagnosis and Management of GABHS**

CRITERIA	POINTS	
Cough absent?	1	
History of fever >38°C?	1	
Tonsillar exudate?	1	
Swollen, tender anterior nodes?	1	
Ages 5-14	1	
Ages 15-44	0	
Ages >45	-1	
In communities with moderate levels of strep infection (10-20% of sore throats):		
<b>SCORE</b>	<b>0-2</b>	<b>3 or more</b>
Risk of GABHS	1-17%	28-53%
Suggested action	No further testing or antibiotics	Perform rapid antigen detection test (RADT) and treat with antibiotics if positive. For negative RADT and patient <20 yr, perform throat culture and treat with antibiotics if culture is positive. For negative RADT and patients ≥20 yr, no antibiotics should be given

Note: Patients who score 2 points should undergo RADT if they are under 18, immunocompromised, frail, or otherwise clinically unwell  
 Limitations:

\*This score is not applicable to patients <5 yr

\*If an outbreak or epidemic of illness caused by GABHS is occurring in any community, the score is invalid and should not be used

Adapted from: Centor RM, et al. *Med Decis Making* 1981;1:239-46; Sykes EA, et al. *Can Fam Physician*. 2020 Apr; 66(4): 251-257.

### Investigations

- suspected GABHS
  - see Table 24 for approach to diagnosis and management of GABHS
  - gold standard for diagnosis is throat culture
  - rapid antigen detection testing: high specificity (95-99%), but moderate sensitivity (85%)
  - nucleic acid detection: high sensitivity (92%)
  - populations at increased risk of GABHS complications, such as Indigenous peoples in Canada, are more likely to benefit from testing
- suspected EBV (infectious mononucleosis)
  - peripheral blood smear, heterophile antibody test (i.e. the latex agglutination assay or "monospot")

### Management

- viral pharyngitis
  - antibiotics not indicated
  - symptomatic therapy: acetaminophen/NSAIDs for fever and muscle aches, decongestants
- GABHS
  - antibiotic treatment decreases severity and duration of symptoms, risk of transmission (after 24 h of treatment), and risk of rheumatic fever and suppurative complications
  - 10 d of treatment required
  - incidence of glomerulonephritis is not decreased with antibiotic treatment
  - no increased incidence of rheumatic fever with 48 h delay in antibiotic treatment; if possible, delay antibiotic treatment until culture confirms diagnosis
  - routine F/U and/or post-treatment throat cultures are not required for most patients
  - F/U throat culture only recommended for: patients with history of rheumatic fever, patients of family member(s) with history of acute rheumatic fever, suspected streptococcal carrier
- infectious mononucleosis (EBV)
  - self-limiting course; antibiotics are not indicated
  - symptomatic treatment: acetaminophen/NSAIDs for fever, pharyngitis, malaise
  - avoid heavy physical activity and contact sports for at least 1 mo or until splenomegaly resolves because of risk of splenic rupture
  - if acute airway obstruction, give corticosteroids and consult ENT

## Palliative Care

### Principles and Quality of Life

- early identification of patients who could benefit from a palliative approach to care
- support, educate, and treat both patient and family
- address physical, psychological, social, and spiritual needs
- establish a multidisciplinary team
- focus on symptom management and comfort measures
- offer therapeutic environment and bereavement support
- ensure maintenance of human dignity

### End-of-Life Care Discussions

- see Palliative Medicine, PM6

### Power of Attorney

- see Ethical, Legal, and Organizational Medicine, ELOM14

### Instructional Advance Directives

- see Ethical, Legal, and Organizational Medicine, ELOM14

### Symptom Management

- see Palliative Medicine, PM9

## Complementary and Integrative Medicine

### Prevalence and Use

- 50-75% of Canadians report some use of CAM over their lifetime, but only half will disclose this use to their physician
- use is highest in Western provinces and lowest in Atlantic provinces
- more likely to be used by younger patients and those with higher education and income
- examples: chiropractic, acupuncture, massage, naturopathy, homeopathy, traditional Chinese medicine, craniosacral therapy, osteopathy, natural health products
- Indigenous peoples may receive support from a Traditional Healer in addition to receiving allopathic/colonial medical care
- try to be cautious about your own feelings about and experiences with different types of medicine; avoid dismissing or shaming

### Natural Health Products

- over 50% of Canadians use NHPs
- most commonly used NHPs include: echinacea, ginseng, ginkgo, garlic, St. John's wort, and soy
- relatively few herbal products have been shown to be effective in clinical trials (though many have been used for millennia)
- many patients believe herbal products are inherently safe and are unaware of potential side effects and interactions with conventional medicines
- all NHPs must be regulated under The Natural Health Products Regulations as of January 1, 2004, including herbal remedies, homeopathic medicines, vitamins, minerals, traditional medicines, probiotics, amino acids, and essential fatty acids (e.g. omega-3)
- always ask patients whether they are taking any herbal product, herbal supplement, or other natural remedy. Further questions may include:
  - are you taking any prescription or non-prescription medications for the same purpose as the herbal product?
  - are you allergic to any plant products?
  - are you pregnant or breastfeeding?
- information resources: National Centre for CAM (<https://www.nccih.nih.gov/>), Health Canada website (<https://www.canada.ca/en/health-canada/services/drugs-health-products/natural-non-prescription/regulation.html>)

### Serum Creatinine Does Not Reflect Creatinine Clearance in the Elderly

Instead, use:

$$\text{CrCl} = \frac{\text{weight in kg}(140 - \text{age})(1.23)}{\text{mL/min} (\text{serum creatinine in } \mu\text{mol/L})}$$

Multiply by 0.85 for females

Limitations:

- Underestimates CrCl in patients without significant age-related decline in renal function
- Overestimates CrCl in patients with muscle mass reduced beyond normal aging

### Approach to Medication Review in the Elderly

Ask patient to bring all their current medications:

- Review Beers Criteria (2019) to identify potentially inappropriate medications
- Consider consulting <https://deprescribing.org>
- Screen for adverse drug effects and drug interactions
- Eliminate unnecessary medications (duplicate therapies or pharmacologic effects)
- Simplify dosing regimen where possible
- Discuss patient's goals of care to guide pharmacologic management of symptoms/disease
- Establish patient's understanding of medications and directions for use
- For tapering off sedatives, consider this tool: [http://www.criugm.qc.ca/images/stories/les\\_chercheurs/risk\\_ct.pdf](http://www.criugm.qc.ca/images/stories/les_chercheurs/risk_ct.pdf)

### Most Common Uses of CAM

- Back/neck problems
- Gynaecological problems
- Anxiety
- Headaches
- Digestive problems
- Chronic fatigue syndromes

Table 25. Common Herbal Products

Common Name	Reported Uses	Possible Adverse Effects	Possible Drug Interactions
Black Cohosh	Menopausal symptoms, PMS, labour induction	Hepatitis, liver failure, GI discomfort, rashes	None reported
Chamomile	Mild sedative, anxiolytic, GI complaints, skin conditions (topical)	Allergic/contact dermatitis, anaphylaxis	Anxiolytics, sedatives, cyclosporine, warfarin
Echinacea	Common cold, flu, wound treatment, URTI, cancer	Hypersensitivity, GI discomfort, avoid use if immunosuppressed	None reported
Evening Primrose	PMS, breast pain, menopausal symptoms, eczema, RA	Headache, nausea, diarrhea, stomach upset, may increase risk of some pregnancy complications	Anticoagulants, antiplatelets
Feverfew	Migraine prevention, headache, RA, anti-inflammatory, fever, menstruation problems, psoriasis, allergies, asthma, tinnitus, dizziness, nausea, vomiting, intestinal parasites	Nausea, GI discomfort, irritation of mouth/skin, miscarriage (may affect uterine contractions), "post-fever few syndrome" (headaches, sleep disturbances, myalgias, arthralgias experienced after discontinuing feverfew)	Anticoagulants
Flaxseed Oil	Laxative, menopausal symptoms, source of omega-3 fatty acids, dietary supplement for DM, cholesterol, cancer	Diarrhea, raw/unripe flaxseeds may contain potentially toxic compounds, can worsen constipation if not taken with plenty of water	Do not take with other medications as fibre content can bind drugs
Garlic	Elevated lipids/cholesterol, atherosclerosis prevention, HTN, common cold, cancer prevention	Breath/body odour, GI irritation, contact dermatitis (raw garlic) May increase postoperative bleeding	Anticoagulants, saquinavir (HIV drug)
Ginger	Nausea, motion sickness, chemotherapy or pregnancy-induced nausea, RA, osteoarthritis	Heartburn, abdominal discomfort, diarrhea, gas, increased flow of bile (use with caution in gallstone disease), not to be used for morning sickness	Anticoagulants
Ginkgo Biloba	Increases peripheral circulation (Alzheimer's disease, dementia, intermittent claudication), eye problems, tinnitus, premenstrual syndrome, vertigo	Headache, stomach upset, bleeding, severe allergic reactions (whole plant/seeds/pulp), poisonous if ingested raw/roasted	Anticoagulants, ASA
Ginseng	Energy enhancer, decreases stress, adjunct support for chemotherapy/radiation	HTN, nervousness, insomnia, breakthrough bleeding, palpitations	Stimulant medications, antihypertensives, hormonal therapies
Glucosamine (Chondroitin)	Osteoarthritis	May cause kidney damage with long-term use, impaired glucose tolerance	Anticoagulants, caution if shellfish allergy
Saw Palmetto	BPH (adjunct to finasteride), chronic pelvic pain, decreased libido, migraine, hair loss	Mild GI distress, headache	None known
St. John's Wort	Mild to moderate depression, dietary supplement for menopausal symptoms, attention-deficit hyperactivity disorder, obsessive-compulsive disorder, bladder problems, anxiety, sleep disorders, wound healing, dermatologic conditions (topical)	Photosensitivity, anxiety, dry mouth, GI symptoms, fatigue, sexual dysfunction, drowsiness, dizziness, headache, confusion	Antidepressants (SSRIs), OCPs, cyclosporine, digoxin, irinotecan (cancer medication), anticoagulants, contraindicated with indinavir
Valerian Root	Sedative, anxiolytic, depression, menopausal symptoms	Drowsiness, dizziness, headache, itching, digestive problems	CNS depressants, antihistamines, other sedatives

Zink T, Chaffin J. Herbal "health" products: What family physicians need to know. *American Family Physician* 1998;58:1133-1140. NIH National Centre for Complementary and Alternative Medicine website (<http://nccam.nih.gov/>)

## Antimicrobial Quick Reference

Condition	Microorganisms	Antimicrobial
<b>RESPIRATORY/ENT</b>		
Acute Rhinitis (common cold)	Rhinovirus, coronavirus, influenza, RSV, parainfluenza, adenovirus	None
Pharyngitis (sore throat)	Rhinovirus, adenovirus, influenza, parainfluenza, coxsackie virus, coronavirus	None
Streptococcal Pharyngitis	Group A $\beta$ -Hemolytic <i>Streptococcus</i>	<p><b>Children:</b>            1st line: penicillin V 40 mg/kg/d PO divided BID-TID (max 750 mg/d) x 10 d (use adult dose if <math>\geq 27</math> kg)            amoxicillin 40 mg/kg/d PO divided BID-TID (max 1 g/d) x 10 d            penicillin allergy (rash): erythromycin estolate 40 mg/kg/d PO divided BID-TID (max 2 g/d) x 10 d            penicillin allergy (anaphylaxis): cephalexin 25-50 mg/kg/d PO divided QID (max 1 g/d) x 10 d</p> <p><b>Adults:</b>            1st line: penicillin V 300 mg PO TID or 600 mg BID x 10 d            penicillin allergy (rash): erythromycin 250 mg PO QID x 10 d            penicillin allergy (anaphylaxis): cephalexin 250 mg PO QID x 10 d</p>
Sinusitis	<i>S. pneumoniae</i> <i>H. influenzae</i> <i>M. catarrhalis</i> <i>S. aureus</i>	<p><b>Children:</b>            1st line: amoxicillin 40-90 mg/kg/d PO divided BID-TID (max 3 g/d) x 10 d            2nd line: amoxicillin/clavulanate 45 mg/kg/d divided BID (max 3 g/d) x 10 d</p> <p><b>Adults:</b>            1st line: amoxicillin 500-1000 mg PO TID x 5-10 d            2nd line: amoxicillin/clavulanate 500 mg PO TID or 875 mg PO BID (7:1 formulation) x 5-10 d</p>
Acute Otitis Media	<i>S. pneumoniae</i> <i>H. influenzae</i> <i>M. catarrhalis</i> Group A Strep <i>S. aureus</i>	<p><b>Children:</b>            Treat with antibiotics if under age 6 mo            If ages 6-24 mo, watchful waiting appropriate if parents can observe child for 24-48 h with appropriate medical follow-up, treat with antibiotics if no better or worse at follow-up            If ages <math>&gt;24</math> mo, treat with antibiotics if worsens after 24-48 h            10 d course if ages <math>&lt;24</math> mo, 5 d course if ages <math>\geq 24</math> mo            1st line: amoxicillin 75-90 mg/kg/d PO divided BID (max 3 g/d)            2nd line: amoxicillin/clavulanate 45-60 mg/kg/d PO divided TID (7:1 formulation) x 10 d if under 35 kg            amoxicillin/clavulanate 500 mg PO TID (7:1 formulation) x 10 d if over 35 kg            Chronic TM perforation or ventilation tubes: Ciprodex<sup>®</sup> otic suspension 4 drops BID x 5 d</p> <p><b>Adults:</b>            1st line: amoxicillin 500 mg PO TID x 7-10 d            2nd line: amoxicillin/clavulanate 500 mg PO TID or 875 mg PO BID x 7-10 d            Chronic TM perforation or ventilation tubes: Ciprodex<sup>®</sup> otic suspension 4 drops BID x 5 d</p>
Otitis Externa	<i>P. aeruginosa</i> <i>Coliforms</i> <i>S. aureus</i>	<p>Cortisporin<sup>®</sup> otic solution 4 drops TID or QID (3 drops TID or QID for children)            TM defect: Ciprodex<sup>®</sup> otic suspension 4 drops BID x 5 d            Necrotizing (i.e. bone involvement): ciprofloxacin 750 mg PO BID x 4-8 wk</p>
Bronchitis	<i>H. influenzae</i> , parainfluenza, coronavirus, rhinovirus, RSV	None
Community Acquired Pneumonia: Outpatient without Comorbidity	<i>S. pneumoniae</i> <i>M. pneumoniae</i> <i>C. pneumoniae</i>	<p>1st line: amoxicillin 1000 mg PO TID x 5-7 d            (for patients over age 50 where mycoplasma infection is less likely)            If atypical organisms present, add either of the following:            clarithromycin 500 mg PO BID or 1000 mg (ER) PO once daily x 5-7 d            azithromycin 500 mg PO on 1st d then 250 mg PO once daily x 4 d or 500 mg PO once daily x 3 d            2nd line: doxycycline 200 mg PO on 1st d then 100 mg PO BID x 5-7 d            amoxicillin/clavulanate 875 mg PO BID x 5-7 d</p> <p><b>PLUS</b>            clarithromycin, azithromycin, or doxycycline as above            if treatment failure: levofloxacin 500-750 mg PO once daily x 5 d OR            moxifloxacin 400 mg PO once daily x 5 d</p>
Community Acquired Pneumonia: Outpatient with Comorbidity	<i>S. pneumoniae</i> <i>M. pneumoniae</i> <i>C. pneumoniae</i> <i>H. influenzae</i>	<p>penicillin V potassium 500 mg PO QID x 7-10 d            clindamycin 300 mg PO QID or 600 mg BID x 7-10 d</p>
<b>DENTAL INFECTIONS/PERIAPICAL AND PERIODONTAL ABSCESSSES</b>		
Dental Infections/Periapical and Periodontal Abscesses	Oral Flora	penicillin V potassium 500 mg PO QID x 7-10 d clindamycin 300 mg PO QID or 600 mg BID x 7-10 d
<b>GASTROENTEROLOGY</b>		
Diarrhea - Enteritis	<i>Enterotoxigenic E. coli</i> <i>Campylobacter</i> <i>Salmonella</i> <i>Shigella</i> Viruses Protozoa	<p>azithromycin is the preferred agent given growing resistance to quinolones, particularly in Southeast Asia</p> <p>azithromycin 1000 mg PO single dose or 500 mg PO once daily x 1-3 d (children: 10 mg/kg/d x 3 d)            ciprofloxacin 750 mg PO single dose or 500 mg PO BID x 1-3 d (prevention: 500 mg PO once daily)            levofloxacin 500 mg PO once daily x 1-3 d (prevention: 500 mg PO once daily)</p>
Diarrhea - Post Antibiotics (common with clindamycin)	<i>C. difficile</i>	<p>Mild to moderate (WBC <math>&lt;15 \times 10^9/L</math> and Cr <math>&lt;1.5 \times</math> baseline): vancomycin 125 mg PO QID x 10-14 d (children: metronidazole 30 mg/kg/d PO divided QID x 10-14 d max 2 g/d)</p> <p>Severe (WBC <math>\geq 15 \times 10^9/L</math> and Cr <math>\geq 1.5 \times</math> baseline):            vancomycin 125 mg PO QID x 10-14 d (children: vancomycin 40 mg/kg/d PO divided TID-QID x 10-14 d max 500 mg/d)</p>
Peptic Ulcer Disease (non-NSAID related)	<i>H. pylori</i>	<p>PPI PO BID + amoxicillin 1000 mg PO BID + clarithromycin 500 mg PO BID + metronidazole 500 mg PO BID x 7 d OR            PPI PO BID + bismuth subsalicylate 524 mg PO QID + metronidazole 375 mg PO QID + tetracycline 500 mg PO QID x 7-14 d</p> <p>PPI: lansoprazole 30 mg or omeprazole 20 mg or pantoprazole 40 mg or rabeprazole 20 mg</p>

Condition	Microorganisms	Antimicrobial
<b>DERMATOLOGIC</b>		
Head and Pubic Lice (crabs)	<i>Pediculus humanus capitis</i> <i>Phthirus pubis</i>	permethrin cream 1%: apply as liquid onto washed hair for 10 min, then rinse; repeat in 1 wk
Vulvovaginal Candidiasis	<i>Candida</i>	Treat only if patient is symptomatic fluconazole 150 mg PO x 1 dose miconazole 2% cream (Monistat 7 <sup>®</sup> ): one applicator (5 g) intravaginally QHS x 7 d Multiple other OTC azole treatments
Bacterial Vaginosis	Overgrowth of: <i>G. vaginalis</i> <i>M. hominis</i> Anaerobes	If patient is asymptomatic, treatment is unnecessary unless high-risk pregnancy, prior IUD insertion, gynaecologic surgery, induced abortion, or upper tract instrumentation 1st line: metronidazole 500 mg PO BID x 7 d metronidazole 0.75% gel: one applicator (5 g) intravaginally QHS x 5 d clindamycin 2% cream: one applicator (5 g) intravaginally QHS x 7 d 2nd line: metronidazole 2 g PO x 1 dose clindamycin 300 mg PO BID x 7 d
Herpes	Herpes simplex virus	1 <sup>st</sup> episode: acyclovir 200 mg PO five times daily x 5-10 d OR famciclovir 250 mg PO TID x 5 d OR valacyclovir 1000 mg PO BID x 10 d Recurrent Episode: acyclovir 200 mg PO five times daily x 5-10 d famciclovir 125 mg PO BID x 5 d valacyclovir 500 mg PO BID x 3 d or 1000 mg PO once daily x 3 d Pregnancy: 1 <sup>st</sup> episode: acyclovir 200 mg PO 5x/d x 5-10 d Prior infection within previous yr: acyclovir 200 mg PO QID at 36 wk valacyclovir 500 mg PO BID at 36 wk
Gonorrhea/Chlamydia	<i>N. gonorrhoeae</i> <i>C. trachomatis</i>	ceftriaxone 250 mg IM x 1 dose + azithromycin 1 g PO x 1 dose OR doxycycline 100 mg PO BID x 7 d No intercourse for one week after treatment
Mastitis	<i>S. aureus</i> <i>S. pyogenes</i>	cloxacillin 500 mg PO QID x 7 d cephalexin 500 mg PO QID x 7 d
Tinea Cruris/Pedis (jock itch/athlete's foot)	<i>Trichophyton</i>	clotrimazole 1% cream BID ketoconazole 2% cream BID
Uncomplicated Cellulitis	<i>S. aureus</i> Group A <i>Streptococcus</i>	<b>Children:</b> 1st line: cephalexin 50-100 mg/kg/d divided QID x 10-14 d 2nd line: cloxacillin 50 mg/kg/d divided QID x 10-14 d clindamycin 25 mg/kg/d x 10-14 d <b>Adults:</b> 1st line: cephalexin 500 mg PO QID x 10-14 d 2nd line: cloxacillin 500 mg PO QID x 10-14 d clindamycin 300 mg PO x 10-14 d

## Landmark Family Medicine Trials

Trial Name	Reference	Clinical Trial Details
<b>HYPERTENSION</b>		
DASH	N Engl J Med 1997; 336:1117-1124	<b>Title:</b> A Clinical Trial of the Effects of Dietary Patterns on Blood Pressure <b>Purpose:</b> To assess the impacts of dietary modifications on blood pressure patterns. <b>Methods:</b> RCT involving 459 patients randomized to receive a control diet, a diet rich in fruits and vegetables, or a combination diet rich in fruits, vegetables and low-fat dairy products. <b>Results:</b> The combination diet exhibited the most promising results. In normotensive patients the combination diet reduced systolic and diastolic pressure by 5.5 and 3.0 mmHg more than the control diet, respectively. Amongst patients with hypertension the combination diet reduced systolic and diastolic blood pressure by 11.4 and 5.5 mmHg, respectively. <b>Conclusion:</b> The combination diet exhibited promising results for the reduction of blood pressure.
SPRINT	N Engl J Med 2015; 373:2103-2116	<b>Title:</b> Intensive vs. Standard Blood Pressure Control <b>Purpose:</b> To assess the effectiveness of various targets for systolic blood pressure with regard to lowering cardiovascular mortality. <b>Methods:</b> RCT including 9361 patients with a systolic blood pressure >130 mmHg and high risk for cardiovascular events. Patients were randomized to a target blood pressure of 120 mmHg (standard target) or 140mmHg (intensive target). The outcomes of interest were myocardial infarction, acute coronary syndromes, stroke, heart failure, or death. <b>Results:</b> After 3 yr of follow up the prevalence of cardiovascular complications were significantly reduced within the intensive treatment group when compared to the standard treatment group - 1.65%/yr and 2.19%/yr, respectively. <b>Conclusion:</b> With regard to patients who are at high risk for cardiovascular events, intensive treatment of their blood pressure resulted in decreased incidence of major cardiovascular complications
HOPE-3	N Engl J Med 2016; 374:2021-2031	<b>Title:</b> Cholesterol Lowering in Intermediate-Risk Persons without Cardiovascular Disease <b>Purpose:</b> To assess the benefits of statins in intermediate-risk populations without cardiovascular disease. <b>Methods:</b> RCT consisting of 12705 patients who did not presently have cardiovascular disease but were deemed to be at intermediate risk. Patients were randomized to receive either 10mg of rosuvastatin per day or a placebo. The outcome of interest were death by cardiovascular cause, non-fatal myocardial infarction, or non-fatal stroke. <b>Results:</b> Low-density lipoprotein levels were reduced by 26.5% within the treatment group in comparison to those that received the placebo. The prevalence of vascular events was significantly reduced within the rosuvastatin group (3.7%) when compared to the placebo group (4.8%). <b>Conclusion:</b> The use of rosuvastatin in an intermediate-risk group without cardiovascular disease reduced the prevalence of vascular events when compared to those that did not receive treatment.

Trial Name	Reference	Clinical Trial Details
CHAP	N Engl J Med. 2022;386(19):1781.	<p><b>Title:</b> Treatment for Mild Chronic Hypertension during Pregnancy</p> <p><b>Purpose:</b> Historically, only severe hypertension (BP <math>\geq 160/110</math> mmHg) was treated. This study aims to assess the benefits of treating mild chronic non-severe hypertension (BP <math>\geq 140/90</math> mmHg).</p> <p><b>Methods:</b> RCT consisting of 2408 pregnant women with mild chronic hypertension and singleton fetuses at a gestational age of less than 23 wk. Patients were randomized to receive the standard medication for severe hypertension in pregnant women or no treatment at all. Primary outcomes were preeclampsia, medically indicated preterm birth (<math>&lt;35</math> wk gestation), placental abruption, or fetal/neonatal death.</p> <p><b>Results:</b> The incidence of the primary outcome was substantially lower within the treatment group as opposed to the control group -30.2% and 37.0%, respectively.</p> <p><b>Conclusion:</b> Targeting a blood pressure below 140/90 mmHg using anti-hypertensive medications resulted in improved health and pregnancy outcomes.</p>
<b>MENOPAUSE/HORMONE REPLACEMENT THERAPY</b>		
Women's Health Initiative Trial	JAMA 2002;288:321-333	<p><b>Title:</b> Risks and Benefits of Estrogen Plus Progestin in Healthy Postmenopausal Women</p> <p><b>Purpose:</b> To assess the impacts of combined hormone therapy in healthy post-menopausal women.</p> <p><b>Methods:</b> RCT consisting of 16608 postmenopausal women with an intact uterus. Participants were randomized to combined estrogen and progesterone, or a placebo. The outcomes of interest were coronary heart disease and breast cancer.</p> <p><b>Results:</b> Amongst the treatment group there were 286 cases of CHD, and 290 cases of breast cancer.</p> <p><b>Conclusion:</b> Results show that the overall health risks exceed the benefits of the combined hormone therapy.</p>

## Anatomy Review

### Overview of Gastrointestinal Tract

- the GI tract runs from mouth to anus ("gum to bum")

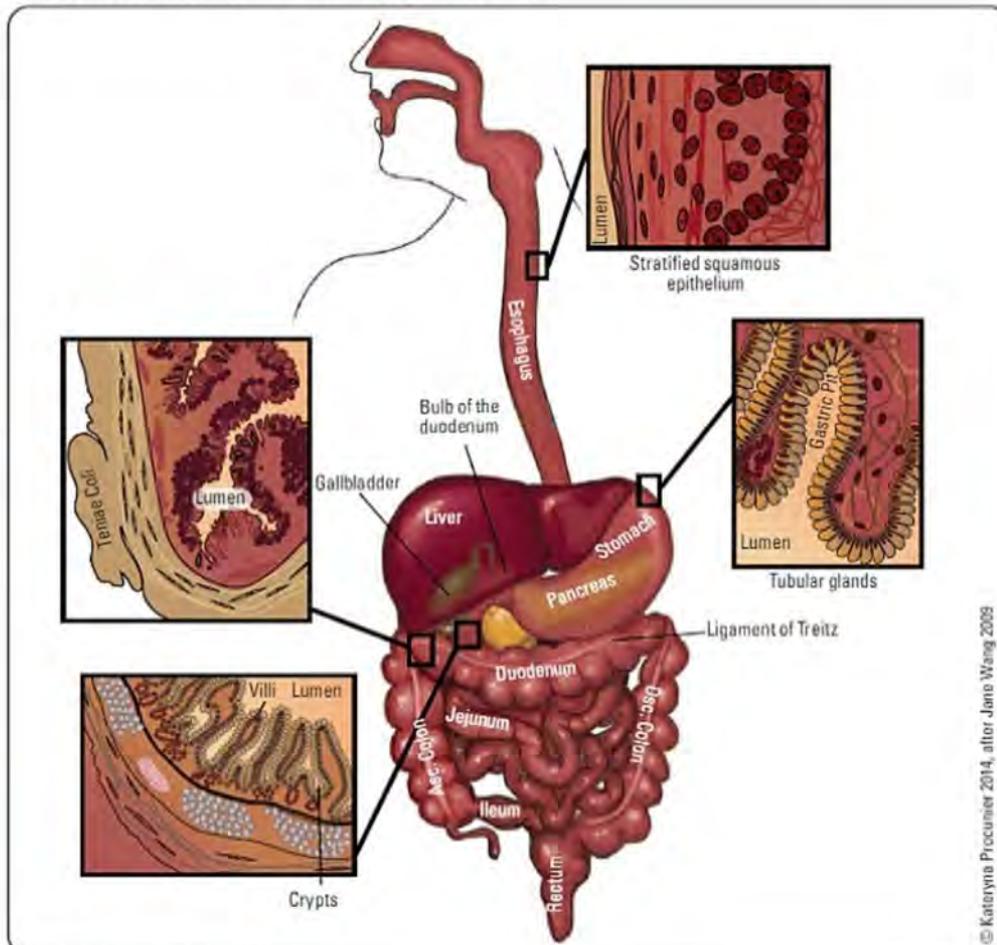

Figure 1. Overview of GI tract

Table 1. Summary of GI Tract Structure and Function

Organ	Function	Blood Supply	Innervation	Histology and Structural Features
<b>Esophagus</b>	Muscular tube approximately 40 cm long with a diameter of 2 cm Extends from the pharynx to the stomach	Arterial: left gastric artery and left inferior phrenic artery Venous: Left gastric vein → portal venous system Esophageal veins → azygos vein → inferior vena cava (systemic)	Parasympathetic innervation via anterior and posterior gastric nerves (vagal trunks) Sympathetic innervation via thoracic trunks of the greater splanchnic nerves	Mucosa: stratified squamous epithelium Submucosa: connective tissue, lymphocytes, plasma cells, nerve cells Muscularis propria (muscularis externa): inner circular, outer longitudinal muscle Upper 1/3: striated muscle Middle 1/3: transition zone Lower 1/3: smooth muscle
<b>Stomach</b>	Delivers food to intestine for digestion and absorption Secretes acid, probably to reduce enteric infections/pneumonia; facilitates digestion of protein and absorption of iron/B12 Secretes intrinsic factor (IF) to facilitate B12 absorption Minor contribution to initial protein digestion via pepsin	Lesser curvature Right and left gastric arteries (from celiac trunk) Greater curvature Right and left gastro-omental (gastroepiploic) arteries (from gastroduodenal and splenic arteries respectively) Fundus: short and posterior gastric arteries (from the splenic artery)	Parasympathetic innervation via vagus nerve Sympathetic innervation via celiac plexus (from T6-T9)	5 parts Cardia Fundus Body Antrum Pylorus
<b>Duodenum</b>	Modulates enteral pH via secretin → decreased gastric acid secretion, increased bicarbonate secretion Secretes CCK to stimulate gallbladder contraction Site of iron absorption	Branches of celiac artery and superior mesenteric artery	Parasympathetic innervation via vagus nerve Sympathetic innervation via greater and lesser splanchnic nerves	4 parts Superior (5 cm) Descending (7-10 cm) Horizontal (6-8 cm) Ascending (5 cm) 1st part is intraperitoneal; rest is retroperitoneal
<b>Jejunum</b>	Absorption of sodium, water, and nutrients (protein, carbohydrates, fat, folic acid, and vitamin A, B, C, D, E, K)	Superior mesenteric artery	Parasympathetic innervation via fibres of the posterior vagal trunk Sympathetic innervation via fibres of T8-T10	Deep red colour 2-4 cm in thickness Thick and heavy wall Plicae circulares are large, tall, and closely packed Has long vasa recta Scant fat in mesentery Scant Peyer's patches
<b>Ileum</b>	Absorption of sodium, water, nutrients, soluble vitamins (only site of vitamin B12 absorption), and bile salts (entero-hepatic circulation)	Superior mesenteric artery	Same as jejunum	When compared to jejunum: Paler pink colour 2-3 cm in thickness Thin and light walls Plicae circulares are small and sparse Contains more mesenteric fat Many Peyer's patches
<b>Large Bowel</b>	Absorption of water (5-10% of total water) Bacteria: further digestion of chyme and metabolism of undigested carbohydrate to short chain fatty acids Formation and storage of feces	Branches of superior and inferior mesenteric arteries Rectal blood supply: sigmoid, right pudendal, and rectal arteries	Parasympathetic innervation via vagus nerve Sympathetic innervation via greater and lesser splanchnic nerves	Consists of cecum, colon (ascending, transverse, descending, and sigmoid), rectum and anal canal Features include teniae coli, haustra, and omental appendices
<b>Liver</b>	Glucose homeostasis Plasma protein synthesis Lipid and lipoprotein synthesis Bile acid synthesis and secretion Vitamin A, D, E, K, B12 storage Biotransformation, detoxification Excretion of compounds	2 sources Portal vein (75-80%) Hepatic artery (20-25%)	Parasympathetic innervation via fibres of the anterior and posterior vagal trunks Sympathetic innervation via fibres of the celiac plexus	Largest internal organ Composed of 4 lobes (left, right, caudate, quadrate), and divided into 8 segments
<b>Biliary Tract</b>	Gallbladder stores and releases bile that is produced in the liver Bile emulsifies fat and is composed of cholesterol, lecithin, bile acids, and bilirubin CCK stimulates gallbladder emptying while trypsin and chymotrypsin inhibit bile release	Cystic artery	Parasympathetic innervation via vagus nerve Sympathetic and visceral innervation via celiac nerve plexus Somatic afferent fibres via right phrenic nerve	Consists of the hepatic ducts (intrahepatic, left, right and common), gallbladder, cystic duct, common bile duct, and ampulla of Vater
<b>Pancreas</b>	Endocrine function: islets of Langerhans produce glucagon, insulin, and somatostatin (from the α, β, and δ cells, respectively) Exocrine function: digestive enzymes, including amylase, lipase, trypsin, chymotrypsin, and carboxypeptidase, are produced	Anterior superior pancreaticoduodenal artery (from the celiac trunk) Anterior inferior pancreaticoduodenal artery (from the superior mesenteric artery) Dorsal pancreatic artery (from the splenic artery) Pancreatic veins drain into the portal, splenic, and superior mesenteric veins	Parasympathetic innervation via vagus nerve Sympathetic innervation via abdominopelvic splanchnic nerves	4 parts of pancreas: head (includes uncinate process), neck, body, and tail (Major) pancreatic duct connecting to common bile duct prior to ampulla of Vater Accessory pancreatic duct connected directly to duodenum

## Visualizing the Gastrointestinal Tract

- see [Medical Imaging](#), M116

### Esophagus, Stomach, Duodenum

- OGD: best visualization of mucosa; also allows for therapeutic intervention (e.g. banding varices, thermal therapy/clipping/injecting bleeding ulcers, and dilatation for the treatment of esophageal strictures)
  - consider barium swallow first if dysphagia, decreased level of consciousness (increases risk of aspiration), inability to cooperate (increases risk of pharyngeal trauma during intubation), possibility of fistulae
  - endotracheal intubation first if massive UGIB, acidemia, or inability to protect airway

### Small Bowel

- most difficult to visualize, especially if mucosal detail is needed
- CT enterography more accurate than small bowel follow-through, but both have low sensitivity
- MRI small bowel imaging increasingly available, especially useful if radiation exposure is an issue (e.g. young patient, multiple radiological images already done)
  - note: MRI enteroclysis, luminal contrast is administered by nasojejunal (NJ) tube to dilate the small bowel – disliked by both radiologist and patient, but may improve sensitivity
- “double balloon” enteroscopy (enteroscope with proximal and distal balloons to propel endoscope into jejunum from mouth or into jejunum/ileum from anus) may be most sensitive but currently available only in selected centres; technically demanding
- wireless endoscopy capsule (26 x 11 mm capsule is swallowed, transmits images to a computer; contraindicated in bowel obstruction, known strictures) is also accurate in diagnosis but does not provide any therapeutic intervention

### Colon and Terminal Ileum

- colonoscopy, with biopsy if required; contraindicated in perforation, acute diverticulitis, and severe colitis (increased risk of perforation)
- CT colonography (“virtual colonoscopy”) more accurate in diagnosing diverticulosis, extrinsic pressure on colon (e.g. ovarian cancer compressing sigmoid colon), and fistulae; increasing evidence for use in colorectal cancer screening, especially for assessment of right side of colon in cases where colonoscopy is less sensitive
  - most often used when optical endoscopic colonoscopy is risky (e.g. frail elderly) or unsuccessful (e.g. stricture)

### Pancreatic/Biliary Duct

- MRCP almost as sensitive as ERCP in determining if bile duct obstruction present, but less accurate in determining cause of obstruction (tumour, stone, stricture)
- ERCP if therapeutic intervention likely to be required (strong suspicion of stone, obstruction requiring stenting, or if tissue sampling required)
- EUS can provide detailed anatomy of biliary tree and pancreas with potential for sampling/intervention (e.g. cyst drainage)

**Acute Upper Abdominal Pain**  
Remember to rule out thoracic sources (e.g. MI, pneumonia, dissecting aneurysm)

## Differential Diagnosis of Common Complaints

- see [General Surgery](#) and [Thoracic Surgery](#), G54

Table 2. Differential Diagnosis of Common Presenting Complaints

CHRONIC/RECURRENT ABDOMINAL PAIN	Inflammatory	Neoplastic/ Vascular	Toxin	Other
	PUD Biliary colic IBD Chronic pancreatitis	Gastric cancer Recurrent bowel obstruction Mesenteric ischemia Sickle cell anemia	Lead poisoning	Mittelschmerz Endometriosis Porphyria IBS Radiculopathy Diverticular disease Anterior cutaneous nerve entrapment syndrome
ACUTE DIARRHEA	Inflammatory	Non-inflammatory		
*Causes of bloody diarrhea	<b>Bacterial</b> <i>Shigella</i> * <i>Salmonella</i> * <i>Campylobacter</i> * <i>Yersinia</i> * <i>E. coli</i> (EHEC 0157:H7)*	<b>Protozoal</b> <i>E. histolytica</i> * (amoebiasis) <i>Strongyloides</i> <b>Others</b> NSAIDs IBD* Ischemia*	<b>Bacterial</b> <i>S. aureus</i> <i>C. perfringens</i> <i>B. cereus</i> <i>E. coli</i> (enterotoxigenic, enteropathogenic) <i>Salmonella enteritidis</i> <i>Vibrio cholera</i> <b>Protozoal</b> <i>Giardia lamblia</i>	<b>Viral</b> Rotavirus Norwalk CMV <b>Drugs</b> ABx Colchicine Laxatives Antacids (magnesium)

**Obscure but Treatable Causes of Abdominal Pain**

- Acute Intermittent Porphyria
- Hereditary Angioedema
- Familial Mediterranean Fever
- Vasculitis (e.g. polyarteritis nodosa)

**Inflammatory Diarrhea:** Occurs when there is damage to the mucosal lining or brush border, which leads to a passive loss of protein-rich fluids and a decreased ability to absorb these lost fluids. Diarrhea may be profuse or very small in volume. Often associated with abdominal pain ± fever and chills. Stool may be positive for white blood cells

**Non-inflammatory Diarrhea:** No damage to the mucosal lining. Nausea/vomiting may be present. Fever, chills, blood in the stool, severe abdominal pain, or tenderness are not present. Stool is negative for white blood cells

**Table 2. Differential Diagnosis of Common Presenting Complaints**

CHRONIC DIARRHEA	Organic				Gastric cancer
*Causes of bloody diarrhea	<b>Inflammatory</b> IBD* Infectious (TB, CMV, HSV) Ischemic bowel* Radiation colitis Neoplasia  <i>C. difficile</i> rarely causes bleeding	<b>Secretory</b> Stimulant laxatives Post-ileal resection/cholecystectomy (bile salts) Bacterial toxins Vasculitis Neoplasia* (colon cancer, carcinoid, vasoactive intestinal peptide tumour (i.e. VIPoma)) Addison's disease Congenital syndromes	<b>Steatorrhea</b> <i>Giardia lamblia</i> <i>Celiac sprue</i> Chronic pancreatitis Chronic cholestasis	<b>Osmotic</b> Osmotic laxatives Lactose intolerance Chewing gum (sorbitol, mannitol)	IBS Constipation (overflow diarrhea) Anal sphincter dysfunction
<b>CONSTIPATION: if no associated rectal bleeding/weight loss, etc., usually no cause found (and dysmotility assumed)</b>					
	Colorectal cancer Stricture Extrinsic compression Anal disease Rectocele	Medications (narcotics, antidepressants, calcium channel blockers) Metabolic (DM, thyroid, hypercalcemia)	Neurologic (Parkinson's, MS, stroke) Migraine Collagen vascular disease (scleroderma, dermatomyositis)		
<b>NAUSEA/VOMITING</b>	<b>With Abdominal Pain</b>	<b>Without Abdominal Pain</b>			
	<b>Relieved by Vomiting</b>	<b>Not Relieved by Vomiting</b>	<b>Headache/Dizziness</b>	<b>No Other Symptoms</b>

IBD is a common cause of bloody diarrhea but can be diagnosed only if mimickers are excluded; such as infection, ischemia, and medication induced

**Commonly Forgotten Causes of Vomiting**

- Drugs
- Uremia
- CNS disease
- Pregnancy
- Cannabis (cannabinoid hyperemesis)

**Differentiating Between Dysphagia and Odynophagia**

- Dysphagia: Difficulty swallowing due to mechanical obstruction or dysmotility of the esophagus or pharynx
- Odynophagia: Pain when swallowing due to ulceration or inflammation (e.g. candida esophagitis) in the esophagus or pharynx

**Differential Diagnosis of Abdominal Distension**

GFs  
 Fat  
 Feces  
 Fetus  
 Flatus  
 Fluid  
 Fatal growth

**Table 2. Differential Diagnosis of Common Presenting Complaints**

JAUNDICE (UNCONJUGATED BILIRUBIN)	Overproduction	Decreased Hepatic Intake	Decreased Conjugation
	Hemolysis Ineffective erythropoiesis (e.g. megaloblastic anemias)	Gilbert's syndrome Drugs (e.g. rifampin)	Drug inhibition (e.g. chloramphenicol) Crigler-Najjar syndromes type I and II Gilbert's syndrome Neonatal jaundice
JAUNDICE (CONJUGATED BILIRUBIN)	Common	Uncommon	
	Hepatocellular disease Drugs Cirrhosis (any cause) Inflammation (hepatitis, any cause) Infiltrative (e.g. hemochromatosis) Familial disorders (e.g. Rotor syndrome, Dubin-Johnson syndrome, cholestasis of pregnancy) PBC PSC Sepsis Postoperative/TPN	Intraductal obstruction Gallstones Biliary stricture Parasites Malignancy (cholangiocarcinoma) Sclerosing cholangitis Extraductal obstruction Malignancy (e.g. pancreatic cancer, lymphoma) Metastases in periportal nodes Inflammation (e.g. pancreatitis)	

**Ischemic Colitis**

The splenic flexure and rectosigmoid junction are watershed areas and are susceptible to ischemia. History and symptoms include acute onset crampy left abdominal pain, rectal bleeding, in addition to possible abdominal tenderness on exam. Risk factors include atherosclerotic risk factors, vasoconstricting medications, and history of low flow state

**Dyspepsia** = postprandial fullness, early satiety, epigastric pain or burning

**Foods/Substances that May Aggravate GERD Symptoms (but diet does not change the underlying disease)**

- EtOH
- Caffeine
- Tobacco
- Fatty/fried foods
- Chocolate
- Peppermint
- Spicy foods
- Citrus fruit juices

# Esophagus

## Gastroesophageal Reflux Disease

**Definition**

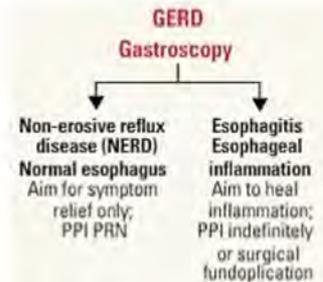

- a condition which develops when the reflux of gastric content causes troublesome symptoms or complications

**Etiology**

- inappropriate transient relaxations of LES – most common cause
- low basal LES tone (especially in scleroderma)
- contributing factors include: delayed esophageal clearance, delayed gastric emptying, obesity, pregnancy, acid hypersecretion (rare) from Zollinger-Ellison syndrome (gastrin-secreting tumour)
- hiatus hernia worsens reflux, does not cause it (see [General Surgery and Thoracic Surgery](#), GS23)

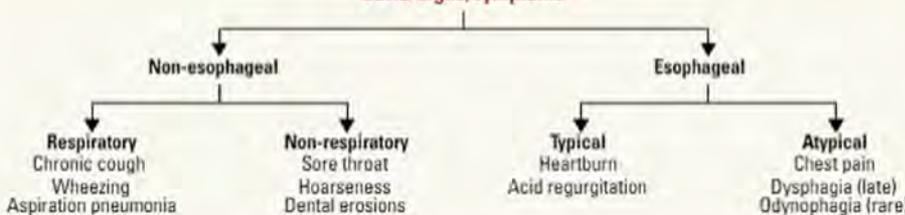

**Clinical Features**

- “heartburn” (pyrosis) and regurgitation (together are 80% sensitive and specific for reflux); less sensitive and less specific: water brash, sensation of a lump in the throat (globus sensation), and frequent belching
- non-esophageal symptoms are increasingly recognized as being poor predictors of reflux

**Figure 2. Classification and gastroscopic findings of GERD**

**GERD signs/symptoms**

**Figure 3. Signs and symptoms of GERD**

**Investigations**

- usually, a clinical diagnosis is sufficient based on symptom history and relief following a trial of pharmacotherapy (PPI: symptom relief 80% sensitive for reflux)
- however, response to anti-secretory agents such as PPI is not a requirement for GERD diagnosis
- gastroscopy indications
  - absolute indications
    - heartburn accompanied by red-flags (bleeding, weight loss, dysphagia, persistent vomiting, family history of GI cancer, etc.)
    - persistent reflux symptoms or prior severe erosive esophagitis after therapeutic trial of 4-8 wk of PPI BID
    - history suggests esophageal stricture especially dysphagia
    - high-risk for BE (male, ages >50, obese, white, tobacco use, long history of symptoms)
- repeat endoscopy after 6-8 wk of PPI therapy indicated if severe esophagitis because it can mask BE or symptoms

**Side Effects of Long-Term Use of PPIs**

- Only some (*C. difficile* diarrhea, hypomagnesemia, vitamin B12 deficiency, small bowel bacterial overgrowth) seem to be related to suppressing gastric acid whereas others (pneumonia, fractures, chronic kidney disease, dementia) have no apparent pathophysiological relationship
- Stopping PPIs can increase gastric acid above baseline by a “rebound effect” causing heartburn even in healthy volunteers
- May increase the risk of IBD with prolonged regular use
- These associations do not preclude long term use of PPIs in patients with esophagitis or peptic ulcer, or those needing gastric protection when taking NSAIDs or anti-platelet drugs, but do emphasize the importance of being as definitive as possible when making these diagnoses and accurately assessing risk-benefit ratios (as is true for all drugs)

- esophageal manometry (study of esophageal motility): indicated in patients who have non-cardiac chest pain and/or dysphagia with normal gastroscopy
  - done to diagnose abnormalities of peristalsis and/or decreased LES tone, but cannot detect presence of reflux; indicated before surgical fundoplication to ensure intact esophageal function; exclude alternative diagnoses like scleroderma and achalasia
  - surgical fundoplication (wrapping of gastric fundus around the lower end of the esophagus) more likely to alleviate symptoms if lower esophageal pressure is diminished; less likely to be successful if abnormal peristalsis
- 24 h pH monitoring: most accurate test for reflux, but not required or performed in most cases
  - most useful if PPIs do not improve symptoms

### Treatment

- PPIs are the most effective therapy and usually need to be continued as maintenance therapy
- empiric 8 wk trial of PPI in patients with classic GERD symptoms; PPIs are the most effective therapy and sometimes usually need to be continued as maintenance therapy
- discontinuation of PPIs after 8 wk in recovered patients without Barrett's esophagus or erosive esophagitis; symptoms may recur if therapy is discontinued
- on-demand: antacids ( $Mg(OH)_2$ ,  $Al(OH)_3$ ), alginate, H<sub>2</sub>-blockers, or PPIs can be used for non-erosive esophagitis (NERD)
- diet helps symptoms, not the disease; avoid EtOH, coffee, spices, tomatoes, and citrus juices
- only beneficial lifestyle changes are weight loss (if obese) and elevating the head of bed (if nocturnal symptoms)
- symptoms may recur if therapy is discontinued

### Complications

- esophageal stricture disease – scarring can lead to dysphagia (solids)
- esophagitis (e.g. ulceration, bleeding)
- BE and esophageal adenocarcinoma – gastroscopy is recommended for patients with chronic GERD or symptoms suggestive of complicated disease (e.g. anorexia, weight loss, bleeding, dysphagia)

## Barrett's Esophagus

### Definition

- metaplasia of normal squamous esophageal epithelium to intestinal columnar epithelium

### Etiology

- thought to be acquired via long-standing GERD and consequent damage to squamous epithelium

### Clinical Features

- prominent GERD symptoms

### Epidemiology

- in North America and Western Europe, 0.5-20% of adults are thought to have BE
- up to 10% of GERD patients will have already developed BE by the time they seek medical attention
- more common in males, ages >50, White individuals, smokers, overweight, hiatus hernia, and long history of reflux symptoms

### Pathophysiology

- endoscopy shows salmon pink mucosa in distal esophagus; diagnosis of BE relies on biopsy demonstrating the presence of specialized intestinal epithelium of any length within the esophagus
- BE predisposes the esophageal lining to premalignant changes characterized as low or high-grade dysplasia, which then progresses to adenocarcinoma

### Significance

- rate of malignant transformation is approximately 0.12% per yr for all BE patients prior to dysplasia
- risk of malignant transformation in high-grade dysplasia is significantly higher; studies have reported a 32-59% transformation rate over 5-8 yr of surveillance

### Treatment

- acid suppressive therapy with high-dose PPI indefinitely (or surgical fundoplication) may reduce the transformation of BE to dysplasia
- surveillance gastroscopy every 3-5 yr if no dysplasia
- high grade dysplasia: regular and frequent surveillance with intensive biopsy, endoscopic ablation/resection, or esophagectomy produce similar outcomes
  - however, evidence increasingly favouring endoscopic ablation with mucosal resection or radiofrequency ablation
- if low grade dysplasia, both surveillance (every 6 mo for 1 yr then annually) and endoscopic ablation/resection are satisfactory options

Up to 25% of patients with BE do not report symptoms of GERD

### Screening for Esophageal Adenocarcinoma in Patients with Chronic Gastroesophageal Reflux Disease

CMAJ 2020;192(27):E768-E777

Though Barrett's esophagus increases the incidence of esophageal adenocarcinoma, the Canadian Task Force on Preventive Health Care currently does not recommend routine screening for esophageal adenocarcinoma and precursor conditions, including Barrett's esophagus, in adults with chronic GERD without red flag features (e.g. dysphagia, odynophagia, weight loss, anemia, gastrointestinal bleeding). In this systematic review, no clinically significant survival benefits were identified in patients undergoing screening. This systematic review reported that patients receiving screening may be unnecessarily exposed to harm, ranging from pre-procedural anxiety to endoscopic injury. Strikingly, the presence of risk factors for esophageal adenocarcinoma, including age, male sex, and family history, is not sufficient to warrant screening endoscopy in patients with chronic GERD. On the other hand, patients with known Barrett's esophagus should be referred to a Gastroenterologist for endoscopy.

### Clinical Guidelines Update on the Diagnosis and Management of Barrett's Esophagus

Form report reviewing the US and International guidelines on the diagnosis and management of BE, please refer to: Dig Dis Sci 2018;63:2122-2128

### Randomized Trial of Medical vs. Surgical Treatment for Refractory Heartburn

NEJM 2019;381:1513-1523

Patients with PPI-refractory and reflux-related heartburn (n=78) were randomly assigned to surgical treatment (laparoscopic Nissen fundoplication), active medical treatment (omeprazole plus baclofen, and desipramine prn), or control medical treatment (omeprazole plus placebo). The incidence of treatment success in the surgical treatment group (67%) was significantly greater than that in the active medical treatment group (28%; P=0.007) or control medical treatment group (12%; P=0.001).

# Dysphagia

**Definition**

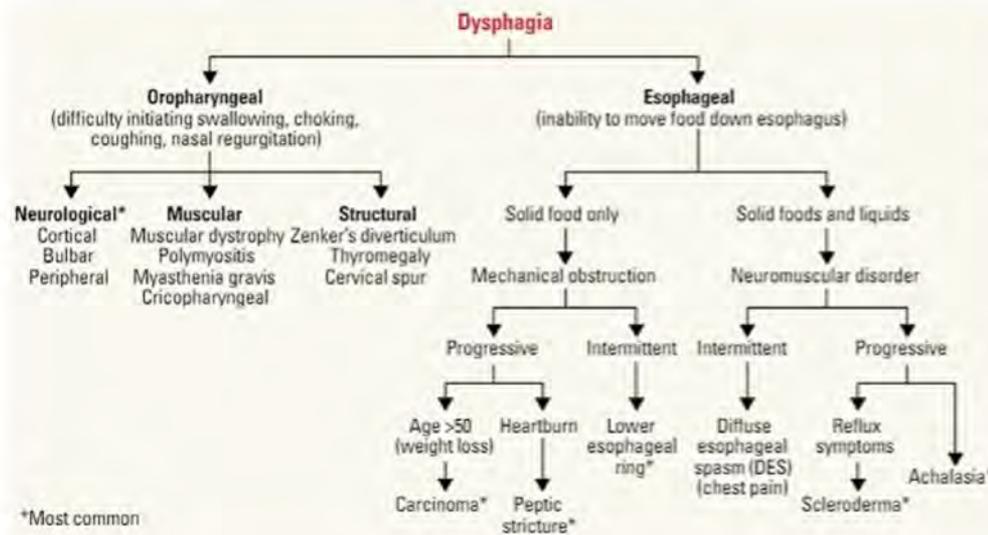

- difficulty swallowing

**Remember:**  
**Dysphagia** = Difficulty in swallowing  
**Odynophagia** = Pain on swallowing

- Key Questions in Dysphagia**
- Abnormal features when initiating the act of swallowing?
  - Associated symptoms? (regurgitation, chest pain, change in voice pitch, weight loss)
  - Solids, liquids, or both?
  - Intermittent or progressive?
  - History of heartburn?
  - Change in eating habits/diet?

\*Most common

• Figure 4. Approach to dysphagia (eosinophilic esophagitis omitted)

## Esophageal Motor Disorders

**Clinical Features**

- dysphagia with solids and liquids
- chest pain (in some disorders)

**Diagnosis**

- motility study (esophageal manometry)
- barium swallow sometimes helpful

**Causes**

- idiopathic
- achalasia
- scleroderma
- DM
- DES: rare and can be difficult to diagnose due to intermittent presentation

**Endoscopic or Surgical Myotomy in Patients with Idiopathic Achalasia**  
 NEJM 2019;381:2219-2229  
**Purpose:** To compare peroral endoscopic myotomy (POEM) to laparoscopic Heller's myotomy (LHM) in the treatment of achalasia.  
**Methods:** Patients with symptomatic achalasia (n=221) were randomly assigned to either POEM or LHM. The primary endpoint was clinical success, while secondary endpoints included adverse events, esophageal function, Gastrointestinal Quality of Life (G-QoL) score, and gastroesophageal reflux (GER).  
**Results:** 83.0% of patients in the POEM group and 81.7% of patients in the LHM group achieved clinical success at 2 yr (P=0.007 for noninferiority). There was no difference in improvement of esophageal function or G-QoL score between groups. Serious adverse events were observed in 2.7% and 7.3% of patients in the POEM and LHM groups, respectively. At 12 mo, 44% of patients in the POEM group and 29% of patients in the LHM group had reflux esophagitis.  
**Conclusions:** POEM was noninferior to LHM in the treatment of symptomatic achalasia. GER was more common among patients who were treated with POEM than those treated with LHM.

Table 3. Esophageal Motor Disorders

Disorder	Achalasia	Scleroderma	Diffuse Esophageal Spasm
<b>Definition</b>	Failure of smooth muscle relaxation at LES Increased LES pressure Progressive loss of peristaltic function	See <i>Rheumatology</i> , RH14 Systemic disease characterized by vasculopathy and tissue fibrosis (especially skin thickening)	Normal peristalsis interspersed with frequent, repetitive, spontaneous, high pressure, non-peristaltic waves (tertiary peristalsis)
<b>Etiology</b>	Usually idiopathic 2° or pseudo-achalasia e.g. malignancy, Chagas disease ( <i>Trypanosoma cruzi</i> )	Involves autoimmune, genetic, hormonal, and environmental factors Dysphagia: caused by reflux, dysmotility, or both	Idiopathic
<b>Pathophysiology</b>	Inflammatory degeneration of Auerbach's plexus → increase in LES pressure, incomplete relaxation of LES with swallowing, aperistalsis	Blood vessel damage → intramural neuronal dysfunction → distal esophageal muscle weakening → aperistalsis and loss of LES tone → reflux → stricture → dysphagia	Potential mechanisms include impaired inhibitory innervation to esophageal body, malfunction in endogenous nitric oxide synthesis
<b>Diagnosis</b>	CXR: no air in stomach, dilated esophagus Barium studies: esophagus terminates in narrowing at LES ("bird's beak") Endoscopy: normal mucosa Manometry: definitive diagnosis (signs listed above)	Clinical features of scleroderma Manometry: decreased pressure in LES, decreased peristalsis in body of esophagus	Barium x-ray: "Corkscrew pattern" Manometry: >20% premature contractions Endoscopy: normal mucosa
<b>Treatment</b>	Pneumatic dilation, 5% risk of perforation Injection of botulinum toxin into LES (temporary) Surgical myotomy POEM (peroral endoscopic myotomy)	Medical: aggressive GERD therapy (PPIs BID)	Reassurance that symptoms are not due to cardiac pain Medical: nitrates, calcium channel blockers, anticholinergics have variable benefit Surgical: long esophageal myotomy if unresponsive to above treatment (rarely helpful), balloon dilation

## Esophageal Diverticula

### Definition

- outpouchings of one or more layers of the esophageal tract

### Clinical Features

- commonly associated with motility disorders
- dysphagia, regurgitation, retrosternal pain, intermittent vomiting, may be asymptomatic

### Classification

- pharyngoesophageal (Zenker's) diverticulum
  - most common form of esophageal diverticulum
  - posterior pharyngeal outpouching most often on the left side, above cricopharyngeal muscle and below the inferior pharyngeal constrictor muscle
  - symptoms: dysphagia, regurgitation of undigested food, halitosis (bad breath)
  - treatment: small and asymptomatic: no treatment required, large and symptomatic: endoscopic or surgical myotomy of cricopharyngeal muscle ± surgical excision of sac

## Peptic Stricture (from Esophagitis)

### Definition

- a smooth, concentric narrowing most commonly seen in the lower esophagus

### Clinical Features

- presents as dysphagia alongside a long history of reflux symptoms, but reflux symptoms may disappear as stricture develops

### Diagnosis

- diagnosed with endoscopy or barium study if endoscopy contraindicated or unavailable

### Treatment

- endoscopic dilatation and indefinite PPI

## Esophageal Carcinoma

- see *General Surgery and Thoracic Surgery*, GS21

## Webs and Rings

### Definition

- web = partial occlusion (upper esophagus)
- ring = circumferential narrowing (lower esophagus)

### Clinical Features

- asymptomatic with lumen diameter >12 mm, provided peristalsis is normal
- dysphagia with large food boluses
- Schatzki ring
  - mucosal ring at squamo-columnar junction
  - causes intermittent dysphagia with solids
  - treatment involves disrupting ring with endoscopic dilation

## Infectious Esophagitis

### Definition

- severe mucosal inflammation and ulceration as a result of a viral or fungal infection

### Risk Factors

- DM
- chemotherapeutic agents
- immunocompromised states

### Clinical Features

- characteristically odynophagia, less often dysphagia

### Appearance

- *Candida* (most common): whitish-yellow plaques without visible ulceration or inflammation
- HSV (second most common), CMV: focal ulcers

### Investigations

- diagnosis via endoscopic visualization and biopsy

### Plummer-Winson Syndrome Triad

- Iron deficiency anemia
- Dysphagia
- Esophageal webs
- Rare (prevalence <1 in 1000000) but good prognosis when treated with iron and esophageal dilatation

### Eosinophilic Esophagitis

- Eosinophils infiltrate the epithelium of the esophagus
- Causes dysphagia, common cause of bolus food impaction
- Usually primary, but can be part of the spectrum of eosinophilic gastroenteritis, secondary to drugs, parasites etc.
- Often associated with allergies
- Most characteristically occurs in young men
- Diagnosis established by endoscopic biopsy, suggested by mucosal rings seen in the esophageal mucosa at endoscopy
- Treatment: (a) diet (milk, soy, eggs, wheat, peanuts/tree nuts, and seafood), (b) PPI (c) swallowed topical corticosteroid (fluticasone or budesonide), (d) rarely prednisone

**Treatment**

- *Candida*: nystatin swish and swallow (for simple *Candida* infection), ketoconazole, fluconazole
- HSV: often self-limiting; acyclovir, valacyclovir, famciclovir
- CMV: IV ganciclovir, famciclovir, or oral valganciclovir

# Stomach and Duodenum

## Dyspepsia

**Definition**

- predominant epigastric pain/burning lasting at least 1 mo
- other symptoms under umbrella of dyspepsia: post-prandial fullness, early satiety
- although the most common cause is functional (investigations show no organic disease but pain persists), sinister disease can present similarly (e.g. pancreatic cancer)

**History and Physical Exam**

- history: most important risk factors are age, associated symptoms (such as weight loss and vomiting), and drugs (especially NSAIDs)
- physical exam: adenopathy, abdominal mass/organomegaly, Carnett's sign (if pain is due to abdominal wall muscle problem then the pain will increase during muscle contraction, such as during a sit-up)

**Investigations**

- consider blood tests including CBC, liver enzymes, calcium, *H. pylori* serology, and U/S
- gastroscopy to investigate dyspepsia: most causes of dyspepsia are either functional or diagnosable by either blood tests or PPI trial (for peptic disease); however, gastric cancer should not be missed. Gastroscopy recommended if ages  $\geq 60$  (and if ages  $< 60$  and under special circumstances such as risk factors for gastric cancer)

The most common cause of dyspepsia is functional (idiopathic) dyspepsia

- Red Flags of Dyspepsia**  
(raise suspicion of gastric malignancy):
- Unintended weight loss
  - Persistent vomiting
  - Progressive dysphagia
  - Odynophagia
  - Unexplained anemia or iron deficiency
  - Hematemesis
  - Jaundice
  - Palpable abdominal mass or lymphadenopathy
  - Family history of upper GI cancer
  - Previous gastric surgery

## Stomach

Table 4. Cells of the Gastric Mucosa

Cell Type	Secretory Product	Important Notes
Parietal Cells	Gastric acid (HCl) and IF	Stimulated by histamine, acetylcholine (ACh), gastrin
Chief Cells	Pepsinogen	Stimulated by vagal input and local acid
D-Cells	Somatostatin	Inhibits release of hormones including gastrin
G-Cells	Gastrin	Stimulates H <sup>+</sup> production from parietal cells
Superficial Epithelial Cells	Mucus, HCO <sub>3</sub> <sup>-</sup>	Protect gastric mucosa

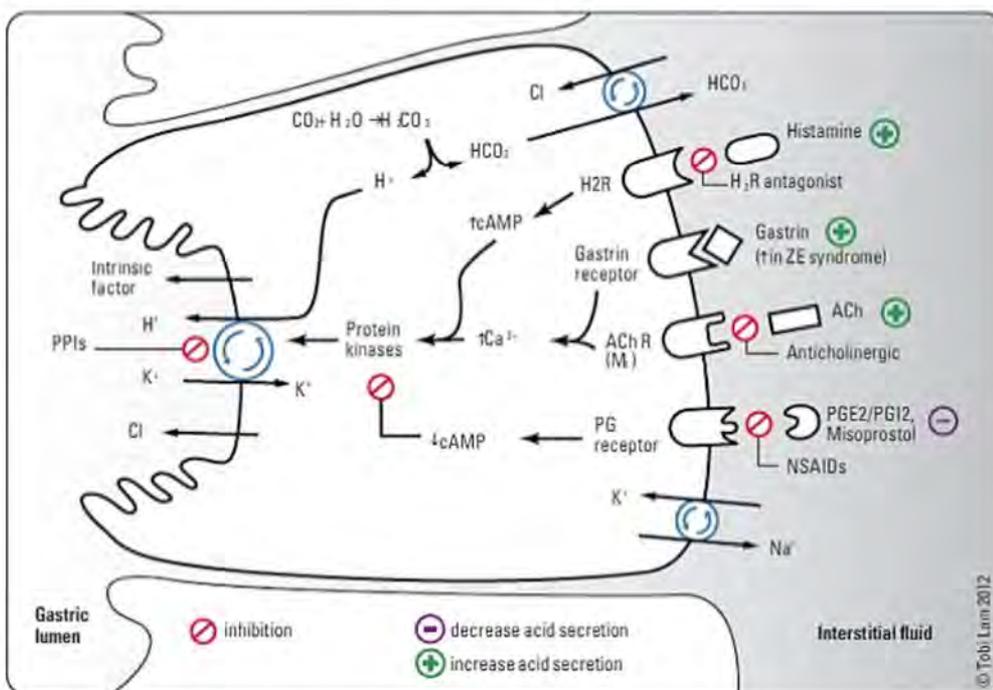

Figure 5. Stimulation of H<sup>+</sup> secretion from the parietal cell

## Gastritis

### Definition

- defined histologically: inflammation of the stomach mucosa

### Etiology

- some causative agents may play a role in more than one type of gastritis and an individual patient may have histopathological evidence of more than one type of gastritis

**Table 5. Updated Sydney Classification of Gastritis**

Type	Common Etiology
<b>Acute Gastritis</b>	
Hemorrhagic/erosive gastritis	EtOH, Aspirin <sup>®</sup> /NSAID, shock/physiological stress (seen in ICU patients)
<i>Helicobacter</i> gastritis	<i>H. pylori</i>
<b>Chronic Gastritis</b>	
Non-atrophic	<i>H. pylori</i>
Atrophic	<i>H. pylori</i> , dietary, environmental factors (multi-focal), autoimmunity
Chemical	NSAID, bile
Radiation	Radiation injury
Lymphocytic	Celiac disease, drug
Eosinophilic	Food allergies
Non-infectious granulomatous	CD, sarcoidosis
Other infectious gastritides	Bacteria, viruses, fungi, parasite, TB, syphilis

### Clinical Features

- non-erosive gastritis is asymptomatic (except with certain rare causes like CD), does not cause pain; difficult to diagnose clinically or endoscopically – requires biopsy for diagnosis
- erosive gastritis can cause bleeding (pain only if progresses to ulcers – rare); can be seen endoscopically

### Treatment

- determined by etiology (see *H. pylori*, G13, NSAID, G13 and Stress-Induced Ulceration, G14)
- non-pharmacological: avoidance of mucosal irritants such as EtOH, NSAIDs, and foods that trigger symptoms

## Peptic Ulcer Disease

### Definition

- focal defects in the mucosa that penetrate the muscularis mucosa layer
- PUD includes defects located in the stomach (gastric ulcers) and duodenum (duodenal ulcers)

### Etiology

**Table 6. Etiology of PUD**

	Duodenal	Gastric
<i>H. pylori</i> Infection	90%	60%
NSAIDs	7%	35%
Physiologic Stress-Induced	<3%	<5%
Zollinger-Ellison Syndrome	<1%	<1%
Idiopathic	15%	10%

- NSAID negative, *H. pylori* negative ulcers becoming more commonly recognized as *H. pylori* prevalence decreases
- others: CMV (especially immunocompromised patients), ischemic, idiopathic
- EtOH: damages gastric mucosa but rarely causes ulcers
- peptic ulcer associated with cigarette smoking, cirrhosis of liver, COPD, and chronic renal failure

### Clinical Features

- dyspepsia: most common presenting symptom
  - only 5% of patients with dyspepsia have ulcers, while most have functional disease
  - however, 70% of peptic ulcers are asymptomatic
- may present with complications
  - bleeding 10% (severe if from gastroduodenal artery), perforation 2% (usually anterior ulcers), gastric outlet obstruction 2%
  - posterior inflammation (penetration) 2%; may also cause pancreatitis

#### Cigarette Smoking and PUD

- Increased risk of ulcer
- Increased risk of complications
- Increased chance of death from ulcer
- Impaired healing

- duodenal ulcers: 6 classical features, but history alone cannot distinguish from functional dyspepsia
  - epigastric pain; may localize to tip of xiphoid
  - burning
  - develops 1-3 h after meals
  - relieved by eating and antacids
  - interrupts sleep
  - periodicity (tends to occur in clusters of weeks with subsequent periods of remission)
- gastric ulcers: more atypical symptoms; a biopsy is necessary to exclude malignancy

### Investigations

- endoscopy (most accurate)
- upper GI series
- *H. pylori* tests (see Table 7, G13)
- fasting serum gastrin measurement if Zollinger-Ellison syndrome suspected (but most common cause of elevated serum gastrin level is atrophic gastritis)

### Treatment

- specific management depends on etiology; (see *H. pylori*, G13, *NSAID-Induced Ulceration*, G13 and *Stress-Induced Ulceration*, G14)
- treat *H. pylori* infection if present; eradication of infection prevents recurrence of PUD
- stop NSAIDs if possible
- start PPI: inhibits parietal cell H<sup>+</sup>/K<sup>+</sup>-ATPase pump which secretes acid
  - heals most ulcers, even if NSAIDs are continued
- other medications (e.g. histamine H<sub>2</sub>-antagonists) less effective
- discontinue cigarette smoking
- no diet modifications required but some people have fewer symptoms if they avoid caffeine, EtOH, and spices

### Management of Bleeding Peptic Ulcers

- Gastroscopy (OGD) to explore upper GI tract
- IV pantoprazole
- establish risk of rebleeding/continuous bleed (since most ulcers stop bleeding spontaneously)
  - clinical risk factors: increased ages >60, bleeding diathesis, history of PUD, comorbid disease, hemodynamically unstable
  - endoscopic signs of recurrent bleeding (active bleeding, visible vessel, clot, red spot) more predictive than clinical risk factors
    - if ulcer possesses high-risk stigmata, then endoscopic therapy (e.g. clip) should be performed, consider ICU admission

#### Gastric vs. Duodenal Ulcers

Most gastric ulcers are biopsied to rule out malignancies; duodenal ulcers are rarely malignant

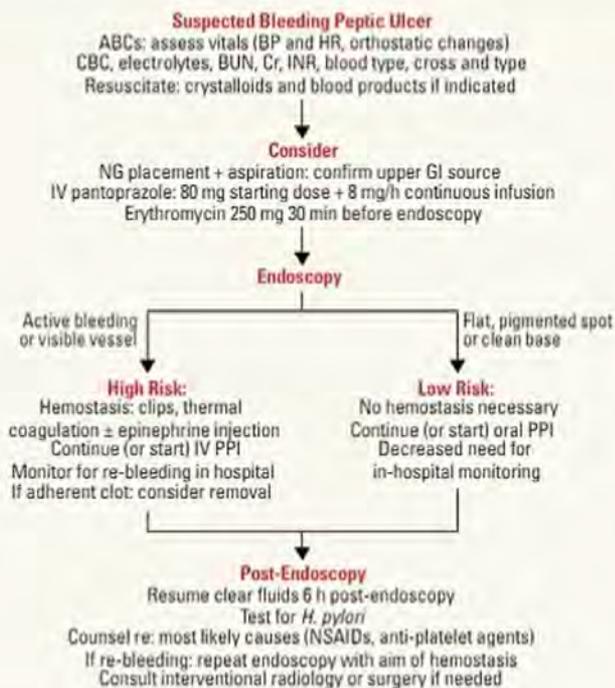

#### Approach to PUD

- Stop NSAIDs
- Acid neutralization
- *H. pylori* eradication
- Quit smoking

#### Bleeding Peptic Ulcers

- Risk Factors for Increased Mortality
- Co-existent illness
- Hemodynamic instability
- Ages >60 yr
- Transfusion required

**Figure 6. Approach to management of suspected bleeding peptic ulcer**

Adapted from: Gralnek I, Barkun A, Bardou M. Management of acute bleeding from a peptic ulcer. *NEJM* 2008;359:928-937

## H. pylori-Induced Peptic Ulceration

### Pathophysiology

- *H. pylori*: Gram-negative flagellated rod that resides within the gastric mucosa, causing persistent infection and inflammation
- acid secreted by parietal cells (stimulated by vagal ACh, gastrin, histamine) necessary for most ulcers
- etiology of PUD secondary to *H. pylori* is not well understood; however, the pattern of colonization correlates with outcome
- gastritis only in antrum (15% of patients), high gastric acid, associated with duodenal ulcer, may progress to gastric metaplasia of duodenum where ulcer forms
- gastritis throughout stomach ("pangastritis" – 85% of patients), low gastric acid, associated with stomach ulcer and cancer

### Epidemiology

- *H. pylori* is found in about 20% of all Canadians, with increased prevalence in Indigenous populations and immigrants from high prevalence countries
- highest prevalence in those raised during 1930s
- infection most commonly acquired in childhood, presumably by fecal-oral route
- high prevalence in developing countries, low socioeconomic status (poor sanitation and overcrowding)

### Outcome

- gastritis (non-erosive) occurs in 100% of patients but is asymptomatic
- peptic ulcer in 15% of patients
- gastric carcinoma and mucosal associated lymphomatous tissue (MALT) lymphoma in 0.5% of patients
- most are asymptomatic but still worthwhile eradicating to lower future risk of peptic ulcer/gastric malignancy and prevent spread to others (mostly children ages <5)

### Diagnosis

Table 7. Diagnosis of *H. pylori* Infection

Test	Sensitivity	Specificity	Comments
<b>Non-invasive Tests</b>			
Urea breath test	90-100%	89-100%	Affected by PPI therapy (false negatives)
Serology	88-99%	89-95%	Does not distinguish active vs. past infection
Can remain positive after treatment			
Fecal antigen			Only rarely used in clinical practice
<b>Invasive Tests (require endoscopy)</b>			
Histology	93-99%	95-99%	Gold standard; affected by PPI therapy (false negatives)
Rapid urease test (on biopsy)	89-98%	93-100%	Rapid
Microbiology culture	98%	95-100%	Not widely available but can be used to determine ABx susceptibility. Research only

### Treatment: *H. pylori* Eradication

- bismuth quadruple therapy recommended for 14 d: PPI (e.g. lansoprazole 30 mg BID) + bismuth 525 mg QID + metronidazole 500 mg QID + tetracycline 500 mg QID
- alternatively, concomitant non-bismuth quadruple therapy for 14 d: PPI + amoxicillin + metronidazole + clarithromycin

## NSAID-Induced Ulceration

### Pathophysiology

- NSAID use causes gastric mucosal petechiae in virtually all, erosions in most, ulcers in some (25%)
- direct: erosions/petechiae – are due to local (direct) effect of drug on gastric mucosa
- indirect: systemic NSAID effect (IV NSAID causes ulcers, but not erosions)
  - NSAIDs also inhibit mucosal cyclooxygenase, leading to decreased prostaglandin synthesis
  - this results in ulcers from reduced secretion of protective bicarbonate and mucous, and decreased mucosal blood flow

### Risk Factors for NSAID-induced Peptic Ulcer

- previous peptic ulcers/UGIB
- age ( $\geq 65$  yr)
- high dose of NSAID/multiple NSAIDs being taken
- concomitant corticosteroid use
- concomitant cardiovascular disease/other significant diseases

#### Helicobacter pylori Therapy for the Prevention of Metachronous Gastric Cancer

NEJM 2018;378:1085-1095

**Purpose:** To evaluate the role of *H. pylori* eradication in the prevention of metachronous gastric cancer.

**Study:** Double-blinded RCT.

**Population:** 470 patients with a subtotal gastrectomy for gastric cancer and *H. pylori* infection with or without ABx treatment.

**Outcome:** Incidence of metachronous gastric cancer.

**Results:** After almost 6 yr, 7.2% of the ABx-treated group developed another cancer in the gastric remnant vs. 13.4% in the placebo control group.

**Conclusions:** This provides definitive evidence that *H. pylori* is worthwhile treating no matter how advanced the gastric carcinogenic process.

Serology for *H. pylori* should not be used to check for eradication

**Clinical Features**

- erosions bleed, but usually only ulcers cause significant clinical problems
- most NSAID-induced ulcers are clinically asymptomatic; dyspepsia is as common in patients with ulcers as in patients without ulcers; NSAID-induced ulcers characteristically present with complications (bleeding, perforation, obstruction)
- NSAIDs more commonly cause gastric ulcers than duodenal ulcers
- may exacerbate underlying duodenal ulcer disease

**Treatment**

- prophylactic cytoprotective therapy with a PPI is recommended if any of the above risk factors exist concomitantly with ASA/NSAID use
- lower NSAID dose or stop all together and replace with acetaminophen
- combine NSAID with PPI or misoprostol (less effective) in one tablet
- enteric coating of Aspirin® (ECASA) provides minor benefit since this decreases incidence of erosion, not incidence of ulceration

If at high-risk for development of ulcers, prophylaxis with PPI indicated

## Stress-Induced Ulceration

**Definition**

- ulceration or erosion in the upper GI tract of ill patients, usually in ICU (stress is physiological, not psychiatric)
- lesions most commonly in fundus of stomach

**Pathophysiology**

- unclear: likely involves ischemia; may be caused by CNS disease, acid hypersecretion, Cushing's ulcers
- mechanical ventilation is the most important risk factor

**Risk Factors**

- mechanical ventilation
- anti-coagulation
- multi-organ failure
- septicemia
- severe surgery/trauma
- CNS injury ("Cushing's ulcers")
- burns involving more than 35% of body surface

**Clinical Features**

- UGIB (see *Upper Gastrointestinal Bleeding, G28*)
- painless

**Treatment**

- prophylaxis with gastric acid suppressants decreases risk of UGIB; PPI most potent but may increase risk of pneumonia; H2 blockers less potent but less likely to cause pneumonia
- treatment same as for bleeding peptic ulcer but often less successful

**Curling's and Cushing's Ulcers**

- **Curling's Ulcer:** acute peptic ulcer of the duodenum resulting as a complication from severe burns when reduced plasma volume leads to ischemia and cell necrosis (sloughing) of the gastric mucosa (think BURN from a CURLING iron)
- **Cushing's Ulcer:** peptic ulcer produced by elevated ICP (may be due to stimulation of vagal nuclei secondary to elevated ICP which leads to increased secretion of gastric acid)

## Gastric Carcinoma

- see *General Surgery and Thoracic Surgery, GS26*

## Small and Large Bowel

### Classification of Diarrhea

**Definition**

- clinically: diarrhea defined as stools that are looser and/or more frequent than normal (i.e.  $\geq 3x/d$ ); physiologically: 24 h stool weight  $>200$  g (less useful clinically)

**Classification**

- acute vs. chronic
- small volume (tablespoons of stool; typical of colonic diseases) vs. large volume ( $>1/2$  cup stool; typical of small bowel diseases)
- watery; secretory (diarrhea persists with fasting) vs. osmotic (diarrhea stops with fasting)
- steatorrhea
- inflammatory
- transit or functional

## Acute Diarrhea

- see [Paediatrics](#), P43

### Definition

- passage of  $\geq 3$  loose or liquid stools/d OR  $>200$  g stool/d for  $>2$  d but  $\leq 14$  d

### Epidemiology

- one of the leading causes of death worldwide (about 88% of diarrhea associated deaths are caused by unsafe water, inadequate sanitation, and insufficient hygiene)
- significant morbidity in developed countries (over 900000 hospitalizations in the United States each year)

### Etiology

- most commonly due to infections
- most infections are self-limiting and resolve within 7 d

### Risk Factors

- food (raw or undercooked meat and seafood, unpasteurized dairy products)
- medications: ABx, laxatives
- others: high-risk sexual activity, infectious outbreaks, occupational exposures (daycare workers), family history (IBD)

### Approach to Acute Diarrhea

- the most common cause of acute diarrhea is infectious
- in most cases, acute diarrheal illness is viral and/or self-limited, and lasts  $<3$  d
- investigations are costly and are necessary only in certain circumstances
  - therefore, evaluation of acute diarrhea involves identifying characteristics of the patient or illness that warrant further investigation and assessing volume status to determine the most appropriate method of rehydration

### Physical Exam

- volume status: appearance, level of alertness, pulse, BP, orthostatic vitals, JVP, mucous membranes, skin turgor, capillary refill
- abdominal exam: pain, guarding, peritoneal signs

**Table 8. Classification of Acute Diarrhea**

	Inflammatory	Non-inflammatory
<b>Definition</b>	Disruption of intestinal mucosa	Intestinal mucosa intact
<b>Site</b>	Usually colon	Usually small intestine
<b>Mechanism</b>	Organisms and cytotoxins invade mucosa, resulting in the destruction of mucosal cells, and perpetuation of the diarrhea	Stimulation of intestinal water secretion and inhibition of water absorption (i.e. net secretion)
<b>Sigmoidoscopy</b>	Usually abnormal mucosa seen	Usually normal mucosa seen
<b>Symptoms</b>	Bloody (not always) Small volume, high frequency Often lower abdominal cramping with urgency $\pm$ tenesmus May have fever $\pm$ shock	Watery, little or no blood Large volume, low frequency Upper/periumbilical pain/cramping $\pm$ shock
<b>Investigations</b>	Fecal WBC and RBC positive	Fecal WBC negative
<b>Etiology</b>	See <i>Differential Diagnosis of Common Complaints, G4</i>	See <i>Differential Diagnosis of Common Complaints, G4</i>
<b>Differential Diagnosis</b>	Acute presentation of idiopathic IBD	Acute presentation of non-inflammatory chronic diarrhea (e.g. celiac disease)
<b>Significance</b>	Higher yield with stool C&S Can progress to life-threatening megacolon, perforation, hemorrhage ABx may be helpful	Lower yield with stool C&S Chief life-threatening problem is electrolyte disturbances/ fluid depletion ABx unlikely to be helpful

### Investigations

- stool cultures/microscopy (C&S/O&P) are required only if diarrhea is inflammatory, severe, or for epidemiological purposes (daycare worker, nursing home resident, community outbreaks, e.g. Walkerton, etc.)
  - O&P takes up to three weeks to obtain the results
  - C&S only tests *Campylobacter*, *Salmonella*, *Shigella*, *E. coli*, *Yersinia*
    - other organisms must be ordered separately
- flexible sigmoidoscopy (without bowel preparation): useful if inflammatory diarrhea suspected
  - histology (i.e. biopsies of mucosa) helps to distinguish idiopathic IBD (CD and UC) from infectious colitis or acute self-limited colitis
- *C. difficile* toxin: indicated in cases with recent/remote antibiotic use, hospitalization, nursing home living, or recent chemotherapy

### Useful Questions in Acute Diarrhea

#### Those Fads Wilt

- Travel
- High-risk sexual activity (increased risk of fecal-oral exposure)
- Outbreaks
- Seafood
- Extra intestinal signs of IBD
- Family history
- ABx
- Diet
- Steatorrhea
- Weight loss
- Immunosuppression
- Laxatives
- Tumour history

### Infectious Causes of Inflammatory Diarrhea

#### Your Stool Smells Extremely Crappy

- Yersinia*
- Shigella*
- Salmonella*
- E. coli* (EHEC 0157:H7), *E. histolytica*
- Campylobacter*, *C. difficile*

### An Update on the Role for Bacteriotherapy SER-109, an Oral Microbiome Therapy for Recurrent *Clostridioides difficile* Infection

NEJM 2022;386:220-229

Building on the success of prior work demonstrating the efficacy of donor fecal transplant in patients with recurrent *C. difficile* infections, this randomized controlled trial shows that oral microbiome therapy (SER-109) effectively reduces the recurrence of *C. difficile* infection to 12% compared to 40% in cohorts receiving placebo. This trial along with similar prospective and retrospective work may standardize the use of medical probiotic therapy in patients with gastrointestinal disorders, including recurrent *C. difficile* infection.

### Treatment

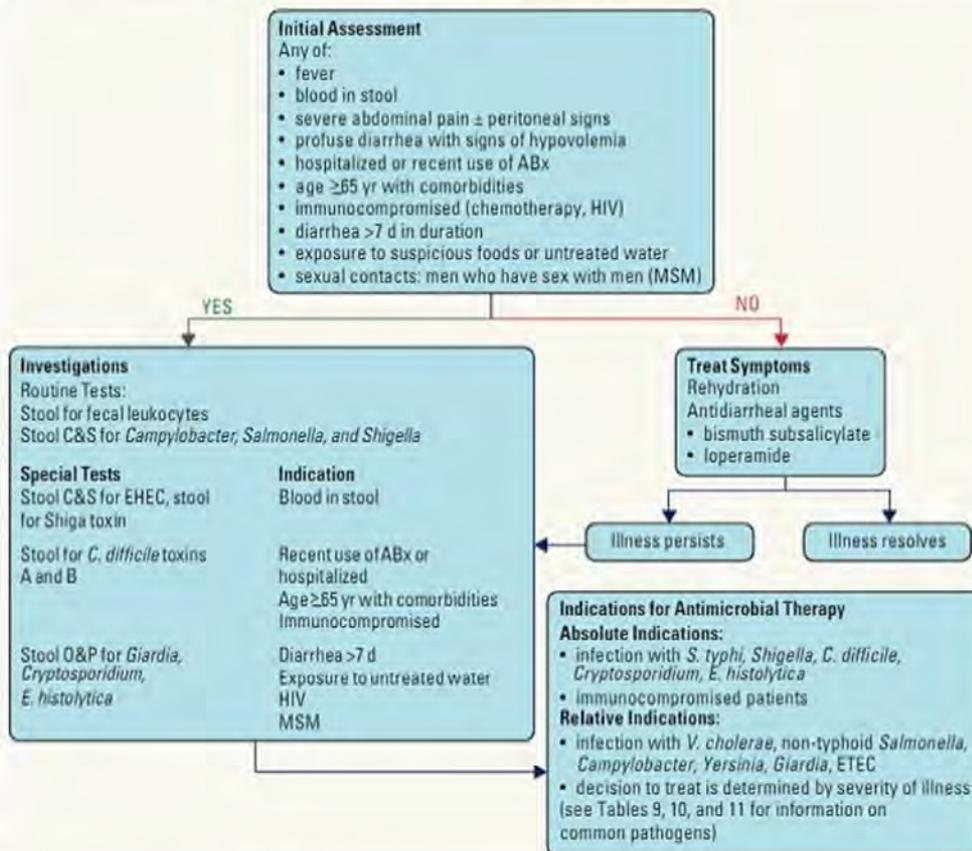

- fluid and electrolyte replacement orally in most cases, intravenously if severe extremes of age/coma
- antidiarrheals
  - antitomotility agents: diphenoxylate, loperamide (Imodium<sup>®</sup>) should be used with caution; contraindicated in patients with mucosal inflammation, bloody diarrhea
  - side effects: abdominal cramps, toxic megacolon
- modifiers of fluid transport: bismuth subsalicylate (Pepto-Bismol<sup>®</sup>) may be helpful (but should not be used in the presence of bloody diarrhea or fever)
- ABx: rarely indicated
  - risks
    - prolonged excretion of enteric pathogen (especially *Salmonella*)
    - drug side effects (including *C. difficile* infection)
    - development of resistant strains
    - renal failure/hemolysis (enterohemorrhagic *E. coli* O157:H7)
  - indications for antimicrobial agents in acute diarrhea
    - septicemia
    - prolonged fever with fecal blood (bloody diarrhea) or WBCs seen on O&P
    - clearly indicated: *Shigella*, *V. cholerae*, *C. difficile*, traveller's diarrhea (*E. coli* (ETEC)), *Giardia*, *Entamoeba histolytica*, *Cyclospora*
    - situational: *Salmonella*, *Campylobacter*, *Yersinia*, non-enterotoxigenic *E. coli*
    - *Salmonella*: always treat *Salmonella typhi* (typhoid or enteric fever); treat other *Salmonella* only if there is underlying immunodeficiency, hemolytic anemia, extremes of age, aneurysms, prosthetic valve grafts/joints, sickle cell disease
- report diarrheal illness to public health if appropriate

### Causes of Acute Bloody Diarrhea

#### CHES

*Campylobacter*  
*Hemorrhagic E. coli* (e.g. O157:H7)  
*Entamoeba histolytica*  
*Salmonella*  
*Shigella*

**Figure 7. Approach to acute diarrhea**

Note: *S. typhi* has a rose spot rash (transient maculopapular rash on anterior thorax, upper abdomen), and a prodrome of high fever, bradycardia, headache, and abdominal pain. Diarrhea is not the initial presentation.

Table 9. Bacteria in Infectious Diarrhea

Pathogen	Source or Mode of Transmission	Incubation	Clinical Features				Duration	Antimicrobial Therapy	Notes
			Fever	Bloody Stool	Abdo Pain	Nausea/Vomiting			
<b>B. cereus – Type A (emetic)</b>	Rice dishes	1-6 h	–	–	–	+	<12 h	None	Preformed exotoxin
<b>B. cereus – Type B (diarrheal)</b>	Meats, vegetables, dried beans, cereals	8-16 h	–	–	–	–	<24 h	None	Secondary endotoxin
<b>Campylobacter jejuni</b>	Uncooked meat, especially poultry	2-10 d	+	±	+	±	<1 wk	Macrolide or fluoroquinolone if diarrhea >1 wk, bloody diarrhea, or immunocompromised	Most common bacterial cause of diarrhea in Canada Associated with Guillain-Barré syndrome
<b>Clostridium difficile</b>	Can be normally present in colon in small numbers (primary risk factor for disease is exposure to antimicrobials)	Unclear	±	±	±	–	Variable	Stop culprit antibiotic therapy if possible Supportive therapy (IV fluids) Empiric treatment with either vancomycin or fidaxomicin If access to empiric treatment is limited, then metronidazole may be used For fulminant <i>C. difficile</i> infection (previously called severe), oral vancomycin is used. IV metronidazole added to regimen if ileus present	Usually follows antibiotic treatment (especially clindamycin, fluoroquinolones, penicillins, cephalosporins) Can develop pseudomembranous colitis
<b>Clostridium perfringens</b>	Contaminated food, especially meat and poultry	8-12 h	±	–	+	–	<24 h	None	<i>Clostridium</i> spores are heat resistant Secondary enterotoxin Enteroinvasive
<b>E. coli (EIEC)</b>	Contaminated food/water	1-3 d	+	±	+	–	7-10 d	None	Relatively uncommon Enterotoxigenic
<b>E. coli (ETEC)</b>	Contaminated food/water	1-3 d	–	–	+	–	3 d	Fluoroquinolone or azithromycin for moderate to severe symptoms	Most common cause of traveller's diarrhea Heat-labile and heat-stable toxins
<b>Enterohemorrhagic E. coli (EHEC/STEC) i.e. O157:H7</b>	Contamination of hamburger, raw milk, drinking, and recreational water	3-8 d	–	+	+	±	5-10 d	None: ABx increase risk of HUS	Shiga toxin production Monitor renal function: 10% develop HUS Antidiarrheals increase risk of HUS
<b>Salmonella Typhi S. Paratyphi (i.e. Enteric Fever, Typhoid)</b>	Fecal-oral Contaminated food/water Travel to endemic area	10-14 d	+	±	+	±	<5-7 d	Empiric treatment with ceftriaxone, ciprofloxacin, or azithromycin Fluoroquinolone resistance is increasing	<i>Salmonella typhi</i> : "Rose spot" rash (on anterior thorax, upper abdomen), fever, and abdominal pain precedes diarrhea
<b>Non-typhoidal Salmonellosis S. Typhimurium, S. Enteritidis</b>	Contaminated animal food products, especially eggs, poultry, meat, milk	12-72 h	+	±	+	+	3-7 d	Ciprofloxacin only in severe illness, extremes of age, joint prostheses, valvular heart disease, severe atherosclerosis, cancer, uremia	
<b>Shigella dysenteriae</b>	Fecal-oral Contaminated food/water	1-4 d	+	±	+	+	<1 wk	Fluoroquinolone	Very small inoculum needed for infection Complications include toxic megacolon, HUS Antidiarrheals may increase risk of toxic megacolon
<b>Staphylococcus aureus</b>	Unrefrigerated meat and dairy products (custard, pudding, potato salad, mayo)	2-4 h	–	–	+	+	1-2 d	None	Heat-stable preformed exotoxin
<b>Vibrio cholerae</b>	Contaminated food/water, especially shellfish	1-3 d	–	–	–	+	3-7 d	Tetracycline or fluoroquinolones (ciprofloxacin)	Massive watery diarrhea (1-3 L/d) Mortality <1% with treatment
<b>Yersinia</b>	Contaminated food Unpasteurized milk	5 d	+	±	+	±	Up to 3 wk	Fluoroquinolone only for severe illness	Majority of cases in children 1-4 yr Mesenteric adenitis and terminal ileitis can occur without diarrhea, mimicking appendicitis Can also mimic CD of terminal ileum

Table 10. Parasites in Infectious Diarrhea

Pathogen	Source or Mode of Transmission	Incubation	Clinical Features				Duration	Antimicrobial Therapy	Notes
			Fever	Bloody Stool	Abdo Pain	Nausea/Vomiting			
<i>Cryptosporidium</i>	Fecal-oral	7 d	±	-	-	+	1-20 d	Paromomycin + nitazoxanide	Immune reconstitution if immunosuppressed
<i>Entamoeba histolytica</i>	Worldwide endemic areas Fecal-oral	2-4 wk	±	+	-	-	Variable	Metronidazole + iodoquinol or paromomycin if symptomatic infection Only iodoquinol or paromomycin for asymptomatic cyst passage	If untreated, potential for liver abscess Sigmoidoscopy may show flat ulcers with yellow exudates
<i>Giardia lamblia</i>	Fecal-oral Contaminated food/water	1-4 wk	-	-	+	+	Variable	Metronidazole or nitazoxanide Treatment of asymptomatic carriers NOT recommended	Higher risk in: daycare children, intake of untreated water ("beaver fever"), MSM, immunodeficiency (decreased IgA) May need duodenal biopsy

Table 11. Viruses in Infectious Diarrhea

Pathogen	Source or Mode of Transmission	Incubation	Clinical Features				Duration	Antimicrobial Therapy	Notes
			Fever	Bloody Stool	Abdo Pain	Nausea/Vomiting			
Norovirus	Fecal-oral	24 h	-	-	+	+	24 h	None	Noroviruses include Norwalk virus
Rotavirus	Fecal-oral	2-4 d	±	-	-	±	3-8 d	None	Can cause severe dehydration Virtually all children are infected by 3 yr Oral vaccine given at 2 and 4 mo

## Traveller's Diarrhea

### Epidemiology

- most common illness to affect travellers
- up to 50% of travellers to developing countries affected in first 2 wk and 10-20% after returning home

### Etiology

- bacterial (80-90%): *E. coli* most common (ETEC), *Campylobacter*, *Shigella*, *Salmonella*, *Vibrio* (non-cholera); wide regional variation (e.g. *Campylobacter* more common in Southeast Asia)
- viral: norovirus, rotavirus, and astrovirus account for 5-8%
- protozoal (rarely): *Giardia*, *Entamoeba histolytica*, *Cryptosporidium*, and *Cyclospora* for ~10% in long-term travellers
- pathogen-negative traveller's diarrhea common despite exhaustive microbiological workup

### Treatment

- rehydration is the mainstay of therapy
  - rehydrate with sealed beverages
  - in severe fluid loss, use oral rehydration solutions (1 package in 1 L boiled or treated water)
- treat symptoms: antidiarrheal agents (e.g. rifamycin ABx, bismuth subsalicylate, loperamide)
- empiric ABx in moderate or severe illness: ciprofloxacin, azithromycin, or rifaximin  
note: there is increasing fluoroquinolone resistance in causative agents, especially in South and Southeast Asia

### Prevention

- proper hygiene practices
  - avoid consumption of: foods or beverages from establishments with unhygienic conditions (e.g. street vendors), raw fruits or vegetables without a peel, raw or undercooked meat and seafood
  - avoid untreated water
- bismuth subsalicylate (Pepto-Bismol®): 60% effective (2 tablets QID)
- antibiotic prophylaxis not recommended
  - increased risk of infection with resistant organisms
  - high-risk groups (e.g. immunocompromised individuals) likely to be infected with pathogen not covered by standard antimicrobial agents

- Dukoral<sup>®</sup>: oral vaccine that offers protection against *V. cholerae* (efficacy ~80%) and ETEC (efficacy ~50-67%)
  - two doses should be taken two weeks prior to traveling and the effect may last up to three months
  - Public Health Agency of Canada recommends that it may be considered for the following situations (not recommended for routine use in travellers):
    - increased risk of acquiring traveller's diarrhea (gastric hypochlorhydria or young children >2 yr)
    - short-term travellers who are high-risk (e.g. chronic illness) and have an increased risk of serious consequences of traveller's diarrhea (e.g. chronic renal failure, CHF, T1DM, IBD)
    - immunosuppression
    - history of repeat traveller's diarrhea
    - travellers to cholera endemic countries at increased risk of exposure
- two vaccines against *Salmonella typhi* are available and their effectiveness is estimated to be 50-70%

## Chronic Diarrhea

### Definition

- passage of frequent unformed stool for >4 wk (compared to persistent diarrhea lasting 14-30 d)

### Etiology/Classification

- majority of cases are non-infectious
- see *Differential Diagnosis of Common Complaints, G5*

### Investigations

- guided by history
- stool analysis for: *C. difficile* toxin, C&S, O&P ± fecal fat, WBC, fecal calprotectin
- blood for: CBC, electrolytes, C-reactive protein (CRP), TSH, celiac serology (IgA anti-tTG; ask for serum protein electrophoresis or immunoglobulin quantitation to rule out IgA deficiency, which has an increased frequency in celiac disease)
- colonoscopy and ileoscopy with biopsy
- upper GI endoscopy with duodenal biopsy
- wireless small bowel endoscopy capsule (low yield)
- trial of lactose free diet
  - caveat: may delay diagnosis of IBD and celiac disease

### Treatment

- approach is similar to that of acute diarrhea

## Maldigestion and Malabsorption

### Definition

- maldigestion: inability to break down large molecules in the lumen of the intestine into their component small molecules
- malabsorption: inability to transport molecules across the intestinal mucosa into circulation

### Etiology

- maldigestion
  - inadequate mixing of food with enzymes (e.g. post-gastrectomy)
  - pancreatic exocrine deficiency
  - primary diseases of the pancreas (e.g. cystic fibrosis (CF) (remember CF can result in pancreatic exocrine insufficiency as well), pancreatitis, cancer)
  - bile salt deficiency
    - terminal ileal disease (impaired enterohepatic recycling in view of loss greater than synthesis), bacterial overgrowth (deconjugation of bile salts), rarely liver disease (cholestatic, e.g. PBC)
  - specific enzyme deficiencies (e.g. lactase)
- malabsorption
  - inadequate absorptive surface
    - infections/infestations (e.g. Whipple's disease, *Giardia*)
    - immunologic (e.g. celiac disease)
    - infiltration (e.g. lymphoma, amyloidosis)
    - fibrosis (e.g. systemic sclerosis, radiation enteritis): can lead to loss of surface area but also areas of stricture formation resulting in stasis with small bowel overgrowth
    - small bowel resection (length, site, location, presence/absence of ileocecal valve, and integrity of colon are important)
    - congenital (e.g. short bowel syndrome)
    - inflammatory: extensive ileal CD (pivotal number is 100 cm as <100 cm = bile salt or cholera diarrhea, >100 cm = fatty diarrhea or steatorrhea)

- drug-induced
  - ♦ cholestyramine, ethanol, neomycin, tetracycline, and other ABx
- endocrine
  - ♦ DM (complex pathogenesis)

### Clinical Features

- symptoms usually vague unless disease is severe
- weight loss, diarrhea, steatorrhea, weakness, fatigue
- manifestations of malabsorption/deficiency

Fat Soluble Vitamins: ADEK  
vitamin A, vitamin D, vitamin E, vitamin K

**Table 12. Absorption of Nutrients and Fat Soluble Vitamins**

Deficiency	Absorption	Clinical Disease and/or Features	Investigations
<b>Iron</b>	Duodenum, upper jejunum	Hypochromic, microcytic anemia, glossitis, koilonychia (spoon nails), pica	♦ Hb, ♦ serum Fe, ♦ serum ferritin
<b>Calcium</b>	Duodenum, upper jejunum (binds to Ca <sup>2+</sup> -binding-protein in cells; levels increased by vitamin D)	Metabolic bone disease, may get tetany and paresthesias if serum calcium falls* (see <a href="#">Endocrinology, E42</a> )	♦ Serum Ca <sup>2+</sup> , ♦ serum Mg <sup>2+</sup> , and ♦ ALP Evaluate for ♦ bone mineralization radiographically (dual energy x-ray absorptiometry, DEXA)
<b>Folic Acid</b>	Jejunum	Megaloblastic anemia, glossitis, ♦ red cell folate (may see ♦ folic acid with bacterial overgrowth)	♦ Serum folic acid
<b>Vitamin B<sub>12</sub></b>	B <sub>12</sub> ingested and bound to R proteins mainly from salivary glands; stomach secretes IF in acidic medium; in basic medium, proteases from the pancreas cleave R protein and B <sub>12</sub> -IF complex forms, protecting B <sub>12</sub> from further protease attack; B <sub>12</sub> absorbed in ileum and binds to transcobalamin (TC)	Subacute combined degeneration of the spinal cord, peripheral/optic neuropathy, dementia, megaloblastic anemia, glossitis	Differentiate causes by nuclear Schilling test (when available) Positive anti-intrinsic factor antibodies and atrophic gastritis point toward pernicious anemia (see <a href="#">Hematology, H25</a> )
<b>Carbohydrate</b>	Complex polysaccharides hydrolyzed to oligosaccharides and disaccharides by salivary and pancreatic enzymes Monosaccharides absorbed in duodenum/jejunum	Generalized malnutrition, weight loss, flatulence, and diarrhea	Hydrogen breath test Trial of carbohydrate-restricted diet D-xylose test
<b>Protein</b>	Digestion at stomach, brush border, and inside cell Absorption occurs primarily in the jejunum	General malnutrition and weight loss, amenorrhea, and ♦ libido if severe	♦ Serum albumin (low sensitivity)
<b>Fat</b>	Lipase, colipase, phospholipase A (pancreatic enzymes), and bile salts needed for digestion Products of lipolysis form micelles which solubilize fat and aid in absorption Absorption occurs primarily in the jejunum Fatty acids diffuse into cell cytoplasm	Generalized malnutrition, weight loss, and diarrhea Foul-smelling feces ♦ gas Steatorrhea	Small bowel biopsy MRCP, ERCP, pancreatic function tests (not routinely available) Quantitative stool fat test (72 h) May start with qualitative stool fat test (Sudan stain of stool) C-triolein breath test (not routinely available)
<b>Vitamin A</b>	Dietary sources (e.g. milk, eggs, liver, carrots, sweet potatoes)	Night blindness Dry skin Keratomalacia	
<b>Vitamin D</b>	Skin (via UV light) or diet (e.g. eggs, fish oil, fortified milk)	Osteomalacia in adults Rickets in children	
<b>Vitamin E</b>	Dietary sources (e.g. vegetable oils, nuts, leafy green vegetables)	Retinopathy, neurological problems	
<b>Vitamin K</b>	Synthesized by intestinal flora ♦ risk of deficiency after prolonged use of broad spectrum ABx and/or starvation	Prolonged INR may cause bleeding	

\* Calcium malabsorption more commonly causes decreased bone density rather than hypocalcemia because serum calcium levels are protected by leaching calcium from the bone.

### Investigations

- tTG-IgA antibody serology/immunoglobulin A quantitation and abdominal imaging are most useful because celiac disease and chronic pancreatitis are the two most common causes of steatorrhea
- 72 h stool collection (weight, fat content) documents steatorrhea (gold standard)
- fecal elastase to screen for pancreatic insufficiency and/or consider empiric trial of pancreatic enzymes based on clinical context
- serum carotene (precursor to vitamin A), folate, Ca<sup>2+</sup>, Mg<sup>2+</sup>, vitamin B<sub>12</sub>, albumin, ferritin, serum iron solution, international normalized ratio/partial thromboplastin time (INR/PTT)
- stool fat globules on fecal smear stained with Sudan (used as an initial qualitative screening tool)
- other tests specific for etiology (e.g. CT scan/MRI to visualize pancreas)

### Treatment

- dependent on underlying etiology

## Celiac Disease (Gluten Enteropathy/Sprue)

### Definition

- abnormal small intestine mucosa due to intestinal reaction to gluten, a protein found in wheat, barley, rye, and possibly oats (certified gluten-free oats may be acceptable in a subgroup of patients)

### Etiology

- unique autoimmune disease because the genetics (HLA-DQ2/8), the auto-antigen (tTG), and the environmental trigger (gluten) are all known
- associated with other autoimmune diseases, especially Sjögren's, T1DM, thyroid disease
- gluten is broken down to gliadin, which is the toxic protein
- HLA-DQ2 (chromosome 6) found in 80-90% of patients compared to 20% of the general population; celiac also associated with HLA-DQ8
- HLA-DQ2/Q8 are necessary permissive genes, but their presence does not confer a diagnosis of celiac disease (note: up to 40% of White individuals carry the HLA alleles, but will never develop celiac disease)

### Epidemiology

- more common in women
- prevalence: 1 first degree relative: 10%; 2 first degree relatives: 20%
- may present any time in life, with peak presentation in infancy (when cereals introduced)

### Clinical Features

- classic presentation: diarrhea, weight loss, anemia, symptoms of vitamin/mineral deficiency, failure to thrive; more common current presentation: bloating, gas, iron deficiency, or asymptomatic (patient at risk)
- improves with gluten-free diet, deteriorates when gluten reintroduced
- disease is usually most severe in proximal bowel
  - iron, calcium, and folic acid deficiency (absorbed in proximal small bowel) more common than vitamin B<sub>12</sub> deficiency (absorbed in distal small bowel or ileum)
- gluten enteropathy may be associated with dermatitis herpetiformis skin eruption, epilepsy, myopathy, depression, paranoia, infertility, bone fractures/metabolic bone disease

### Investigations

- serological tests
  - serum anti-tTG antibody, IgA, is 90-98% sensitive, 94-97% specific
  - patients with selective IgA deficiency have false-negative anti-tTG
    - therefore, measure serum IgA concomitantly (via serum immunoglobulin quantitation)
- incorporate serum testing tTG and/or DGP IgG in IgA deficiencies
- small bowel mucosal biopsy (usually duodenum) is diagnostic:
  - increased intraepithelial lymphocytes (earliest pathologic finding)
  - crypt hyperplasia (next stage of pathophysiology)
  - villous atrophy (last stage of pathophysiology)
  - note: there is a wide differential diagnosis for villous atrophy, including, but not limited to, small bowel overgrowth, CD, lymphoma, Giardia, HIV
- improvement with a gluten-free diet, but should not be started in adults before serological tests and biopsy
- consider CT enterography to visualize small bowel to rule out lymphoma
- evidence of malabsorption (localized or generalized)
  - steatorrhea
  - low levels of ferritin/iron saturation, Ca<sup>2+</sup>, Fe, albumin, cholesterol, carotene, B<sub>12</sub> absorption
- quantitative fecal fat >7%

### Treatment

- dietary counselling
  - gluten free diet; avoid barley, rye, wheat (as these grains are related and have toxic proteins, similar to gliadin)
  - oats allowed if not contaminated by other grains (grown in soil without cross-contamination)
  - rice and corn flour are acceptable
  - iron, folate supplementation (with supplementation of other vitamins as needed)
- if poor response to diet change, consider
  - alternate diagnosis
  - non-adherence to gluten-free diet (advertent or inadvertent)
  - concurrent disease (e.g. microscopic colitis, pancreatic insufficiency)
  - development of intestinal (enteropathy-associated T-cell) lymphoma (abdominal pain, weight loss, palpable mass)
  - development of diffuse intestinal ulceration, characterized by aberrant intraepithelial T-cell population (precursor to lymphoma)

#### Early Gluten Introduction and Celiac Disease in the EAT Study: A Prespecified Analysis of the EAT Randomized Clinical Trial

JAMA Pediatr 2020;174:1-7

**Purpose:** Determine whether introduction of high-dose gluten lowers celiac disease prevalence at 3 yr of age

**Methods:** Infants were randomized to consume 6 allergenic foods in addition to breast milk from age 4 mo (early introduction), or to avoid allergenic foods and follow exclusive breastfeeding guidelines (standard introduction). Evaluation of celiac disease was an a priori secondary outcome of the EAT trial, tested at age 3 with anti-transglutaminase 2 antibodies.

**Results:** 1.4% of infants in the standard introduction group had a celiac disease diagnosis confirmed, versus 0% of infants in the early introduction group. **Conclusion:** Introduction of gluten from age 4 mo was associated with a reduction in the prevalence of celiac disease.

#### Gluten Found in BROW

Barley  
Rye  
Oats (controversial)  
Wheat

**Prognosis**

- associated with increased risk of lymphoma, carcinoma (e.g. small bowel and colon; slight increase compared with general population), autoimmune diseases
- risk of lymphoma may be lowered by dietary gluten restriction

## Inflammatory Bowel Disease

**Definition**

- group of disorders characterized by inflammation, and potentially ulceration, of the gastrointestinal tract; two main forms include CD and UC

**Etiology**

- complex, multifactorial etiology
- most likely a sustained response of the immune system, perhaps to enteric flora
- lack of appropriate down-regulation of immune responsiveness after an infection in a genetically predisposed individual

**Genetics**

- increased risk of both UC and CD in relatives of patients with either disease, especially siblings; early onset disease
  - familial risk greater if proband has CD rather than UC
- likely polygenomic pattern: 200+ associated gene loci
- CARD15/NOD2 gene mutation associated with CD (relative risk in heterozygote is 3, in homozygote is 40), especially in Ashkenazi Jews, early onset disease, ileal involvement, and fistulizing, fibrostenotic, or stricturing disease
  - CARD15 gene product modulates NF $\kappa$ B, which is required for the innate immune response to microbial pathogens, best expressed in monocytes-macrophages

**Clinical Features****Table 13. Clinical Differentiation of Ulcerative Colitis from Crohn's Disease**

	<b>Crohn's Disease</b>	<b>Ulcerative Colitis</b>
<b>Location</b>	Any part of GI tract ("gum to bum") Small bowel + colon: 50% Small bowel only: 30% Colon only: 20%	Isolated to large bowel Always involves rectum, may progress proximally
<b>Rectal Bleeding</b>	Uncommon; possible if colonic disease	Very common (90%)
<b>Diarrhea</b>	Usually non-bloody (may be bloody, particularly if distal colon is involved)	Frequent, mucous, bloody, small volume stools
<b>Abdominal Pain</b>	Post-prandial/colicky	Predefecation/colicky
<b>Fever</b>	Common	Uncommon
<b>Urgency/Tenesmus</b>	Uncommon (unless rectum involved)	Common
<b>Palpable Mass</b>	Frequent (25%), RLQ	Rare (if present, often related to cecum full of stool)
<b>Recurrence After Surgery</b>	Common	None post-colectomy (with permanent ileostomy)
<b>Endoscopic Features</b>	Segmental inflammation, ulcers (aphthous, stellate, linear), patchy lesions, pseudopolyps, cobblestoning	Continuous diffuse inflammation, erythema, friability, loss of normal vascular pattern, pseudopolyps
<b>Histologic Features</b>	Transmural distribution with skip lesions Focal inflammation ± Noncaseating granulomas, deep fissuring + aphthous ulcerations, strictures Glands intact	Mucosal distribution, continuous disease (no skip lesions) Architectural distortion, gland disruption, crypt abscess Granulomas absent
<b>Radiologic Features</b>	Cobblestone mucosa Frequent strictures and fistulae Abdominal x-ray: bowel wall thickening, "string sign"	Lack of haustra Strictures rare; if present, need to rule out complicating cancer
<b>Complications</b>	Strictures, fistulae, perianal disease	Toxic megacolon
<b>Colon Cancer Risk</b>	Increased if >30% of colon involved	Increased except in proctitis

**Table 14. Extraintestinal Manifestations of IBD**

System	Crohn's Disease	Ulcerative Colitis
<b>Dermatologic</b>		
Erythema nodosum	15%	10%
Pyoderma gangrenosum	10%	Less common
Perianal skin tags	75-80%	Rare
Oral mucosal lesions, stomatitis	Common	Rare
Psoriasis	Present in 5-10% of those with IBD but not an EIM	
<b>Rheumatologic</b>		
Peripheral arthritis	15-20% of those with IBD (CD>UC)	
Ankylosing spondylitis	10% of those with IBD (CD>UC)	
Sacroiliitis	Occurs equally in CD and UC	
<b>Ocular (~10% of IBD)</b>		
Uveitis (vision threatening)		
Episcleritis (benign)	3-4% of IBD patients (CD>UC)	
<b>Hepatobiliary</b>		
Cholelithiasis	15-35% of patients with ileal CD	
PSC	1-5% of IBD cases with colonic involvement	
Fatty liver		
Gallstones	Pigment stones in CD	
<b>Urologic</b>		
Calculi	Most common in CD, especially following ileal resection or extensive terminal ileal disease (oxalate stones), usually in context of an intact colon	
Ureteric obstruction		
Fistulae	Characteristic of CD	
<b>Others</b>		
Thromboembolism		
Vasculitis		
Osteoporosis	Increased in CD with/without prior steroids, in UC only after steroids usage	
Vitamin deficiencies (B <sub>12</sub> , ADEX)		
Cardiopulmonary disorders		
Pancreatitis (rare)		
Phlebitis		

## Crohn's Disease

### Definition

- chronic transmural inflammatory disorder potentially affecting the entire gut from mouth to perianal region ("gum to bum")

### Epidemiology

- worldwide incidence 3-15 to 10-20/100000; 135000 Canadians living with CD
- bimodal: onset before age 30, second smaller peak at age 60; M=F
- incidence of CD increasing (relative to UC) especially in young females
- more common in White people, Ashkenazi Jews
  - risk in Asians increases with move to Western countries
- smoking incidence in CD patients is higher than general population

### Pathology

- most common location: ileum + right colon
- linear ulcers leading to mucosal islands and "cobblestone" appearance
- granulomas are found in 50% of surgical specimens, 15% of mucosal biopsies

### Clinical Features

- natural history unpredictable; young age, perianal disease, and need for corticosteroids have been associated with poor prognosis, but associations are not strong enough to guide clinical decisions
- commonly presents as recurrent episodes of abdominal cramps, diarrhea (with or without bleeding), fatigue, and weight loss
- ileitis may present with post-prandial pain, vomiting, RLQ mass; mimics acute appendicitis
- EIMs are more common with colonic involvement
- fistulae, fissures, abscesses are common
- deep fissures with risk of perforation into contiguous viscera (leads to fistulae and abscesses)
- enteric fistulae may communicate with skin, bladder, vagina, and other parts of bowel

### Effect of Tight Control Management on Crohn's Disease (CALM): A Multi-Centre, Randomized Controlled Phase 3 Trial

Lancet 2017; 390:2779-2789

**Purpose:** To define the role of incorporating laboratory biomarkers in the management algorithm of active CD.

**Study:** RCT

**Population:** 224 adult patients (22 countries at 74 hospitals) with active CD were randomized to intensify treatment based on either laboratory biomarkers (serum CRP, fecal calprotectin) plus clinical evaluation (CD activity index and prednisone use) or treatment based on clinical evaluation alone.

**Outcomes:** Mucosal healing via the absence of deep ulcers.

**Results:** At 2 yr, more patients receiving treatment criteria that included laboratory tests had complete mucosal healing (i.e. no ulcers) than the group treated on the basis of symptoms alone (46% vs. 30%).

Admittedly, the endpoint of mucosal healing is not a strong clinically relevant result, but other studies have shown that the greater the mucosal ulceration, the higher the rate of complications (i.e. strictures, fistulae, abscesses, hospitalizations, and surgery).

**Conclusions:** This is not definitive data but adds to other evidence showing that the traditional management paradigm needs revising, so in most patients it is worthwhile aiming for endoscopic healing of CD irrespective of symptoms.

Activate Windows

Go to Settings to activate Windows

**Investigations**

- colonoscopy with biopsy to visualize (less often gastroscopy)
- CT/MR enterography to visualize small bowel
- CRP elevated in most new cases, useful to monitor treatment response (especially acutely in UC)
- bacterial cultures, O&P, *C. difficile* toxin to exclude other causes of inflammatory diarrhea

**Management (see Figure 8)**

**Table 15. Management of Crohn's Disease**

Management	Notes
<b>Lifestyle/Diet</b>	Smoking cessation Fluids only during acute exacerbation Enteral diets may aid in remission only for Crohn's ileitis, not colitis No evidence for any non-enteral diet changing the natural history of CD, but may affect symptoms Those with extensive small bowel involvement or extensive resection require electrolyte, mineral, and vitamin supplements (vitamin D, Ca <sup>2+</sup> , Mg <sup>2+</sup> , Zn, Fe, B12)
<b>Antidiarrheal Agents*</b>	Loperamide (Imodium <sup>®</sup> ) > diphenoxylate (Lomotil <sup>®</sup> ) > codeine (cheap but addictive) All work by decreasing small bowel motility, used only for symptom relief CAUTION: if colitis is severe (risk of precipitating toxic megacolon), therefore avoid during flare-ups
<b>5-ASA**</b>	Sulfasalazine (Salazopyrin <sup>®</sup> ): 5-ASA bound to sulfapyridine Hydrolysis by intestinal bacteria releases 5-ASA (active component) Dose-dependent efficacy Mesalamine (Pentasa <sup>®</sup> , Salofalk <sup>®</sup> , Mezavant <sup>®</sup> , Olsalazine <sup>®</sup> ): used for the treatment of mild ileitis (CD) and mild UC, when inflammation is mild
<b>Antibiotics</b>	E.g. metronidazole (20 mg/kg/d, BID or TID dosing) or ciprofloxacin Best described for perianal CD, although characteristically relapse when discontinued
<b>Corticosteroids</b>	Prednisone: starting dose 40 mg once daily for acute exacerbations; IV methylprednisolone if severe No proven role for steroids in maintaining remission; masks intra-abdominal sepsis
<b>Immunosuppressives</b>	6-mercaptopurine (6-MP), azathioprine (Imuran <sup>®</sup> ); MTX (used less often) More often used to maintain remission than to treat active inflammation Most commonly used as steroid-sparing agents i.e. to lower risk of relapse as corticosteroids are withdrawn May require >3 mo to have beneficial effect; usually continued for several years May help to heal fistulae, decrease disease activity Increases efficacy of biologics plus lowers chances of biologic dosing efficacy (tolerance) so often given in combination with biologics Side effects: vomiting, pancreatitis, bone marrow suppression, increased risk of malignancy (i.e. lymphoma)
<b>Biologics</b>	Infliximab IV (Remicade <sup>®</sup> ) or adalimumab SC (Humira <sup>®</sup> ): both = antibody to TNF- $\alpha$ Proven effective for treatment of fistulae and medically refractory CD First-line immunosuppressive therapy with infliximab + azathioprine (dual therapy) more effective than using either alone (monotherapy) Ustekinumab, monoclonal antibody against P40 subunit of interleukin 12 and 23 Vedolizumab, monoclonal antibody directed against integrin $\alpha 4\beta 7$ thereby reducing lymphocyte traffic to gut – now indicated for UC and CD
<b>Immunotherapy (Small molecules)</b>	JAK (Janus Kinase) inhibitors (e.g. tofacitinib). Efficacy demonstrated in UC
<b>Surgical/ Experimental</b>	Surgical treatment (see <i>General and Thoracic Surgery</i> , G536) Surgery generally reserved for complications such as fistulae, obstruction, abscess, perforation, bleeding, and for medically refractory disease If <50% or <200 cm of functional small intestine, risk of short bowel syndrome At least 50% clinical recurrence within 5 yr; 85% within 15 yr; endoscopic recurrence rate even higher 40% likelihood of second bowel resection, 30% likelihood of third bowel resection Complications of ileal resection  <100 cm resected $\rightarrow$ watery diarrhea or cholorrhea (impaired bile salt absorption) Treatment: cholestyramine or antidiarrheals, e.g. loperamide >100 cm resected $\rightarrow$ steatorrhea (reduced mucosal surface area, bile salt deficiency) Treatment: fat restriction, medium chain triglycerides

\*Cholestyramine: a bile-salt binding resin; for watery diarrhea with <100 cm of terminal ileum diseased or resected; however, non-specific antidiarrheals are more convenient and often more potent  
\*\*5-ASA use in CD is controversial; however, initial trial for mild ileitis only is warranted (induction and maintenance if clinical response)

**Prognosis**

- highly variable course
- 10% disabled by the disease eventually, spontaneous remission also described
- increased mortality, especially with more proximal disease, greatest in the first 4-5 yr
- complications include
  - intestinal obstruction/perforation
  - fistula formation
  - malignancy (lower risk compared to UC)
- surveillance colonoscopy same as UC (see *Ulcerative Colitis*, G25) if more than 1/3 of colon involved

**Traditional Medical Management of Crohn's Disease**

	Induction of Remission	Maintenance
5-ASA*	?	?
Steroids	+	
Immuno-modulators (e.g. azathioprine, methotrexate (MTX))	-	+
Antibiotics	+	
Biologics	+	+

\*5-aminosalicylic acid (5-ASA) use in CD is controversial. However, initial trial for mild ileitis only is warranted (induction and maintenance if clinical response)

**Figure 8. Traditional graded approach to induction therapy in Crohn's disease**

Note: immunosuppressants and immunomodulators are increasingly used initially ("top-down management strategy"). 5-ASA drugs have limited role in Crohn's disease

## Ulcerative Colitis

### Definition

- inflammatory disease affecting colonic mucosa anywhere from rectum (always involved) to cecum

### Epidemiology

- worldwide incidence 3-15 to 10-20/100000; 120000 Canadians living with UC (less common than CD)
- 2/3 onset by age 30 (with second peak after 50 yr); M=F
- small hereditary contribution (15% of cases have 1st degree relative with disease)
- reduced risk in smokers
- inflammation limited to rectum or left colon is more common than pancolitis

### Pathology

- disease can involve any portion of lower bowel ranging from rectum only (proctitis) to entire colon (pancolitis)
- inflammation is diffuse, continuous, and confined to mucosa

### Clinical Features

- rectal bleeding is the hallmark feature; diarrhea present if more than the rectum is involved
  - can also have abdominal cramps/pain, especially with defecation
- severity of colonic inflammation correlates with symptoms (stool volume, amount of blood in stool)
- tenesmus, urgency, incontinence
- systemic symptoms: fever, anorexia, weight loss, fatigue in severe cases
- EMs (see Table 14, G23)
- characteristic exacerbations and remissions; 5% of cases are fulminant

### Investigations

- sigmoidoscopy with mucosal biopsy (to exclude self-limited colitis) without bowel preparation often sufficient for diagnosis
- colonoscopy helpful to determine extent of disease; contraindicated in severe exacerbation
- CT colonography (formerly barium enema) if colonoscopy cannot be done; contraindicated in severe disease
- stool culture, microscopy, *C. difficile* toxin assay necessary to exclude infection
- no single confirmatory test

### Treatment

- mainstays of treatment: 5-ASA derivatives (only in mild to moderate disease) and corticosteroids, with azathioprine used in steroid-dependent or resistant cases
- diet of little value in decreasing inflammation but may alleviate symptoms
- antidiarrheal medications generally not indicated in UC
- 5-ASA
  - topical (suppository or enema): effective for distal disease (rectum to splenic flexure) if inflammation is mild, preferable to corticosteroids
  - oral: effective for mild to moderate, but not severe colitis (e.g. sulfasalazine 3-4 g/d, mesalamine 4 g/d)
  - commonly used in maintaining remission (decreases yearly relapse rate from 60% to 15%)
  - may decrease rate of colorectal cancer
- corticosteroids
  - to remit acute disease, especially if severe or first attack; may need maximum dose IV steroids initially (e.g. methylprednisolone 30 mg IV q12 h)
  - limited role as maintenance therapy for mild to moderate disease
  - use suppositories (predominantly available in compound pharmacies) for proctitis
  - use enemas and topical steroids (e.g. hydrocortisone foam, budesonide enemas) for inflammation distal to splenic flexure
- immunosuppressants (steroid-sparing)
  - in hospitalized patients with severe UC – add IV infliximab if no response to IV methylprednisolone within 3 d; then consider colectomy if inadequate response
  - biologics (infliximab, adalimumab, golimumab, vedolizumab) and small molecules (tofacitinib) can also be used for outpatients with moderate-severe disease, particularly those that are steroid-unresponsive or steroid-dependent, some evidence that they are best used early in course of disease
  - azathioprine and 6-MP: too slow to rapidly resolve acute relapse
    - most commonly used to maintain remission as corticosteroids withdrawn
    - given with biologics: increase efficacy of infliximab and decrease likelihood of developing tolerance to infliximab (~10% chance/yr)
- Ozanimod
  - an oral sphingosine-1-phosphate receptor modulator used for treating moderate-to severe UC
  - does not require previous failure of immunosuppressants, glucocorticoids, biologics, or other small molecules
  - increases clinical remission rates compared to placebo
- surgical treatment (restorative)
  - aim for cure with colectomy; bowel continuity can be restored with ileal pouch-anal anastomosis (IPAA)
  - indications: failure of adequate medical therapy, toxic megacolon, uncontrollable bleeding, pre-cancerous changes detected either by endoscopy or endoscopic biopsies (dysplasia), inability to taper corticosteroids, overt malignancy

In UC, non-bloody diarrhea is frequently the initial presentation; eventually progressing to bloody diarrhea

### Medical Management of Ulcerative Colitis

	Induction of Remission	Maintenance
5-ASA	+	+
Steroids	+	
Immuno-suppressive	±	±

### Complications

- similar to CD, except:
  - more liver problems (especially PSC in men)
  - greater risk of colorectal cancer
    - risk increases with duration and extent of disease (5% at 10 yr, 15% at 20 yr for pancolitis; overall relative risk is 8%)
    - risk also increases with active mucosal inflammation and sclerosing cholangitis
    - thus, regular colonoscopy and biopsy in pancolitis of  $\geq 8$  yr is indicated
  - toxic megacolon (transverse colon diameter  $> 6$  cm on abdominal x-ray) with immediate danger of perforation (see [General Surgery and Thoracic Surgery, GS45](#))

### Prognosis

- chronic relapsing pattern in most patients
- 10-15% chronic continuous pattern
- $> 1$  attack in almost all patients
- more colonic involvement in the 1st yr correlates with increased severity of attacks and increased colectomy rate
  - colectomy rate = 1% for all patients after the 1st yr; 20-25% eventually undergo colectomy
- normal life expectancy
- if proctitis only, usually benign course, lifetime risk of extension is 15%
- fecal calprotectin increasingly recognized as a marker of bowel mucosal inflammation, reported to be especially useful in monitoring the activity of IBD, but accuracy is still controversial

When Considering Complications of IBD, Think:

#### ULCERATIVE COLITIS

Urinary calculi  
Liver problems  
Cholelithiasis  
Epithelial problems  
Retardation of growth/sexual maturation  
Arthralgias  
Thrombophlebitis  
Iatrogenic complications  
Vitamin deficiencies  
Eyes  
Colorectal cancer  
Obstruction  
Leakage (perforation)  
Iron deficiency  
Toxic megacolon  
Inanition (wasting)  
Strictures

## Irritable Bowel Syndrome

### Definition

- a form of functional bowel disease, now also known as disorder of gut-brain interaction; more than just a label for GI symptoms unexplained after normal investigations

### Epidemiology

- 11% worldwide prevalence
- onset of symptoms usually in young adulthood
- F  $>$  M

### Clinical Features

- Rome IV Criteria are used for diagnosis
- diagnosis is based chiefly on history; no specific diagnostic test available

### Pathophysiology

- associated with either abnormal perception of intestinal activity or abnormal intestinal motility
- abnormal motility: multiple abnormalities described; unclear if associated or causative
- psychological: stress may increase IBS symptoms but probably does not cause IBS
- 4 main types of IBS
  - IBS-D: IBS with predominant diarrhea
  - IBS-C: IBS with predominant constipation
  - IBS-M: IBS-mixed with both diarrhea and constipation (each  $> 25\%$  of all abnormal bowel movements)
  - IBS untyped: insufficient abnormalities to be IBS-C, D, or M

### Diagnosis

**Table 16. Rome IV Criteria for Diagnosing Irritable Bowel Syndrome**

IBS Rome IV Criteria	
Recurrent abdominal pain for more than 6 mo, at least 1 d/wk in the last 3 mo, associated with 2 or more of the following:	
1. Related to defecation	
2. Associated with a change in frequency of stool	
3. Associated with a change in form (appearance) of stool	
Symptom onset at least 6 mo before diagnosis and criteria present during the last 3 mo	
The following are supportive, but not essential to the diagnosis:	
Abnormal stool frequency ( $> 3/d$ or $< 3/wk$ )	
Abnormal stool form (lumpy/hard/loose/watery) $> 1/4$ of defecations	
Abnormal stool passage (straining, urgency, feeling of incomplete evacuation) $> 1/4$ of defecations	
Passage of mucus $> 1/4$ of defecations	
Bloating	
Diagnosis of IBS Less Likely in Presence of "Red Flag" Features	
Weight loss	Anemia
Fever	Blood or pus in stool
Nocturnal defecation	Abnormal gross findings on flexible sigmoidoscopy
Normal Physical Exam	

Emerging Biologic Treatments for Ulcerative Colitis

Generic Name	Brand Name	Major Study
Ustekinumab	Stelara™	NEJM 2019; 381:1201-1214
Vedolizumab	Entyvio™	NEJM 2019; 381:1215-1226
Adalimumab	Humira™	NEJM 2019; 381:1215-1226

### Investigations

- if history consistent with Rome IV criteria, no alarm symptoms, and no family history of IBD or colorectal cancer, limited investigations required
- aim is to rule out diseases which mimic IBS, particularly celiac disease and IBD
- investigations can be limited to CBC and celiac serology
- if available, fecal calprotectin is likely more reliable test to rule out IBD
- consider TSH, stool cultures depending on clinical circumstances
- consider colonoscopy (e.g. if alarm features present, family history of IBD, or ages >50)

### Treatment

- education: reassurance, explanation, support, aim for realistic goals
- relaxation therapy, biofeedback, hypnosis, stress reduction, cognitive behavioural therapy, probably exercise
- dietary: low FODMAP (Fermentable Oligo-, Di-, Monosaccharides And Polyols) diet for pain, bloating, gas, irregular bowel movements (BMs)
- no therapeutic agent consistently effective, pain most difficult to control, no drug changes natural history so the drug should be "wanted, since it is not needed"
- symptom-guided treatment
  - pain predominant
    - antispasmodic medication before meals (e.g. hyoscine, pinaverium, trimebutine - low level of evidence)
    - tricyclic antidepressants (TCA), selective serotonin reuptake inhibitors (SSRI) - moderate level of evidence
  - IBS-D
    - increase fibre (bran or psyllium) to increase stool consistency but may worsen abdominal gas (controversial)
    - loperamide (Imodium\*) (continuous use advised against)
    - diphenoxylate (Lomotil\*)
    - eluxadoline
    - rifaximin
  - IBS-C
    - increase fibre in diet
    - linaclotide, plecanatide, tenapanor
    - osmotic or other laxatives (help more with the constipation than the pain)

### Prognosis

- 80% improve over time
- most have intermittent episodes
- normal life expectancy

## Constipation

### Definition

- passage of infrequent/hard stools and/or difficult stool evacuation (e.g. straining, sensation of anorectal blockage)

### Epidemiology

- increasing prevalence with age; F>M
- rare in Africa and India where stool weight is 3-4x greater than in Western countries

### Etiology

- most common: functional, idiopathic attributed to colon dysmotility but this is difficult to measure
- organic causes: likely only if there are symptoms other than constipation
  - medication side effects (e.g. narcotics, antidepressants) are the most common
  - intestinal obstruction, left sided colon cancer (consider in older patients), and fecal impaction
  - metabolic
    - DM
    - hypothyroidism
    - hypercalcemia, hypokalemia, uremia
  - neurologic
    - intestinal pseudo-obstruction
    - Parkinson's disease
    - MS
  - collagen vascular disease (e.g. scleroderma)
  - painful anal conditions (e.g. fissures)

### Clinical Features

- overlaps with IBS with constipation (IBS-C) but labeled as IBS-C when pain is a predominant feature
- stool firm, difficult to expel, passed with straining, abdominal pain relieved by defecation, flatulence, overflow diarrhea, tenesmus, abdominal distension, infrequent BMs (<3/wk)

### IBS Mimickers

- Enteric infections e.g. Giardia
- Lactose intolerance/other disaccharidase deficiency
- CD
- Celiac sprue
- Drug-induced diarrhea
- Diet-induced (excess tea, coffee, colas)

### Rifaximin Therapy for Patients with Irritable Bowel Syndrome without Constipation

NEJM 2011;364:22-32

**Purpose:** Previous evidence suggests that gut flora may play an important role in the pathophysiology of IBS. This study evaluated rifaximin, a minimally absorbed antibiotic, in treating IBS without constipation.

**Methods:** Two phase 3, double-blind, placebo-controlled trials (TARGET 1 and TARGET 2). 1260 patients who had IBS without constipation were randomly assigned to rifaximin (550 mg dose) or placebo, 110 for 2 wk, with a follow-up of 10 wk. The primary endpoint was adequate self-reported relief of global IBS symptoms.

**Results:** Significantly more patients in the rifaximin group had adequate self-reported relief of global IBS symptoms compared to the placebo group during the first 4 wk after treatment (40.8% vs. 31.2%, respectively). Also, more patients in the rifaximin group had adequate relief of bloating compared to the placebo group (39.5% vs. 28.7%, respectively).

**Conclusions:** Rifaximin therapy for 2 wk provided significant relief of symptoms, bloating, abdominal pain, and stool consistency associated with IBS without constipation.

### Causes of Constipation

- DOPED
- Drugs
- Obstruction
- Pain
- Endocrine dysfunction
- Depression

### Investigations

- underlying disease rarely found if constipation is the only presenting symptom
  - only test indicated in this situation is a CBC (2013 recommendation of American Gastroenterology Association), but also consider TSH, calcium, glucose, and abdominal x-ray
- colon visualization (colonoscopy, CT colonography) if concomitant symptoms such as rectal bleeding, weight loss, anemia or ages >50
- if refractory to treatment, consider classification based on colon transit time; can measure colonic transit time with radio-opaque (Sitz) markers that are ingested and followed with a series of plain film abdominal x-rays (normal: elimination of markers within 70 h)
  - normal = misperception of normal defecation (IBS)
  - prolonged throughout = "colonic inertia" (infrequent bowel movements with gas/bloating, tends to occur in youth)
  - outlet obstruction = inability to coordinate pelvic floor muscles to empty rectum, straining, stool in rectum on digital exam, tends to occur in old age
- combination of 1 and 3 common

### Treatment (in order of increasing potency)

- dietary fibre
  - useful if mild or moderate constipation, but not if severe
  - aim for 30 g daily, increase dose slowly
- surface-acting (soften and lubricate)
  - docusate salts (likely limited efficacy based on evidence), mineral oils
- osmotic agents (effective in 2-3 d)
  - polyethylene glycol 3350, lactulose, sorbitol, magnesium salts (e.g. magnesium hydroxide, i.e. milk of magnesia), lactitol ( $\beta$ -galactosido-sorbitol)
- cathartics/stimulants (effective in 24 h)
  - senna, bisacodyl
- enemas and suppositories (e.g. saline enema, phosphate enema, glycerin suppository, bisacodyl suppository)
- prokinetic agents (e.g. prucalopride)
- secretagogues: linaclotide, plecanatide (increases water secretion into the intestinal lumen)
- NHE3 inhibitors: tenapanor

## Upper Gastrointestinal Bleeding

### Definition

- bleeding proximal to the ligament of Treitz, see *Overview of Gastrointestinal Tract, G2* (75% of GI bleeds)
  - ligament of Treitz: suspensory ligament where fourth portion of the duodenum transitions to jejunum

### Etiology

- above the GE junction
  - epistaxis
  - esophageal varices (10-30%)
  - esophagitis
  - esophageal cancer
  - Mallory-Weiss tear (10%)
- stomach
  - gastric ulcer (20%) (see *Peptic Ulcer Disease, G11*)
  - erosive gastritis (e.g. from EtOH or post-surgery) (20%)
  - gastric cancer
  - gastric antral vascular ectasia (rare, associated with cirrhosis and connective tissue disease)
  - Dieulafoy's lesion (very rare)
- duodenum
  - ulcer in bulb (25%)
  - aortoenteric fistula: usually only if previous aortic graft (see sidebar)
- coagulopathy (drugs, renal disease, liver disease)
- vascular malformation (Dieulafoy's lesion, arteriovenous malformation)

### Clinical Features

- in order of decreasing severity of the bleed: hematochezia (brisk UGIB) > hematemesis > melena > coffee ground emesis > occult blood in stool

Always ask about NSAID/Aspirin<sup>®</sup> or anticoagulant therapy in GI bleed

Aortoenteric Fistula is a rare and lethal cause of GI bleed, most common in patients with a history of aortic graft surgery. Therefore, perform emergency endoscopy if suspected, emergency surgery if diagnosed  
 Note: The window of opportunity is narrow. Suspect if history of aortic graft, abdominal pain associated with bleeding

### Transfusion Strategies for Acute Upper Gastrointestinal Bleeding

NEJM 2013;368:11-21

**Study:** Prospective, unblinded, RCT, follow-up up to 45 d.

**Population:** 921 patients with hematemesis, bloody nasogastric aspirate, melena, or both. Exclusion criteria included massive bleed, acute coronary syndrome, stroke/transient ischemic attack or transfusion within previous 90 d; recent trauma/surgery; lower GI bleed.

**Intervention:** Patients randomized to restrictive (<70 g/L) or liberal (>90 g/L) transfusion.

**Outcome:** Mortality, further bleeding, adverse events.

**Results:** Fewer patients in the restrictive group required transfusion (51% vs. 75%;  $P=0.001$ ). The hazard ratio for death for restrictive compared to liberal transfusion was 0.55; 95% CI 0.33-0.92;  $P=0.02$ . Further bleeding occurred in 10% vs. 16% ( $P=0.01$ ) of patients, while adverse effects occurred in 40% vs. 48% ( $P=0.02$ ) of patients in the restrictive and liberal strategies, respectively. The restrictive strategy had a better survival rate in patients with bleeding associated with cirrhosis Child-Pugh class A or B (HR: 0.30; 95% CI 0.11-0.85), but not in cirrhosis Child-Pugh class C (HR: 1.04; 95% CI 0.45-2.37) or a peptic ulcer (HR: 0.70; 95% CI 0.26-1.25).

**Conclusions:** Transfusing patients with an acute UGIB at Hb of <70 g/L rather than 90 g/L is associated with fewer transfusions, better survival, and fewer adverse events.

### Treatment

- stabilize patient (1-2 large bore IVs, IV fluids, monitor)
- send blood for CBC, cross and type, platelets, PT, PTT, electrolytes, BUN, Cr, LFTs
- keep NPO
- consider nasogastric (NG) tube to determine upper vs. lower GI bleeding in some cases
- IV PPI: decrease risk of rebleed if endoscopic predictors of rebleeding seen (see prognosis section)
  - given to stabilize clot, not to accelerate ulcer healing
  - if given before endoscopy, decreases need for endoscopic therapeutic intervention
- for variceal bleeds, octreotide 50 µg loading dose followed by constant infusion of 50 µg/h and ABx for those with cirrhosis (reduces risk of infections)
- consider IV erythromycin (or metoclopramide) to accelerate gastric emptying prior to gastroscopy to remove clots from stomach
- H2-antagonists should not be used since they have minimal impact on rebleeding rates and need for surgery
- endoscopy (OGD): establish bleeding site + treat lesion
  - if bleeding peptic ulcer: most commonly used method of controlling bleeding is injection of epinephrine around bleeding point + thermal hemostasis (bipolar electrocoagulation or heater probe); less often thermal hemostasis may be used alone, but injection alone not recommended
  - endoclips
  - Hemospray™
  - dual therapy (more than one therapeutic intervention method) is standard of care and has greater efficacy than single therapy

### Prognosis

- 80% stop spontaneously
- peptic ulcer bleeding: low mortality (2%) unless rebleeding occurs (25% of patients, 10% mortality)
- endoscopic predictors of rebleeding (Forrest classification): spurt or ooze, visible vessel, fibrin clot
- can send home if clinically stable, bleed is minor, no comorbidities, endoscopy shows clean ulcer with no high-risk predictors of rebleeding
- esophageal varices have a high rebleeding rate (55%) and mortality (29%)

#### Forrest Prognostic Classification of Bleeding Peptic Ulcers

Forrest Class	Type of Lesion	Risk of Rebleed (%)
I	Arterial bleeding (oozing/spurting)	55-100
IIa	Visible vessel	43
IIb	Sentinel clot	22
IIc	Hematin covered flat spot	10
III	No stigmata of hemorrhage	5

Lancet 1974;2:394-397

#### Management of Nonvariceal Upper Gastrointestinal Bleeding: Guideline Recommendations from the International Consensus Group

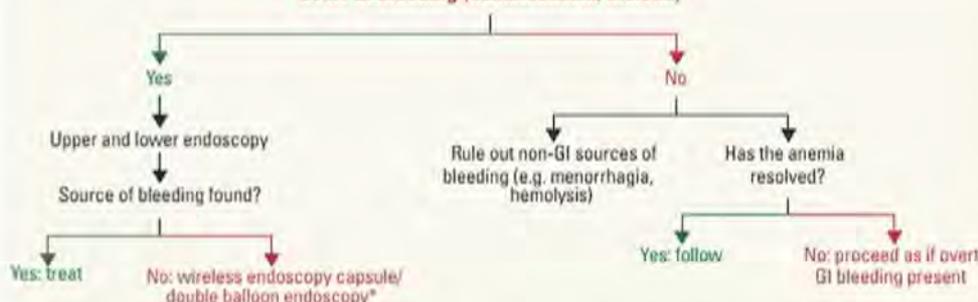

Ann Intern Med 2019;171:805-822

**Pre-Endoscopic Management:** In patients without cardiovascular disease, the suggested Hb threshold for blood transfusion is >80 g/L. The threshold is higher for patients with cardiovascular disease.

**Endoscopic Management:** Patients with acute UGIB should undergo endoscopy within 24 h of presentation. In patients with high-risk stigmata, thermocoagulation and sclerosant injection are recommended. TC-325, a hemostatic powder, can be used as a temporizing agent for actively bleeding ulcers.

**Pharmacologic Management:** High-dose PPI should be given for 3 d to patients with bleeding ulcers with high-risk stigmata who have undergone successful endoscopic therapy. Continued oral PPI therapy is recommended twice daily for 14 d, then once daily for a duration that depends on the nature of the bleeding lesion.

#### Overt GI bleeding (hematochezia, melena)

- \* Wireless endoscopy capsule results help double balloon endoscopy localize source of bleeding
- Angiography if overt bleeding hemodynamically significant, estimated >0.5 cc/min
- CT enterography if wireless endoscopy capsule/double balloon endoscopy not available

Figure 9. Approach to iron deficiency anemia

## Esophageal Varices

### Etiology

- almost always due to portal hypertension

### Clinical Features

- characteristically massive upper GI bleeding

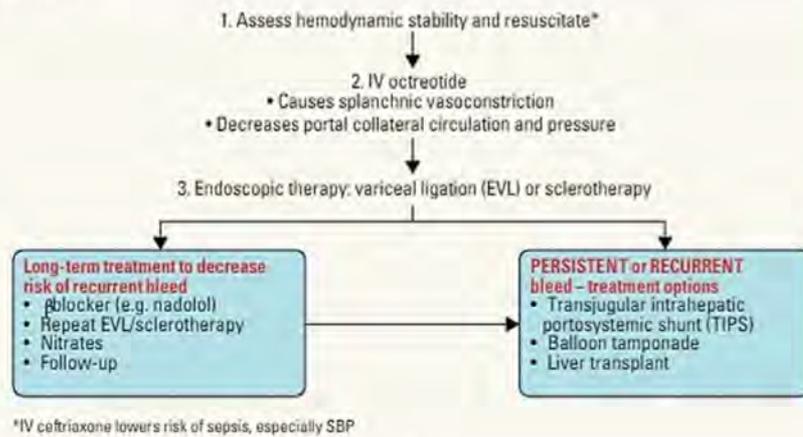

### Prognosis

- risk of bleeding: 30% in 1st yr
- risk of rebleeding: 50-70% (20% mortality at 6 wk)

### Investigations

- endoscopy

**Management**

If varices isolated to stomach, think of splenic vein thrombosis

Gastric varices best treated by endoscopic injection of cyanoacetate ("crazy glue")

Figure 10. Management of bleeding esophageal varices

**Mallory-Weiss Tear**

**Definition**

- longitudinal laceration in gastric mucosa on lesser curvature near GE junction (20% straddle junction, 5% in distal esophagus)

**Etiology**

- due to rapid increases in gastric pressure from retching/vomiting against a closed glottis
- hiatus hernia often present

**Clinical Features**

- hematemesis ± melena, classically following an episode of retching without blood
- can lead to fatal hematemesis

**Management**

- 90% stop spontaneously
- if persistent: endoscopy with epinephrine injection ± clips or surgical repair

**Lower Gastrointestinal Bleeding**

**Definition**

- bleeding distal to ligament of Treitz

**Etiology**

- diverticular
- vascular
  - angiodysplasia (small vascular malformations of the gut)
  - anorectal (hemorrhoids, fissures)

**Neoplasm**

- cancer
- polyps
- inflammation
  - colitis (ulcerative, infectious, radiation, ischemic) (see *Ulcerative Colitis, G25*)
- post-polypectomy

**Clinical Features**

- hematochezia
- anemia
- occult blood in stool
- occasionally melena due to slow small bowel or right-colonic course

**Treatment**

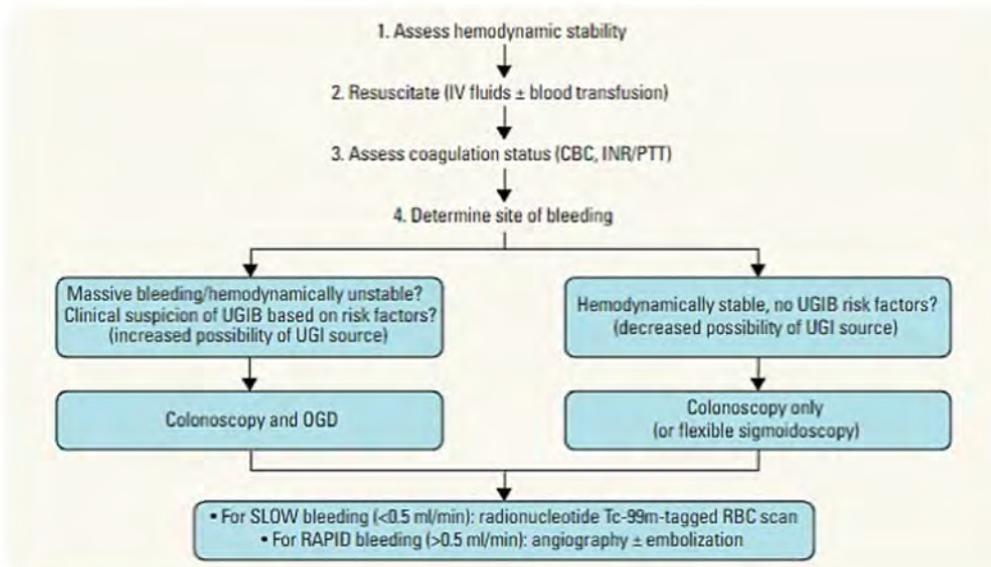

- if blood per rectum with hemodynamic instability, stabilize patient (1-2 large bore IVs, IV fluids, monitor) and rule out upper GI source with endoscopy (OGD)
- send blood for CBC, cross and type, INR/PTT, electrolytes, BUN, Cr, LFTs
- initial examination of choice is colonoscopy to determine source of the bleeding
- if bleeding is severe or ongoing, consider radionuclide imaging or angiography (see *Medical Imaging, M116*)
- treat underlying cause
  - majority of cases will stop bleeding spontaneously

**Lower GI Bleed**

**CHAND**

- Colitis (radiation, infectious, ischemic, IBD (UC > CD))
- Hemorrhoids/fissure
- Angiodysplasia
- Neoplasm
- Diverticular disease

Always exclude upper GI lesion before localizing the site of the bleeding to the lower GI tract

Figure 11. Approach to hematochezia

## Diverticular Bleeding

### Etiology

- herniation of diverticula exposes vasa recta, increasing susceptibility to disruption
- bleeding most common from the right colon (thinner walled), although diverticula often develop throughout colon

### Clinical Features

- painless hematochezia, acute onset
- stool can range from bright red to dark maroon; gelatinous clots often mixed in

### Management

- often resolves spontaneously
- if colonoscopy identifies source (rare), hemostatic therapy can be applied
- if ongoing, can consider embolization or surgery

## Infectious Colitis

### Etiology

- variety of pathogens; often due to *Campylobacter*, *Entamoeba histolytica*, *Salmonella*, *E. coli*, *Shigella*
- consider travel history, food exposures

### Clinical Features

- bloody diarrhea, fever, abdominal pain

### Management

- stool cultures to determine pathogen and guide management
- see *Acute Diarrhea*, G15

## Colorectal Carcinoma

- see *General Surgery and Thoracic Surgery*, GS43

## Colorectal Polyps

- see *General Surgery and Thoracic Surgery*, GS41

## Familial Colon Cancer Syndromes

- see *General Surgery and Thoracic Surgery*, GS42

## Benign Anorectal Disease

- see [General Surgery and Thoracic Surgery, GS47](#)

## Liver

### Investigations of Hepatobiliary Disease

#### A. Tests of Liver Function

Table 17. Liver Function Tests

Test	What Do Levels Correlate With?	Increased by	How to Interpret
Prothrombin Time (PT or INR)	Hepatic protein synthesis All coagulation factors except VIII	Hepatocellular dysfunction Vitamin K deficiency (due to malnutrition, malabsorption, etc.)	PT/INR will promptly correct if vitamin K is administered, so increased PT/INR in absence of vitamin K deficiency is a reliable marker of hepatocellular dysfunction
Serum Albumin	Hepatic protein synthesis (and other causes listed in next column)	Hepatocellular dysfunction Malnutrition Renal or GI losses Significant inflammation Malignancy	Rule out potential causes other than hepatocellular dysfunction
Serum Direct Bilirubin*	Hepatic excretion from hepatocyte to biliary system	Liver dysfunction	Conjugation is preserved even in end stage liver failure, thus increased direct bilirubin indicates liver dysfunction

\*Serum Bilirubin  
 • canalicular breakdown product of hemoglobin; metabolized in the reticuloendothelial system of liver, transported through biliary system, excreted via gut  
 • direct bilirubin = conjugated; indirect bilirubin = unconjugated

#### B. Tests of Liver Injury

Table 18. Liver Enzyme Profile

Profile	Liver Enzyme Change	Notes
Hepatocellular	↑ AST ↑ ALT	ALT more specific to liver AST from multiple sources (especially muscle) Elevation of both highly suggestive of liver injury Most common cause of elevated ALT is fatty liver
Cholestatic	↑ ALP ↑ GGT	Cholestasis = stasis of bile flow If ALP is elevated alone, rule out bone disease by fractionating ALP and/or checking GGT If ALP elevation out of proportion to ALT/AST elevation, consider: Obstruction of common bile duct (e.g. extraluminal = pancreatic cancer, lymphoma; intraluminal = stones, cholangiocarcinoma, sclerosing cholangitis, helminths) Predominant rise in hepatocellular enzyme possible in acute biliary obstruction secondary to a stone due to the sudden impairment in bile flow and because ALP is an inducible enzyme which takes time to rise Destruction of microscopic ducts (e.g. PBC) Bile acid transporter defects (e.g. drugs, intrahepatic cholestasis of pregnancy) Infiltration of the liver (e.g. liver metastases, lymphoma, granulomas, amyloid)

## Acute Viral Hepatitis (General)

#### Definition

- viral hepatitis lasting <6 mo

#### Clinical Features

- most are subclinical
- flu-like prodrome may precede jaundice by 1-2 wk
  - N/V, anorexia, headaches, fatigue, myalgia, low-grade fever, arthralgia, and urticaria (especially HBV)
- only some progress to icteric (clinical jaundice) phase, lasting days to weeks
  - pale stools and dark urine 1-5 d prior to icteric phase
  - hepatomegaly and RUQ pain
  - splenomegaly and cervical lymphadenopathy (10-20% of cases)

#### Quick Reference Diagnostic Tests for Common Liver Conditions

Disease	Diagnostic Tests
Viral Hepatitis	Anti-HAV IgM, HBsAg, anti-HCV
Autoimmune Hepatitis	ANA, SMA, LKM, Ig levels
Wilson's Disease	Ceruloplasmin, liver biopsy
Hereditary Hemochromatosis	Iron saturation, ferritin, HFE genetic testing
α1-Antitrypsin Deficiency	α1-antitrypsin levels, liver biopsy
Drug-induced Liver Injury	Careful medication history, liver biopsy
NAFLD/Nonalcoholic Steatohepatitis (NASH)	U/S, metabolic testing, liver biopsy

ANA = anti-nuclear antibody; SMA = smooth muscle antibody; LKM = liver-kidney microsomal-1 antibody; HFE = hemochromatosis gene

#### DDx for Hepatomegaly

- Congestive (right heart failure, Budd-Chiari syndrome)
- Infiltrative
- Malignant (primary, secondary lymphoproliferative, leukemia)
- Benign (fatty liver, cysts, hemochromatosis, extramedullary hematopoiesis, amyloid)
- Proliferative
- Infectious (viral, tuberculosis, abscess, echinococcus)
- Inflammatory (granulomas (sarcoid), histiocytosis X)

All clotting factors except factor VIII and von Willebrand factor are exclusively synthesized in the liver. Factor VIII is also produced in the endothelium. In cirrhosis, risk of bleeding does not correlate closely with elevations in INR/PTT since so many of the proteins in the coagulation cascade are affected

ALT > AST = most causes of hepatitis  
 AST > ALT = alcoholic liver disease or other causes of hepatitis (i.e. non-alcoholic liver disease) that have progressed to advanced cirrhosis

#### Serum Transaminases >1000 due to

- Viral hepatitis
- Drugs/toxins
- Autoimmune hepatitis
- Hepatic ischemia
- Less often, common bile duct stone

**Investigations**

- AST and ALT (>10-20x normal in hepatocellular necrosis)
- ALP minimally elevated
- viral serology, particularly IgM antibody directed to the virus

**Treatment**

- supportive (hydration, diet)
- usually resolves spontaneously, but if severe HBV infection, treatment with antiviral agent such as tenofovir or entecavir can be considered; in acute hepatitis C, antiviral treatment should be considered (see *Hepatitis C Virus, G34*)
- indications for hospitalization: encephalopathy, coagulopathy, severe vomiting, hypoglycemia

**Prognosis**

- poor prognostic indicators: comorbidities, persistently high bilirubin (>340 mmol; 20 mg/dL), increased INR, decreased albumin, hypoglycemia

**Complications**

- cholestasis (most commonly associated with HAV infection)
- hepatocellular necrosis: AST, ALT >10-20x normal, ALP and bilirubin minimally increased, increased cholestasis

**Hepatitis A Virus**

- RNA virus
- fecal-oral transmission; incubation period 4-6 wk
- diagnosed by elevated transaminases, positive anti-HAV IgM
- in children: characteristically asymptomatic
- in adults: fatigue, nausea, arthralgia, fever, jaundice, hepatomegaly
- can cause ALF and subsequent death (<1-5%)
- can relapse (rarely), but never becomes chronic
- treatment is supportive (no specific treatments available, disease is often self-limiting)

**Hepatitis B Virus**

Table 19. Hepatitis B Serology

	HBsAg	Anti-HBs	HBeAg	Anti-HBe	Anti-HBc	Liver Enzymes
Acute HBV	+	-	+	-	IgM	
Chronic (HBe-Ag positive) HBV (generally high HBV-DNA)	+	-	+	-	IgG	ALT, AST may or may not be elevated
Chronic (HBe-Ag negative) HBV (generally low HBV-DNA)	+	-	-	+	IgG	ALT, AST may or may not be normal
Resolved Infection	-	±	-	±	IgG	
Immunization	-	+	-	-	-	

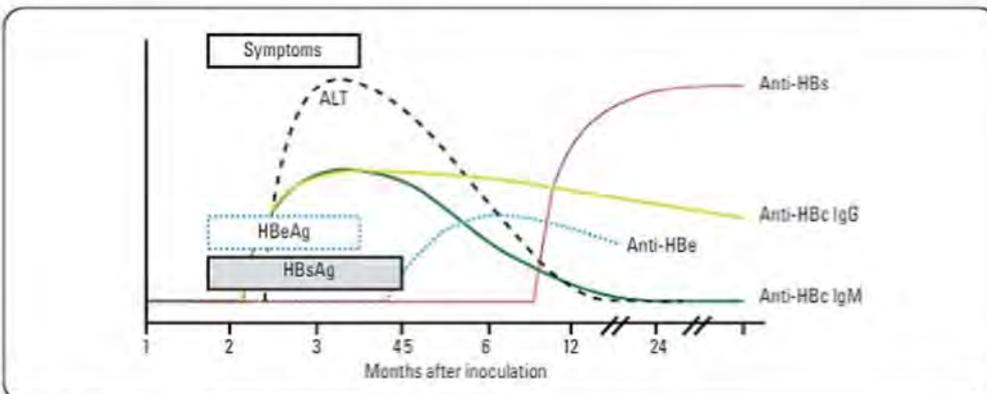

Figure 12. Time course of acute hepatitis B infection

**Alcoholic Hepatitis:** history of chronic EtOH use (possibly with recent increased consumption, although often patient may have stopped drinking in the days-weeks prior to presentation due to symptoms). RUQ abdominal pain, AST/ALT >2, AST usually <300, low grade fever, mildly elevated WBC

**Major Sources of ALP**

- Hepatobiliary tree
- Bone
- Placenta
- Intestine

**DDx for Hepatitis**

- Viral infection
- Alcohol
- Drugs
- Immune-mediated
- Toxins

Without treatment, 8-20% of those with ongoing immunoinactive chronic hepatitis can develop cirrhosis within 5 yr. In contrast, those in the immune tolerant phase (with extremely high HBV-DNA levels) are at minimal risk for liver fibrosis as they do not have immune-mediated liver injury

Risk of HCC in HBV increases with increasing age, which is likely a surrogate for increasing liver fibrosis/cirrhosis, and serum HBV-DNA  
Risk of HCC in HCV increases only after cirrhosis develops

HCV (and HBV) treatment lowers the risk of HCC

**Risk Factors for Progression**

- EtOH
- HIV coinfection
- Old age at diagnosis

### Epidemiology

- 4 phases of chronic hepatitis B: not all carriers will go through all 4 phases, but all carriers will have positive HBsAg
  - immune tolerance:** extremely high HBV-DNA (>20000 IU/mL), HBeAg positive, but normal ALT/AST; due to little immune control and minimal immune-mediated liver damage; characteristic of perinatal infection (or 'incubation period' in adult with newly-acquired HBV)
  - immune clearance (or immunoactive):** HBV-DNA levels (>20000 IU/mL), HBeAg positive; due to immune attack on the virus and immune-mediated liver damage; characterized by progressive disease without treatment and increasing liver fibrosis (sometimes progressing to cirrhosis and/or HCC); likely to benefit from treatment
  - inactive carrier (immune control):** lower HBV-DNA (<2000 IU/mL), HBeAg negative, anti-HBe positive, ALT/AST normal; due to immune control without immune-mediated liver damage; risk of reactivation to phase 2 (clinically resembles acute hepatitis B), especially with immunosuppression e.g. corticosteroids or chemotherapy
  - HBeAg-negative chronic hepatitis (immune escape) ("core or precore mutant"):** elevated HBV-DNA (>2000 IU/mL), HBeAg negative because of pre-core or core promoter gene mutation, anti-HBe positive, ALT/AST high; characterized by progressive disease without treatment and increasing liver fibrosis (sometimes progressing to cirrhosis and/or HCC); likely to benefit from treatment

### Treatment

- counselling: 40% of men and 10% of women with perinatal infection without treatment will die from HBV-related complications
- HCC screening with U/S q6 mo, especially if high serum HBV-DNA levels, cirrhosis, men, (ages >40 in Asian men, >50 in Asian women, and >20 in African descent)
- contexts to consider pharmacological therapy:
  - HBeAg positive and HBV-DNA >20000 IU/mL and elevated ALT
  - HBeAg negative and HBV-DNA >2000 IU/mL and elevated ALT with or without stage ≥2 fibrosis on liver biopsy
  - to prevent flare when placed on immunosuppressive therapy such as prednisone, chemotherapy, biologics, etc.
- treatment goal: reduce serum HBV-DNA to undetectable level
  - prolonged immune-mediated damage leads to higher risk of liver fibrosis
- treatment options: tenofovir, entecavir, lamivudine (not preferred due to high rate of developing resistance)
- vaccinate against HAV if serology negative (to prevent further liver damage)
- follow blood and sexual precautions
- vaccinate household contacts

## Hepatitis D Virus

- defective RNA virus requiring HBsAg for entry into hepatocyte, therefore infects only patients with HBV; causes more aggressive disease than HBV alone
- coinfection: acquire HDV and HBV at the same time
- HDV can present as ALF and/or accelerate progression to cirrhosis
- treatment: low-dose interferon (20% response) and liver transplant for end-stage disease

## Hepatitis C Virus

- RNA virus (7 genotypes; genotype 1 is most common in North America)
- blood-borne transmission; sexual transmission is "inefficient"
- major risk factor: injection drug use
- other risk factors: blood transfusion received before 1992 (or received in developing world), tattoos, intranasal cocaine use
- acute hepatitis C occurs 2-6 mo after transmission
  - symptoms mild and vague (fatigue, malaise, nausea) therefore not commonly diagnosed in acute stage
  - almost 30% of cases of acute hepatitis C are cleared spontaneously without therapy

### Diagnosis

- suspected on basis of elevated ALT/AST and positive serum anti-HCV
- diagnosis established by detectable HCV-RNA in serum
- normal hepatocellular enzymes does not rule out active disease or presence of advanced fibrosis
- abdominal U/S and transient elastography (FibroScan<sup>®</sup>) to assess the staging of the disease and the degree of fibrosis

In acute hepatitis B, HDV coinfection increases severity of hepatitis but does not increase risk of progression to chronic hepatitis. However in the context of chronic hepatitis B, superinfection with HDV increases progression to cirrhosis

### Causes of Elevated Serum Transaminases in Chronic Hepatitis B

- Active hepatitis (either immune clearance phase in HBeAg-positive individuals or HBeAg-negative active hepatitis)
- Reactivation (e.g. due to immunosuppression)
- Hepatitis D
- Other liver insult (fatty liver, EtOH, drugs, hepatitis A)

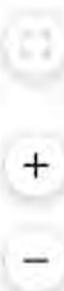

### Risk Factors for Contracting Hepatitis B

- Infants born to a hepatitis B-infected parent (maternal or paternal)
- Unprotected sexual intercourse (especially if multiple partners)
- Needle sharing (e.g. injection drug users)
- Travel to endemic regions
- Exposure to human blood, semen, and other bodily fluids

### Clinical Features of Hepatitis B

- Many patients are asymptomatic, both in the acute and chronic phases
- Acute hepatitis can manifest as jaundice, nausea, arthritis, or constitutional symptoms
- Patients with chronic hepatitis can be asymptomatic, experience exacerbations, develop extrahepatic complications (e.g. glomerular disease), or develop cirrhosis

### Treatment

- blood-borne precautions; vaccinate for hepatitis A and B if serology negative; avoid EtOH
- clearest indication for treatment is in subgroups likely to develop clinically significant liver disease, i.e. persistently elevated transaminases, liver biopsy showing moderate-advanced fibrosis/cirrhosis, and at least moderately severe necrosis/inflammation
  - now that a safe, effective cure is available, the risk/benefit ratio favours treating everyone with chronic hepatitis C
- choice and duration of treatment depends mostly on whether patient is cirrhotic (and if so, whether decompensated or not), prior treatment history, and possibly genotype (but less so with availability of pan-genotypic therapies)
- direct acting antiviral (DAA) tablets (Maviret®, a combination of glecaprevir and pibrentasvir, and Epclusa®, a combination of velpatasvir and sofosbuvir) are the most commonly used
- other oral interferon-free regimens (for all genotypes) (e.g. sofosbuvir/ledipasvir, ombitasvir/paritaprevir/ritonavir+dasabuvir, or elbasvir/grazoprevir, and sofosbuvir/velpatasvir) are also available but used less frequently
- it is important to check for hepatitis B prior to therapy as direct acting antivirals may lead to reactivation of hepatitis B

### Prognosis

- 80% of acute hepatitis C cases become chronic (of these, 20% evolve to cirrhosis within 20 years of exposure)
- risk of HCC increases if cirrhotic
- can cause cryoglobulinemia; associated with membranoproliferative glomerulonephritis, lymphoma

Table 20. Characteristics of the Viral Hepatitides

	HAV	HBV	HCV	HDV	HEV	CMV	EBV	Yellow Fever
<b>Virus Family</b>	<i>Picornaviridae</i>	<i>Hepadnaviridae</i>	<i>Flaviviridae</i>	<i>Deltaviridae</i>	<i>Caliciviridae</i>	<i>Herpesviridae</i>	<i>Herpesviridae</i>	<i>Flavivirus</i>
<b>Genome</b>	RNA	DNA	RNA	RNA	RNA	DNA	RNA	RNA
<b>Envelope</b>	No	Yes	Yes	Yes	No	Yes	Yes	Yes
<b>Transmission</b>	Fecal-oral	Parenteral/sexual or equivalent Vertical	Parenteral/sexual (transfusion, IV drug user, sexual (-HBV)) 40% have no known risk factors	Non-parenteral (close contact in endemic areas) Parenteral (blood products, IV drug user) — sexual transmission is inefficient	Fecal-oral (endemic: Africa, Asia, central America, India, Pakistan)	Close contacts, most body fluids	Saliva-oral	Vector (mosquito)
<b>Incubation</b>	4-6 wk	6 wk-6 mo	2-26 wk	3-13 wk	2-8 wk	20-60 d	30-50 d	3-6 d
<b>Onset</b>	Usually abrupt	Usually insidious	Insidious	Usually abrupt	Usually abrupt	Variable	Variable	Usually abrupt
<b>Communicability</b>	2-3 wk in late incubation to early clinical phase Acute hepatitis in most adults, 10% of children	HBsAg+ state highly communicable Increased during third trimester or early post-partum	Communicable prior to overt symptoms and throughout chronic illness	Infectious only in presence of HBV (HBsAg required for replication)	Unknown	Variable — dormant or persistent	Highly communicable during year after primary infection but never zero	Variable, vector-dependent
<b>Chronicity</b>	None, although can relapse	5% adults, 90% infants	80%, 20% of which develop cirrhosis	5%	None	Common; latent	Common; latent	Infection confers lifelong immunity
<b>Serology</b>	Anti-HAV (IgM)	See Table 19, 633	HCV-RNA Anti-HCV (IgG/IgM)	HBsAg Anti-HDV (IgG/IgM)	Anti-HEV (IgG/IgM)	Anti-CMV (IgM/IgG)	Monospot; anti-EBV IgM/IgG, EBV-DNA quantitation	Anti-YF (IgM/IgG)
<b>Vaccine</b>	Havrix®, 2 doses q6 mo, combined with Twinrix® at 0, 7, and 21 d	Recombivax® HBV, ages 11-15, 2 doses q6 mo	No	No	No	No	No	YF-VAX®, 1 dose booster q10 yr
<b>Management</b>	General hygiene Treat close contacts (anti-HAV Ig) Prophylaxis for high-risk groups (HAV vaccine ± HAV Ig) unless immune	Prevention: HBV vaccine and/or hepatitis B Ig (HBIG) for needlestick, sexual contact, infants of infected mothers (unless already immune) Rx: oral antivirals vs. interferon if indications met	Prevention: no vaccine Rx: interferon + ribavirin ± protease inhibitor; although all oral antiviral (IFN-free) therapies now available are highly efficacious	Prevention: HBV vaccine	Prevention: general hygiene, no vaccine	In high-risk transplant patients: CMV Ig and antivirals (ganciclovir, valganciclovir)	Supportive treatment post-infection	Prevention Supportive treatment post infection
<b>Acute Mortality</b>	0.1-0.3%	0.5-2%	1%	2-20% coinfection with HBV, 30% superinfection Predisposes HBV carriers to more severe hepatitis and faster progression to cirrhosis	1-2% overall, 10-20% in pregnancy	Rare in immunocompetent adults	Rare	20-60% in developing countries
<b>Oncogenicity</b>	No	Yes	Yes	Yes	No	No	Yes	No
<b>Complications</b>	Can cause ALF and subsequent death (~1-5%)	HCC secondary to cirrhosis, serum sickness-like syndrome, glomerulonephritis, cryoglobulinemia, polyarteritis nodosa, porphyria cutanea tarda	HCC in 2-5% of cirrhosis per yr, cryoglobulinemia, B-cell non-Hodgkin lymphoma	Leukocytoclastic vasculitis, membranous glomerulonephropathy	Mild, except in third trimester (10-20% ALF)	5% of newborns with multiple handicaps Immunocompromised patients at risk of CMV-induced hepatitis, retinitis, colitis, esophagitis, pneumonitis	Associated with Burkitt's lymphoma and nasopharyngeal carcinoma (rare in Western world)	Can cause a recurrent toxic phase with liver damage, GI bleeding, and high mortality rates

## Autoimmune Liver Disease

- diagnosis of exclusion: rule out viruses, drugs/EtOH, metabolic, or genetic causes
- can be severe: 40% mortality at 6 mo without treatment
- extrahepatic manifestations
  - sicca, Raynaud's, thyroiditis, Sjögren's, arthralgias
  - hypergammaglobulinemia (particularly elevated IgG)
  - typical auto-antibodies: ANA and/or anti-smooth muscle antibody
  - infrequently may see anti-LKM elevation (liver kidney microsome), especially in children
  - can have false positive viral serology (especially anti-HCV)
  - biopsy – periportal (zone 1) and interface inflammation and necrosis
- treatment: corticosteroids (80% respond) ± azathioprine (without this, most will relapse as corticosteroids are withdrawn)

## Drug-Induced Liver Disease

Table 21. Classification of Hepatotoxins

	Predictable	Idiosyncratic
Example	Acetaminophen, CCl <sub>4</sub>	Phenytoin, INH
Dose-Dependence	Usual	Unusual
Latent Period	Hours-days	Weeks-months
Host Factors	Not important	Very important

- many different patterns of liver injury (i.e. hepatocellular, cholestatic, mixed, granulomatous, ALF) can be seen in drug-induced liver injury and thus this requires a high index of suspicion
- see: LiverTox for Information regarding drug-specific risks and patterns of hepatotoxicity (<http://livertox.nih.gov>)

### Specific Drugs

- acetaminophen
  - metabolized by hepatic cytochrome P450 system
  - can cause ALF (transaminases >1000 U/L followed by jaundice and encephalopathy)
  - requires 10-15 g in healthy individuals, 4-6 g in alcoholics/anticonvulsant users
  - mechanism: high acetaminophen dose saturates glucuronidation and sulfation elimination pathways → reactive metabolite (NAPQI (n-acetyl-p-benzoquinone imine)) is formed → covalently binds to hepatocyte membrane
  - presentation
    - first 24 h: nausea and vomiting (usually within 4-12 h of overdose)
    - 24-48 h: asymptomatic, but ongoing hepatic necrosis resulting in increased transaminases
    - >48 h: continued hepatic necrosis possibly complicated with ALF or resolution
    - note: potential delay in presentation in sustained-release products
  - blood levels of acetaminophen correlate with the severity of hepatic injury, particularly if time of ingestion known
  - therapy
    - gastric lavage/emesis (if <2 h after ingestion)
    - oral activated charcoal
    - N-acetylcysteine (NAC – Mucomyst\*) can be given PO or IV (most effective within 8-10 h of ingestion, but should be given regardless of time of ingestion)
      - promotes hepatic glutathione regeneration
    - no recorded fatal outcomes if NAC given before increase in transaminases
    - NAC use should be determined by the Rumack-Matthew nomogram or if unclear, time of ingestion
- chlorpromazine: cholestasis in 1% after 4 wk; often with fever, rash, jaundice, pruritus, and eosinophilia
- Isoniazid (INH)
  - 20% develop elevated transaminases but <1% develop clinically significant disease
  - susceptibility to injury increases with age
- Methotrexate (MTX)
  - causes fibrosis/cirrhosis; increased risk in the presence of obesity, DM, alcoholism (i.e. with underlying risk for pre-existing fatty liver)
  - scarring develops without symptoms or changes in liver enzymes, therefore biopsy may be needed in long-term treatment
- amiodarone: can cause same histology and clinical outcome as alcoholic hepatitis
- others: azoles, statins, methyl dopa, phenytoin, propylthiouracil (PTU), rifampin, sulfonamides, tetracyclines
- herbs: chaparral, Chinese herbs (e.g. germander, comfrey, bush tea)

**Hy's Law:** drug-induced hepatocellular jaundice indicates a mortality of at least 10%

## Wilson's Disease

### Definition

- autosomal recessive defect in copper elimination (gene *ATP7B*)

### Etiology

- decreased biliary excretion of copper plus decreased incorporation of copper into ceruloplasmin
- worldwide incidence: 1 in 40000

### Clinical Features

- liver: acute hepatitis, ALF, chronic active hepatitis, cirrhosis, low-risk of HCC
- eyes: Kayser-Fleischer rings (copper deposits in Descemet's membrane); more common in patients with CNS involvement, present in only 50% of isolated liver involvement
- CNS: basal ganglia (wing flapping tremor, Parkinsonism), cerebellum (dysarthria, dysphagia, incoordination, ataxia), cerebrum (psychosis, affective disorder)
- kidneys: Fanconi's syndrome (proximal tubule transport defects) and stones
- blood: intravascular hemolysis; may be initial presentation in fulminant hepatitis
- joints: arthritis, bone demineralization, calcifications

### Investigations

- suspect if increased liver enzymes with clinical manifestations at young age (<40); especially combination of liver disease with dystonia, psychiatric symptoms
- screening tests
  1. reduced serum ceruloplasmin (<50% of normal)
  2. Kayser-Fleischer rings (usually require slit-lamp examination)
  3. increased urinary copper excretion (measure 24-hour urine copper)
- gold standard
  1. increased copper on liver biopsy by quantitative assay
  2. genetic analysis imperfect as many mutations in *ATP7B* are possible
- first-degree relatives should also be considered for screening

### Treatment

- 4 drugs available
  1. penicillamine: chelates copper, but poorly tolerated
  2. trientine: chelates copper
  3. zinc: impairs copper excretion in stool and decreases copper absorption from gut. Often used as maintenance therapy or in neurologic presentations
  4. tetrathiomolybdate: preferred if neurological involvement
- hepatic presentations are best treated with a trientine + zinc combination
- liver transplant in severe cases of liver failure

### Clinical Manifestations of Wilson's Disease

#### ABCD

- Asterixis
- Basal ganglia degeneration: suspect if parkinsonian features in the young
- Ceruloplasmin decreases
- Cirrhosis
- Corneal deposits (Kayser-Fleischer ring)
- Copper
- Dementia

## Hemochromatosis

### Definition

- excessive iron storage causing multiorgan system dysfunction (liver, in particular) with total body iron stores increased to 20-40 g (normal 1 g)

### Etiology

- primary (hereditary) hemochromatosis
  - usually related to HFE mutation (see Epidemiology below)
  - decreased hepcidin production results in increased GI absorption and tissue iron deposition despite adequate iron stores
- secondary hemochromatosis
  - parenteral iron overload (e.g. transfusions, hemodialysis, parenteral iron injections)
  - excessive oral iron intake (e.g. dietary iron overload)
  - other liver diseases (e.g. EtOH, NAFLD, viral hepatitis)
  - iron-loading anemias (hemolytic, sideroblastic, aplastic, thalassemia major)
  - ineffective erythropoiesis

### Epidemiology

- classic hereditary hemochromatosis most common in Northern European descent
- primarily due to the recessive gene, *HFE*, which has a homozygous genetic prevalence of 1/400
- mainly caused by mutations in the *HFE* gene (e.g. C282Y/C282Y, C282Y/H63D)
  - C282Y/H63D only potentially causative as compound heterozygote
- rare non-*HFE* mutations also exist (e.g. ferroportin, hemojuvelin, hepcidin, aceruloplasminemia)

### Hemochromatosis Clinical Features

#### ABCDH

- Arthralgia
- Bronze skin
- Cardiomyopathy, cirrhosis of liver
- Diabetes (pancreatic damage)
- Hypogonadism (anterior pituitary damage)

### Clinical Features

- usually presents with trivial elevation in serum transaminases although often picked up incidentally when iron studies noted to be elevated
- liver: cirrhosis (less common nowadays due to earlier detection), HCC (200x increased risk)
- pancreas: DM, chronic pancreatitis
- skin: bronze or grey (due to melanin, not iron)
- heart: diastolic dysfunction and arrhythmias in early stages with dilated cardiomyopathy in later stages
- pituitary: hypogonadotropic hypogonadism (impotence, decreased libido, amenorrhea)
- joints: arthralgia (any joint, but especially metacarpophalangeal joints), chondrocalcinosis

### Investigations

- screening for individuals with clinical features and/or family history (25% chance of sibling having the disease)
  - transferrin saturation (free Fe<sup>2+</sup>/total iron binding capacity (TIBC)) >45%
  - serum ferritin >400 ng/mL
  - HFE gene analysis: 90% of primary hemochromatosis involves C282Y allele, while H63D and S65C alleles also commonly involved and screened
- MRI (often used instead of a liver biopsy)
  - non-invasive approach to assess iron overload
  - most sensitive and specific modality in the diagnosis of hemochromatosis
  - serum ferritin >1000 ng/mL or symptoms of organ injury (e.g. elevated LFTs, symptoms of heart failure)
  - can be used to follow treatment by phlebotomies
- liver biopsy (generally used to detect cirrhosis or if potential for other causes of liver disease)
  - markers of advanced fibrosis: if any of the following are present at the time of diagnosis → ages >40, elevated liver enzymes, or ferritin >1000 ng/mL
  - considered if compound heterozygote and potential other cause of liver injury (e.g. NAFLD, excess EtOH, hepatitis)
  - if C282Y/C282Y and no markers of advanced fibrosis, then biopsy generally not needed
- HCC screening if cirrhosis

### Treatment

- phlebotomy: weekly or q2 wk then lifelong maintenance phlebotomies q2-6 mo, generally aiming for ferritin of 50-100 ng/mL
- deferoxamine if phlebotomy contraindicated (e.g. cardiomyopathy, anemia)
- primary hemochromatosis responds well to phlebotomy
- secondary hemochromatosis usually requires chelation therapy (administration of agents that bind and sequester iron, and then excreted)

### Prognosis

- normal life expectancy if treated before the development of cirrhosis or DM

## Alcoholic Liver Disease

### Definition

- spectrum of diseases, ranging from:
  - fatty liver (common amongst individuals with EtOH use disorder): reversible if EtOH stopped
  - alcoholic hepatitis (35% of individuals with EtOH use disorder): usually reversible if EtOH stopped
  - cirrhosis (10-15% of individuals with EtOH use disorder): potentially irreversible

### Pathophysiology

- several mechanisms, poorly understood
- ethanol oxidation to acetaldehyde
  - reduces NAD<sup>+</sup> to NADH; increased NADH decreases ATP supply to liver, impairing lipolysis so fatty acids and triglycerides accumulate in liver
  - binds to hepatocytes evoking an immune reaction
- EtOH increases gut permeability leading to increased bacterial translocation
- EtOH metabolism causes:
  - relative hypoxia in liver zone III (near central veins; poorly oxygenated) > zone I (around portal tracts, where oxygenated blood enters)
  - necrosis and hepatic vein sclerosis
- histology of alcoholic hepatitis
  - ballooned (swollen) hepatocytes often containing Mallory bodies, characteristically surrounded by neutrophils
  - large fat globules
  - fibrosis: space of Disse and perivenular

Ferritin may never normalize if other causes of high ferritin present (e.g. fatty liver from metabolic syndrome or EtOH)

#### Standard Drink Equivalent

- 1 standard drink = 14 g EtOH
- = 12 oz beer (5% alcohol)
- = 5 oz wine (12-17%)
- = 3 oz fortified wine (17-22%)
- = 1.5 oz liquor (40%)
- Tip: percentage EtOH multiplied by oz in 1 standard drink roughly equals 60

#### Biopsy + Histology of Alcoholic Hepatitis (triad)

- Hepatocyte necrosis with surrounding inflammation in zone III
- Mallory bodies (intracellular eosinophilic aggregates of cytokeratins)
- Chicken-wire fibrosis (network of intralobular connective tissue surrounding cells and venules)

**Clinical Features**

- >2-3 standard drinks/d in females and >3-6 standard drinks/d in men for >10 yr leads to cirrhosis, but only in about 10-20% of those who consume this amount daily on a continuous basis; cirrhosis risk increases with amount of EtOH consumed above threshold
- clinical findings do not accurately predict type of liver involvement
- fatty liver
  - mildly tender hepatomegaly; jaundice rare
  - mildly increased transaminases <5x normal
- alcoholic hepatitis
  - variable severity: mild to fatal liver failure
  - mild: stops drinking because feels unwell, resumes when feeling better (if assessed, findings of hepatitis, potentially mild jaundice, and mildly elevated INR)
  - severe: stops drinking but feels unwell, low grade fever, RUQ discomfort, increased WBC count – mimics right lower lobe pneumonia and cholecystitis

**Investigations**

- blood tests are non-specific, but in general
  - AST:ALT >2:1 (both usually <300)
  - CBC: increased mean corpuscular volume (MCV), increased WBC often seen with alcoholic hepatitis but not necessarily in other alcohol-related liver injury
  - increased GGT

**Treatment**

- alcohol cessation (see [Psychiatry, PS28](#))
  - Alcoholics Anonymous (or similar programs), disulfiram, naltrexone, acamprostate
- multivitamin supplements (especially thiamine)
- caution with drugs metabolized by the liver
- prednisolone if severe alcoholic hepatitis based on Maddrey's discriminant function or Model for End-Stage Liver Disease (MELD) score as described in Prognosis
  - pentoxifylline less used since most definitive trial did not demonstrate efficacy

**Prognosis**

- Maddrey's discriminant function (based on PT and bilirubin) and MELD predict mortality and guide treatment (consideration of corticosteroids for severe disease based on Maddrey  $\geq 32$  or MELD  $\geq 21$ )
- bilirubin response at day 7 of corticosteroids (Lille model) also factors into prognosis and decision on whether to continue full course of corticosteroids if started
- fatty liver: complete resolution with cessation of EtOH intake
- alcoholic hepatitis mortality
  - immediate: 30%-60% in the first 6 mo if severe
  - with continued EtOH: 70% in 5 yr
  - with cessation: 30% in 5 yr

**Non-Alcoholic Fatty Liver Disease****Definition**

- spectrum of disorders characterized by macrovesicular hepatic steatosis, sometimes with inflammation and/or fibrosis
- most common cause of liver disease in North America

**Etiology**

- pathogenesis not well elucidated; insulin resistance implicated as key mechanism, leading to hepatic steatosis
- histological changes indistinguishable from those of alcoholic hepatitis despite negligible history of EtOH consumption

**Risk Factors**

- component of the metabolic syndrome along with obesity, T2DM, HTN, hypertriglyceridemia
- other less common causes such as medications (e.g. tamoxifen, corticosteroids, MTX), Wilson's, TPN, rapid weight loss, and others

**Clinical Features**

- often asymptomatic
- may present with fatigue, malaise, and vague RUQ discomfort

**Investigations**

- elevated serum AST, ALT  $\pm$  ALP; AST/ALT <1
- presents as echogenic liver texture on U/S
- non-invasive testing of fibrosis: FIB4, NAFLD fibrosis score, FibroTest<sup>™</sup>, FibroScan<sup>®</sup>
- liver biopsy cannot distinguish fatty liver from alcoholic vs. non-alcoholic, but considered when investigating alternative etiologies or assessing for level of fibrosis

**GI Complications of Alcohol Use**

- Esophagus
  - Mallory-Weiss tear
  - Esophageal varices (secondary to portal hypertension)
- Stomach
  - Alcoholic gastritis
- Pancreas
  - Acute pancreatitis
  - Chronic pancreatitis
- Liver
  - Alcoholic hepatitis
  - Fatty liver
  - Cirrhosis
  - Hepatic encephalopathy
  - Portal hypertension
  - Ascites
  - HCC

### Treatment

- mainstay is gradual weight loss (0.5-1 kg/wk) as rapid weight loss can worsen liver disease
  - ideally, aim to lose at least 7-10% of body weight
- evidence for the use of pharmacologic agents such as pioglitazone and liraglutide, but potential benefits must be balanced with associated adverse effects (e.g. weight gain and CHF with pioglitazone)
- some evidence for vitamin E (800 IU daily) if there is hepatic inflammation in non-diabetic, non-cirrhotic patients
- some evidence for benefits of coffee drinking (3 cups/d) and vitamin D
- consideration for bariatric surgery

### Prognosis

- main causes of death, particularly in non-cirrhotic group, are cardiovascular disease and malignancy
- better prognosis than alcoholic hepatitis
  - <25% progress to cirrhosis over a 7-10 yr period
- risk of progression increases if inflammation or scarring occurs alongside fat infiltration (non-alcoholic steatohepatitis)
- other clinical indicators of unfavourable prognosis: obesity, T2DM, age, metabolic syndrome, higher levels of fibrosis

## Acute Liver Failure (formerly Fulminant Hepatic Failure)

### Definition

- severe decline in liver function characterized by coagulation abnormality (INR >1.5) and encephalopathy
- in setting of previously normal liver
- rapid (<26 wk duration)

### Etiology

- drugs (especially acetaminophen), hepatitis B (measure anti-HBc, IgM fraction because sometimes HBV-DNA and even HBsAg rapidly become negative), hepatitis A, hepatitis C (rare), ischemic, idiopathic

### Treatment

- correct hypoglycemia, monitor level of consciousness, prevent GI bleed with PPI, monitor for infection and multiorgan failure (usually requires ICU)
- consider liver biopsy before INR becomes too high
- chief value of biopsy is to exclude chronic disease, less helpful for prognosis
- liver transplant (King's College criteria can be used as prognostic indicator); consider early, especially if time from jaundice to encephalopathy >7 d (e.g. not extremely rapid), ages <10 or >40, cause is drug or unknown, bilirubin >300  $\mu\text{mol/L}$ , INR >3.5, creatinine >200  $\mu\text{mol/L}$

Figure 13. Progression of liver dysfunction based on liver function tests – the “W”

## Cirrhosis

### Definition

- liver damage characterized by diffuse distortion of the basic architecture with fibrosis and formation of regenerative nodules
- biopsy gold standard for diagnosis
- compensated cirrhosis = absence of complications, can last for 10-20 yr with almost normal life expectancy
- decompensated cirrhosis = development of complications such as ascites (most common), variceal bleeding, encephalopathy

### Etiology

- fatty liver (alcoholic or NAFLD)
- chronic viral hepatitis (B, B+D, C; not A or E)
- autoimmune hepatitis
- drugs (e.g. chronic MTX or amiodarone use)
- hereditary hemochromatosis
- PBC
- chronic hepatic congestion
  - cardiac cirrhosis (chronic right heart failure, constrictive pericarditis)
  - hepatic vein thrombosis (Budd-Chiari)
- cryptogenic (i.e. no identifiable cause, although many of these patients may represent “burnt-out non-alcoholic steatohepatitis (NASH)”)
  - rare: Wilson’s disease, Gaucher’s disease,  $\alpha$ 1-antitrypsin deficiency

### MELD-Na (Model for End-Stage Liver Disease)

- Predicts 3 mo survival and used to stratify patients on transplant list
- Based on creatinine, INR, total bilirubin, and serum sodium concentration

### MELD 3.0

- Updated score that includes new variables such as female sex and serum albumin

### Investigations

- definitive diagnosis is histologic (liver biopsy)
- other tests may be suggestive
  - blood work
    - fall in platelet count <150 is the earliest finding
    - in late stages of cirrhosis, rise in INR, fall in albumin, rise in bilirubin
    - elevated bilirubin is usually seen in more advanced disease or in the setting of a concurrent insult
    - in very advanced cirrhosis (pre-terminal event), may also see hypoglycemia but this is more often a feature seen in severe ALF
  - FibroTest™: combination of various clinical and biochemical markers that can predict degree of fibrosis
  - imaging
    - U/S is the primary imaging modality but only finds advanced cirrhosis
    - CT to look for varices, nodular liver texture, splenomegaly, ascites
    - transient elastography (FibroScan®): non-invasive tool using elastography for measuring liver compliance (variable availability)
      - rapidly replacing liver biopsy to determine extent of liver fibrosis and make the diagnosis of cirrhosis
- gastroscopy: varices or portal hypertensive gastropathy

### Treatment

- treat underlying disorder
- decrease insults (e.g. EtOH cessation, hepatotoxic drugs, immunize for hepatitis A and B if non-immune)
- follow patient for complications (esophageal varices, ascites, HCC)
- prognosis: Child-Pugh Score and MELD score
- liver transplantation for end-stage disease; use MELD score (e.g. MELD ≥15)

**Table 22. Child-Pugh Score and Interpretation**

Classification	1	2	3
Serum bilirubin (µmol/L)	<34	34-51	>51
Serum albumin (g/L)	>35	28-35	<28
INR	<1.7	1.7-2.3	>2.3
Presence of ascites	Absent	Controllable	Refractory
Encephalopathy	Absent	Minimal	Severe
Interpretation			
Points	Class	Life Expectancy	Perioperative Mortality
5-6	A	15-50 yr	10%
7-9	B	Candidate for transplant	30%
10-15	C	1-3 mo	82%

Score: 5-6 (Child's A), 7-9 (Child's B), 10-15 (Child's C)

\*Note: Child's classification is rarely used for shunting (TIPS or other surgical shunts), but is still useful to quantitate the severity of cirrhosis.

### Complications

- hematologic changes in cirrhosis
  - pancytopenia from hypersplenism: platelets first, then WBC, then hemoglobin
  - decreased clotting factors resulting in elevated INR
  - relationship of INR to bleeding tendency is controversial; some patients may be hypocoagulable, others may be hypercoagulable
- variceal bleeds
  - 1/2 of patients with cirrhosis have gastroesophageal varices and 1/3 of these develop hemorrhage with an overall mortality of >30%
  - HVPG ≥10 mmHg is the strongest predictor of variceal development
  - treatment: resuscitation, antibiotic prophylaxis, vasoactive drugs (e.g. octreotide IV) combined with endoscopic band ligation or sclerotherapy, TIPS
- renal failure in cirrhosis
  - classifications
    - pre-renal (usually due to overdiuresis)
    - acute tubular necrosis
    - HRS
      - type I: sudden and acute renal failure (rapid doubling of creatinine over 2 wk)
      - type II: gradual increase in creatinine with worsening liver function (creatinine doubling over years)
  - HRS can occur at any time in severe liver disease, especially after:
    - overdiuresis or dehydration, such as diarrhea, vomiting, etc.
    - GI bleed
    - sepsis

#### Cirrhosis Complications

##### VARICES

- Varices
- Ascites/Anemia
- Renal failure (HRS)
- Infection
- Coagulopathy
- Encephalopathy
- Sepsis

Usual causes of death in cirrhosis: renal failure (hepatorenal syndrome), sepsis, GI bleed, or HCC

#### Hepatorenal Syndrome vs. Pre-Renal Failure – Difficult to Differentiate

- Similar blood and urine findings
- Urine sodium: very low in hepatorenal; low in pre-renal
- IV fluid challenge: giving volume expanders improves pre-renal failure, but not HRS

#### Hepatopulmonary Syndrome

##### Clinical Triad

- Liver disease
- Increased alveolar-arterial gradient while breathing room air
- Evidence for intrapulmonary vascular abnormalities

Fibrosis may regress and disappear if cause of liver injury is treated or resolves

- treatment for HRS (generally unsuccessful at improving long-term survival)
  - for type 1 HRS: octreotide + midodrine + albumin (increases renal blood flow by increasing systemic vascular resistance)
  - definitive treatment is liver transplant
- hepatopulmonary syndrome
  - majority of cases due to cirrhosis, though may be due to other chronic liver diseases, such as non-cirrhotic portal HTN
  - thought to arise from:
    - ventilation-perfusion mismatch (intrapulmonary shunting and limitation of oxygen diffusion)
    - failure of damaged liver to clear circulating pulmonary vasodilators and/or increased production of vasodilators by liver
  - clinical features
    - hyperdynamic circulation with cardiac output  $>7$  L/min at rest and decreased pulmonary + systemic resistance (intrapulmonary shunting)
    - dyspnea, platypnea (increase in dyspnea in upright position, improved by recumbency), and orthodeoxia (desaturation in the upright position, improved by recumbency)
    - diagnosis via contrast-enhanced echocardiography: inject air bubbles into peripheral vein; air bubbles appear in left ventricle after third heartbeat (normal = no air bubbles; in ventricular septal defect, air bubbles seen  $<3$  heart beats)
    - only proven treatment is liver transplantation

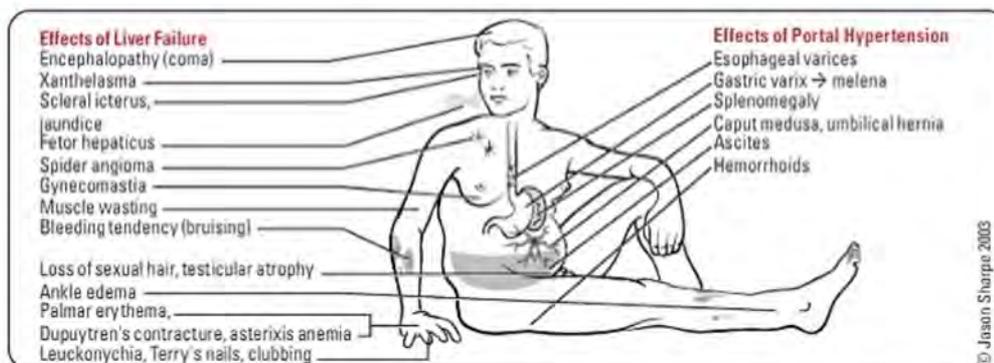

Figure 14. Clinical features of liver disease

## Hepatocellular Carcinoma

- see [General Surgery and Thoracic Surgery, GS53](#)

## Liver Transplantation

- see [General Surgery and Thoracic Surgery, GS54](#)

## Portal Hypertension

### Definition

- pressure gradient between hepatic vein pressure and wedged hepatic vein pressure (corrected sinusoidal pressure)  $>5$  mmHg

### Pathophysiology

- 3 sites of increased resistance (remember pressure = flow  $\times$  resistance)
  - pre-sinusoidal (e.g. portal vein thrombosis, schistosomiasis, sarcoidosis)
  - sinusoidal (e.g. cirrhosis, alcoholic hepatitis)
  - post-sinusoidal (e.g. right-sided heart failure, hepatic vein thrombosis, veno-occlusive disease, constrictive pericarditis)

### Complications

- GI bleeding from varices in esophagus, less commonly in stomach, even less frequently from portal hypertensive gastropathy
- ascites
- hepatic encephalopathy
- thrombocytopenia
- renal dysfunction
- sepsis
- arterial hypoxemia

### Portal Hypertension

#### Signs

- Esophageal varices
- Melena
- Splenomegaly
- Ascites
- Hemorrhoids

#### Management

- $\beta$ -blockers
- Nitrates
- Shunts (e.g. TIPS)

### Treatment

- non-selective  $\beta$ -blockers (propranolol, nadolol, carvedilol) decrease risk of bleeding from varices; PREDESCI trial (Lancet 2019;393:1597-1608) showed that non-selective  $\beta$ -blockers in cirrhotic patients with portal hypertension lowers risk of decompensation (particularly ascites)
- TIPS: to decrease portal venous pressure
  - radiologically inserted stent between portal and hepatic vein via transjugular vein catheterization and percutaneous puncture of portal vein
  - can be used to stop acute bleeding or prevent rebleeding or treat ascites
  - complications: hepatic encephalopathy, deterioration of hepatic function
  - contraindicated with severe liver dysfunction, uncontrolled hepatic encephalopathy, and congestive heart failure
  - most commonly used as a "bridge" to liver transplant

## Hepatic Encephalopathy

### Definition

- spectrum of potentially reversible neuropsychiatric syndromes secondary to hepatic insufficiency and/or portosystemic shunting, diagnosed after ruling out other causes for symptoms (e.g. structural/metabolic)

### Pathophysiology

- portosystemic shunt around hepatocytes and decreased hepatocellular function increase level of systemic toxins (believed to be ammonia from gut, mercaptans, fatty acids, amino acids) which go to the brain

### Precipitating Factors

- nitrogen load (GI bleed, protein load from food intake, renal failure, constipation)
- drugs (narcotics, CNS depressants)
- electrolyte disturbance (hypokalemia, alkalosis, hypoxia, hypovolemia)
- infection (SBP)
- deterioration in hepatic function or superimposed liver disease
- spontaneous portosystemic shunts (e.g. splenorenal shunts) or intentional portosystemic shunts (e.g. TIPS)

### Stages

- minimal hepatic encephalopathy (diagnosed with specialized cognitive testing)
- overt hepatic encephalopathy (stages I to IV)
  - I: apathy, restlessness, reversal of sleep-wake cycle, slowed intellect, impaired computational abilities, impaired handwriting
  - II: asterixis, lethargy, drowsiness, disorientation
  - III: stupor (rousable), hyperactive reflexes, extensor plantar response (positive Babinski sign)
  - IV: coma (response to painful stimuli only)

### Investigations

- clinical diagnosis: supported by laboratory findings and exclusion of other neuropsychiatric diseases
- rule out:
  - non-liver-related neuropsychiatric disease in a patient with liver problems (e.g. EtOH withdrawal or intoxication, sedatives, subdural hematoma, metabolic encephalopathy)
  - causes of metabolic encephalopathy (e.g. renal failure, respiratory failure, severe hyponatremia, hypoglycemia)
- characteristic EEG findings: diffuse (non-focal), slow, high amplitude waves
- serum ammonia levels increased, but not often necessary to measure in routine clinical use

### Treatment

- treat underlying precipitating factors
- decrease generation of nitrogenous compounds
